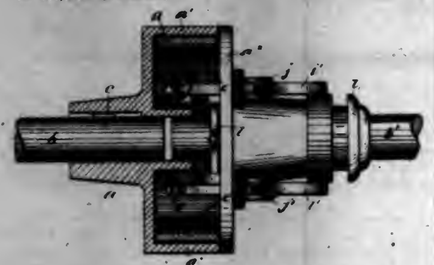
8. In weighing-scales, the combination of a centrally-poised main scale-beam having both arms graduated, the two sets of double poises arranged, respectively, on the two arms of the scale-beam, and a movable sleeve fitting on said beam between the series of graduations and carrying the pivots for the scale-beam and the scale-platform rod, substantially as specified.



9. In weighing-scales, the combination, with a separate sleeve provided with pivots and a scale-beam extending through and supported in said sleeve, of the movable slide carrying weighing-pivots adjusted on the said sleeve, substantially as and for the purpose specified.

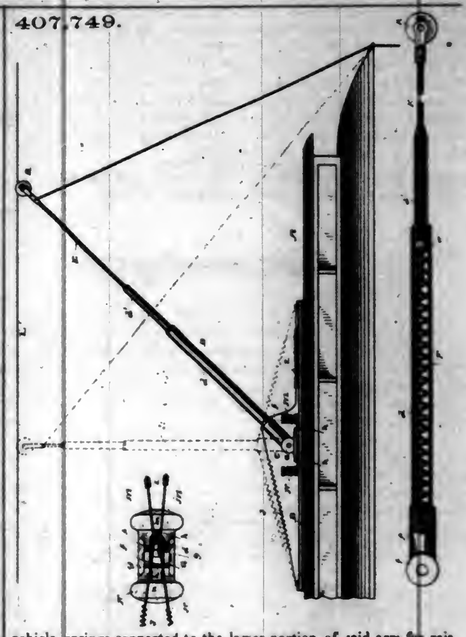
10. In weighing-scales, the combination, with a double or centrally-fulcrumed main scale-beam carrying weighing-poises and provided with a movable sleeve having the poising and weighing pivots, of the auxiliary scale-beam fitting in a fulcrumed sleeve which is connected to one arm of the main scale-beam, said auxiliary beam being longitudinally adjustable in the said sleeve, substantially as specified.

11. In weighing-scales, the combination, with the main centrally-poised scale-beam, of an auxiliary scale-beam provided with a fulcrumed sleeve which is connected to the main scale-beam and is provided with a threaded stem and a milled nut fitting on said stem and provided with a flange which engages a notch in said auxiliary beam, whereby the latter may be longitudinally adjusted in the sleeve by turning the nut on the stem, substantially as and for the purpose specified.

12. In weighing-scales, the combination, with a scale-beam, of a loose sleeve fitting on the beam and provided with pivots and a slide fitting on the said sleeve and provided with pivots, substantially as specified.

407,748. FRICTION-CLUTCH. WILLIAM B. TATRO, Hartford, Conn., assignor to William J. Pierce, same place. Filed Aug. 27, 1888. Serial No. 283,923. (No model.)

Claim.—1. In a friction-clutch, in combination, a driving clutch-section, the divided ring located in said section and having the lever-socket with rounded surfaces formed between the adjacent ends of the ring, the tilting lever radially arranged and having the enlarged rounded head supported between the ends of the ring, and the cam-slide having a projecting lug in sliding contact with one side of the tilting lever, all substantially as described.



2. In combination, in a friction-clutch, the driving clutch-section, the driven clutch-section, the tilting lever with one end held between the ends of the divided ring and radially arranged, the divided ring having the shoulder on the inner side and adjacent to the tilting-lever socket, and the cam-slide having a projecting lug adapted to engage the said shoulder on the divided ring, all substantially as described.

3. In combination, in a friction-clutch, the divided ring having the tilting-lever socket with rounded surfaces formed between the adjacent ends of the ring, the tilting lever, with one end held in the lever-socket in the divided ring, the cam-slide borne in the guide-block upon one side of said tilting lever, and the stop-slide borne in a guide-block upon the opposite side of said tilting lever, and the within-described slide-operating mechanism, all substantially as described.

4. In combination, in a friction-clutch, the divided ring, with the lever-socket and the shoulders upon opposite sides of the socket, the guide-blocks arranged upon opposite sides of the axis of the clutch-body, the cam-slide, with its projecting arm borne in one of the said guide-blocks, the stop-slide borne in the opposite block and interchangeable each with the other, the sliding collar, and the connected levers and links, whereby the sliding movement of the collar is imparted to the several cam-slides, all substantially as described.

5. In a friction-clutch, in combination, the driving clutch-section provided with bolt-holes, the driven clutch-section provided with corresponding bolt-holes, the two shafts appurtenant to said sections, respectively, the tilting lever held in the socket between the ends of the ring, the within-described tilting-lever-operating mechanism, and the bolts whereby the parts may be positively connected, all substantially as described.

407,749. EXTENSIBLE UPWARD-PRESSURE CONTACT-ARM. CHARLES J. VAN DEPOELE, Lynn, Mass. Original application filed Nov. 23, 1888, Serial No. 291,652. Divided and this application filed June 7, 1889. Serial No. 313,473. (No model.)

Claim.—1. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a rigid arm hinged to the top of said vehicle, said arm being composed of a tubular section and a telescopic end section carrying a contact-wheel at its free end and fitting into said tubular arm, and a spring within said arm acting against said end section and keeping the contact-wheel normally against the conductor when the arm is moved upon its support.

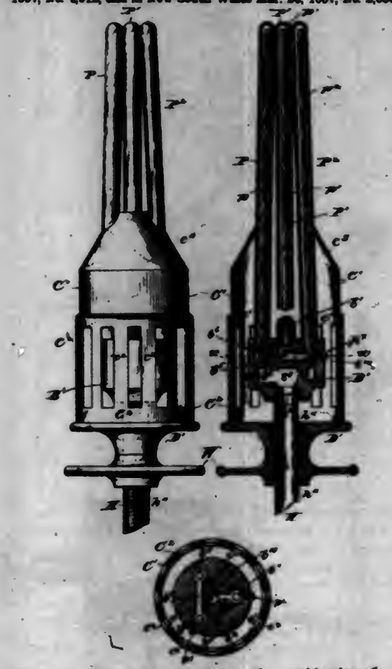
2. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a rigid arm hinged to the top of said vehicle, said arm having a telescopic end section carrying a contact-wheel, a spring for projecting said end section and keeping the contact-wheel normally against the under side of the conductor when the arm is moved upon its support, and springs in engagement with the lower part of said arm for raising the same from a horizontal toward a vertical position, according to the height of the conductor.

3. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a rigid arm hinged to the top of said vehicle, springs connected to the lower portion of said arm for raising the same toward a vertical position, and a telescopic end section carrying a contact-wheel at its free end and fitting into said tubular arm, and a spring within said arm acting against the end section for projecting the same, whereby the arm may be moved into operative position toward either end of the car without detaching the contact device from the conductor.

4. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a rigid arm hinged to the top of said vehicle, springs connected to the lower portion of said arm for raising the same toward a vertical position from either direction, and a telescopic end section carrying a contact-wheel at its free end and fitting into said tubular arm, and a spring within said arm acting against the end section for projecting the same, whereby the arm may be moved into operative position toward either end of the car without detaching the contact device from the conductor.

5. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a rigid arm hinged to the top of said vehicle upon a transverse axis, said rigid arm having a telescopic end section fitting within the arm and carrying a contact device at its free extremity, a spring within the arm for projecting the end section, and a spring or springs in engagement with the lower portion of said arm and acting to raise the same toward a vertical position.

6. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a rigid arm mounted at its lower end upon both a vertical and transverse axis upon the top of said vehicle, springs connected to the lower portion of said arm for raising the same toward a vertical position, and a telescopic end section carrying a contact-wheel at its free end and fitting into said tubular arm, and a spring within said arm acting against said end section for projecting the same, whereby said arm may be moved into operative position toward either end of the car without detaching the contact device from the conductor.



7. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a contact-carrying arm hinged to the top of the car, springs coiled about the axis thereof, their free ends engaging the said arm, detent devices connected to the other ends of said springs, and devices adjustably engaging the detents, whereby the tension of the springs may be adjusted.

8. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of a contact-carrying arm hinged to the top of the car, springs coiled on the axis thereof, their free ends engaging the shank of the arm, ratchets, as Q, mounted on said axis, the inner end of said springs being secured to the interior of the ratchets, and ratchets, as *q*, rigidly secured on said axis and having teeth engaging the teeth on the ratchets Q, whereby the tension of the springs may be adjusted.

9. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of an arm hinged to the top of the car, a contact-wheel engaging the under side of said conductor, the axis thereof being pivoted in a fork on the end of the arm, and an arm or arms, as L, pivoted at one end to the prongs of the fork and at their outer ends engaging the hub of the contact-wheel, whereby external contact is made between the conductor and the arm.

10. In an electric railway, the combination, with an overhead conductor and a moving vehicle, of an arm hinged to the top of the car, a contact-wheel engaging the under side of said conductor, the axis thereof being pivoted in a fork on the end of the arm, and arms, as L L, pivoted at one end to the prongs of the fork and embracing the hub of the contact-wheel, and an adjustable spring connecting the outer ends of said arms.

407,750. REGENERATIVE BURNER. ROSEMMOND WALLWORK, Manchester, County of Lancaster, England. Filed Oct. 24, 1888. Serial No. 289,045. (No model.) Patented in England Nov. 24, 1886, No. 15,338; in France Dec. 20, 1886, No. 180,379; in Belgium Dec. 22, 1886, No. 75,679; in Germany Dec. 22, 1886, No. 42,190; in Victoria Feb. 1, 1887, No. 4,912, and in New South Wales Mar. 28, 1887, No. 2,099.

Claim.—1. In a regenerative burner, the combination of a supply-pipe, a group of rectilinear regenerative pipes, and a burner-tip arranged axially within the group at the base thereof and in such proximity thereto as to bring them in contact with the flame, substantially as and for the purposes specified.

2. In a regenerative burner, the combination of a supply-pipe, a group of rectilinear regenerative pipes, each composed of two concentric pipes, and a burner-tip arranged axially within the group at the base thereof and in such proximity thereto as to bring them within reach of the flame, said pipes being so connected as to form a continuous circuit the initial whereof is in communication with the supply-pipe and the terminal with the burner-tip, substantially as and for the purposes specified.

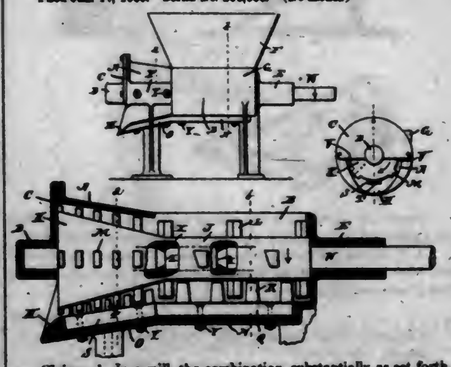
3. In a regenerative burner, the combination of a supply-pipe, a group of rectilinear and converging regenerative pipes, and a burner-tip arranged axially within the group at the base thereof and in such proximity thereto as to bring them within reach of the flame, said pipes being connected in series the initial whereof is in communication with the supply-pipe and the terminal with the burner-tip, substantially as and for the purposes specified.

4. In a regenerative burner, the combination, with the supply-pipe and the burner tip or orifice, of a plurality of regenerative pipes, the diameter whereof gradually decreases outwardly, grouped around the burner-orifice and in such proximity thereto to bring them in contact with the flame, said pipes being connected in series, the initial thereof communicating with the supply-pipe and the terminal with the burner-orifice, substantially as and for the purposes specified.

5. In a regenerative burner, the combination, with the burner tip or orifice and the supply-pipe, of a plurality of regenerative pipes, each comprising concentrically-arranged pipes connected in a continuous series, the initial communicating with the supply-pipe and the terminal with the burner-orifice, the diameter of the outer pipes gradually decreasing outwardly, said pipes being grouped around the burner-orifice to bring them in contact with the flame, substantially as and for the purposes specified.

6. In a regenerative burner, the combination, with the burner tip or orifice, and the supply-pipe, of a plurality of regenerative pipes grouped around the burner-orifice and converging toward the axial plane thereof, each pipe comprising concentrically-arranged pipes connected in continuous series, the initial communicating with the supply-pipe and the terminal with the burner-orifice, the diameter of the outer pipes gradually decreasing outwardly, substantially as and for the purposes specified.

7. In a regenerative burner, the combination, with the burner provided with an axial gas-passage leading to the burner tip or orifice, the supply-pipe, a plurality of regenerative pipes, open-ended passages or channels formed in said burner, and apertured connections between the outer ends of the pipes to connect them in series, the initial communicating with the supply-pipe and the terminal with the passage leading to the burner-orifice, of screw-plugs for the open ends of the channels and the apertures in the pipe-connections, substantially as and for the purposes specified.



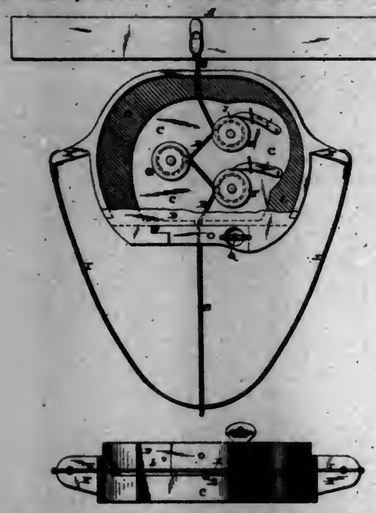
8. In a regenerative burner, the combination, with the burner tip or orifice, the supply-pipe, and a plurality of regenerative pipes grouped around the burner-orifice in such proximity as to bring them in contact with the flame, said pipes being connected in series, the initial communicating with the supply-pipe and the terminal with the burner-orifice, of an air cylinder or chamber encompassing the burner and regulating devices for regulating the volume of air admitted to the burner, substantially as and for the purposes specified.

9. The herein-described regenerative burner, comprising an injector and a multitubular regenerator, having its tubes connected in series and arranged in a projection of the plane of and in proximity to the injector-nozzle, said injector being connected with the terminal of the multitubular regenerator, substantially as and for the purposes specified.

10. The herein-described regenerative burner, comprising an injector, a combining-cone arranged in front of the injector, and a multitubular regenerator having its tubes connected in series and arranged in a projection of the plane of and in proximity to the injector-nozzle and combining-cone, said injector being connected with the terminal of the multitubular regenerator, substantially as and for the purposes specified.

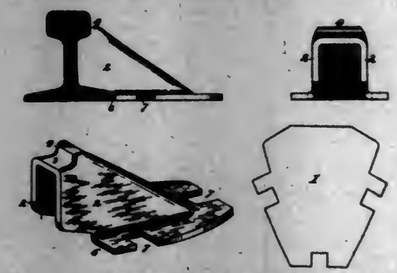
11. In a regenerative burner for volatile combustible liquids, the combination of the cone-cylinder C with regenerative pipes arranged in proximity to the flame for converting the liquid into vapor or gas, and the ejector-tip *b'*, connected with the regenerative pipes and arranged in the axial plane of the cone, for injecting the gas or vapor generated into said cone to produce a partial vacuum and forcibly entrain the air necessary to combustion into the cone, substantially as and for the purposes specified.

407,751. MILL. CHARLES F. WALTERS and WILLIAM H. GARTSIDE, Richmond, Ind., assignors to the Richmond City Mill Works, same place. Filed Jan. 17, 1888. Serial No. 296,660. (No model.)



Claim.—1. In a mill, the combination, substantially as set forth, of a horizontal frusto-conical shell prolonged into an open-topped eccentric trough and provided with an axial bearing at the end of the trough and with longitudinally-arranged pockets, a removable axial bearing at the larger end of the shell, toothed blocks secured in the pockets, a shaft mounted in said bearings, and a toothed revolver secured to said shaft and having its body cylindrical in said trough and conical in said conical shell.

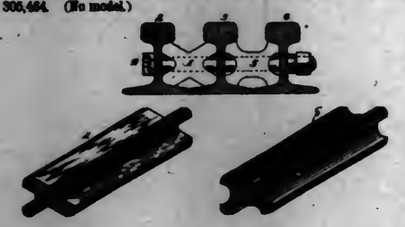
2. In a mill, the combination, substantially as set forth, of a frusto-conical shell prolonged into an open-topped eccentric trough and provided with teeth and bearings, a shaft journaled in said bear-



ings and provided with two oppositely-facing shoulders, and a toothed revolver upon said shaft and engaging said shoulders.

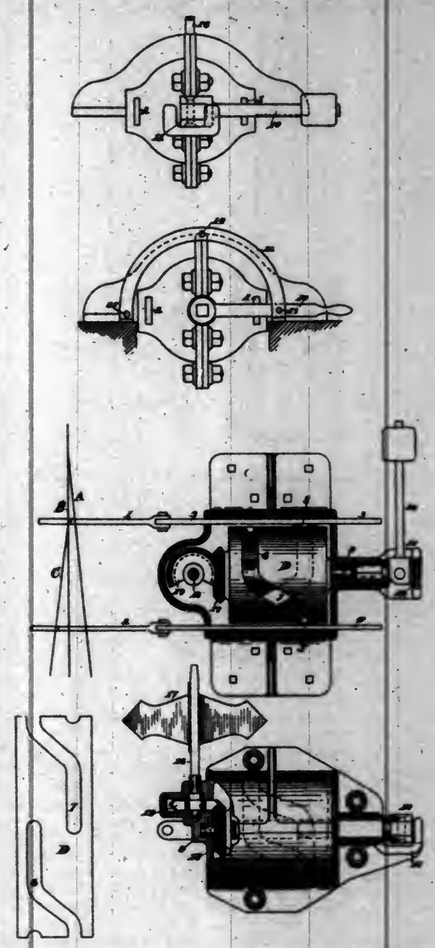
407,752. FIRE-ESCAPE. GEORGE C. WATERHOUSE, New Albany, Ind. Filed Sept. 10, 1888. Serial No. 285,094. (No model.)

Claim.—The combination of descending rope B with the main frame C, having the arms H formed integral therewith, and its lower portion cut away so as to form a shoulder, the cover D, having its lower portion provided with the enlarged part L, engaging the shoulder upon the frame, the brake-lever O, pivoted in the part L at right angles to its face, the screw Q, passing through its free end into the frame C, and the friction-rollers around which the rope passes journaled in the frame and cover, substantially as and for the purpose shown and described.



407,753. RAIL-BRACE. FREDERIC C. WEIR and CHARLES PARTINGTON, Cincinnati, Ohio, assignors to The Weir Frog Company, same place. Filed Feb. 18, 1889. Serial No. 300,338. (No model.)

Claim.—1. A railway-brace made from a blank struck up to form the vertical sides 2 and plane shoulder 3, substantially as specified.

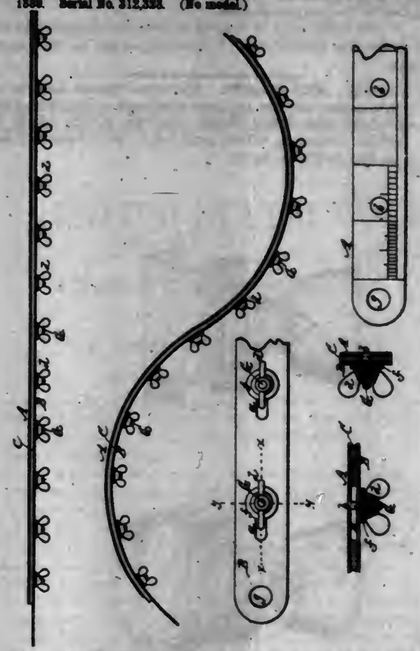


2. A railway-brace made from a blank struck up to form the vertical sides 2 and having the plane shoulder 3 and the bottom shoulders 5, substantially as specified.

407,754. FILLING FOR RAILWAY FROGS AND CROSSINGS. FREDERIC C. WEIR, Cincinnati, Ohio. Filed Mar. 30, 1889. Serial No. 305,464. (No model.)

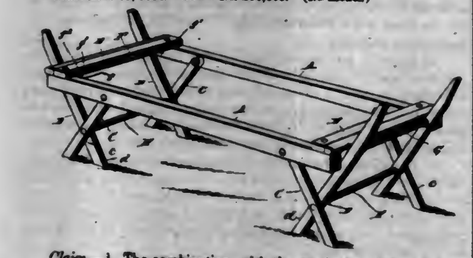
Claim.—A filling-piece for railway frogs and crossings made in cross form and having the four arms abutting the two adjacent rails in such manner that the two upper arms abut at the juncture of the heads of the rails and the web and the two lower arms at the juncture of the base and the web, substantially as described.

407,755. SWITCH-STAND. FREDERIC C. WEIR and NATHANIEL O. GOLDSMITH, Cincinnati, Ohio, assignors to The Weir Frog Company, same place. Filed Mar. 30, 1889. Serial No. 305,469. (No model.)



Claim.—1. In a three-throw switch-stand, the horizontal rotating drum having the slots 6 and 7, each formed with an inclined working portion, from which runs a straight idle portion substantially at right angles to the axis of the drum, in combination with drive-bars 3 and 4, connected with different switch-bars and having studs which respectively engage the slots, substantially as described.

2. In a three-throw switch-stand, the horizontal drum having two independent slots 6 and 7, in combination with the casing, the two parallel drive-bars 3 and 4, movable in the casing and having studs respectively engaging the slots, and two different switch-bars 1 and 2, connected, respectively, with the drive-bars, substantially as described.

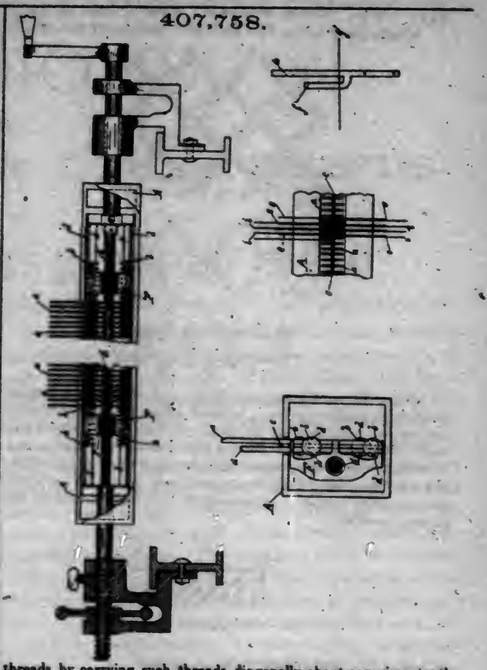


3. The combination of the casing, the horizontal drum having two independent slots 6 and 7 and a shaft 9, the two parallel drive-bars 3 and 4, moving in the casing and having studs respectively engaging the slots, the two switch-bars connected to the drive-bars, the hand-lever 10, connected with the drum-shaft, and a locking device for holding the lever in the three different positions required for the use of the main and switch rails, substantially as described.

407,756. FLEXIBLE RULE. HENRY B. WILLIAMS, Rochester, N.Y., assignor of one-half to Lemuel A. Jeffreys, same place. Filed May 27, 1889. Serial No. 312,323. (No model.)

Claim.—In a flexible rule, the combination of two elastic strips, an intermediate flexible packing, the inner strip and the packing being provided with slots, screws attached to the outer strip and passing through the slots, and nuts turning on the screws, as shown and described, and for the purpose specified.

407,757. FOLDING-COT FRAME. GEORGE H. WILSON, Utica, N.Y. Filed Nov. 15, 1888. Serial No. 290,965. (No model.)

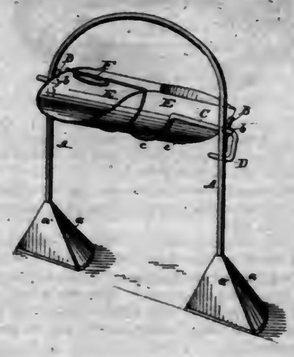


Claim.—1. The combination, with the cot-frame, of the two leg-sections pivoted together, one leg-section being pivoted to the side rails of the cot, the other leg-section D being longer to project above the plane of the cot-frame, and the connections *f f*, having offsets *f'*, which pivotally connect the leg-section D with the front edge of the end bar of said cot-frame, substantially as and for the purpose described.

2. The herein-described folding cot, composed of the side rails, the end bars, supports at each end of the frame, each composed of the two leg-sections of unequal length pivoted together, the shorter leg-section being pivoted to the said side rails, the bars F, connected by staples to the inner ends of the said end bars and having their ends bent at right angles to form the offsets *f'*, and again at right angles to form the connections *f f*, which are connected at their outer ends with the longer of the two leg-sections, substantially as and for the purpose described.

407,758. STRIPING ATTACHMENT FOR WARP-DRESSING MACHINES. HENRY GILDARD, Lewiston, Me. Filed Apr. 23, 1888. Serial No. 271,851. (No model.)

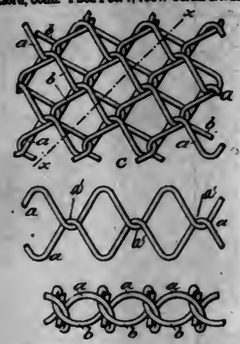
Claim.—1. A series of bifurcated reed-dents composing a double reed, the teeth of which are adapted to regulate and guide certain



407,758.

threads by carrying such threads diagonally about any given tooth of their respective series, whereby they take and maintain a proper place on the warp-beam, according to the design of the pattern when the yarn is woven into cloth, substantially as described.

2. A reed-dent consisting of a single post bifurcated at the top and operating substantially as and for the purposes set forth and described.

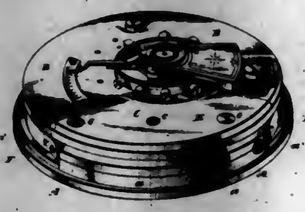


407,759. COUNTER FOR FACILITATING THE TRANSFER OF MONEY. JAMES S. KEY, New York, N. Y. Filed Oct. 23, 1886. Renewed Dec. 13, 1888. Serial No. 293,493. (No model.)

Claim.—1. The combination, with the standard A, having attached spring-bearing B, provided with a concavity *b*, and the weighted pedestals *a*, having smooth rear surface *a'* in the same vertical plane with said standards, of the weighted scoop E, the thumb-rest F, and the pivotal rod C, having a central concavity *c*, a stop D at one end, and a ring *d* at the other, substantially as shown and described, and for the purposes herein set forth.

2. The combination, with the weighted standards A, having attached spring-bearings B, of the scoop E, provided with a thumb-rest at its upper outer end, and a weighted plate *e*, attached to the under side at its inner end, together with a rod C, having a curved central surface *c*, secured to said scoop, and an integral stop D, formed at one end, the said rod adapted to enter said spring-bearings, substantially as shown and described.

407,760. WOVEN-WIRE MAT. ROBERT B. PEASE and HENRY ROBERTS, Hartford, Conn. Filed Feb. 7, 1887. Serial No. 226,757. (Model.)



Claim.—In combination, in an interwoven wire fabric, a series of interlocking primary coils *a*, a series of transverse and interlocking bracing-coils *b*, the turns of the latter coils lying outside of the successive primary coils *a*, whereby the several coils of the primary and secondary fabrics are held against depthwise movement on each other, and a flexible shape-defining frame attached to the edge of the fabric and extending around it, all substantially as described, and for the purpose specified.

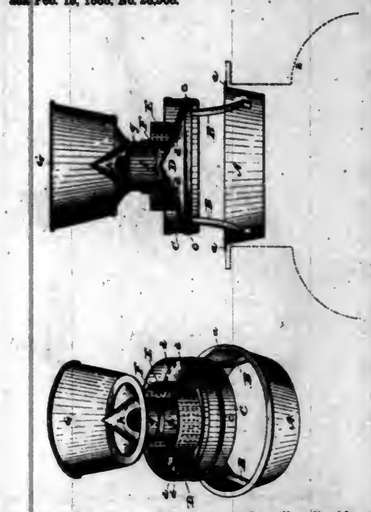
REISSUES.

11,013. WITHDRAWN.

11,014. WATCH-MOVEMENT. GEORGE HUNTER, Elgin, assignor to the Elgin National Watch Company, Chicago, Ill. Filed May 31, 1889. Serial No. 312,700. (Original No. 347,272, dated Aug. 10, 1886.

Claim.—1. A full-plate watch-movement in which the barrel-bridge extends to and is secured directly upon the bottom plate, substantially as and for the purpose specified.

2. A full-plate watch-movement in which the barrel-bridge is secured to and supported entirely by the bottom plate, substantially as and for the purpose shown.



3. A full-plate watch-movement in which the barrel-arbor is in part journaled within a bridge that is disconnected from and independent of the top plate, substantially as and for the purpose set forth.

4. A full-plate watch-movement in which the barrel-arbor and winding-pinion are in part journaled within a bridge that is secured directly to the bottom plate, substantially as and for the purpose shown and described.

5. A full-plate watch-movement in which the barrel-arbor and winding-pinion are journaled within and between the bottom plate and a bridge that is entirely independent of the top plate, substantially as and for the purpose specified.

6. The combination of the bottom plate, the top plate, the barrel-bridge, and the dust-bands, substantially as and for the purpose shown.

11,015. MILK-STRAINER. ALEXANDER THOMSON, Caledonia, Ontario, assignor, by direct and mesne assignments, to John Bellamy Miller, Parry Sound, Ontario, Canada. Filed Mar. 15, 1889. Serial No. 303,504. Original No. 385,582, dated July 3, 1888. Patented in Canada Feb. 13, 1888, No. 28,508.

Claim.—1. A device for aerating and cooling liquids, consisting of a straining receiver or funnel G, and a cylinder arranged centrally under the funnel and provided with a series of small holes arranged to discharge the milk radially and outwardly in separate streams in a horizontal direction, substantially as described.

2. A device for aerating and cooling liquids, comprising a receiver or funnel G, provided with suitable strainers, a perforated cylinder below the same, and a perforated ring surrounding said cylinder, substantially as described.

3. A device for aerating and cooling liquids, comprising a receiver or funnel G, provided with suitable strainers, a perforated cylinder below the same, a perforated ring surrounding said cylinder, an imperforate ring surrounding said perforated ring, and a conical plate connecting said rings and cylinder together and having perforations near its outer edge, substantially as described.

4. In a device for aerating milk, the combination of a funnel provided with strainers *h h*, attached over openings formed in the sides of a conical portion, a band C, having a conical plate D, with perforations *d* therein, a perforated band E, and a supporting-band F, with perforations *f*, the parts being organized substantially as shown, and for the purpose set forth.

5. The combination, in a strainer and cooler for the purpose set forth, of a flanged rim A, having upwardly-projecting standards secured thereto, said standards supporting at their upper ends a band C, of less diameter than the rim A, a conical plate D, with perforations *d*, perforated bands E and F, projecting upwardly therefrom, and a funnel G, having a strainer and depending portion *g*, adapted to fit within the band, substantially as and for the purpose set forth.

PHOTO LITH NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

VON WELSBACH *v.* LUNGREN.

Decided June 10, 1889.

MOTION TO DISMISS AN APPEAL FROM DECISION OF PRIMARY EXAMINER GRANTING OR DENYING A MOTION TO DISSOLVE AN INTERFERENCE ON THE GROUND THAT NO INTERFERENCE IN FACT EXISTS UNDER RULE 122.

1. From a decision of the Primary Examiner granting or denying a motion to dissolve an interference on the ground that no interference in fact exists, an appeal lies to the Commissioner under the first paragraph of Rule 124 without any reference whatever to the reasons which the examiner may give for deciding the motion either affirmatively or negatively.
2. A motion to dismiss such appeal on the ground that the decision of the Primary Examiner is affirmative of appellant's right to a patent, that the law makes no provision for appeal from such favorable decision, and that the Commissioner of Patents is without jurisdiction of said appeal, must be denied.
3. The ultimate authority under the statute upon the question whether an interference exists in fact is "the opinion of the Commissioner," (Rev. Stats., sec. 4904,) and it is more than doubtful whether a construction of Rule 124 which would deprive the Commissioner of jurisdiction could possibly be a valid one.

MOTION to dismiss appeal.

ILLUMINANT APPLIANCES FOR BURNERS.

Application of Carl Auer von Welsbach filed June 8, 1886, No. 204,558. Application of Charles M. Lungren filed June 8, 1887, No. 240,572.

Mr. James L. Norris for Von Welsbach.

Mr. Frank MacArthur and *Mr. W. C. McIntire* for Lungren.

MITCHELL, *Commissioner:*

This interference was declared on February 27, 1888. On September 22, 1888, Von Welsbach filed a motion to dissolve the same on the ground that there was no interference in fact, and on November 17, 1888, this motion was granted by the Primary Examiner, then in charge, who decided that "there is no interference in fact." At this stage this class of inventions was transferred from Division XXV to Division XXX. On December 5, 1888, Lungren filed a motion for rehearing before the examiner in charge of Division XXX. This motion was, on April 13, 1889, denied, the examiner holding, with his predecessor, that there was no interference in fact. On April 23, 1889, Lungren appealed from the decision rendered by the examiner formerly in charge. On April 29, 1889, Von Welsbach filed a motion to dismiss this appeal on the ground that—

the decision of the Primary Examiner is affirmative of Lungren's right to a patent for the invention claimed by him; that the law makes no provision for appeal from such favorable decision, and that consequently the Commissioner of Patents is without jurisdiction of said appeal.

Rule 122 provides for four classes of cases in which motions to dissolve an interference may prevail, to wit: when no interference in fact exists; when there has been such irregularity in declaring the interference as will preclude a proper determination of the question of priority; when the patentability of applicant's claim is denied, and when there is a denial of the right to make the claim. Rule 124 provides that appeals may be taken to the Commissioner from the Primary Examiner on all motions, with certain enumerated exceptions. The only two exceptions which relate to the dissolution of interferences are motions to dissolve which deny the patentability of an applicant's claim and motions which deny the right of an applicant to make the claim. It follows that motions to dissolve because there is no interference in fact must be appealable to the Commissioner, since they are not included in the exceptions and are included in the rule.

In the case under consideration it is claimed on behalf of Von Welsbach that no appeal lies to the Commissioner because the decision of the examiner permits a patent to each party for his claim as framed, the position of the applicant being, apparently, that under such circumstances the last paragraph of Rule 124 is applicable. This last paragraph reads as follows:

From a decision affirming the patentability of the claim or the applicant's right to make the same no appeal can be taken.

This paragraph is clearly a limitation upon the right of appeal to the Examiners-in-Chief in the cases referred to in the preceding paragraph of Rule 124; that is to say, the rule, having provided that appeals from decisions on motions to dissolve which deny the patentability of an applicant's claim and on motions to dissolve which deny the right of an applicant to make a claim should, when authorized, go to the Examiners-in-Chief, (when appealable,) goes on to say that decisions on such motions shall not be appealable when the Primary Examiner affirms the patentability or the right of an applicant to make the claim. The last paragraph of Rule 124 simply indicates under what circumstances decisions are appealable which, when appealable, go to the Examiners-in-Chief. When, however, an appeal is taken upon a motion to dissolve upon the ground that there is no interference in fact, the jurisdiction of the Commissioner is in no way affected by the character of the decision rendered by the examiner. It may be added that the ultimate authority under the statute upon the question whether an interference exists in fact is "the opinion of the Commissioner," (Rev. Stats., sec. 4904,) and it is more than doubtful whether a construction of the rule which would deprive the Commissioner of jurisdiction could possibly

be a valid one. But there is no doubt as to the meaning of Rule 124, which, so far as the last paragraph is concerned, simply provides that if, on a motion to dissolve which denies the patentability the Primary Examiner affirms the patentability, or upon a motion to dissolve which denies the right of an applicant to make the claim the examiner affirms such right, there shall be no appeal. In all cases, however, where the ground of the motion is that no interference in fact exists an appeal lies to the Commissioner under the first paragraph of Rule 124, without any reference whatever to the reasons which the examiner may give for deciding the motion either affirmatively or negatively.

In disposing of this case I have not thought it worth while to lay stress upon the fact that this appeal is taken from the decision of the examiner formerly in charge, and that it is immaterial to the present inquiry what reasons were given by the examiner now in charge for refusing to grant a rehearing.

My attention was directed on the hearing of this case to the decision in *Weston* v. *Brush*, (MS. Dec., vol. 22, p. 38.) I have not overlooked that case, but have given it the fullest consideration before reaching the conclusions herein announced.

The motion to dismiss the appeal is denied.

MANNY *v.* EASLEY *v.* GREENWOOD, JR.

Decided July 16, 1889.

1. MOTION TO DISSOLVE—APPEAL.

No appeal lies to the Commissioner from a decision upon a motion to dissolve except upon the ground that there is no interference in fact, or that there has been such irregularity in the declaration as to preclude a proper determination of the question of priority.

2. SAME—JURISDICTION.

Where it appears upon the face of the papers that the real ground of a motion to dissolve relates to the merits, the Commissioner will not take jurisdiction either by appeal or petition.

ON petition.

LEMON-SQUEEZERS.

Application of John P. Manny filed November 19, 1888, No. 291,191. Patent granted John L. Easley July 10, 1888, No. 271,876. Application of John T. Greenwood, Jr., filed August 16, 1887, No. 247,059.

Referred to the Assistant Commissioner, by order of the Commissioner, for hearing and decision.

Mr. A. O. Behel and *Mr. E. C. Seward* for Manny.
Messrs. Munn & Co. for Easley.
Mr. J. J. Sheehy and *Mr. L. L. Morrison* for Greenwood, Jr.

FISHER, *Assistant Commissioner:*

This petition is filed by Easley, one of the parties to the above-entitled interference, asking that he be heard upon the questions, first, that no interference in fact exists, and, second, that there has been such irregularity in declaring the same as will preclude the proper determination of the question of priority.

The history of this case is that on March 9, 1889, a motion was filed by Easley to dissolve the interference upon four grounds, as follows:

(1) Because no interference in fact exists, as the issue is fully shown and described in said patent to Gernert, issued more than three years prior to the claimed conception thereof by either Manny or Greenwood, Jr.; (2) because, in view thereof, neither Manny nor Greenwood, Jr., have the right to claim the invention set forth in the issue hereof; (3) because, in view of said patent to Gernert, the issue of this interference is not patentable by either Manny or Greenwood, Jr.; (4) because the interference has been improperly declared.

This motion, having been transmitted to the Primary Examiner, was by him denied, without allowing Easley an opportunity to appeal from his decision, whereupon the interference proceedings were resumed and times were set for taking testimony. On April 2, 1889, a motion was made by Easley for leave to appeal to the Commissioner from the decision of the Primary Examiner. This motion, having been heard by the Examiner of Interferences, was dismissed for want of jurisdiction. April 15 following a new motion to dissolve was made upon the ground that in view of the patent to Gernert, previously referred to, and an affidavit by one Metcalf, which set forth the former proceedings in the case, there was no interference in fact, and also that there had been such irregularity in declaring the same as would preclude the proper determination of the question of priority. This motion was dismissed by the Examiner of Interferences upon the ground that it embraced substantially the matter covered by the former motion already decided by the Primary Examiner. On May 27, 1889, Easley filed this petition, by which he seeks to have the whole matter reopened and determined by the Commissioner.

It will be seen from the recitals which have been made of the former actions in this case that Easley's original motion was based entirely upon the ground that the subject-matter of the issue is fully shown and described in patent to Gernert. There was no allegation that the devices of the several parties to the interference are not in conflict or that the interference was so irregularly declared that the question of priority could not properly be determined, both of which allegations are necessary before an appeal can be taken to the Commissioner from a decision on a motion to dissolve. The motion in fact was one based wholly upon the merits of the case, and, if appealable, could be taken only to the Examiners-in-Chief; but it was not appealable even to them, as the decision of the examiner was favorable to patentability. The Primary Examiner was therefore right in not fixing a limit of appeal.

The second motion to dissolve, although it stated as grounds for dissolution the two grounds which under Rules 122 and 124 are appealable to the Commissioner, was in fact based upon precisely the same ground as the former motion—want of patentability, in view of the patent to Gernert. The Examiner of Interferences therefore correctly dismissed this motion upon the ground of *res adjudicata*.

It is urged that the second motion was made in the strict language of the Office rules, and that, as it states the grounds upon which appeal may be taken to the Commissioner, the question involved should now be considered by him; but to do this would be entirely to disregard the spirit of the rules. Parties cannot confer jurisdiction upon the Commissioner regardless of the matter involved by the use of a mere form of words. Beneath the words must be sought the real reason upon which the proceeding is based, and if it be found that such reason relates to a question determinable by some other tribunal than the Commissioner, he will rightfully refuse to consider it either upon appeal or petition.

This case is distinguishable from one in which the motion to dissolve is based upon the want of interference in fact and in which the examiner in reaching his conclusion has given reasons involving the merits. In such case the Commissioner has jurisdiction; but it is determined by the real ground of the motion and not by the reason given by the examiner in his decision.

The petition is dismissed.

EX PARTE LASKEY.

Decided July 6, 1889.

1. OBJECTIONS GOING TO THE MERITS.

When applicant claims the combination of a "stitch-forming and cloth-feeding mechanism" in a sewing-machine and "an automatic expansible or yielding hemmer and feller," and the examiner objects to the claim for the reason that the "means for securing an automatic action of the hemmer and feller" and "the means for securing an expansible or yielding action thereof" are not stated, and the applicant insists that his invention resides in a combination of which the peculiar hemmer and feller is an element, irrespective of the mere means by which its automatic action or its expansible or yielding action is secured, *Held* that the objection of the examiner presents a question of fact which relates to the merits, upon which applicant has a right of appeal to the Examiners-in-Chief.

2. PROVINCE OF CLAIMS.

It is the province of claims to relegate to the specification the enumeration of such details of construction as shall be found upon examination to be immaterial to the true scope of the actual invention. The object of enumerating these parts is to enable persons skilled in the art to practice the invention in the form set out in the patent, but not to so limit the claim of the inventor as to make it the easy prey of the infringer.

ON petition.

HEMMERS AND FELLERS.

Application of Stephen Laskey filed May 10, 1888, No. 273,503.

Messrs. Coburn & Thacher for the applicant.

MITCHELL, *Commissioner:*

The examiner objects to claims 1 to 5, inclusive, in this application as vague, indefinite, and litigious. It is unnecessary to quote more than the first claim, which is as follows:

1. The combination, with the stitch-forming and cloth-feeding mechanism of a sewing-machine, of an automatically expansible or yielding hemmer and feller to permit the passage of enlargements of the cloth, substantially as and for the purposes specified.

With reference to this claim the examiner says:

To the old combination of "stitch-forming and cloth-feeding mechanism" in a sewing-machine, applicant has added "an automatically expansible or yielding hemmer and feller." Now, if the means for securing (1) an automatic action of the hemmer and feller and (2) the means for securing the expansible or yielding action thereof were involved in the claims, there would be no objection that the claim set up function alone, stripped of the means by which said function should be certainly secured.

I am unable to understand how the distinction set forth clearly in the passage quoted is a distinction of mere form. Of course if it could be conclusively assumed that the "means for securing an automatic action of the hemmer and feller" and "the means for securing an expansible or yielding action thereof" constitute the entire invention of Laskey, then the proper method of securing that invention would be to designate such "means" in the claims. But the applicant insists that his invention does not reside in such means; that, on the contrary, it resides in a combination of which the peculiar hemmer and feller is an element, irrespective of the mere means by which its automatic action or its expansible or yielding action is secured.

Whether or not applicant's invention is as broad as he insists is a question of fact and not of mere form. It is a question of fact which relates to the merits, upon which the applicant has a right to appeal to the Examiners-in-Chief if he differs in opinion from the Primary Examiner.

The inventor claims to have been the first person who used an automatically expansible or yielding hemmer and feller in combination with the stitch-forming and cloth-feeding mechanism of a sewing-machine to permit the passage of enlargements of the cloth substantially as and for the purposes described by him in the specification. If he is the original and first inventor of that combination there is no reason why he should not receive the usual protection accorded by a patent. There is no adequate reason why he should be compelled to so state his claim that another person using the same combination of elements would be held to be free from the charge of infringement, if such person should prudently omit some one or more of the specific means for securing the yielding action or the automatic action of the hemmer and feller.

It is also said by the examiner that the words of function insisted on by applicant are not objected to *per se*, but because the definite parts of applicant's hemmer and feller upon which he relies to get these functions are omitted from the claims. But it is the province of claims to relegate to the specification the enumeration of such details of construction as shall be found upon examination to be immaterial to the true scope of the actual invention. The object of enumerating these parts is to enable persons skilled in the art to practice the invention in the form set out in the patent, but not to so limit the claim of the inventor as to make it the easy prey of the infringer.

Again, it is said that claims such as those objected to are precisely of that class of claims which are always in contention and have to be brought before the courts for adjudication, and that such claims necessarily call for a lawsuit upon their face. It is not the province of this Office to save lawsuits by unduly limiting claims. It is true there would be little danger of lawsuits if an inflexible rule of form should be adopted requiring that claims should always and invariably detail all the means, immaterial as well as material, which, in the particular structure described, are auxiliary to the essential elements of the combination. Lawsuits certainly would not flourish if no patents were worth protecting.

The attempt of the applicant in this case is to set forth his claim broadly, so as to cover as infringers those who appropriate the principle of the invention which he claims, whether they employ his special means or not. He may be entirely mistaken in his belief that he is entitled to so broad a statement of claim. It may be that the resources of the Office afford proof that patents have been already granted which constitute lawful references to a claim thus broadly stated. If so, the claims must be rejected;

not because they are lacking in an imperative requirement of form, but because they are too broad in their scope—that is to say, because the inventor is mistaken in his supposition that he is entitled to his combination irrespective of the special means for producing the automatic and yielding action. It may be found, indeed, upon examination that only by a detailed enumeration of all the specific means employed by him can he escape the prior art and secure even a claim of restricted scope. But these things can only be known after an investigation. They cannot be known in advance of an examination. They cannot be assumed to have existence and to justify the refusal to act upon the claims because of defective form.

It is again objected that five claims are drawn, "differing the one from the other only in the omission or retention of certain ascriptions of function." The first claim is for the combination broadly stated. The second claim requires that the cloth-turning mechanism shall be in the form of a yielding member. The third claim enumerates the elements of which the proposed hemmer and feller is composed. The fourth and fifth claims enumerate combinations found in the hemmer and feller. This being the case, it is apparent that, although the applicant might possibly have adequately protected the invention with a less number of claims, the latter have been framed upon an intelligible theory and with reference to so stating the invention that no possible infringer could escape. I certainly have not the foresight which enables me to know that the prudence of applicant's solicitors in this regard will necessarily be to no purpose in possible future litigation.

If the claims as framed are too broad, they should be rejected upon the merits. If not, and if it shall appear either to the examiner or to any appellate tribunal of the Office that the actual invention of applicant is co-extensive with the claims as now stated, then the applicant should go out of the Office with claims which will adequately protect his invention.

The objections of the examiner are overruled and the petition is granted.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

THOMPSON *et al. v.* AMERICAN BANK NOTE COMPANY.

Decided June 28, 1889.

INFRINGEMENT.

The combination covered by the third claim of plaintiffs' patent, which includes an inclined and retreating anvil to sustain the wire of the staple while being bent and to support the staple while being driven, is infringed by defendant's device having a two-part anvil, which, though different in form, accomplishes the same result in the same way.

Mr. Horace Barnard for the complainants.
Mr. H. D. Donnelly for the defendant.

WHEELER, *J.*:

The patent in this case was before this court in *Thompson* v. *Gildersleeve*, (34 Fed. Rep., 43,) and the validity of the third claim was there sustained. It was again before this court on the same question of infringement that is here now in *Thompson v. American Bank Note Co.*, (35 Fed. Rep., 203.) On account of doubts expressed in other cases as to whether the device in question is an infringement of the combination of that claim, the matter has been fully heard and considered again now. (*Thompson* v. *Rand-Avery Supply Co.*, 38 Fed. Rep., 112.) That combination is of an "inclined" and "retreating" anvil, so called, to sustain the wire of the staple while being bent and to support the staple while being driven, with the bender-foot and driver, in a wire-stapling machine, operating substantially as described. By the operation of these parts wire staples are bent and driven through the material, being stapled without having holes first punched for the prongs of the staples. This had not been done before this invention. The bender-foot and driver operating as in former machines are here without question. The presence of the inclined and retreating anvil of the combination only is denied.

The bender-foot boxed the prongs of the staples on all but their inner sides and prevented their crippling in any other direction. The inclined and retreating anvil of the patent, after supporting the wire for bending by the bender-foot, by filling the space between the prongs and retreating out of the way of the crown as the staples are driven home by the driver, supports the prongs on their inner sides and prevents their crippling in that direction. Thus the prongs of staples of very slender wire are steadied in place and driven into the material. This invention underlies the use of the anvil for this purpose and covers all forms of it based upon the invention. (*Railway Co.* v. *Sayles*, 97 U. S., 554.) In the machine of *Thompson* v. *Gildersleeve* the anvil was in two parts, one for supporting the wire while being bent and the other for supporting the prongs while being driven. Both were inclined in shape, and one retreated in one direction after supporting the wire in being bent and the other retreated in the opposite direction, supporting the prongs as it went, both making room for the crown of the staple. Together these two parts constituted the inclined and retreating anvil of the patent, different in form but accomplishing the same result in the same way. In the machine of this case, now in question, the part of the anvil which supports the wire while being bent is precisely the same in shape and operation. The other part fills the space between the prongs in width and supports them on their inward sides and prevents them from crippling in that direction in precisely the same manner, and retreats out of the way of the crown of the staple in the same way. It does not fill the whole space between the prongs of the staple in height to the crown and does not support the prongs in that place while being driven. Support in that place is not necessary, and this difference appears to be wholly immaterial. All the support against inward crippling of the prongs furnished is by the same means, operating in substantially the same way. This is none the less an infringement because more support is not furnished, especially when all that is useful is furnished. The conclusion reached after going over the whole ground again is the same reached before.

Let there be a decree for a continuance of the injunction and for an account, with costs.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Instructions to Examiners, Applicants, and Others.

(ORDER NO. 560.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 2, 1889.

1. All marginal notes, interlineations, or other marks placed upon application-papers by examiners for convenience in conducting their work of examination will be removed when the application is passed to issue.

2. Official communications will not refer to memoranda or pencil notes made by examiners on application-papers.

3. Letters emanating from this Office must be couched in respectful and courteous language, and give full, clear, and explicit information to the applicant or correspondent on the subject under consideration, and must be absolutely free from personal controversy.

4. The Commissioner will strictly enforce the provisions of Rule 22 requiring applicants and attorneys to conduct their business with the Office with decorum and courtesy. No complaints against examiners will be permitted in papers intended to be filed in connection with applications.

C. E. MITCHELL,
Commissioner.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

19,246.—CARPET.—*Emil G. Sauer*, Brooklyn, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed June 25, 1889. Serial No. 315,552. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,867.—COMPOUND CONSTITUTING A DEODORIZER, A DISINFECTANT, AND GERMICIDE.—*William Bannerman*, Chicago, Ill. Application filed April 24, 1889. Used since March 27, 1889.
"The name of the registrant in the possessive case and divided by a star and the word 'PHENYLE.'"

16,868.—MILL OR FIRE HOSE.—*Boston Woven Hose Company*, Boston, Mass. Application filed December 15, 1888. Used since January, 1885.
"The letters 'O K,' the letter 'K' being placed within the letter 'O.'"

16,869.—PAPER AND ENVELOPES.—*Z. & W. M. Crane*, Dalton, Mass. Application filed March 27, 1889. Used since January 1, 1889.
"The words 'CRANE'S KID FINISH.'"

16,870.—PAPER AND ENVELOPES.—*Z. & W. M. Crane*, Dalton, Mass. Application filed March 27, 1889. Used since January 1, 1889.
"The words 'CRANE'S OLD STYLE.'"

16,871.—SALVES.—*George J. Kannmacher*, Minneapolis, Minn. Application filed June 11, 1889. Used since February, 1889.
"The words 'ARCTIC ANTI FROST SALVE.'"

16,872.—REED-ORGANS.—*Mason & Risch*, Toronto, Ontario, Canada, and Worcester, Mass. Application filed March 14, 1889. Used since January 26, 1889.
"The word 'CHORALION.'"

16,873.—COFFEE-EXTRACT.—*Douw D. Williamson*, New York, N. Y. Application filed June 24, 1889. Used since April 1, 1889.
"An escutcheon containing a chevron and fleur-de-lis, the word-symbol 'SEMPER FORTIS,' and the words 'COFFEE EXTRACT' in block letters, with the word 'EXTRACT' across the face of the word 'COFFEE.'"

16,874.—WATCH-MOVEMENTS.—*American Waltham Watch Company*, Waltham, Mass. Application filed April 23, 1889. Used since 1864.
"The letters and word 'P. S. BARTLETT' stamped or engraved in a semicircular or curved manner in type or script letters."

16,875.—BRAIDS.—*Butler, Richards & Co.*, New York, N. Y. Application filed June 22, 1889. Used since December 1, 1887.
"The representation of a mailed arm, the hand grasping and holding aloft a weapon."

16,876.—VEHICLE-WHEELS.—*Jerome Bolick*, Conover, N. C. Application filed May 21, 1889. Used since March, 1888.
"The representation of a wheel having printed across its face the words 'SPRING STEEL WHEEL,' the word 'SPRING' being curved downwardly and the other words appearing in horizontal lines, the letters of said words being arranged between the spokes of the wheel."

16,877.—TEA.—*Davidson & Co.*, Belfast, Ireland, and New York, N. Y. Application filed March 29, 1889. Used since December 1, 1888.
"A representation of the warehouse-building of the firm, which is five stories high in the center, with wings four stories high, and having upon one end of the same the words 'SIROCCO TEA WAREHOUSE, DAVIDSON & Co.'"

16,878.—TEA.—*Davidson & Co.*, Belfast, Ireland, and New York, N. Y. Application filed March 29, 1889. Used since December 1, 1888.
"The representation of a tea plantation or estate and a number of people occupied in gathering the leaves of the tea plants, associated with the word 'SIROCCO.'"

16,879.—INSECT-EXTERMINATORS.—*Luise Dirksen*, Brooklyn, N. Y. Application filed May 13, 1889. Used since July 18, 1887.
"The words 'DEAD DROPS.'"

16,880.—HAIR-RESTORER.—*Mary A. Dodge*, St. Paul, Minn. Application filed February 25, 1889. Used since September 1, 1888.
"The fac-simile signature of 'MARY A. DODGE,' and the bust likeness of B. F. Zahm."

16,881.—LUBRICATING AND ILLUMINATING OILS.—*John Ellis & Co.*, New York, N. Y. Application filed March 6, 1889. Used since February 10, 1888.
"The word 'MAGNET.'"

16,882.—WHEAT-FLOUR.—*Charles F. Horning*, Pittsburg, Pa., and Minneapolis, Minn. Application filed May 13, 1889. Used since January 1, 1889.
"The word 'DUQUESNE.'"

16,883.—SILVER-POLISH.—*Jones & Dudley*, Jersey City, N. J. Application filed May 10, 1889. Used since May 1, 1889.
"The word 'KLENZER.'"

16,884.—BEER, ALE, MINERAL WATERS, AND CARBONATED (AERATED) DRINKS.—*Koster & Bial*, New York, N. Y. Application filed May 22, 1889. Used since July 1, 1885.
"The word 'CABINET.'"

16,885.—BOOTS AND SHOES OF ALL KINDS.—*John E. Lentz*, Allentown, Pa. Application filed April 19, 1889. Used since April 12, 1889.
"The words 'HONEST SHOES' appearing in floating clouds across the representation of the globe of the world."

16,886.—SOAP-POWDER.—*Christopher Lipps*, Baltimore, Md. Application filed April 29, 1889. Used since July 16, 1886.
"The name and word 'CHRIS. LIPPS BLEACHER.'"

16,887.—RAT AND ROACH EXTERMINATOR.—*Conrad D. Maurer*, Philadelphia, Pa. Application filed June 1, 1889. Used since May 20, 1889.
"The picture of a roach of white or very light color upon a strongly-contrasted ground of black or dark color."

16,888.—DEVICE FOR CONTAINING A POISON SOLUTION FOR KILLING FLIES.—*Moore & Kibler*, New York, N. Y. Application filed March 30, 1889. Used since July 1, 1888.
"The word 'DAISY.'"

16,889.—BELLS.—*Henry McShane & Co.*, Baltimore, Md. Application filed October 9, 1888. Used since March 30, 1880.
"The fac-simile signature 'McSHANE.'"

16,890.—BELLS.—*Henry McShane & Co.*, Baltimore, Md. Application filed October 9, 1888. Used since March 30, 1889.
"The representation of two bells inverted with regard to one another and one back of the other."

16,891.—ROPES, YARNS, TWINES, AND CORDS.—*Plymouth Cordage Company*, Plymouth, Mass. Application filed June 28, 1889. Used since December, 1881.
"The word 'PLYMOUTH' and the representation of a ship or vessel."

16,892.—RUBBER OR COTTON HOSE.—*Revere Rubber Company*, Boston, Mass. Application filed June 20, 1889. Used since May 1, 1889.
"The word 'TIGER.'"

16,893.—RUBBER OR COTTON HOSE.—*Revere Rubber Company*, Boston, Mass. Application filed June 20, 1889. Used since February 1, 1889.
"The letters 'S. A. P.'"

16,894.—COFFEE.—*John H. Thompson & Company*, Detroit, Mich. Application filed June 17, 1889. Used since November 1, 1888.
"The word 'TIGER' and the representation of a tiger's head."

LABELS.

5,981.—Title: "DALSIMER LAST," (FOR BOOTS AND SHOES.)—*Eva Dalsimer*, Philadelphia, Pa. Application filed July 5, 1889. (Trade-Mark Registered.)

5,982.—Title "MARTINSVILLE MINERAL WATER."—*Myron Dickson*, Martinsville, Ind. Application filed July 6, 1889.

5,983.—Title: "MARTINSVILLE ARTESIAN MINERAL WATER."—*Myron Dickson*, Martinsville, Ind. Application filed July 6, 1889.

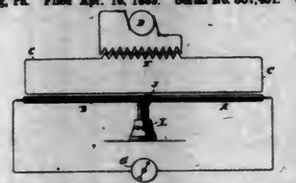
5,984.—Title: "PACKERS' FACTORY FILLED," (FOR SALT.)—*Genesee Salt Company*, New York and Piffard, N. Y. Application filed June 27, 1889.

5,985.—Title: "HOP TEA TONIC."—*Ferd. Heim Brewing Co.*, Kansas City, Mo. Application filed March 5, 1889. (Trade-Mark Registered.)

5,986.—Title: "JENCKS' PILE REMEDY."—*Sherwood R. Jencks*, Milwaukee, Wis. Application filed July 6, 1889.

5,987.—Title: "LANGLÉS BISCUITS."—*Justin J. Langlés*, New Orleans, La. Application filed May 13, 1889.

5,988.—Title: "PLYMOUTH CORDAGE COMPANY" (FOR ROPES, YARNS, AND TWINES.)—*Plymouth Cordage Company*, Plymouth and Boston, Mass. Application filed June 28, 1889. (Trade-Mark Registered.)



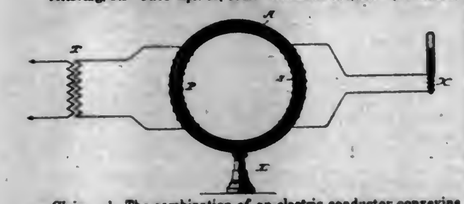
5,989.—Title: "SAXE'S PHOSPHO-GUARANA WITH CELERY."—*De Forest W. Saxe*, Omaha, Nebr. Application filed July 1, 1889. (Trade-Mark Registered.)

5,990.—Title: "RIVEREDGE" (FOR PRINTED WOOLEN GOODS.)—*Union Print Works*, New York, N. Y. Application filed June 28, 1889.

PATENTS

GRANTED JULY 30, 1889.

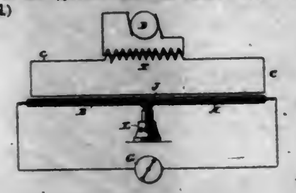
407,761. CALELECTRIC GENERATOR. EDWARD G. ACHESON, Pittsburg, Pa. Filed Apr. 16, 1889. Serial No. 307,481. (No model.)



Claim.—1. The method of converting heat energy into electric energy, which consists in causing heat energy to traverse the elements of a thermo-couple and subjecting the said energy to the influence of changing lines of magnetic force, substantially as described.

2. The method, substantially as hereinbefore set forth, of converting heat energy into electric energy, which consists in causing heat-currents to flow from the points of junction of two dissimilar metals, and subjecting said currents to the influence of lines of magnetic force.

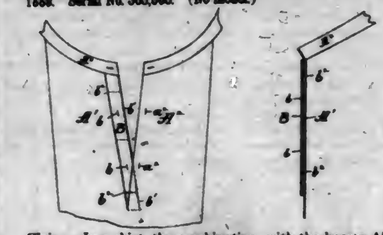
3. The method, substantially as hereinbefore set forth, of converting heat energy into electric energy, which consists in producing intermitting currents in a circuit arranged in inductive relation to a thermo-couple producing magnetic lines by the agency of said currents, applying heat to said couple, and subjecting the heat energy in said couple to the influence of said lines of magnetic force, substantially as described.



407,762. CALELECTRIC GENERATOR. EDWARD G. ACHESON, Pittsburg, Pa. Filed Apr. 19, 1889. Serial No. 307,825. (No model.)

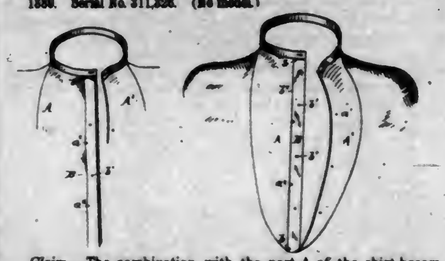
Claim.—1. The combination of an electric conductor conveying a current of changing value, a mass of material magnetized thereby, and a source of heat arranged to influence said mass, substantially as described.

2. The combination of an electric conductor conveying a current of changing value, a mass of magnetic material magnetized by said current, a source of heat arranged to influence said mass, and a second electric conductor, including a translating device and arranged within the influence of the magnetic mass, substantially as described.



407,763. CALELECTRIC GENERATOR. EDWARD G. ACHESON, Pittsburg, Pa. Original application filed Apr. 16, 1889, Serial No. 307,481. Divided and this application filed June 18, 1889. Serial No. 314,686. (No model.)

Claim.—1. The combination, with an electric conductor through which varying electric currents are passed, of a thermo-couple arranged in inductive relation to said conductor and a source of heat for said couple, substantially as described.



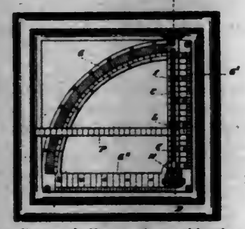
2. The combination, with an electric conductor, of a core energized thereby, thermo-couples arranged in inductive relation to said core, and a source of heat for said couples, substantially as described.

407,764. SHIRT. JAMES ADAIR, New York, N. Y. Filed Apr. 1, 1889. Serial No. 305,660. (No model.)

Claim.—In a shirt, the combination, with the bosom A' A^3, of a fly B, attached to the edge of the upper face of the underlying part A', the outer edge of the fly being unattached to the shirt, the fly B and the overlapping part A^3 being provided, respectively, with the button-holes b a^3, as and for the uses and purpose set forth.

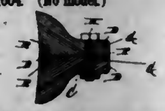
407,765. SHIRT. JAMES ADAIR, New York, N. Y. Filed May 18, 1889. Serial No. 311,226. (No model.)

Claim.—The combination, with the part A of the shirt-bosom, the tacks b, placed at the top and bottom of the same a short distance from the edge thereof, the intermediate tacks a^3, and with the independent fly B secured to the bosom A by the tacks b a^3, of the part A' of the bosom adapted and arranged to overlap the bosom A and the fly B, substantially as described.



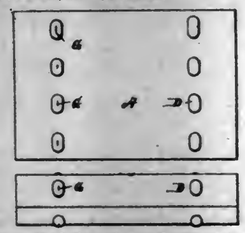
407,766. CULTIVATOR. ROBERT H. AVERY, Peoria, Ill., assignor to the Avery Planter Company, same place. Filed Mar. 6, 1889. Serial No. 302,174. (No model.)

Claim.—1. The combination, with a cultivator-beam, of a standard pivoted to the beam, and a top piece, as C, pivoted to the upper end of the standard and adjustably secured to the beam, substantially as and for the purpose specified.



2. In a cultivator, the combination of a shovel-block D, having ears *e*, a standard B, and a curved bolt or clip *f*, passing around the standard B, and having its ends secured in the ears *e*, substantially as and for the purpose specified.

407,767. DISTANCE-INSTRUMENT. WILLIAM BARTON, Liverpool, County of Lancaster, England. Filed June 14, 1888. Serial No. 277,112. (No model.) Patented in England May 12, 1888, No. 7,110.



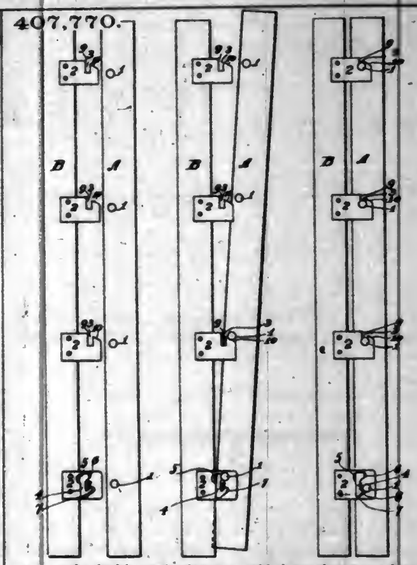
Claim.—In a distance-indicator, the combination, with the graduated arc G and the graduated margin-scales G′ and G″ thereof, of the graduated arm C, pivoted at H and formed with the slot *f*, the sight-vanes D D′, hinged to either end of said arm C, the graduated movable arm P, pivoted in said slot *f*, and the screw and thumb nut L, whereby said movable arm P is adjustably fastened in said slot, all substantially as and for the purpose set forth.

407,768. TOE-WEIGHT. JAMES A. BAUGHMAN, Charlotte, Mich., assignor of one-half to James L. Whitford, same place. Filed Dec. 31, 1888. Serial No. 295,004. (No model.)

Claim.—A horseshoe having an integral elongated dovetailed spur on the upper side of the toe thereof, in combination with a toe-weight constructed of two equal sections, the rear of each of which is concaved and has the half of a dovetailed recess to engage the spur, and the front provided with apertured lugs, and a clamping-bolt adapted to pass through the apertured lugs and adjustably secure the weight on the spur close to the hoof, substantially as described.

407,769. VEHICLE-WHEEL. ROSCOE BEAN, Springfield, Ohio, assignor to the Tricycle Manufacturing Company, same place. Filed May 17, 1889. Serial No. 311,141. (No model.)

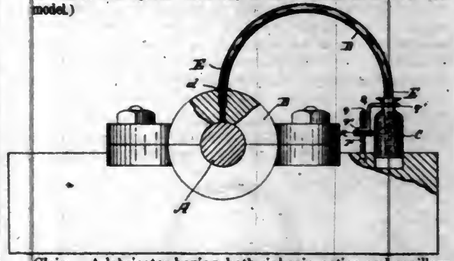
Claim.—1. In a wheel, the tube or sleeve constructed of sheet metal and having exterior bulged shoulders, and its meeting edges from shoulder to shoulder, inclusive, in close proximity and made oil-tight by the application of a seam-closing fluid.



2. In a wheel, the tube or sleeve constructed of sheet metal, and exterior shoulders produced by bulging the blank at intervals, and its meeting edges substantially regular and in close proximity and made oil-tight by the application of seam-closing metallic fluid in a molten state.

407,770. CORSET-CLASP. WILLIAM F. BROOKS, Bridgeport, Conn., Filed Feb. 16, 1889. Serial No. 300,182. (No model.)

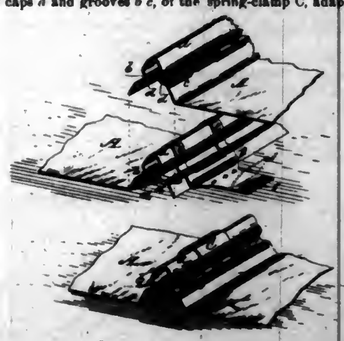
Claim.—1. In a corset-clasp, the combination, with the stud secured to one of the steels, of the hook secured to the other steel and having a closed vertical slot leading at the top into an eye and at the bottom into an inclined recess, substantially as set forth.



2. In a corset-clasp, the combination, with the open hooks and the studs adapted to be engaged as described, of the lower stud and hook, the latter having a closed slot, an upwardly-extending inclined

407,770.

recess, and a locking-point between said slot and recess, substantially as shown, and for the purposes herein set forth and described.



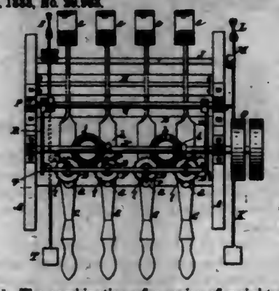
407,771. LUBRICATOR FOR SHAFT-BEARINGS. JOHN CONER, Anderson, Cal., assignor, by direct and mesne assignments, of three-fourths to R. Berger and Edwin Aldersley, same place, and Frederick H. Deakin, Redding, Cal. Filed May 15, 1888. Serial No. 273,955. (No model.)

Claim.—A lubricator having both siphonic action and capillary attraction, for the purpose set forth, and comprising a reservoir adjustably mounted in juxtaposition to the bearing to be lubricated, a siphon-tube extending from the reservoir to a point near said bearing, and a wick within said siphon-tube and extending from the oil in the reservoir to said bearing.

407,772. SHEET-METAL ROOFING, CEILING, OR SIDING. WALLACE R. CURTIS and WILLIAM H. HUNTLEY, Pomeroy, assignors of one-third to Colonel Elsworth Bright, Columbus, Ohio. Filed Feb. 28, 1889. Serial No. 301,449. (No model.)

Claim.—1. The combination, with sheet-metal-roofing sections having caps *a* and grooves *b c*, of the spring-clamp C, adapted to be

407,772.



sprung over the joint of the roofing, with its ends engaging in the grooves thereof, substantially as and for the purpose described.

2. The combination, with the sheet-metal-roofing sections, of the anchor D, having straps *c*, substantially as and for the purpose specified.

3. The roofing-sections having caps with side grooves, as shown, in combination with the spring-clamp and anchor, substantially as set forth.

407,773. MACHINE FOR SOLDERING CAPS ON FRUIT-CANS. BARETON DU CREW and ALBERT R. CARPENTER, Hamilton, Ontario, Canada. Filed Oct. 3, 1888. Serial No. 287,598. (No model.) Patented in Canada Oct. 12, 1888, No. 29,963.

Claim.—1. The combination of a series of weighted levers G, pivoted to a frame, the soldering-irons C, the spindles D of the soldering-irons passing through the levers and provided with collars *f*, and a series of lifting-arms operating under the levers, substantially as described.

2. The combination, with the soldering-irons C and their spindles D, of a series of weighted levers G, having the apertures *d*, and a series of lifting-arms I on the shaft J, and collars *f* on the spindles D, substantially as and for the purpose specified.

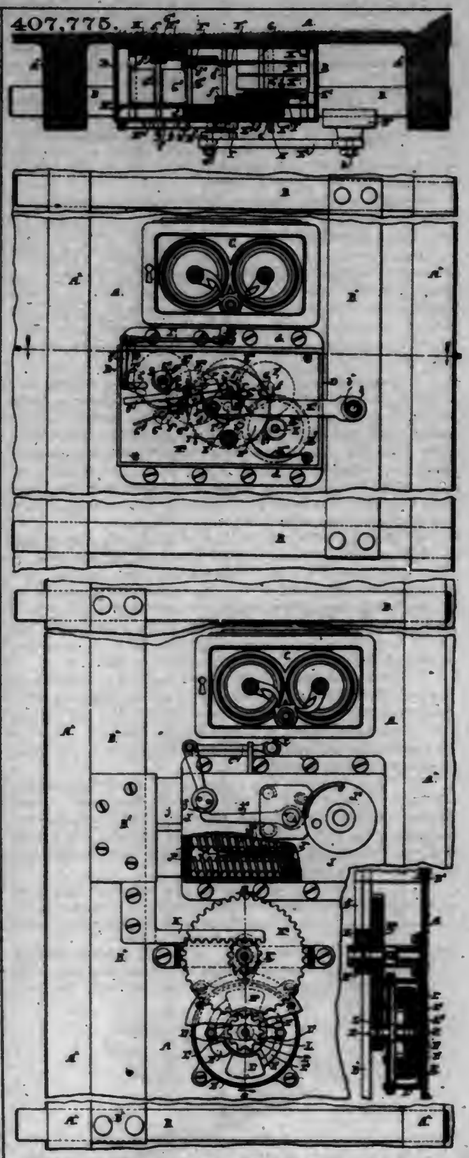
3. In combination with the spindles D, soldering-irons C, and rods E, the slightly-movable frame F, means for moving the frame vertically, springs *a*, and collars *b*, substantially as and for the purpose specified.

4. The combination of the shaft Q, the slotted arms R, the movable frame F, the rods E, the connecting-rod S, the lever T, the springs *a*, and the collars *b*, substantially as described.

5. The combination of the levers G, having the apertures *d*, the spindles D, having the collars *f*, the soldering-irons C, the shaft J, the arm M, the connecting-lever L, the foot-lever K, and the arms I, substantially as described.

6. The combination, with a series of revolving soldering-irons, of the spindles E, frame F, arms R, connecting-rod S, the lever T, the springs *a*, and the collars *b*, substantially as and for the purpose specified.

7. The hollow spindles D, having the collars *f* and feathers *e*, in combination with the pinions *l*, having recesses *p*, in which the feathers move vertically with the spindles, the levers G, having apertures *d*, the rods E, extending through the spindles, and the soldering-irons C on the spindles, substantially as described.



407,774. FELT BOOT. MILLARD H. DRAKE, Hanover, Mich. Filed Oct. 29, 1888. Serial No. 289,395. (No model.)

Claim.—In felt boots and similar foot-wear, a heel-strap consisting of an outer strap secured at the points C and D of the boot, and the inner strap E, secured at its ends to an exterior strap and at its middle to the boot, substantially as described.

407,775. SAFE-LOCK. JAMES C. HARRIS, Dayton, Ohio, assignor of one-half to Augustus G. Burton, Chicago, Ill. Filed Dec. 20, 1888. Serial No. 292,991. (No model.)

407,775.

Claim.—1. The combination, with the bolts of a safe, of a motor applied to actuate the said bolts, said motor comprising a spring, weight, or other prime mover, and a train of gears for retarding the action of said prime mover and the bolt-work, substantially as described.

2. The combination, with the bolts of a safe, of a motor applied to actuate the said bolts, said motor comprising a spring, weight, or other prime mover, a train of gears, and an escape device for retarding the action of the said prime mover and bolt-work, substantially as described.

3. The combination, with the bolts of a safe, of a motor applied to actuate the said bolts, said motor comprising a spring, a train of gears, and an escape device connected with and actuated by a rotating part of the train of gears remote from the actuating-spring and acting to retard the motion of the parts under the action of the spring, and a time mechanism, substantially as described.

4. The combination, with the bolts of a safe, of a spring-motor applied to actuate the said bolts, said motor comprising an actuating

spring or springs, a train of gears, a detent engaging a rotating part of the said train of gears remote from the actuating-springs, and means for actuating said detent in opening the safe, substantially as described.

5. The combination, with the bolts of a safe, of a spring applied to actuate the bolts, means for retarding the movement of the bolts under the action of the spring, a train of gears connected with and actuated by the spring, and a time mechanism applied to control the movement of the train under the action of the spring, substantially as described.

6. The combination, with the bolts of a safe, of a rotating part or crank connected with the said bolts for casting and retracting the latter, a spring applied to actuate said rotating part, a train of gears connected with the said rotating part, a detent engaging a part which is moved by the train of gears for holding the latter and the said rotating part from movement, and automatically-acting means controlled by the movement of the said rotating part for actuating said detent to stop the train when the bolts are cast, and means acting upon the detent for releasing the train to retract the bolts, substantially as described.

7. The combination, with the bolts of a safe, of a rotating part or crank connected with the bolts for actuating the latter, a spring applied to move the said rotating part, a train of gears connected with the said rotating part, a rotating arm *g*, actuated by one of the gears of the train remote from the spring, a pivoted detent-lever I, adapted for engagement with said arm *g*, a cam connected with the said rotating part and having operative connection with said detent-lever, and means for actuating said detent-lever for releasing the arm *g* in opening the safe, substantially as described.

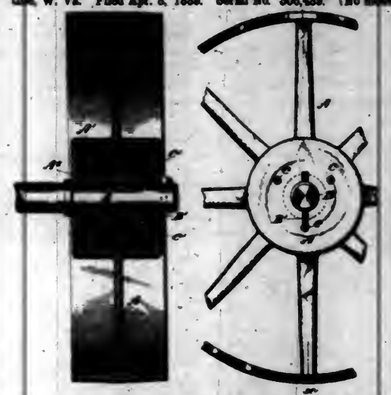
8. The combination, with the bolts of a safe, of a rotating part or crank connected with the bolts for casting and retracting the latter, a spring applied to actuate said rotating part, a train of gears connected with and moved by the said rotating part, a rotating fan or other escape device for controlling the movement of said train of gears, a revolving arm *g*, actuated by one of the arbors of the train remote from the spring, a detent engaging the said arm *g*, and a time mechanism actuating said detent, substantially as described.

9. The combination, with the bolts of a safe, of an actuating device therefor, consisting of coiled spring or springs, a pinion upon the spring-shaft, a gear-wheel intermeshing with said pinion and carrying a crank, means connecting said crank with the safe-bolts, and means for retarding the motion of said bolts under the action of the spring or springs, substantially as described.

10. The combination, with a shaft E^3 and the spring actuating said shaft, of a cam I′ upon the shaft, a pivoted detent-lever I, a train of gears connected with the shaft, a revolving arm *g* upon an arbor belonging to the train, a spring holding said detent-lever in position to engage the said arm *g*, and a time mechanism applied to move said detent-lever, substantially as described.

11. The combination of the bolts of a safe and a spring or other motor actuating said bolts, said bolts having a throw greater than necessary to free them from the jamb, substantially as described.

407,776. FOLDING PILLOW. ARTHUR W. HARRISON, Washington, D. C., assignor of one-half to John F. Waggaman, same place. Filed June 15, 1888. Renewed June 29, 1889. Serial No. 315,984. (No model.)

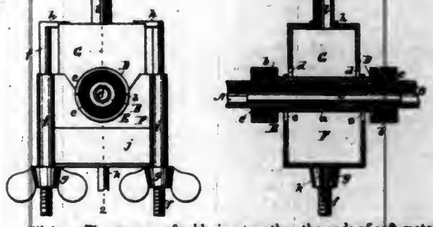


Claim.—1. The combination, with two legs, each of which is provided with a slot extending part way across its width, of a band connecting the upper ends of said legs, substantially as and for the purpose described.

2. A folding pillow consisting of two legs and a band connecting two ends thereof, each of said legs being provided with a slot extending half-way across its width, and being inclined at one end from one edge to the other, substantially as shown and described.

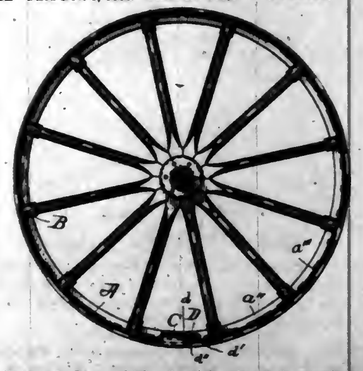
3. A folding pillow consisting of two legs and a band, each of the legs being provided with a slot extending part way across its width, and the band being secured at one end to the upper end of one leg, the other leg being provided with a series of hooks to penetrate the other end of the band, substantially as described.

407,777. SELF-OILING WHEEL. NATHANIEL D. HELMICK, Palatine, W. Va. Filed Apr. 3, 1888. Serial No. 306,459. (No model.)



Claim.—1. An oil-reservoir provided with inwardly-disposed and outwardly and exteriorly flared tubes, substantially as specified.

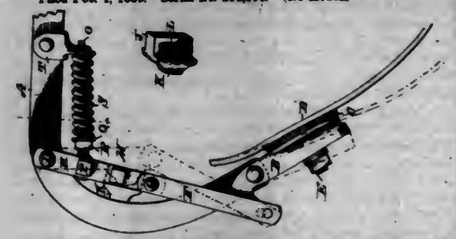
2. An oil-reservoir provided with inwardly-disposed and outwardly and exteriorly flared tubes formed integral therewith, substantially as specified.



3. The wheel A, having reservoir A′, and hub A^3, provided with oil-receiving openings, in combination with inwardly-disposed and outwardly and exteriorly flared tubes C, inserted in the reservoir A′, substantially as specified.

407,778. PROCESS OF SOLDERING METAL PIPES. WILLIAM A. HENDERSON, Malden, Mass. Filed May 31, 1889. Serial No. 312,692. (No model.)

Claim.—The process of soldering together the ends of soft-metal pipes by placing them end to end, with a narrow ring of solder between them, over a short piece of lining-pipe, inclosing the joint thus formed in a closely-fitting metal casing, melting the solder by the application of heat through the casing, and compressing the melted solder by forcing the ends of the pipes toward each other, substantially as and for the purpose described.

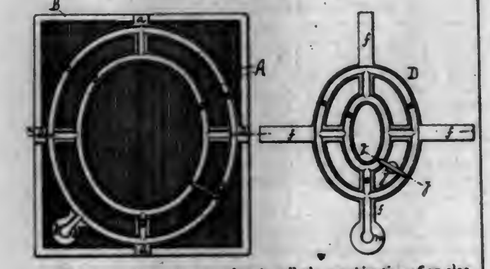


407,779. VEHICLE-WHEEL. WILLIAM C. HODNETT, Douglasville, Ga. Filed Nov. 9, 1888. Serial No. 290,405. (No model.)

Claim.—1. In a vehicle-wheel, the rim A, its contiguous ends formed with screw-threaded projections *a* and *a′*, in combination with the internally-screw-threaded sleeve C, engaging the screw-threaded projections of the rim, substantially as shown and described.

2. In a vehicle-wheel of the class described, the rim A, the sleeve C, attached to contiguous ends of the rim by right and left hand screw-threads, the catch D, attached to the rim, and the notch *d*, arranged and operating substantially as and for the purpose specified.

407,780. SHOVEL-STANDARD FOR CULTIVATORS. MARTIN L. KISSELL, Springfield, Ohio, assignor to P. P. Mast & Company, same place. Filed Feb. 1, 1889. Serial No. 298,396. (No model.)



Claim.—1. The combination, with a shovel-standard, a lever pivoted thereto, and a shovel carried by said lever, of two sets of toggle-bars pivoted to each other and respectively to the said lever and standard, and a stop-block adjustable up and down and toward the intersection of either set of toggle-bars with the standard.

2. The combination, with a shovel-standard, of the toggle-bars and the stop-block carried by said bars and adjustable toward and from the intersection of the standard and said bars.

3. The combination, with a set of toggle-bars arranged with a space between them, of a stop-block having a slotted heel fitted upon said bars and a bolt passing through the bars and said slot and arranged to clamp the bars against the said heel while the slot admits of adjustment.

407,781. GALVANIC BATTERY. WILLIAM P. KOOKOGEY, Brooklyn, assignor to the Kookogey Electric Company, of New York, N. Y., Filed Aug. 27, 1888. Serial No. 283,902. (No model.)

Claim.—1. In an electro-galvanic cell, the combination of an electrode provided with a hook-shaped top, with a support from which the electrode hangs, such support having a groove or cavity to contain mercury, substantially as and for the purpose described.

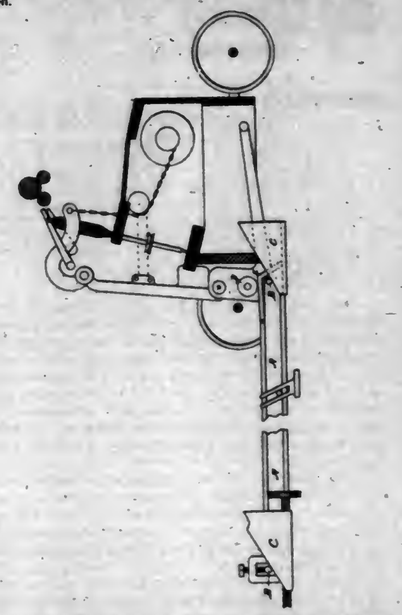
2. In an electro-galvanic cell, the combination of a plate or casting which rests on the top of the receptacle, having openings through which all the elements of the battery of like kind are suspended, and having a continuous groove upon its upper surface to contain mercury, with a series of elements of like kind having hook-shaped tops to rest in the mercury-grooves, substantially as and for the purpose described.

3. An electro-galvanic cell consisting of a receptacle for the solution, two separate plates insulated from each other to rest on top of the receptacle, each of such plates having openings through which the elements of the battery may be suspended, and also having a continuous groove upon its upper surface to contain mercury, and two series of positive and negative elements having hooked-shaped tops to rest in the mercury-grooves of the respective plates, substantially as and for the purpose described.

4. In an electro-galvanic cell having its elements suspended therein by hooks resting in mercury which is held on a supporting-plate, a cap for mercury formed as a part of or attached to such supporting-plate, substantially as and for the purpose described.

407,782. WIRE-SPLICING TOOL. WATSON S. LESLIE, Hartinsburg, Ky. Filed May 20, 1889. Serial No. 311,363. (No model.)

Claim.—1. A wire-splicing tool composed of the handled body A A′ with recess *a*, short jaw B, pivoted to the body A and having a beveled and recessed mouth b' b^3, spring D, and spring locking-bolt C C′, as described, for the purposes specified.



2. In a wire-splicing tool of the nature described, in combination with the handled body A A′, with recess *a*, and short pivoted jaw B, with recess b^3, of the recessed plate b^3 and set-screw b^4, as described, for the purposes specified.

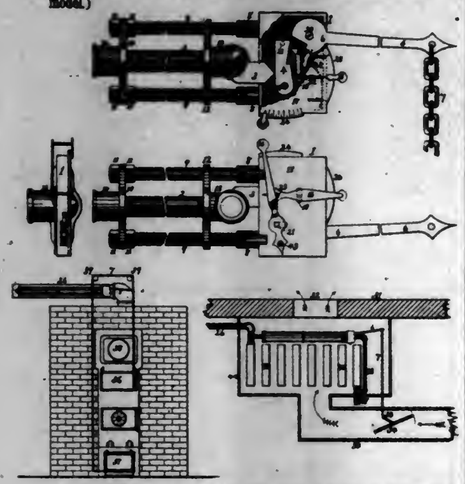
3. A tool for splicing wire, composed of a handled body with a recess, short spring-jaw pivoted to said body, a latch engaging said short pivoted jaw, and a stud E, substantially as described, for the purposes specified.

407,783. SPINNING-MULE. JAMES LOWE, Philadelphia, Pa. Filed Oct. 31, 1887. Serial No. 252,981. (No model.)

Brief.—The point of the copping-rail is caused to descend more slowly than the body of the rail, thereby causing the faller-wires to descend somewhat lower than they otherwise would at the end of each inward run of the carriage, the variation being greater with each successive run. Thus all the yarn spun at each stretch is wound up, preventing the usual slack and consequent irregularities in the yarn caused by the yarn running off the point of the cop as it nears completion.

Claim.—1. The combination, with the copping-rail, the bowl, and the shoe, of an arm hinged to the rail at a short distance from the end of the run of the bowl on the rail, and a support independent of the rail for maintaining the free end of the arm elevated during the descent of the rail, the upper surface of the arm, when raised from the rail during the descent of the latter, forming an inclined plane which acts upon the bowl before the close of the winding on to cause the faller-wires to direct the yarn on to the cop and insure its being wound thereon.

2. In combination with the copping-rail, the bowl, and the shoe, an arm hinged to the rail at a short distance from the end of the run of the bowl on the rail, and a support independent of the rail for maintaining the free end of the arm elevated during the descent of the rail adapted to retard the descent of the arm but not to raise it.



3. In combination with the copping-rail, the bowl, and the shoe, a bent arm hinged to the rail at a short distance from the end of the run of the bowl on the rail, and adapted to carry the bowl, and a support independent of the rail adapted to engage with the point of the arm during the descent of the rail.

4. In combination with the copping-rail, the bowl, and the shoe having a horizontal web, a bent arm hinged to the rail at a short distance from the end of the run of the bowl on the rail and adapted to carry the bowl and to rest at its point upon the web of the shoe.

5. In combination with the copping-rail, the bowl, and the shoe, a bent arm hinged to the rail at a short distance from the end of the run of the bowl on the rail, and adapted to carry the bowl and to rest at its point upon a support independent of the rail, and having an extensible arm.

6. In combination with the copping-rail, the bowl, and the shoe, an arm hinged to the rail at a short distance from the end of the run of the bowl on the rail, and adapted to carry the bowl and to rest at its point upon a support independent of the rail, and having a curved termination at its point.

407,784. REGULATOR FOR HOT-WATER HEATING APPARATUS. SHADUEL MAJOR, Rochester, N. Y., assignor of one-fourth to John H. Stedman, same place. Filed Feb. 10, 1888. Serial No. 263,612. (No model.)

Claim.—1. In a regulator for hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, and a wedge 5, interposed between said lever 4 and the arm 41, substantially as and for the purposes described.

2. In a regulator for hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, and a regulator-arm 15, pivoted at one extremity to said box 1 and connected with the wedge 5 by a pivot, substantially as and for the purposes described.

3. In a regulator for hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulating system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, and an indicator-arm 16, pivoted to the box 1 and to the free end of the lever 4, substantially as and for the purposes described.

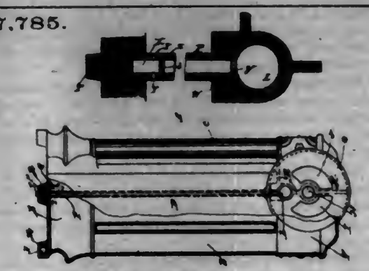
4. In a regulator for hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, a regulator-arm 15, pivoted at one extremity to said box 1 and connected with the wedge 5 by a pivot, and a chain or rope 7, attached to the free end of the lifting-bar 6, the end of said chain or rope attached to the draft-door 37 of the furnace, substantially as and for the purposes described.

5. In a regulator for hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, a regulator-arm 15, pivoted at one extremity to said box 1 and connected with the wedge 5 by a pivot, and a chain or rope 7, attached to the free end of the lifting-bar 6, the end of said chain or rope attached to the draft-door 37 of the furnace, substantially as and for the purposes described.

6. In a hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, an indicator-arm 16, pivoted to the box 1 and to the free end of the lever 4, and a chain or rope 7, attached to the free end of the lifting-bar 6, the end of said chain or rope attached to the draft-door 37 of the furnace, substantially as and for the purposes described.

7. In a hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, a regulator-arm 15, pivoted at one extremity to said box 1 and connected with the wedge 5 by a pivot, and a chain or rope 7, attached to the free end of the lifting-bar 6, the end of said chain or rope attached to the draft-door 37 of the furnace, substantially as and for the purposes described.

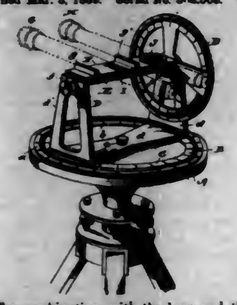
8. In a hot-water, hot-air, or steam heating appparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, an indicator-arm 16, pivoted to the box 1 and to the free end of the lever 4, and a chain or rope 7, attached to the free end of the lifting-bar 6, the end of said chain or rope attached to the draft-door 37 of the furnace, substantially as and for the purposes described.



9. In a hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, and a chain or rope 7, attached to the free end of the lifting-bar 6 and to the weighted arm 35 of the damper 34 of the cold-air inlet 30, substantially as and for the purposes described.

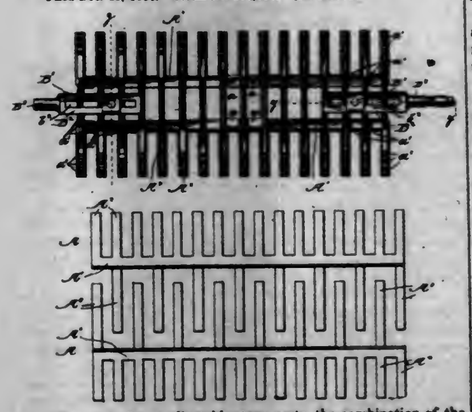
10. In a hot-water, hot-air, or steam heating apparatus, or in any heating or refrigerating apparatus having a circulation system, the combination of an expansion-tube 2, inserted in the circulation system, an elbow 13, connected to one end of said tube and provided with an arm 3, a box 1, rigidly connected to the other end of said tube 2 by rods 9 9, a lever 4, abutting against the arm 3 and pivoted at one end to said box 1, a lifting-bar 6, provided with an arm 41, and also pivoted to said box, a wedge 5, interposed between said lever 4 and the arm 41, a regulator-arm 15, pivoted at one extremity to said box 1 and connected to the wedge 5 by a pivot, and a chain or rope 7, attached to the free end of the lifting-bar 6 and to the weighted arm 35 of the damper 34 of the cold-air inlet 30, substantially as and for the purposes described.

11. In an apparatus constructed and operating substantially as shown, the wedge 5, interposed between the lever 4 and the arm 41, of the lifting-bar 6, in combination with the indicator-arm 16, pivoted at one extremity to the box 1 and to the free end of the lever 4, substantially as and for the purposes described.



407,785. HOT-WATER RADIATOR. EUGENE S. HARDY, Montreal, Quebec, Canada. Filed Dec. 22, 1888. Serial No. 294,442. (No model.)

407,785.



Claim.—In a hot-water radiator, the combination, with a section of the main body provided with water-passages and with the air-passage L in the lower part of it, of the tube P, communicating with said passage L and having holes Y at its upper end and communicating with the upper part of the water-space, and the thin partition Z, provided with a very small air-hole and secured in the said tube a little below the holes Y, substantially as set forth.

407,786. DISTANCE-INSTRUMENT. ANDREW R. MELSCOSE, Villard, Dak. Filed Mar. 3, 1888. Serial No. 265,503. (No model.)

Claim.—The combination, with the base and the carriage pivoted thereon on a vertical pivot, of the platform F, having downwardly-extending ears *f*, arranged within the upright portion of the carriage and formed upon its upper face with flanged supports *g* and *g'*, and the rod E, passed through openings in the said lugs and through openings in the upright portions of the carriage and forming the fulcrum on which the platform tilts, substantially as shown and described.

407,787. STOVE-GRATE. WILLIAM C. METZNER, Chicago, Ill. Filed Dec. 19, 1888. Serial No. 294,007. (No model.)

Claim.—1. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other the ribs A^3, said ribs of each section alternating in spacing with those on the other section and extending beneath the other section, slotted bars B^3, terminating in journals B^4, applied at the ends of said grate, and bolts to secure said bars and said sections to each other, substantially as shown and described.

2. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other the ribs A^3, said ribs of one section alternating in spacing with those on the other section and extending beneath the other section, bars B^3, terminating in journals B^4, applied at the ends of said grate, and bolts to secure said bars and said sections to each other, substantially as shown and described.

3. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other the ribs A^3, said ribs of one section alternating in spacing with those on the other section and extending beneath the other section, slotted bars B^3, terminating in journals B^4, applied at the ends of said grate, and bolts to secure said bars and said sections to each other, substantially as shown and described.

4. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other ribs A^3, said ribs of one section alternating in spacing with those on the other section and extending beneath the other section, bars B^3, terminating in journals B^4, applied at the ends of said grate, and bolts to secure said bars and said sections to each other, substantially as shown and described.

5. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other the ribs A^3, said ribs of one section alternating in spacing with those on the other section and extending beneath the other section, one or more lugs *a*, seated in said sections between the ribs A^3, bars B^3, terminating in journals B^4, applied at the ends of said grate, and bolts to secure said bars and said sections to each other, substantially as shown and described.

6. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other the ribs A^3, said ribs of one section alternating in spacing with those on the other section and extending beneath the other section, one or more lugs *a*, seated in said sections between the ribs A^3, slotted bars B^3, terminating in journals B^4, applied at the ends of said grate, and bolts to secure said bars and said sections to each other, substantially as shown and described.

Claim.—1. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other the ribs A^3, said ribs of each section alternating in spacing with those on the other section and extending beneath the other section, and bolts to secure said sections to each other, substantially as shown and described.

2. In an adjustable stove-grate, the combination of the sections A A, each having on the side adjacent to the other the ribs A^3, said ribs of one section alternating in spacing with those on the other section and extending beneath the other section, one or more lugs *a*, seated on said sections between the ribs A^3, and bolts to secure said sections to each other, substantially as shown and described.

407,788. LIFTING-JACK. LEWIS MILLER, Akron, Ohio. Filed Oct. 23, 1888. Serial No. 288,880. (No model.)

Claim.—1. The combination, in a lifting-jack, of a shield or casing, a lever pivoted therein and having sockets *d d'* in its end, and two pawls or clamps, one engaging and actuated directly by the lever, the other through a link interposed between it and said lever, substantially as described.

2. The combination, with a rack-standard, the pawls, and their actuating-lever, of an angular link having its inner face grooved or recessed at one end, and a bearing for the lever at the other eccentric to the pivoted center of the lever, substantially as described.

3. The combination, with a rack-standard and two pawls engaging therewith, of a lever provided on its lower or inner end with a fixed projection or lug formation engaging one of said pawls, and an angular link interposed between said lever and the second pawl for operating the latter, substantially as described.

4. The combination, with the rack-standard and pawls, a guiding-link connecting the pawls, whereby each pawl is guided by the other, as described, a lever acting directly on the lifting-pawl, and a link interposed between said lever and the second pawl, for the purpose and substantially as described.

5. The combination, with the rack-standard and pawls, of a shield or casing having an adjustable cap or side plate provided with lugs or pins on one side for operating the pawls, and means, substantially as described, for adjusting said cap or plate.

6. In a lifting-jack, a casing or shield having an arc extension and slots for the passage of a rack-standard, in combination with a rack-standard and two pawls engaging therewith, and a pawl-operating lever provided with a laterally-projecting arc bearing conforming to and lying in said arc extension of the casing, substantially as specified.

7. In a lifting-jack, the combination, with the rack-standard, of two pawls made in the form of rectangular links, provided each with toothed cross-bars and cam-faced cross-bars and connected by a link for joint operation, and means, substantially as described, for operating said pawls.

8. The combination, with a rack-standard and its pawls, of an inclosing shield or casing having one of its sides adjustable relatively thereto, said adjustable side carrying one or more pins or projections, which act, when the side is adjusted, to disengage the pawls from the

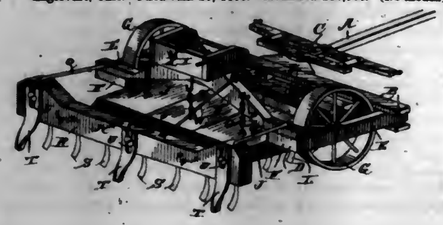
rack-standard, and means, substantially as described, for adjusting said side.

407,789. SELF-ADJUSTING EYEGLASS-FRAME. FRED W. HOLTE, St. Louis, Mo. Filed July 17, 1888. Serial No. 280,162. (Model.)

Claim.—1. In eyeglasses, the bridge having connecting-stems, and the sliding bifurcated loop-straps, within which the connecting-stems of said bridge fit, substantially as and for the purpose set forth.

2. In eyeglasses, the combination of the bridge having connecting-stems, the bifurcated loop-straps, within which loops the connecting-stems of said bridge fit, the angle-pins projecting inward from said stems into the bifurcations of said loop-straps, and the reactionary loop-spring nose-pieces, whose fast ends are secured to said angle-pin, and whose loose ends spring against and within said loop-straps, substantially as and for the purpose set forth.

3. In eyeglasses, the combination of the bridge having connecting-stems, the bifurcated loop-straps, within which the connecting-stems of said bridge fit, the traveling angle-pin at the terminals of said stems of the bridge projecting into said bifurcations, the reactionary loop-spring frames constituting the nose-pieces, the said frames pivotally looped around said angle-pins, the loose end of said spring-loop pressing against and within said loop-strap, the clips 15, embracing the spring-loops near the middle of their attached sides, and the screw attachments by which said clips are secured to lugs that project from the eyeglass-frames, the said clips providing a fulcrum attachment to secure the relatively-increased expansion and contraction of the lower part of the nose-pieces, substantially as and for the purpose set forth.



4. In eyeglasses, the combination of the frames 1, the spring-loop nose-pieces, the loop-straps secured to said frames and having bifurcations, the bridge-piece having connecting-stems and angle-pins projecting from said stems and fitting in said bifurcations, and the fulcrum-clips securing the said spring-loop nose-pieces to the frames, whereby said spring-loop fulcrumed on the clip secures an increased ratio of expansion and contraction relatively in the movement of the lower portion of the nose-pieces, substantially as set forth.

5. In eyeglasses, the combination, with the glass-frames, of the loop-straps 5, a bridge having stems fitting in said loop-straps, and the spring-loops carrying nose-cushions having their ends secured to said stems and bearing against said loop-straps, as set forth.

407,790. FOLDING IRONING-TABLE. JEFF. D. PAGE, Gibsland, La. Filed Dec. 15, 1888. Serial No. 293,684. (No model.)

Claim.—The combination, with the table-top having the legs B B pivoted to its rear end, of the side bars pivoted at their rear ends to the upper ends of the said legs, the standard supporting the free end of the table and pivoted at its lower end between the front ends of the side bars, and braces G G, pivoted at their rear ends to the legs B B, fitting at their front ends in keepers on opposite sides of the standard, near its upper end, provided with notches in its lower edge to engage the lower sides of the said keepers, and further provided at intermediate points in their upper edges with notches K K, engaging studs on the side bars, substantially as and for the purpose specified.

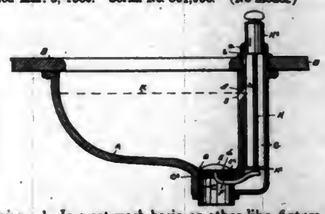
407,791. HARROW AND CLOD-CRUSHER. LUCIUS B. PHELPS, Ragleville, Ohio. Filed Jan. 29, 1889. Serial No. 297,976. (No model.)

Claim.—1. The combination of the frame, the clod-crusher sections arranged side by side and having their front ends loosely connected with the frame, and the harrow-bar connected to the frame in rear of the clod-crusher sections, as set forth.

2. The combination of the frame, the clod-crusher sections loosely connected thereto, the harrow-bar loosely connected to the frame in rear of the clod-crusher sections, and the markers carried by the harrow-bar and adjustable both vertically and longitudinally thereon, as set forth.

3. The combination of the frame, the arched bar secured to the rear portion of the same, the clod-crusher sections having their front ends loosely connected with the frame, and the chains secured to the rear portions of said sections and adapted to suspend the same from the said arched bar, as set forth.

4. The combination, with the frame, of the clod-crusher sections having the teeth L and the pulverizing-bar M, and the links N, having their front ends pivoted to the frame and their rear ends pivoted to the clod-crusher sections, as set forth.

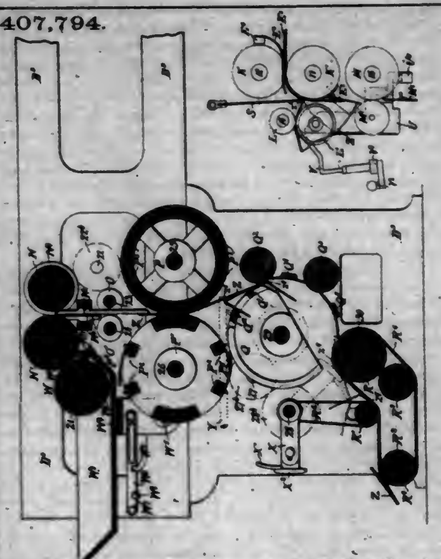


5. The combination, with the harrow-bar having a longitudinal series of bolt-holes, of the markers having longitudinal slots or notches in their upper portions, and the securing-bolts passed through said slots or notches into one of the bolt-holes in the harrow-bar, as set forth.

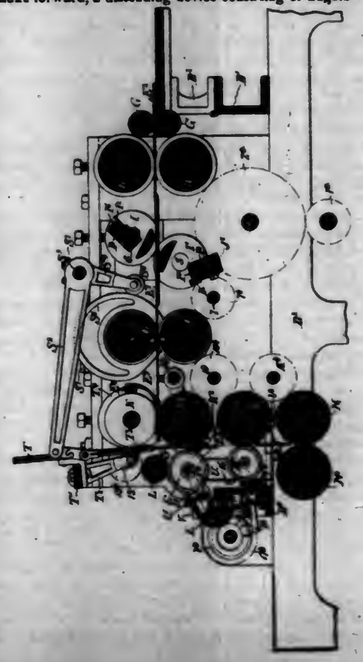
407,792. BURIAL-CASKET. JOHN D. RIPSON, Suspension Bridge, N. Y., assignor of three-fourths to M. J. Hoenig and William A. Fraser, both of same place. Filed Apr. 8, 1889. Serial No. 306,324. (No model.)

Claim.—A casket having a sliding head-panel and a sliding glass, in different horizontal planes, in combination with a catch having a substantially vertical portion adapted to engage the end of both said panel and glass for holding the two closed, substantially as and for the purpose specified.

407,793. SET WASH-BASIN. WILLIAM SCOTT, Medford, Mass. Filed Mar. 5, 1889. Serial No. 301,980. (No model.)



Claim.—1. In a set wash-basin or other like fixture having outlets at its lower and upper portions and waste-water ways C G leading from each of said outlets, the combination of a side chamber C^3 of said waste-water way C, leading from said lower outlet B of the basin, an opening and closing valve E, located within the basin and at its said lower outlet B, a lever-arm F, to operate on the under side of said valve and located within and across and extended into said side chamber C^3 of said waste-water way C, a waste and overflow water way G, connecting upper outlet of the basin and side chamber C^3 of said waste-water way C, and an up and down moving stem or rod H, located in said overflow-way and entered into said side chamber C^3 and therein adapted, in co-operation with said lever-arm, to secure an opening and closing of said valve, substantially as described.



2. In a set wash-basin or other like fixture having outlets at its lower and upper portions and waste-water ways C G leading from each of said outlets, the combination of a side chamber C^3 of said waste-water way C, leading from the lower outlet B of the basin, and opening and closing valve E, located within the basin and at and swinging on one side of said lower outlet B, a lever-arm F, to operate on the under side of said valve and located within and extended into said side chamber C^3 of said waste-water way C, and an up and down moving stem or rod H at its lower end portion entered into said side chamber C^3 and therein adapted, in co-operation with said lever-arm, to secure an opening and closing of said valve, substantially as described.

3. In a set wash-basin or other like fixture having outlets at its lower and upper portions and waste-water ways C G leading from each of said outlets, the combination of a side chamber C^3 of said waste-water way C, leading from said lower outlet B of the basin, an opening and closing valve E, located within the basin and at and swinging on one side of said lower outlet B, a lever-arm F, curving in the direction of its length and to operate on the under side of said valve and located within and across and extended into said side chamber C^3 of said waste-water way C, a stationary partition C^2 of the waste-water way C, and having a slotted bearing *d* for said lever-arm, and an up and down moving stem or rod H at its lower end portion entered into said side chamber C^3 and therein adapted, in co-operation with said lever-arm, to secure an opening and closing of said valve, substantially as described.

4. In a set basin or other like fixture having an outlet at its bottom and a waste-water passage in communication with said outlet, the combination of an overflow-water outlet *f* at and open to the water-chamber of the basin appreciably below the overflow-water level thereof, and thence leading upward through the wall of the basin and rising to the height of said overflow-water level, and a waste-water way G in communication with said overflow-water outlet *f*, substantially as described, for the purpose specified.

407,794. PAPER-BAG MACHINERY. CHARLES B. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed Mar. 21, 1888. Serial No. 267,965. (No model.)

Claim.—1. In a bag-machine, the device for distending a bellows folded blank in the plane of the bag-bottom to be formed on it, which consists of feed-rolls for feeding the blanks forward, in combination with a device for opening the advancing end of the blanks as they pass through the rolls, distending-fingers V V, or equivalent mechanism, as specified, for engaging the corners of the upper side of the blank, and gripping-fingers K^2 K^3, or equivalent mechanism, as specified, for engaging the corresponding corners of the lower side of the blank, said fingers and grippers or their equivalents being arranged and actuated to coact in distending the bellows-sided tube as it advances through the feed-rolls, substantially as shown and described.

2. In a bag-machine, the device for distending a bellows-sided blank in the plane of the bag-bottom and for defining the folds lying above said bottom, which consists of feed-rolls for feeding the blanks forward, in combination with a device for opening the advancing ends of the blanks, a device for distending the advancing blanks, consisting of the fingers V V and grippers K^2 K^3, or their equivalents, as specified, and a tucker having actuating mechanism whereby it is caused to strike and bend the upper side of the advancing blank on or about the line s^2 and to follow the motion of the blank while it is distending and until the fold at s^2 is fully defined, substantially as shown and described.

3. In a bag-machine, the combination, with feed-rolls for feeding the blanks forward, a distending device consisting of fingers V V and grippers K^2 K^3, or equivalent devices, as specified, for distending a bellows-folded tube as it advances through the feed-rolls, and a tucker for defining the folds lying above the distended part of the tube, of a narrow support placed so as to lie under the center of the upper side of the blank as it advances from the feed-rolls during the distention of its end, said support serving to draw out the upper end of the diamond as the upper side of the blank is withdrawn from it after distention, substantially as shown and described.

4. In a bag-machine, the combination, with feed-rolls for feeding the blanks forward, a distending device consisting of fingers V V and grippers K^2 K^3, or equivalent devices, as specified, for distending a bellows-folded tube, as it advances through the feed-rolls, and a tucker for defining the folds lying above the distended part of the tube, of a narrow support placed so as to lie under the center of the upper side of the blank as it advances from the feed-rolls during the distention of its end, said support serving to draw out the upper end of the diamond as the upper side of the blank is withdrawn from it after distention, and a narrow guide situated between the feed-rolls aforesaid and the rolls which deliver the diamond-folded blank to the mechanism for completing the bag, said guide being arranged to lie within the lower side of the blank and serve to pull out the front point of the diamond, substantially as shown and described.

5. In a bag-machine, the combination, with feed-rolls for feeding the blanks forward, a distending device consisting of fingers V V, grippers K^2 K^3, or equivalent devices, as specified, for distending a bellows-folded tube as it advances through the feed-rolls, and a tucker for defining the folds lying above the distended part of the tube, of a narrow support placed so as to lie under the center of the upper side of the blank as it advances from the feed-rolls during the distention of its end, said support serving to draw out the upper end of the diamond as the upper side of the blank is withdrawn from it after distention, a narrow guide situated between the feed-rolls aforesaid and the rolls which deliver the diamond-folded blank to the mechanism for completing the bag, said guide being arranged to lie within the lower side of the blank and serve to pull out the front point of the diamond, and folder-plates arranged to close down on the diamond and hold it to form after it is drawn out, as aforesaid, and while the diamond-folded end of the blank is passing to the mechanism which completes the bag, substantially as shown and described.

6. In a bag-machine, the combination, with feed-rolls for feeding the bag-blanks forward and a device for opening the advancing end of the blank as it leaves the rolls, of distending-fingers having actuating mechanism whereby they are made to extend forward to receive the upper side of the partially-opened blank, to move apart so as to engage the corners of said upper side at a selected point, and to move together to permit the retraction of side above them, and grippers K^2 K^3, or equivalent mechanism, as described, to engage the edges of the lower side of the blank and coact with the distending-fingers to open the tube in the plane of the bag-bottom, substantially as shown and described.

7. In a bag-machine, the combination, with feed-rolls for feeding the bag-blanks forward and a device for opening the advancing end

of the blank as it leaves the rolls, of distending-fingers having actuating mechanism whereby they are made to extend forward to receive the upper side of the partially-opened blank, to move apart so as to engage the corners of said upper side at a selected point, and to move together to permit the retraction of side above them, grippers K^2 K^2, or equivalent mechanism, as described, to engage the edges of the lower side of the blank and coact with the distending-fingers to open the tube in the plane of the bag-bottom, and a reciprocating tucker having operative mechanism whereby it is caused to strike and bend the advancing blank between the feed-rolls and the distending-fingers, and at the line where the fold z^2 is to be formed in the bag to remain in contact with the blank and move down with it until the fold z^2 is fully defined, and then move up to permit the advance of another blank, substantially as shown and described.

8. In a bag-machine, the combination, with feed-rolls for feeding the bag-blanks forward and a device for opening the advancing end of the blank as it leaves the rolls, of distending-fingers having actuating mechanism whereby they are made to extend forward to receive the upper side of the partially-opened blank, to move apart so as to engage the corners of said upper side at a selected point, and to move together to permit the retraction of side above them, grippers K^2 K^2, or equivalent mechanism, as described, to engage the edges of the lower side of the blank and coact with the distending-fingers to open the tube in the plane of the bag-bottom, a narrow support placed so as to lie centrally under the upper side of the blank as it advances from the feed-rolls and is distended, a narrow guide placed so as to lie centrally within the under side of the blank as it passes to the presser-rolls which complete the diamond, said support and guide coacting to spread out the distended end of the blank to a diamond form, and a reciprocating tucker having operative mechanism whereby it is caused to strike and bend the advancing blank between the feed-rolls and the distending-fingers and at the line where the fold z^2 is to be formed in the bag, to remain in contact with the blank and move down with it until the fold z^2 is fully defined, and then move up to permit the advance of another blank, substantially as shown and described.

9. In a bag-machine, the combination, with feed-rolls for feeding the bag-blanks forward and a device for opening the advancing end of the blank as it leaves the rolls, of distending-fingers having actuating mechanism whereby they are made to extend forward to receive the upper side of the partially-opened blank, to move apart so as to engage the corners of said upper side at a selected point, and to move together to permit the retraction of side above them, grippers K^2 K^2, or equivalent mechanism, as described, to engage the edges of the lower side of the blank and coact with the distending-fingers to open the tube in the plane of the bag-bottom, a narrow support placed so as to lie centrally under the upper side of the blank as it advances from the feed-rolls and is distended, a narrow guide placed so as to lie centrally within the under side of the blank as it passes to the presser-rolls which complete the diamond, said support and guide coacting to spread out the distended end of the blank to a diamond form, a reciprocating tucker having operative mechanism whereby it is caused to strike and bend the advancing blank between the feed-rolls and the distending-fingers and at the line where the fold z^2 is to be formed in the bag, to remain in contact with the blank and move down with it until the fold z^2 is fully defined, and then move up to permit the advance of another blank, substantially as shown and described.

10. In a bag-machine, the device for distending the blank in the plane of the bag-bottom, consisting of the feed-roll K', having a coacting roll, in combination with a device for opening the mouth of the advancing bag-blank as it passes through said rolls, grippers K^2 K^2, pivoted on roll K' and having actuating mechanism whereby they move inward to engage the corners of the lower side of the blank at selected points, remain in contact with the blank for a definite part of the rotation of the roll, and then move outward and release the blank, and reciprocating distending-fingers V V, having actuating mechanism whereby they are made to extend forward to permit the upper side of the blank to pass over them, to spread out so as to engage the corners of the said upper side at points corresponding to those on the side engaged by the grippers, and to close together again to permit the retraction of said upper side, said distending-fingers and grippers being arranged to coact in distending the blank, substantially as shown and described.

11. In a bag-machine, the device for opening the end of a bellows-folded tube into the diamond form, consisting of the feed-roll K', having a coacting roll, in combination with a device for opening the mouth of the advancing bag-blank as it passes through said rolls, grippers K^2 K^2, pivoted on roll K' and having actuating mechanism whereby they move inward to engage the corners of the lower side of the blank at selected points, remain in contact with the blank for a definite part of the rotation of the roll, and then move outward and release the blank, reciprocating distending-fingers V V, having actuating mechanism whereby they are made to extend forward to receive the upper side of the partially-opened blank, to move apart so as to engage the corners of said upper side at a selected point, and to move together to permit the retraction of side above them, grippers K^2 K^2, or equivalent mechanism, as described, to engage the edges of the lower side of the blank and coact with the distending-fingers to open the tube in the plane of the bag-bottom, a narrow support placed so as to lie centrally under the upper side of the blank as it advances from the feed-rolls and is distended, a narrow guide placed so as to lie centrally within the under side of the blank as it passes to the presser-rolls which complete the diamond, said support and guide coacting to spread out the distended end of the blank to a diamond form, a reciprocating tucker having operative mechanism whereby it is caused to strike and bend the advancing blank between the feed-rolls and the distending-fingers and at the line where the fold z^2 is to be formed in the bag, to remain in contact with the blank and move down with it until the fold z^2 is fully defined, and then move up to permit the advance of another blank, substantially as shown and described.

12. In a bag-machine, the combination, with feed-rolls for feeding bellows-folded blanks forward, of a curved former-plate F^2, whereby the advancing end of the blank is opened as it leaves the rolls, mechanism for distending the blanks on the plane of the bag-bottom to be formed and for defining the folds lying above said bottom, consisting of the fingers V V and grippers F^2 F^2, or their equivalents, as described, and a tucker S, all substantially as and for the purpose specified.

13. In a bag-machine, the combination, with the feed-rolls for feeding the blanks forward, a device for distending bellows-folded blanks, consisting of the fingers V V and grippers F^2 F^2, or equivalent mechanism, as specified, and a tucker S, arranged to coact with said distending device, as described, of the narrow drawing-rollers L L' and a narrow guide placed to lie within the lower side of the blank and coact with the roll L' in drawing the distended end of the blank to the diamond form.

14. In a bag-machine, the combination, with the feed-rolls for feeding the blanks forward, a device for distending bellows-folded blanks, consisting of the fingers V V and grippers F^2 F^2, or equivalent mechanism, as specified, and a tucker S, arranged to coact with said distending device, as described, of the narrow drawing-rollers L L' and the drawing-rolls M M', said roll M' being narrow and arranged to rest centrally within the lower blank side, so as to coact with roller L in drawing out the distended end of the blank to the diamond form.

15. In a bag-machine, the combination, with the feed-rolls for feeding the blanks forward, a device for distending bellows-folded blanks, consisting of the fingers V V and grippers F^2 F^2, or equivalent mechanism, as specified, and a tucker S, arranged to coact with said distending device, as described, of a narrow support placed so as to lie centrally under the upper side of the blank as it advances and is distended and the drawing-rolls M M', said roll M' being narrow and placed so as to lie centrally within the under side of the blank, so as to coact with the narrow support aforesaid in drawing out the distended end of the blank into the diamond form.

16. In a bag-machine substantially as specified, the combination of the supporting-roll L' with the reciprocating distending-fingers V V, so that the ends of said fingers in their forward position lie beneath the rim of said roll.

17. In a bag-machine substantially as specified, the combination of the loosely-journaled roll L', having a spring-supported sustaining-arm L^4 and adjustable stop L^5, with the draw-roll L, having a portion of its surface cut away, so as to loosen the grip of said rolls on the blank and permit its withdrawal from between said rolls.

18. In a bag-machine substantially as specified, the combination of the feed-rolls K K', the curved former F^2, the rolls L L', to engage the upper side of the blank, and the guide-plate E^2, for directing said upper side between said rolls.

19. In a bag-machine substantially as specified, the combination, with a rocker-shaft V', of distending-fingers V V, journaled in said rocker-shaft, and actuating-cams whereby the shaft is oscillated and the fingers rotated back and forward in their bearings, so as to give their points a double reciprocating motion.

20. In a bag-machine substantially as specified, the combination of the feed-roll K', the fingers K^2 K^2, secured at the outer edges of said roll, and the cams K^3 K^3, whereby said fingers are made to move inward and engage the blank at a certain point to remain in their inward position for a determined period in the rotation of roll K', and then allowed to move out to release the blank.

21. In a bag-machine substantially as specified, the combination of the tucker S with a reciprocating lever connected with said tucker, cam mechanism for actuating said lever to regulate the up-and-down stroke of the tucker, guides T, within which said tucker reciprocates, a rock-shaft T', attached to said guides, and cam mechanism for actuating said rock-shaft, so as to guide the edge of the tucker during its downward and upward motion.

22. In a bag-machine substantially as specified, the combination, with the feed-roll K', of the tucker S, a reciprocating lever connected with said tucker, cam mechanism for actuating said lever to regulate the up-and-down stroke of the tucker, guides T, within which said tucker reciprocates, a rock-shaft T', attached to said guides, and cam mechanism for actuating said rock-shaft, so as to guide the edge of the tucker during its downward stroke in a path close to the face of roll K'.

23. In a bag-machine substantially as specified, the combination, with the roll M and plate M^2, or equivalent backing, of the folder-plates U U, having actuating cams whereby they are caused to compress and hold the diamond after it is brought to shape and while it passes from the forming mechanism to the presser-rolls, and the presser-rolls N N'.

24. In a bag-machine substantially as specified, the combination of the tucker S, mechanism for actuating said tucker, as specified, the roll M, and plate M^2, comprising a backing or support for the blank or equivalent backing, the folder-plates U U, having actuating-cams whereby they are caused to fold down against the tucker and backing to compress and hold the diamond to form, and the presser-rolls N N'.

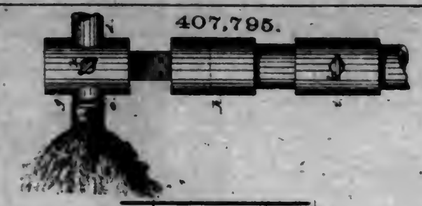
25. In a bag-machine substantially as specified, the combination, with the drawing-rolls M M', the said roll M' being narrow to aid in drawing out the diamond, as specified, of the presser-rolls N N' and the folder-plates U U, arranged to fold down against roll M on each side of roll M' and having actuating-cams whereby said plates are folded down on the diamond and remain in contact with it while it passes to the rolls N N' aforesaid.

26. In a bag-machine substantially as specified, the combination, with the folder-plates U U, for holding the diamond in shape after it is formed and as it passes to the presser-rolls, of the presser-rolls N N', and the paste-roll W, held in contact with the roll N' and grooved to contain lines of paste, substantially as specified, whereby the diamond is, while being compressed, furnished with paste to complete the closing of the bag-bottom.

27. In mechanism for forming the final folds on a diamond-folded bag-blank, the combination of creasing-rolls for creasing the diamond on the lines of its final folds, the segmental double roll Q, rotating with greater speed than said creaser-rolls and having recesses Q^2 to engage the edges of the back flap, and guides to hold the blank in contact with said segmental roll.

28. In mechanism for forming the final folds on a diamond-folded bag-blank, the combination of creasing-rolls for creasing the diamond on the lines of its final folds, the segmental double roll Q, rotating with greater speed than said creaser-rolls, having recesses Q^2 to engage the edges of the back flap, guides to hold the blank in contact with said segmental roll, and a presser-roll Q^3, so placed that the blank will be gripped between it and roll Q after it is released by the creasing-rolls.

29. In mechanism for forming the final folds on a diamond-folded bag-blank, the combination of creasing rolls for creasing the diamond on the lines of its final folds, the segmental double roll Q, rotating with greater speed than said creaser-rolls, having recesses Q^2 to engage the edges of the back flap, and recesses Q', guides to hold the blank to the face of roll Q, and a presser-roll Q^3, to coact in feeding the blank forward when it is released by the creasing-rolls, all substantially as and for the purpose specified.



30. In mechanism for forming the final folds on a diamond-folded bag-blank, the combination, with the double segmental roller Q, of the roll R and the rotating arm X, having the segmental presser-plate X^2 for pressing the back flap down upon the bottom of the blank.

31. In mechanism for forming the final folds on a diamond-folded bag-blank, the combination, with the double segmental roller Q, of the roll R the rotating arm X, having the segmental presser-plate X^2 for pressing the back flap down upon the bottom of the blank, the apron R^4, the roll R', and the tapes R^5, coacting to press down the front flap and complete the bag.

32. In mechanism for forming the final folds on a diamond-folded bag-blank, the combination, with the double segmental roller Q, of the roll R, the rotating arm X, having the segmental presser-plate X^2 for pressing the back flap down upon the bottom of the blank, and the fork X', the apron R^4, the roll R', and the tapes R^5, coacting to press down the front flap and complete the bag.

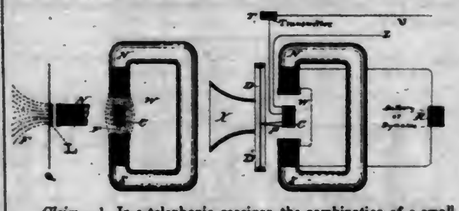
407,795. EXTENSION JOINT OR SPLICE. LIDA A. TARRING, Baltimore, Md. Filed July 16, 1888. Serial No. 280,090. (No model.)

Claim.—The coupling, as a new article of manufacture, formed from a cylinder and having three cylindrical bands, one of which is pierced with two opposite openings, and the other two provided with screw-threaded openings and thumb-screws, substantially as and for the purpose set forth.

407,796. WITHDRAWN.

407,797. HOOK. CHARLES H. THURSTON, Boston, Mass. Filed Oct. 12, 1887. Serial No. 252,227. (No model.)

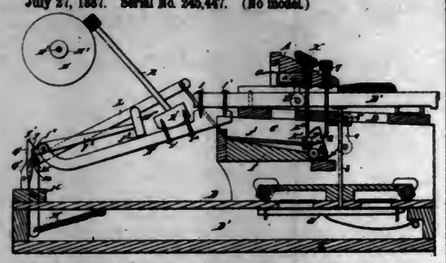
Claim.—The improved hook herein described, consisting of a continuous wire provided with an attaching-shank and having a horizontal upper arm *b*, bent at the outer end to form the loop *d*, the arm *c*, passing from said loop backward and downward beneath the upper arm and thence bent upward over the inner end of the said upper arm, and the hook *i*, formed by a continuation of said bent end, as herein described.



407,798. SLED. ADOLPH TOOK, Monroe, N. Y. Filed June 4, 1888. Serial No. 313,087. (No model.)

Claim.—1. A sled having its runners turned upward and backward at their forward ends to form a pair of foot-receiving recesses above the foot-board, substantially as specified

2. The combination of mortised runners *b* with foot-boards *a*, received by the mortises, the runners *b* being turned upward and backward at their forward ends to form the lips *b'*, and the recesses b^3, above the foot-board, substantially as specified.



407,799. TELEPHONE. JOHN TROWBRIDGE and SAMUEL SHELDON, Cambridge, Mass. Filed Dec. 17, 1888. Serial No. 293,902. (No model.)

Claim.—1. In a telephonic receiver, the combination of a small movable coil, through which the feeble telephonic currents are passed, and a fixed electro-magnet, the strength of which can be increased indefinitely, said movable coil being so placed in respect to the said fixed magnet as to embrace the fewest possible lines of force of the fixed electro-magnet—that is, it is in the magnetic field and substantially parallel with the direction of the lines of force, substantially as herein set forth and described.

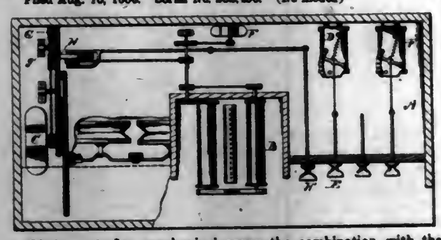
2. The combination of a small movable coil held upon a horizontal wire and a microphonic contact, the small coil being placed between the poles of a strong electro-magnet, in the manner hereinbefore described, and pressing, by means of a button placed eccentrically, upon a microphonic contact placed horizontally, as herein described.

407,800. REED-ORGAN. EDWIN S. VOTEY, Detroit, Mich. Filed July 27, 1887. Serial No. 245,447. (No model.)

Claim.—1. In an organ, the combination, with a key pivoted near its inner end, of a yoke adjustably engaged with its inner end and extending beyond the same about the length of the key, and a hammer having its handle pivotally engaged with the rear end of the yoke and extended therefrom to engage the tripping-jack, said yoke provided with adjustable muffles, substantially as described.

2. In an organ, the combination, with a key, of a yoke connected with its inner end, a hammer pivotally engaged with said yoke, and a muffle also engaged in said yoke, the connection of the yoke to the key and the muffle to the yoke being each an adjustable rocking connection, substantially as described.

3. In an organ, the combination, with a key, of a yoke engaged therewith at its rear extremity, a hammer having its handle pivotally engaged upon the rear end of the yoke and extended therefrom, and a muffle engaged with said yoke, the end of the yoke adjacent to the key and the lower end of the muffle adjacent to the yoke each constructed on the arc of a circle, substantially as and for the purposes described.

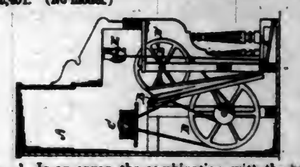


4. The combination, with an organ and its chime of bells, of a series of yielding arms or tripping-jacks G, adapted to engage the bell-hammers, and in connection with said tripping-jacks an oscillatory bar M, against which they impinge, said bar connected with a stop for operating the same, the construction being such that by advancing or withdrawing said bar the said jacks are brought into or thrown out of engagement with said hammers, substantially as described.

5. The combination, with an organ, of a chime of bells, hammers to strike said bells, yielding arms to engage the hammer-handles, and mechanism to throw said arms out of engagement with said hammers, substantially as described.

6. The combination, in an organ, of a key provided with a yoke firmly engaged therewith, a hammer having its handle pivotally engaged with the rear of the yoke and extending therefrom, a device to engage the extended ends of said hammer-handles, and means for throwing said device into and out of operation with said hammer-handles, substantially as described.

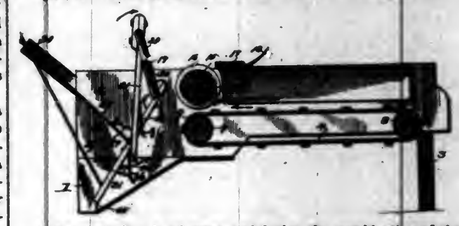
7. In an organ, the combination of a chime of bells nested into each other, a rod or bar for supporting said bells, hammers to strike said bells, washers placed between the bells along said rod or bar and each having a thickness corresponding to the space between the bell-hammers, arms to engage the hammer-handles, and means for throwing the said arms out of engagement with the hammers, substantially as described.



407,801. MECHANICAL ORGAN. EDWIN S. VOTEY, Detroit, Mich. Filed Aug. 10, 1888. Serial No. 282,450. (No model.)

Claim.—1. In a mechanical organ, the combination, with the paper-feeding mechanism, of an electric motor, a rheostat, and a stop, whereby more or less resistance may be inserted in the circuit at will to vary the speed of the paper, the bellows being operated by independent means, substantially as described.

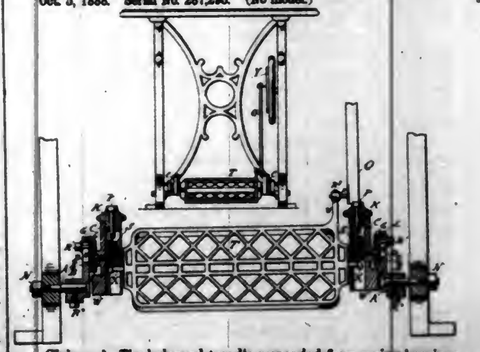
2. In a mechanical organ, the combination, with a rotary disk geared to the motor, of a disk having its axis at right angles to the first disk and bearing with its periphery against the flat face of the latter, means for adjusting said disk to have its frictional contact with the first disk at different points upon the flat face of the latter between the shaft and the edge, and a pulley on the shaft of the frictionally-driven disk geared to the music-roll or paper-feeding roll, substantially as described.



407,802. DRIVING AND GOVERNING MECHANISM FOR ORGANS. EDWIN S. VOTEY, Detroit, Mich. Filed Aug. 10, 1888. Serial No. 282,451. (No model.)

Claim.—1. In an organ, the combination, with the bellows, of an electric motor operating the same, a rheostat by which the speed of the motor may be increased or diminished, and a treadle for controlling said rheostat without requiring the use of the hands of the player, substantially as described.

2. The combination, with the feeders of an organ, of an electric motor, and a worm-gear connection C^2 B', whereby the motor is engaged with and adapted to operate the feeders, substantially as and for the purposes described.



407,803. BAND-CUTTER AND FEEDER. DE WITT WEST, Tampico, Ill. Filed Feb. 24, 1888. Serial No. 265,097. (No model.)

Claim.—1. In a band-cutter and feeder, the combination of the crank-shaft 19, arms 21, pivotally attached thereto at or near their upper ends, and provided with tines 25 at their lower ends, arms 26, provided with tines 36, pivotally attached to the under sides of the arms 21, the rods 27, having the heads 28 pivotally attached to the arms 26, the perforated bar 30, and the rods 29, provided with heads 31, pivotally attached at their lower ends to the lower ends of the arms 21 and with their upper ends passing loosely through the perforations in the bar 30, substantially as described.

2. In a band-cutter and feeder, the combination of the throat 1, frame 2, shaft 19, suitably journaled transversely on said frame, arms 21, pivotally attached at or near their upper ends to the crank-wrists 20 of said shaft, and provided with tines 25 at their lower ends, the perforated bar 30, and the rods 29, provided with heads 31, pivotally attached at their lower ends to the lower ends of the arms 21, and with their upper ends passing loosely through the perforations in the bar 30, and suitable means for rotating said shaft 19, substantially as shown, and for the purpose described.

407,804. TREADLE. JAMES H. WHITNEY, Brooklyn, N. Y. Filed Oct. 5, 1888. Serial No. 287,295. (No model.)

Claim.—1. The balanced treadle suspended from spring-bearings suspended in swivel-chambers.

2. The balanced treadle T, suspended from and in combination with the springs S S, and the swivel-chambers C C.

3. The treadle T, suspended from the springs S S, and the slotted swivel-chambers C C, all in combination.

4. In combination, a balance-wheel, a pitman operating the same, a balanced treadle connected with the pitman through a ball-and-socket joint, substantially as shown and described, and suspended from spring-bearings held in swivel-chambers.

5. In combination, a balance-wheel provided with a counter-weight, a pitman operating the same, a balanced treadle connected with the pitman through a ball-and-socket joint, substantially as shown and described, and suspended from spring-bearings held in swivel-chambers.

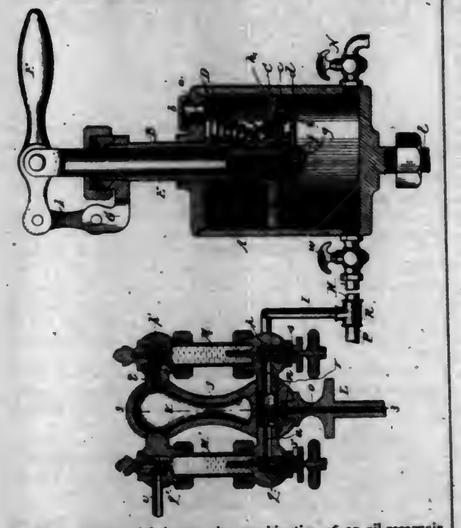
6. A balanced treadle provided with trunnions X X, arranged to vibrate in the slots D' D' of the swivel-chambers C C, in combination with the springs S S.

7. In treadles, the combination of the following elements: the swiveled spring-chamber C, the swivel-plate L, and the connecting-plate E.

8. In treadles, the swivel-chamber C, the spring S, swivel-pin P, the cap K, and swivel-plate L.

9. In treadles, and in combination, the following elements: the spring-chamber C, having stop-lug W, and the swivel-plate L.

10. In treadles the following elements in combination: the connecting-plate E, provided with the gibs G G, the slot D, and the adjustable pin A.



11. The connecting-plate E, provided with the slot D and the gibs G G, the adjusting-pin A, the swivel-chamber C, swivel-plate L, and the pins R and R', all in combination.

12. The treadle T, suspended on each side in spring-bearings and provided with a ball-and-socket connection with the pitman, as shown and described, and in combination.

13. The drive-wheel Y, provided with a counter-balance or weight Z, and a treadle T, suspended in spring-bearings inclosed in swivel-chambers, substantially as shown and described.

14. The drive-wheel Y, provided with a counter-balance or weight Z, a treadle T, suspended in spring-bearings inclosed in swivel-chambers, and having the ball-and-socket connection between the treadle and the pitman, substantially as shown and described.

407,805. SIGHT-FEED LUBRICATOR. WILLIAM WOODWARD, Chicago, Ill. Filed Apr. 19, 1889. Serial No. 307,906. (No model.)

Claim.—1. In a lubricator, the combination of an oil-reservoir, a piston-head dividing the reservoir into an upper oil-holding and a lower oil-receiving chamber, valves for the passage of oil through the piston-head, a hand-pump by operating which the oil is forced from the upper oil-chamber through the piston-head into the lower oil-chamber, and a pipe for connecting the latter with the oil-distributing part of the lubricator, substantially as described.

2. In a lubricator, the combination of an oil-reservoir, a piston-head dividing the reservoir into an upper oil-holding and a lower oil-receiving chamber, valves for the passage of oil through the piston-head, a tubular piston-rod, a reciprocating plunger in the piston-rod, and a hand-lever for reciprocating the plunger and thereby pumping the oil from the upper oil-chamber through the piston-head into the lower oil-chamber, and a pipe for connecting the latter with the oil-distributing part of the lubricator, substantially as described.

3. In a lubricator, the combination, with a series of sight-feed tubes, and a casting having a chamber which connects with the said tubes, of an oil-reservoir, a piston-head dividing the reservoir into an upper oil-holding and a lower oil-receiving chamber, valves for the passage of oil through the piston-head, a hand-pump by operating which the oil is forced from the upper oil-chamber through the piston-head into the lower oil-chamber, and a pipe connecting the latter with the chambered casting and having a single valve which controls the passage of oil to the casting, substantially as described.

4. The combination of a reservoir, a piston-head having an oil-passage, and a tubular piston-rod, a washer secured to the piston-head and having a recess and an oil-passage, valves for governing the flow of oil through said passages, a spring pressing on the piston-head, and a reciprocating plunger in the piston-rod for pumping the oil from one side of the piston-head to the opposite side, substantially as described.

5. In a sight-feed lubricator, the combination of a casting J, having a chamber *m* in its lower portion, and a passage K in its upper portion which communicates with a stem to conduct the oil to a part to be lubricated, a sight-tube M, communicating at its lower end with the chamber and at its upper end with the passage, a sight-tube M', communicating at its lower end with the chamber and at its upper end with a pipe for conveying the oil to another part to be lubricated, and an oil-reservoir having a pipe-connection with said chamber of the casting for supplying it with oil, substantially as described.

6. A lubricator consisting of a chambered casting, a series of sight-feed tubes supplied with oil from the chamber of the casting, an oil-reservoir, and a pipe leading from the reservoir to the chamber of the casting and provided with a single valve *w* for governing the passage of oil to all the sight-tubes, substantially as described.

7. The combination, with an oil-reservoir A and a pipe-connection H, of the casting J, having in its lower portion the chamber *m*, the castings *p* and *q*, having respectively the passages *r* and *u* communicating with said chamber, the sight-feed tubes M M', and the branch pipe I, connecting the chamber of the casting with the pipe-connection of the oil-reservoir, substantially as described.

407,806. VALVE-GEAR FOR ENGINES. ELIJ J. WOOLF and JOHN PERELLE, Minneapolis, Minn., assignors, by mesne assignments, to the Woolf Valve Gear Company, same place. Filed Feb. 25, 1889. Serial No. 301,033. (No model.)

Claim.—1. In a valve-gear, the combination, with an eccentric or crank, of a rigid arm actuated by the eccentric or crank, a guide for said arm constraining it to move in a definite path, and a rod for

driving the valve attached to said arm at a point offset from the center line of the arm's motion, substantially as described.

2. In a valve-gear, the combination, with an eccentric or crank, of a rigid arm actuated by the eccentric or crank, a pivoted guide for said arm constraining it to move in a definite path variable at will, and a rod for driving the valve attached to said arm at a point offset from the center line of the arm's motion, substantially as described.

3. In locomotives, the combination, with the driving-axle and its eccentric, of a carrier boxed on the axle, a guide pivotally mounted on said carrier, an eccentric-strap having an extended arm pivotally mounted in said guide, and a rod for driving the valve attached to said arm at a point offset from the center line of the arm's motion, substantially as described.

4. In a valve-gear, the combination, with an eccentric or crank, of a rigid arm actuated by the eccentric or crank, a guide for said arm constraining it to move in a definite path, an eccentric-rod attached at one end to said rigid arm at a point offset from the center line of the arm's motion, and a rock-shaft having a pair of rocker-arms connected, respectively, one to the valve-rod and the other to said eccentric-rod at or about right angles when the valve is in mid-position, substantially as described.

5. In a locomotive, an automatically-adjustable support for the point of suspension of a valve-gear, consisting of a carrier boxed on the driving-axle and a fixed guide for the carrier rigidly secured to the main frame, of such form as to constrain the point of suspension to move approximately on the arc of a circle when the axle rises and falls with reference to the frame, substantially as described.

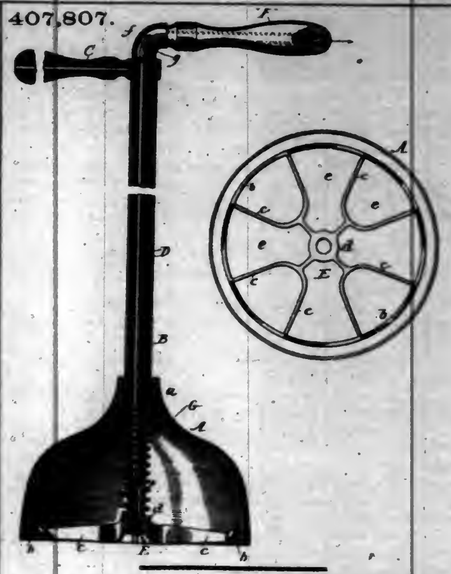
6. In a locomotive, an automatically-adjustable support for the point of suspension of a valve-gear, consisting of a carrier boxed on the driving-axle, a fixed guide for the carrier rigidly secured to the main frame, and anti-friction rollers between their bearing-surfaces, the said guide being of such form as to constrain the point of suspension to move approximately on the arc of a circle when the axle rises or falls with reference to the frame, substantially as described.

7. In a locomotive, an automatically-adjustable support for the point of suspension of a valve-gear, consisting of a carrier boxed on the driving-axle having a vertical slot, and anti-friction rollers on the opposite sides of the slot, and a guide-pin fixed to the main frame at an oblique angle to the vertical plane and working in said slot against said rollers, substantially as described.

8. In a locomotive, an automatically-adjustable support for the point of suspension of a valve-gear, consisting of a carrier boxed on the main driving-axle and provided with a vertical slot, and a guide-pin fixed to the main frame at an oblique angle to the vertical plane and working in said slot, substantially as described.

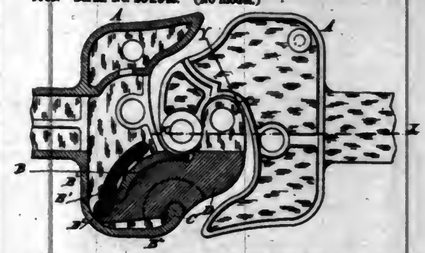
9. In a locomotive, the combination, with the driving-axle, of an eccentric thereon, an eccentric-strap having an extended arm, a carrier boxed on the axle, a guide for the outer end of said arm pivotally mounted in said carrier, a rod for driving the valve attached to said arm at a point offset from the center line of its motion, and a fixed guide for said carrier rigidly secured to the main frame, of such form as to constrain the point of suspension to move approximately on the arc of a circle when the axle rises and falls, substantially as described.

10. In a valve-gear, the combination, with an eccentric or crank, of a pivoted guide, a roller movable in said guide, a rigid arm actuated by the eccentric or crank and having a rigid pivot-pin loosely mounted in said roller, and a rod for driving the valve attached to said arm at a point offset from the center line of motion, substantially as described.



11. In a locomotive, the combination, with the driving-axle and its eccentric, of a carrier boxed on the axle, a guide pivotally mounted on said carrier, a roller movable in said guide, an eccentric-strap having an extended arm pivotally mounted in said roller, a fixed guide for said carrier rigidly attached to the main frame at an oblique angle to the vertical plane, an eccentric-rod attached to said eccentric-arm at a point offset from the center line of its motion, and a rocker-arm on the main frame having a pair of rocker-arms connected, respectively, one to the valve-rod and the other to said eccentric rod at or about at right angles when the valve is in mid-position, substantially as described.

407,807. CLOTHES-POUNDER. JOHN WOOLRIDGE, Rockefeller, Ill. Filed Mar. 16, 1888. Serial No. 303,561. (No model.)



Claim.—1. The combination of the hollow pounder A, tube B, secured to the hollow pounder A, hollow shaft D, provided with an opening at or near each end for the passage of air from the inside of the hollow pounder, and a rubber E, secured to the hollow shaft D and capable of being rotated with such shaft, substantially as and for the purposes specified.

2. The combination of the hollow pounder A, tube B, handle C, hollow shaft D, handle F, rubber E, spring G, and an outlet for air from the pounder A, substantially as and for the purposes specified.

407,807.

407,808. CAR-COUPLING. DAVID L. BARBER, Chicago, Ill., assignor to the Consolidated Coupling Company, of New Jersey. Filed Sept. 7, 1888. Serial No. 284,946. (No model.)

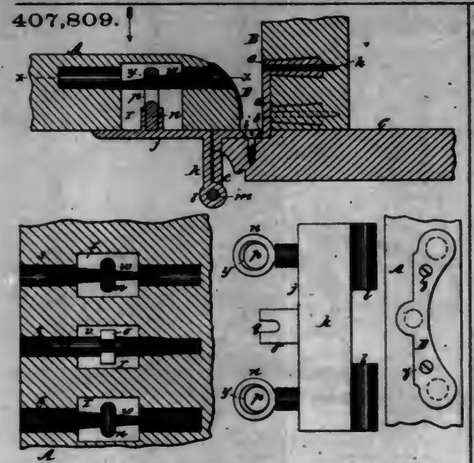
Claim.—1. In a car-coupler, the combination, with a draw-head having an arc-shaped slot formed therein, of a movable knuckle provided with an arc-shaped stem and a tongue or projection extending from said stem, through which is made an opening for receiving a locking device, substantially as described.

2. In a car-coupler, and in combination with a draw-head having an arc-shaped slot formed therein, an inclined slot concentric with such arc-shaped slot, a movable knuckle provided with an arc-shaped stem, a projection or tongue on the end of said stem, and a locking device, one portion of which is adapted to engage with said inclined slot in the draw-head, substantially as and for the purpose described.

3. In a car-coupler, the combination, with a draw-head and the movable knuckle thereof, of a sectional coupling-pin, substantially as described.

4. In a car-coupler, the combination, with a draw-head and the movable knuckle thereof, of a vertically-acting sectional coupling-pin and the means for limiting the motion of the pin, consisting of the pins S and S′ and slots O and O′, substantially as described.

5. In a car-coupler, the combination, with a draw-head and knuckle thereof, and with the sectional coupling-pin substantially of the character indicated, of the lever adapted to give motion to said pin, substantially as described.



407,809. HINGE. WILLIAM J. BODA, Dayton, Ohio. Filed Apr. 16, 1889. Serial No. 307,395. (No model.)

Claim.—1. A hinge having the leaf which fits upon the door provided with inwardly-extending lugs having eyes and adapted to fit in recesses in the door and be clamped by tapering screws inserted in the rear edge of the door, and with an adjusting-lug likewise fitted in a recess in the door and adapted to be engaged by an adjusting-screw, substantially as described.

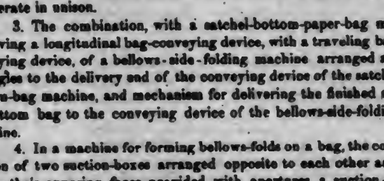
2. A hinge having the leaf which fits upon the door provided with inwardly-extending lugs, to which adjustable eyes are secured and adapted to fit in recesses in the door and be clamped by tapering screws inserted in the rear edge of the door, substantially as described.

3. A threaded or barbed fastening-lug for hinges, split up to the plate from which it projects, and having an opening from said split through the plate for the insertion of a pin to spread the lug, substantially as described.

407,809.

407,810. HOSE-SUPPORTER. MINER W. BRUCE, Knox Center, Nebr. Filed Nov. 3, 1888. Serial No. 290,392. (No model.)

Claim.—1. The herein-described hose-supporter, consisting of a divided band A, having the hooks B B rigidly attached to its ends, a clasp D, also provided with a hook B′ at its upper end, and an endless cord C, passing around the hooks B B′ and adapted to slide freely within the same, substantially as and for the purpose described.



2. The herein-described hose-supporter, consisting of an elastic divided band A, having the hooks B B rigidly attached to its ends, a clasp D, carrying the loop D′ in its upper end, said loop having a hook B′ rigidly attached thereto, and the endless cord C, passing around all the hooks B B′ and adapted to slide freely within the same, substantially as and for the purpose described.

407,811. NECKTIE. MINER W. BRUCE, Knox Center, Nebr. Filed Nov. 13, 1888. Serial No. 290,681. (No model.)

Claim.—A necktie provided with two retaining tapes or bands *a a′*, extending from the opposite upper ends of the shield partly encircling the collar, one of said tapes being permanently secured to the shield, the other detachable, both of said bands carrying hooks a^2 at or near their ends, adapted to engage with the apertures arranged in the sides of the collar, the hook upon the fixed band being secured to the same by means of the elastic tab a^3, substantially as shown and described.

407,812. TABLE-LEAF SUPPORT. THOMAS G. BOOSER, Sheboygan, Wis. Filed Dec. 22, 1888. Serial No. 294,302. (No model.)

Claim.—In a table-leaf support, the combination, with the leaf, of a clip secured thereto and having a recess in one side, a spring-actuated arm pivoted in the clip, the free end of which is bent to one side of the clip and has an opening adjacent to said recess in the clip, and a bar pivoted to a fixed portion of the table and extending through said opening in the arm, and having a lateral projection at its outer end adapted to engage the recess in the clip to support the leaf in a horizontal position, substantially as described.

407,813. PAPER-BAG MACHINE. HARRY C. BURDICK, New York, N. Y. Filed Oct. 19, 1888. Serial No. 288,008. (No model.)

Claim.—1. The combination of a satchel-bottom-paper-bag machine, a bellows-side-folding machine having its feeding end arranged adjacent to the delivery end of the satchel-bottom-bag machine, and feeding-rollers interposed between the delivery end of the satchel-bottom-bag machine and feeding end of the bellows-side-folding machine.

2. The combination of a satchel-bottom-paper-bag machine, a bellows-side-folding machine having its feeding end arranged adjacent to the delivery end of the satchel-bottom-bag machine, and consisting of bag-conveying devices, suction devices for drawing the faces of the bag apart, and folding devices for pressing the side edges of the bag, feeding-rollers interposed between the delivery end of the satchel-bottom-bag machine and feeding end of the bellows-side-folding machine and power mechanism to make all of the machines and feeding-rollers operate in unison.

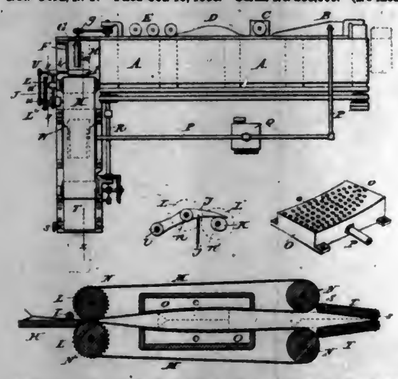
3. The combination, with a satchel-bottom-paper-bag machine having a longitudinal bag-conveying device, with a traveling bag-conveying device, of a bellows-side-folding machine arranged at right angles to the delivery end of the conveying device of the satchel-bottom-bag machine, and mechanism for delivering the finished satchel-bottom bag to the conveying device of the bellows-side-folding machine.

4. In a machine for forming bellows-folds on a bag, the combination of two suction-boxes arranged opposite to each other and having their opposing faces provided with apertures, a suction-fan or exhauster for said suction-boxes, means to convey a bag between said suction-boxes, whereby it is opened, and fingers or arms to press in the sides of the bag between the suction-boxes during the travel of the bag.

5. The combination of two endless aprons of open-work brought together at one end, two suction-boxes arranged, respectively, back of the aprons and with their opposing faces perforated to suck air through the aprons to open the bag-tube conveyed by said aprons, a

suction-fan or exhauster to draw air through said suction-boxes, and stationary fingers or arms arranged between the lateral edges of the suction-boxes to act upon the bag-tube to press in its sides when the tube is opened and being conveyed between the suction-boxes.

6. The combination of the rollers N and two endless open-work bands M with the suction-boxes O, having perforated faces, and fingers or arms W on each side and between the boxes.



7. The combination of the rollers N and two endless open-work bands M with the suction-boxes O, having perforated faces, fingers or arms W on each side and between the boxes, table H, feed-roll I, and mechanism for intermittently actuating said feed-roll to feed the tubes between the aprons.

8. The combination of the rollers N and two endless open-work bands M with the suction-boxes O, having perforated faces, fingers or arms W on each side and between the boxes, and rollers S and bands T for flattening the tubes after the bellows-folds are formed.

9. A suction-box for a paper-bag machine, having its face formed with a series of perforations covering an area decreasing in width as we move from one end to the other of said face.

10. A suction-box for a paper-bag machine, having its face formed flat in a transverse direction and with a slight curvature in the direction of its length, and with a series of perforations covering an area decreasing in width as we move from one end to the other of said face.

407,814. MANUFACTURE OF PAPER BAGS. HARRY C. BURDICK, New York, N. Y. Filed Oct. 19, 1888. Serial No. 288,609. (No model.)

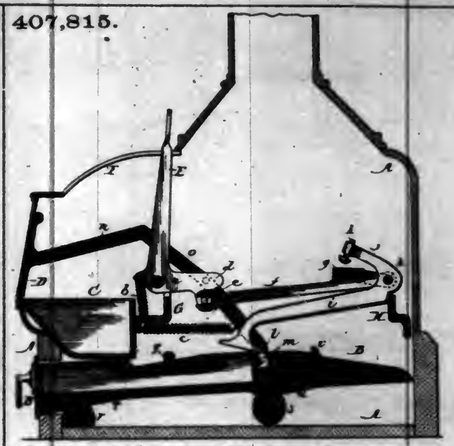
Claim.—1. The method of rapidly making satchel-bottom paper bags with bellows side folds, which consists in moving the paper tube with a continuous movement, and during such continuous movement first folding one end of the flattened paper tube into a satchel-bottom and pasting said bottom thus formed, and then during the further continued movement opening the bag thus formed and folding in the sides of the finished satchel-bottom bag, forming a completed satchel-bottom bellows side-fold bag, the whole being performed in one continuous operation.

2. The method of forming a bellows-fold satchel-bottom bag, which consists in first forming the satchel-bottom bag and then causing the two flat faces of the bag to be sucked apart, and finally pressing in the edges of the sides while the faces are thus held apart.

3. The method of forming bellows folds on satchel-bottom bags, which consists in causing the two faces of the bag to be sucked apart, and then pressing in the sides, and subsequently flattening down the bag with the sides folded or tucked in to form bellows folds.

4. The method of forming bellows folds on a satchel-bottom bag, which consists in passing said bag in the direction of its length between two suction-boxes, and during its travel sucking its faces apart and simultaneously therewith pressing in the sides, and finally folding or flattening down the bag with the sides folded or tucked in to form bellows folds.

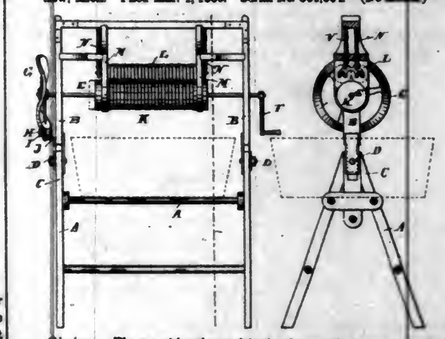
407,815. CASH INDICATOR AND REGISTER. THOMAS CARNEY, Chicago, Ill., assignor to himself and Moses Bensinger, same place. Filed May 11, 1888. Serial No. 302,895. (No model.)



Claim.—1. The combination of the drawer B, having the inclines *t u*, with the rollers *r s*, substantially as and for the purpose specified.

2. The combination of the drawer B, having the inclines *t u* and stop *v*, with the rollers *r s* and stop-pin *q*, substantially as described.

3. The combination of the cash-receptacle B and the pivoted lever *o* with the link or rod *n* and door D, substantially as described.



4. The combination of the key E, having the arm *d*, and the lever F, with the cross-bar *g* and lever *i*, constructed and operating substantially as specified.

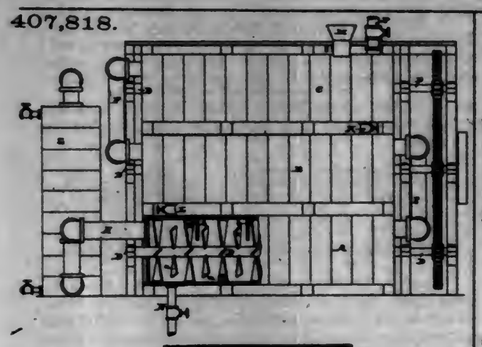
407,815.

5. In a cash-register, the combination of a fixed or permanent cash-box with a movable cash-box, access to both of which is obtained by the movement of a key and both closed by the return of the movable cash-box, substantially as specified.

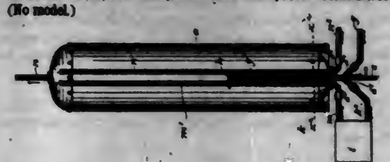
407,816. WASHING-MACHINE. THOMAS H. CARSON, East Saginaw, Mich. Filed Mar. 1, 1889. Serial No. 301,604. (No model.)

Claim.—The combination, with the frame, the pressure-rollers, and the laterally-vibrating rubbing-roller K, of the wave cam-wheel G on the shaft of the rubbing-roller, the bracket J on the frame, the horizontal plate I, swiveled on said bracket, and the rollers H on said plate engaging the cam-wheel, substantially as shown and described.

407,817. METHOD OF MAKING PARTS OF HOLLOW DOOR-KNOBS. CROMWELL O. CASE, New Britain, Conn., assignor to P. & F. Corbin, same place. Filed May 16, 1889. Serial No. 310,986. (No model.)



Claim.—That improvement in the method of making parts of knobs which consists in providing the knob-shank A and shell B, having, respectively, the flange 7 and hub 10, securing the parts together by spreading out or heading the end of the knob-shank, and turning the flange 7 down upon the end of the hub 10 of the shell, substantially as described, and for the purpose specified.



407,818. PROCESS OF CHARGING LIQUIDS WITH GAS. CHARLES A. CATLIN, Providence, R. I. Filed Oct. 30, 1885. Serial No. 181,356. (No model.)

Claim.—The herein-described method of charging or combining liquid with gas, consisting in passing a current of mixed gas continuously through a series of tanks in one direction, passing the liquid intermittingly through the same tanks in the opposite direction, and agitating the liquid and gas, all substantially as described.

407,818.

407,819. APPARATUS FOR HEATING AND PURIFYING WATER. ALLEN P. CARSON, New York, N. Y. Filed Jan. 2, 1889. Serial No. 151,762. (No model.)

Claim.—1. The reservoir and cold-water-inlet pipe therefor extending up through the lower end thereof, combined with an automatically-operated valve seating on the end of the said pipe, the said valve being automatically operated by changes of pressure upon it, substantially as described.

2. The reservoir and cold-water-inlet pipe extended upward therein from the bottom of the reservoir, combined with a check-valve, the pipe or valve having a vent, to operate substantially as described.

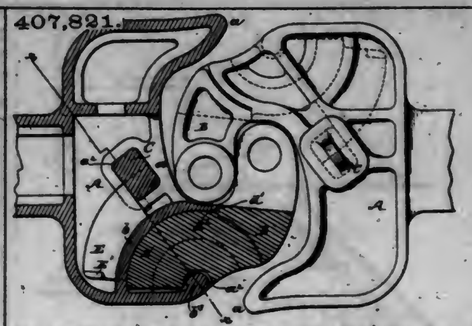
3. The reservoir and the cold-water-inlet pipe, combined with an automatically-operated check-valve having an inclined surface for the lateral diffusion of the incoming water, substantially as described.

4. The combination, with a reservoir provided with a hand-hole, of a removable multipassage cover having two or more independent tubular projections attached to or forming part of said cover and to which the pipes or tubes can be attached, and a clamping mechanism to secure and hold the said cover in position to cap the hand-hole without rotating the removable cover, substantially as described.

5. The combination, with the water-heater of a range or stove, of a reservoir and a pipe connecting the said heater and reservoir and extended up within the said reservoir above the sediment-line, the said pipe forming the induction-pipe of the said heater and receiving water from the boiler only, substantially as described.

407,820. HOOF-EXPANDER. FRANK K. DOWLER, Jamestown N. Y. Filed Mar. 23, 1888. Serial No. 304,400. (No model.)

Claim.—1. A V-shaped hoof-expander for use independent of the shoe, having spurs on the inner sides of its arms to engage the opposite sides of the frog, substantially as specified.



2. The herein-described hoof-expander for use independent of the shoe, having the divergent arms B B, terminating at their rear ends in points E E, to engage the hoof, and provided at intermediate points with spurs G G, to engage the opposite sides of the frog, substantially as and for the purpose specified.

407,821. CAR-COUPLING. EDWARD P. EASTWICK, Jr., New York, assignor to H. Clinton Clark, Saratoga, N. Y. Filed Sept. 10, 1888. Serial No. 285,798. (No model.)

Claim.—1. In a car-coupler, the combination, with a draw-head having an arc-shaped opening formed therein, of a movable knuckle provided with an arc-shaped stem and a web or wing extending from said stem, substantially as described.

2. In a car-coupler, the combination, with a draw-head having an arc-shaped opening formed therein, of a movable knuckle provided with an arc-shaped stem, a web or wing extending from said stem, and a locking device engaging said web or wing, substantially as described.

407,821.

3. In a car-coupler, the combination, with a draw-head having an arc-shaped opening formed therein, of a movable knuckle provided with an arc-shaped stem and a web or wing of less vertical depth than said stem, substantially as described.

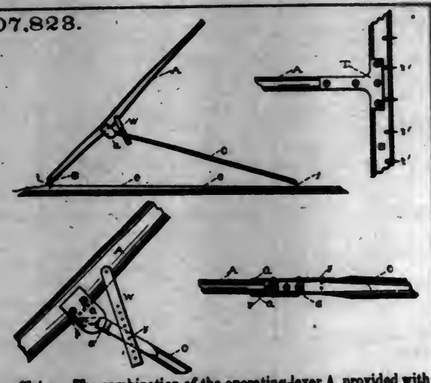
4. In a car-coupler, the combination, with an essentially hollow draw-head provided with interior top and bottom circular channels, of a locking jaw or knuckle having formed upon an inner section or stem circular ribs and a wing extending outward from the said inner section or stem, substantially as shown and described.

5. In a coupler, the combination, with an essentially hollow draw-head provided with interior top and bottom circular channels, a locking jaw or knuckle having formed upon the inner section or stem circular ribs, and a wing extending from the said inner section or stem, of a locking-pin passed through the draw-head, provided with a recess at the lower end, whereby a shoulder *d* is formed adapted to rest upon the ring when the latter is in an uncoupled position, substantially as shown and described.

6. In a coupler, the combination, with an essentially hollow draw-head provided with interior top and bottom circular channels, a locking jaw or knuckle having formed upon the inner section or stem top and bottom circular ribs, and a wing extending from the said inner section or stem provided with a stop, of a pin passed through the draw-head coincident with the radial line from the center of revolution of the knuckle and provided with a longitudinal recess in one side, forming a shoulder *d*, all adapted to operate substantially as shown and described.

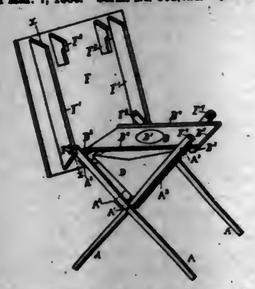
7. The combination, with an essentially hollow draw-head provided with an interior top and bottom channel, of a locking jaw or knuckle provided with a buffing-surface, ribs formed top and bottom of the interior section or stem of the jaw, a wing extending from the said inner section or stem, a lug integral with said wing, and a locking-pin rectangular in cross-section provided with a reduced lower surface, whereby the pin will lock the jaw in an open position at the end of the wing carrying said lug, the plane of which lug is in an approximately radial line from the center of motion, substantially as shown and described.

8. In a car-coupler, the locking-jaw, substantially as shown and described, consisting of an outer knuckle-section, an inner pivotal section or stem provided with a circular rib at top and bottom, and a wing extending horizontally from said pivotal section or stem provided with a stop-lug, substantially as shown and described.



407,822. SEED-PLANTING. SAMUEL R. CROSS, Chicago, Ill. Filed Mar. 25, 1889. Serial No. 304,736. (No model.)

Claim.—As a new article of manufacture, a foundation for planting seed, consisting of a sheet of fabric having its surface supplied with paste and seed attached to the fabric by the paste in the regular form that the plants are desired to appear in the ground, substantially as described.



407,823. CARPET-STRETCHER. SAMUEL C. HARLAN, Lake City, Minn. Filed Feb. 23, 1888. Serial No. 300,261. (No model.)

407,828.

Claim.—The combination of the operating-lever A, provided with the flanges *e*, and the bolt *p*, the detachable bar C, provided with the hook G, adapted to engage the bolt *p*, the pivoted retaining-bar W, provided with a series of apertures adapted to engage the pin *y*, located on the bar C, the head B, and the fork *f*, substantially as and for the purpose specified.

407,824. TABLE. SAMUEL HENRY and MARGARET HENRY, Rockford, Ill. Filed Mar. 7, 1888. Serial No. 302,731. (No model.)

Claim.—1. In combination, the legs A, secured together by means of pintles A' and cross-pieces A^2 A^3, the top F, provided with cross-pieces F', hinge-jointed to said table-legs by means of pintles F^2, and the hooks F^3 for engaging with the pins F^4, the attachment B, provided with side pieces B^1, end piece B^2, cleats B^3, and having an opening B' therethrough to admit a wash-bowl, and a wash-bowl B^4, substantially as described, and for the purpose set forth.

2. In combination, the legs A, secured together by means of pintles A' and cross-pieces A^2 A^3, the folding pocket D, depending from the upper cross-pieces A^2, the top F, provided with cross-pieces F', whereby it is hinge-jointed to said table-legs by means of pintles F^2, and the hooks F^3 for engaging with the pins F^4, and the attachment B, provided with side pieces B^1, end piece B^2, cleats B^3, and having an opening B' therethrough to admit a wash-bowl B^4, substantially as described, and for the purpose set forth.

407,825. PRICE-CALCULATING DEVICE. SILVESTER HOADLEY, Seaport, Ind. Filed Apr. 2, 1889. Serial No. 305,657. (No model.)

Claim.—1. A calculating device consisting of a suitable frame, a beam having the units of measure and fractional parts thereof indicated thereon, and a cylinder divided longitudinally into spaces, each of which represents a rate price per measure, and is divided into the number of spaces between each unit of measure, which is represented by the rate price represented on said space, substantially as set forth.

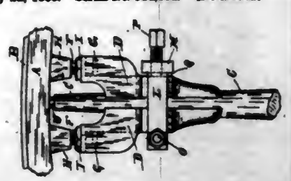
2. The combination, in a calculating device, of the scale-beam having the units of measure and fractional parts thereof indicated thereon, the cylinder having the rate price and multiples thereof indicated thereon in longitudinal lines, a holding and stopping device on the end of said cylinder for securing it in exactly the position desired, and the curtain A', arranged as described, substantially as set forth.

3. The combination, in a calculating device, of the scale-beam, the calculating-cylinder arranged in close proximity thereto, and a curtain extending over said cylinder to within about one space of said scale-beam, substantially as described, and for the purposes specified.

407,826. ART OF MAKING CUTLERY-HANDLES. ALLEN JOHNSON, Ottumwa, Iowa. Filed Feb. 18, 1889. Serial No. 300,232. (No model.)

Claim.—1. The improvement in the art or process of manufacturing cutlery-handles, consisting in first securing the rough handle-pieces to the shank; second, grinding the handle to the required shape and size, and, third, casting the soft-metal bolster upon such ground handle, substantially as specified.

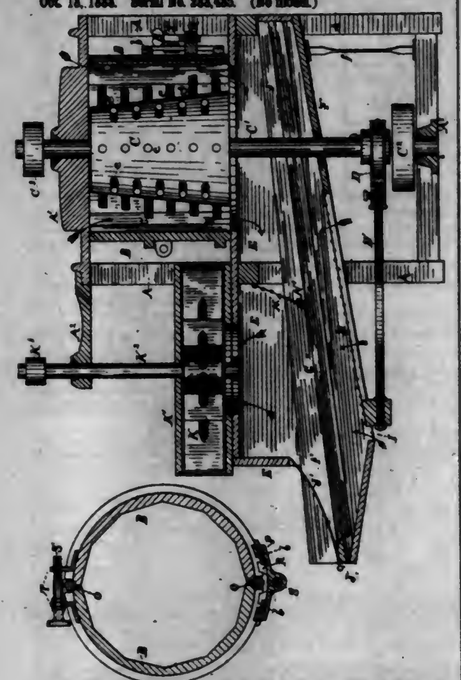
2. The improvement in the art or process of manufacturing cutlery-handles, consisting in first securing the rough handle-pieces upon the shank; second, automatically grinding such handle to an exact predetermined size and shape, so that it will fit the bolster-casting mold, and, finally, casting a soft-metal bolster of the finished size and shape thereon, substantially as specified.



407,827. MACHINE FOR CUTTING CORN-FODDER. PETER J. JORDAN, Wakefield, Kans. Filed Nov. 16, 1888. Serial No. 291,050. (No model.)

Claim.—1. The combination of the platform, the knife secured to the front edge of the same, the reel erected on the platform adjacent to the knife, with its arms extending over the knife, the railing upon the platform extending across the front end of the same and along the sides, the railing on the side adjacent to the knife being inclined, as set forth.

2. The combination of the platform having the notch M in its front end, the hooks R, secured to the front edge of the platform at each side of the notch, and the knife having a shank bolted to the under side of the platform, and a U-shaped portion substantially registering with the notch and having loops at its end engaging the hooks R, the edge of said U-shaped portion being projected beyond the edge of the platform and sharpened, as set forth.



407,828. TIRE-TIGHTENER. ANDREW KNOX, Pewamo, Mich. Filed May 22, 1889. Serial No. 311,892. (No model.)

Claim.—1. In a tire-tightener, the combination, with a pair of jaws having transverse grooves in their sides registering with each other, of a clip formed with two parallel arms united by an enlarged integral portion and formed with lateral openings in their outer ends, a pin fitting in said openings, and a set-screw in the connecting portion, substantially as described.

2. In a tire-tightener, the combination, with two jaws having longitudinally-movable bolts in their outer ends and rectangular grooves formed in their sides, of a clip constructed with two rectangular arms united by an integral cross-piece and having lateral openings in their outer ends, a pin in said openings, and a set-screw in the cross-piece, substantially as described.

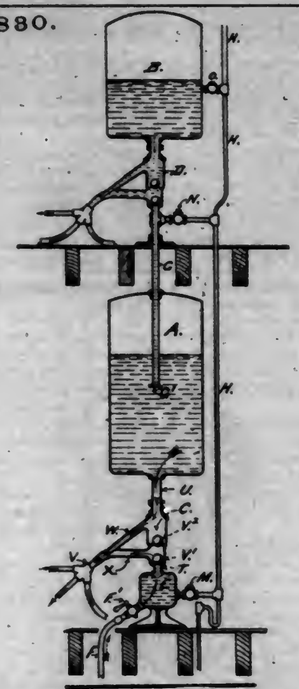
407,829. CORN-SHELLER. HENRY LEPPOLD, Jr., Corry, Pa. Filed Oct. 12, 1888. Serial No. 288,485. (No model.)

Claim.—1. In a corn-shelling machine, the combination of a horizontal screener-case, a screener operating within said case, a sheller which is mounted at one end of said case and discharges upon said screener, and a suction-fan which is mounted on the other end of said case and has its eye opening through the wall of said case into the space above said screener, whereby husks and other light particles mixed with the cobs on the top of said screener will be separated from said cobs by the action of said fan.

2. In a corn-shelling machine, the combination of a horizontal screener-case, a vertical sheller located above one end of the screener-case and mounted upon a vertical shaft, an exhaust-fan located above the opposite end of the screener-case, and mounted also upon a vertical shaft parallel to the beater-shaft and run by the latter, and having its eye opening directly into the screener-case above the screen, and a screen-frame mounted horizontally within the screen-case and reciprocated longitudinally by gearing from the beater shaft, substantially as and for the purposes described.

3. In a corn-shelling machine, the combination, with a toothed beater-case, of a toothed beater, as C, having a number of teeth of greater length than the remainder of the teeth, said longer teeth serving to break the conical contour of the beating-surface, substantially as and for the purpose specified.

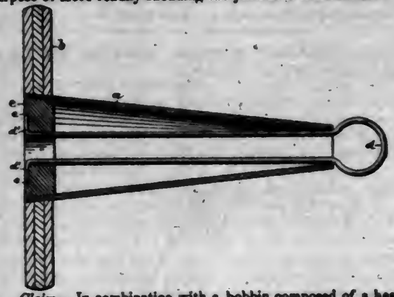
4. In a corn-shelling machine, the combination of the beater C, the screener case or chamber E, the screener F, having fine and coarse screens H and G, as described, the curtain-screen N dividing the screener-chamber, as described, the curtain or apron J' over the cob-exit from said screener, and an exhausting-fan in position to draw air from said screener-chamber at a point above said screen G.



5. In a corn-shelling machine, the combination, with the two parts B of the beater-case, of the inclined bars *b*, the clasp P, block R, and screw S, as shown, and for the purposes specified.

407,830. WATER REGULATOR AND ACCUMULATOR FOR HOUSE PURPOSES. ARTHUR J. L. LORETT, Brooklyn, N. Y. Filed Sept. 19, 1887. Serial No. 250,068. (No model.)

Claim.—1. In combination with a supply-pipe F and accumulators A and B, provided with their respective regulators C and D, and connecting-pipe G, a chamber E, provided with valve M, inlet for pipe F, and outlet at T, substantially as and for the purpose herein set forth.



2. In combination with accumulators A and B, provided with regulators C and D, and chamber E, valves M N O, and fresh-air pipe H, substantially as and for the purpose described.

407,880.

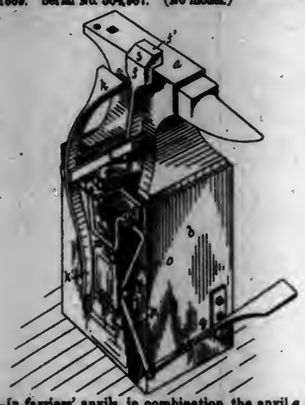
407,881. BOBBIN. DWIGHT P. MILLS, Naugatuck, Conn. Filed Apr. 17, 1888. Serial No. 270,970. (No model.)

Brief.—The object of the invention is to provide a light, cheap, and serviceable bobbin of that class made conical or tapered for the purpose of more readily shedding the yarn as it is drawn off.

Claim.—In combination with a bobbin composed of a head-section with a tapered opening, a correspondingly-tapered body-section seated in said opening, and a correspondingly-tapered wedge seated in the large end of said body, as set forth, a supplemental lock or toggle formed of wire having one end spread to engage the small end of the barrel and the opposite ends bent to interlock with the said wedge, all being substantially as and for the objects specified.

407,882. SHOT-PROOF CAGE FOR RAILWAY-CARS. ANDREW W. MITCHELL, Detroit, Mich. Filed May 11, 1888. Serial No. 310,427. (No model.)

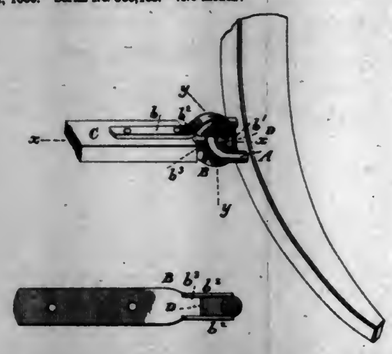
Claim.—1. The combination, with a car or other conveyance, of a shot-proof cage provided with glow-lights or bull's-eyes and port-holes for commanding both the interior and exterior of the car, said port-holes being protected on the inside by doors or slides, and the



cage being provided with a door having an interior lock, substantially as described.

2. The combination, with a car, of a shot-proof cage projecting up through the top of the car and provided with port-holes commanding the surrounding area, said cage provided with an entrance-door through the bottom and with port-holes also commanding the interior of the car, substantially as described.

3. The combination, with a car provided with a cage C, of a car-door, a spring governed by a latch for violently closing the door, and a button or treadle located in the cage, whereby the latch may be released and the door thrust shut, substantially as described.

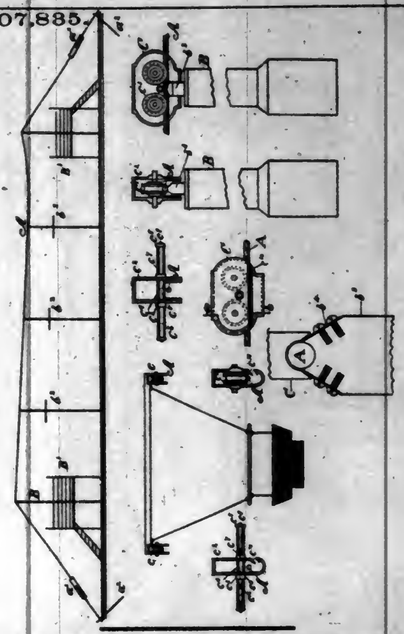


4. The combination, with the cage C, of glow-lights or bull's-eyes, cushions of rubber or equivalent embracing its edges, and screw-caps for holding them in place, substantially as described.

407,833. FARRIER'S ANVIL. JOHN T. HENDON, Decatur, Ill. Filed Mar. 27, 1889. Serial No. 304,967. (No model.)

Claim.—In farriers' anvils, in combination, the anvil *a*, the block *b*, the bar *c*, secured to the upper end of the block and carrying the plate *e*, the jaw *f*, pivotally connected with the bolt and adapted to the anvil, the jaw *k*, pivotally connected with the jaw *f* and having the downward extension *k'*, and the crank-shaft *m*, adapted to be operated by the treadle *q* to close the jaws, as set forth.

407,834. HAME-CLIP. PETER PERNER, McCook, Nebr. Filed May 1, 1889. Serial No. 309,185. (No model.)



Claim.—A hame-clip constructed with the arms *b b*, curved part *b'*, plates b^2 b^3, and provided with the wearing-strip D, all arranged substantially as shown and described.

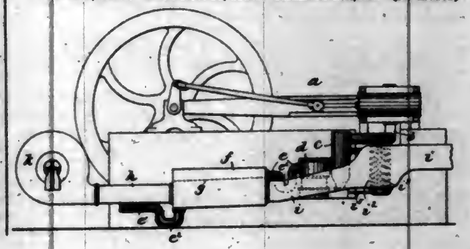
407,835. AERIAL CABLE RAILWAY. JAMES B. PERRY, Toronto, and JOHN MACKENZIE, Presqu'ile, Ontario, Canada; said Mackenzie assignor to said Perry. Filed Dec. 20, 1888. Serial No. 294,205. (No model.)

Claim.—An aerial cable A, supported on a series of standards B, with platforms B' and small platforms b^2 in one or more rows and tightened and secured by the screws *a'* and sloping stakes a^3, in combination with the car C, as shown in Figs. 2 and 4 of the drawings, having wheels c', sides c^2, bolt c^3, ferrule c^4, threaded nuts c^5, projecting ends c^6, rubber sleeves c^7, washers c^8, and screws c^9, constructed as shown and described, and operating as set forth.

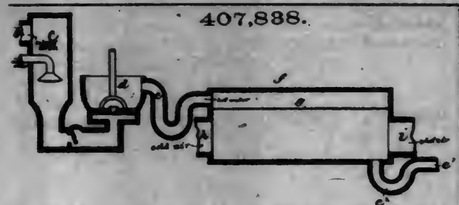
407,835.

407,836. WHIFFLETREE. GEORGE REITER, Allegheny, assignor to the Pittsburg Tubular Steel Whiffletree Company, Pittsburg, Pa. Filed Feb. 15, 1889. Serial No. 300,045. (No model.)

Claim.—A whiffletree or draft-bar formed of wrought-metal tubing tapering from its middle portion toward the ends and having its ends cylindrical and its body flat or oval between the ends, substantially as and for the purposes set forth.



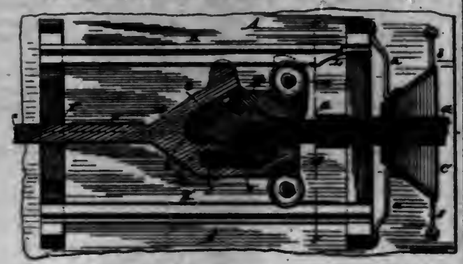
407,837. MANUFACTURE OF WHIFFLETREES AND DRAFT-BARS. GEORGE REITER, Allegheny, assignor to the Pittsburg Tubular Steel Whiffletree Company, Pittsburg, Pa. Filed Feb. 15, 1889. Serial No. 300,046. (No model.)



Claim.—1. The herein-described method of forming the bodies of whiffletrees or draft-bars, consisting in tapering a wrought-metal tube from its middle portion toward the ends and then flattening part or all of the blank so obtained, substantially as and for the purposes set forth.

2. The herein-described method of forming the bodies of whiffletrees or draft-bars, consisting in tapering a wrought-metal tube from its middle portion toward the ends and then flattening said blank between the ends thereof, leaving the ends cylindrical, substantially as and for the purposes set forth.

407,838. APPARATUS FOR UTILIZING WASTE HEAT FROM STEAM-ENGINES AND SIMILAR APPARATUS. HENRY S. ROBINSON, Andover, Mass. Filed Nov. 10, 1887. Serial No. 254,760. (No model.)



407,838.

Claim.—1. The combination of a steam-engine having a fly-wheel and condenser for exhaust-steam with a heater and a duct connecting the same with said condenser, and an air duct or passage leading from the fly-wheel to the said heater, as described, whereby the motion of the fly-wheel produces a current of air through the heater in which the said air is heated from the hot water conveyed to the heater from the condenser, substantially as described.

2. The combination of an engine having a condenser in which the exhaust-steam is condensed by water, which is thereby heated, with a heater and duct connecting the same with the condenser of the engine, and an air-duct communicating with the said heater by which air is conveyed through the said heater and heated by the hot water delivered thereto from the condenser, substantially as described.

407,839. AUTOMATIC AIR-BRAKE COUPLING. PETER G. ROGUEMORE, Marshall, Tex., assignor of one-half to J. H. Thompson, same place. Filed June 22, 1887. Serial No. 242,157. (No model.)

Claim.—1. The combination, in a pipe-coupling, of guide tracks or rods, a sliding coupling-head supported between and provided with guides operating upon said tracks or rods, a coupling or hose head, and a locking-latch whereby the hose-head is removably coupled to the sliding head, substantially as described.

2. In a hose or pipe coupling, the combination of guide tracks or rods, a sliding coupling-head provided with lateral guides operating upon said tracks or rods, a stationary yoke, a guide upon the coupling-head working in said yoke, a coupling or hose head adapted to engage the sliding head, and a latch carried by the sliding head, whereby the hose-head is removably locked to the sliding head, substantially as described.

3. The combination, in a pipe or hose coupling, of guide tracks or rods, a sliding coupling-head supported between said tracks or rods and provided with a locking-socket, a coupling or hose head adapted to enter said locking-socket, and a locking device to removably hold said hose-head in said socket, substantially as described.

4. In combination, guide tracks or rods, a sliding coupling-head supported between and having lateral guides operating upon said tracks or rods and provided with a locking-socket and coupling-latch bearing upon one of said tracks, and a coupling or hose head adapted to enter said socket and provided with a shoulder with which said latch engages, substantially as described.

5. In combination, guide tracks or rods, a sliding coupling-head supported between and operating upon said tracks or rods, a latch pivoted to said sliding head and bearing upon one of said tracks, and a coupling or hose head adapted to engage said sliding head, substantially as described.

6. The combination, in a hose or pipe coupling, with a sliding coupling-head provided with a locking-socket, a steam or air chamber communicating with the locking-socket, and a coupling-latch pivoted to the sliding coupling-head, of a hollow coupling or hose head adapted to be removably held in the locking-socket in communication with said chamber by the coupling-latch, substantially as described.

7. The combination, in a hose or pipe coupling, with guide tracks or rods one of which is provided with a recess, a sliding coupling-head, lateral guides carried by said sliding head and operating upon the tracks or rods, and a spring-actuated latch adapted to slide on the recessed track or rod, of a coupling or hose head adapted to engage the sliding head and be removably locked to the same by said latch, substantially as described.

8. In combination, a supporting-frame, a flaring mouth attached to the same, a sliding coupling-head, a spring-actuated latch pivoted to the sliding head, and a coupling or hose head adapted to engage the sliding head and be removably locked to the same by said latch, substantially as described.

9. In combination, a sliding coupling-head having a locking-socket and a steam or air chamber provided with inlet and outlet ports, one of said ports opening into the locking-socket, a spring-actuated locking-latch pivoted to the sliding head, and a hollow coupling or hose head adapted to enter and be removably held in the locking-socket by said latch, said hose-head being provided with a port which registers with the port from the steam or air chamber which opens into the locking-socket when the parts are locked together, substantially as described.

10. The combination, with a supporting-frame, a sliding coupling-head operating in said frame, a spring-actuated locking device pivoted to the sliding head, and a flaring mouth carried by the frame, of a coupling or hose head, the main conduit or hose, and the conduit or hose connecting the main conduit with the sliding head, substantially as described.

11. The combination, in an automatic pipe or hose coupling, with a sliding coupling-head provided with anti-friction guides and with an internal steam-chamber having induction and eduction ports and an automatic locking device, of a hose or coupling head adapted to engage the sliding head and guide tracks or rods between which the sliding coupling-head is supported and upon which the anti-friction guides operate, substantially as described.

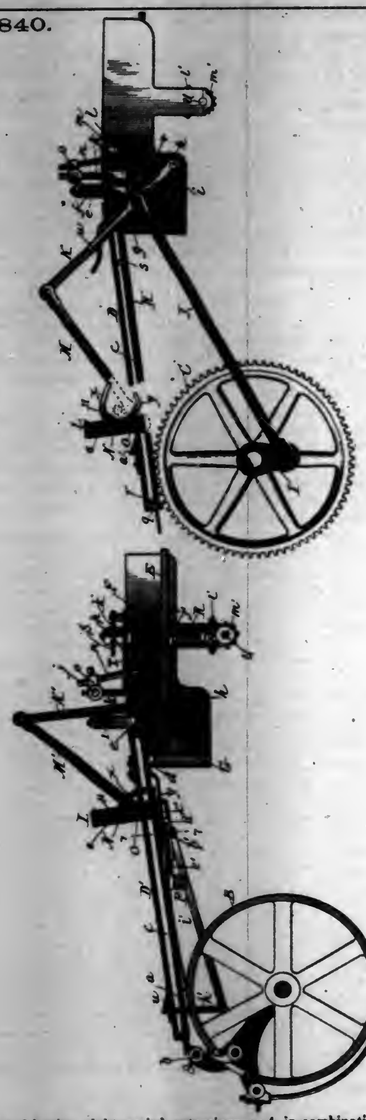
12. In combination, guide tracks or rods, a sliding coupling-head operating upon said tracks or rods and provided with a locking-socket, a main pipe or conduit, a coupling or hose head carried by an end of the pipe or conduit and adapted to enter the locking-socket of the sliding coupling-head, and a locking device bearing upon one of said guide tracks or rods and adapted to removably hold the hose-head in the locking-socket, substantially as described.

13. In combination, guide tracks or rods, a sliding coupling-head supported between and operating upon said tracks or rods and provided with a locking-socket and a steam or air chamber in communication with the locking-socket, a main conduit or hose communicating with said steam or air chamber, a coupling or hose head carried by an end of the main conduit or hose and adapted to enter the locking-socket in the sliding coupling-head, and a locking-latch sliding upon one of said guide tracks or rods, whereby the hose-head is removably held in the locking-socket, substantially as described.

14. In combination, a supporting-frame, a sliding coupling-head operating therein and provided with a locking-socket having a port, a conduit or pipe communicating with the port opening into the locking-socket, a coupling or hose head adapted to enter the locking-socket, said hose-head being provided with a shoulder upon one side and a port upon another side to register with said port in the locking-socket, and a latch to engage said shoulder and removably hold the hose-head in the locking-socket, substantially as described.

15. In combination, guide tracks or rods, a sliding coupling-head supported between and operating upon said tracks or rods and provided with a locking-socket, a locking device carried by the coupling-head, a guide carried by the locking device and bearing upon one of said tracks or rods and by which the locking device is operated, and a coupling or hose head adapted to enter the locking-socket and be removably locked in the same by said locking device, substantially as described.

407,840. AUTOMATIC FEEDER FOR PRINTING-PRESSES. JOHN SCHAEFER, Hyde Park, assignor to himself, and Henry H. Windsor, Chicago, Ill. Filed Oct. 8, 1888. Serial No. 287,502. (No model.)



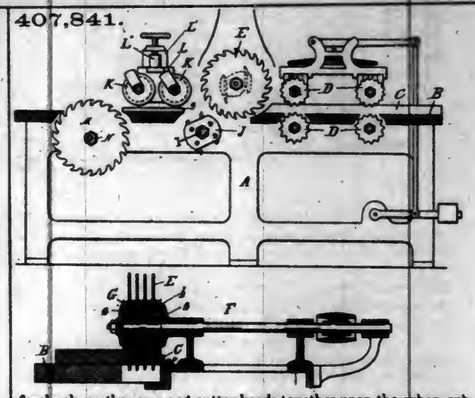
Claim.—1. The combination of the presser-bar *e*, having end rods *f*, the laterally and vertically movable uprights *k*, carrying a rod *j*, provided with pushers *p*, the rock-shaft *h*, having cams *i*, acting on the end rods of the presser-bar, and means, substantially as described, for rocking the shaft and moving the uprights.

2. The combination of the pressure-bar *e*, having end rods *f*, the rock-shaft *h*, having cams *i* to act upon and raise said rods with the pressure-bar, side bars D D', a sliding bar L, supported by the side bars and carrying grippers, the levers K K', connected to the rock-shaft, and arms M M', connecting the levers with the gripper-carrying bar, substantially as described.

3. A pressure-bar, as *e*, the ends of which are secured to vertical rods, as *f*, having right-angled extensions, as 4, in combination with a rod *j*, supported by uprights *k*, which pass through a piece, as *l*, upon a sliding bar *m*, rubbers or pushers, such as *n*, on the rod *j*, and a rock-shaft *h*, having cams *i*, substantially as and for the purposes specified.

4. A pressure-bar, as *e*, the ends of which are secured to vertical

407,840.



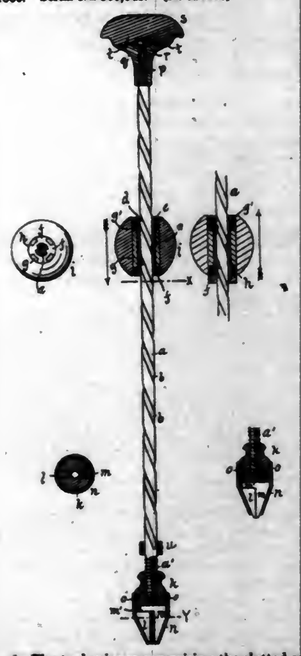
rods, as *f*, having right-angled extensions, as 4, in combination with a rod, as *j*, supported by uprights, as *k*, which pass through a piece, as *l*, upon a sliding bar *m*, a rock-shaft *h*, having cams *i*, rubbers or pushers, as *n*, and rods H H', provided with tappets *r s*, substantially as and for the purposes specified.

5. A pressure-bar, as *e*, supported by rods *f*, rubbers or pushers, as *n*, rock-shaft *h*, and cams *i*, in combination with the cylinder of a printing-press, crank-arm I, connecting-arm J, levers K K', and rods H H', provided with tappets *r s*, side bars D D', sliding bar L, shafts N O, carrying grippers, and connecting-arms M M', substantially as and for the purposes specified.

407,841. MACHINE FOR CUTTING HOOPS. OTTO SCHIRAMSKY, Sandusky, Ohio, assignor to Barney & Kilby and the D. J. Brown Manufacturing Company, both of same place. Filed Dec. 19, 1887. Serial No. 258,269. (No model.)

Claim.—1. In a hoop-cutting machine, a cutter-head consisting of a rotary arbor carrying rotary saws to divide the plank into strips, cutter-heads placed alternately between the saws and in the same relative position thereto and carrying cutters between the saws to plane and round the upper side of the strips, and clamping-collars to

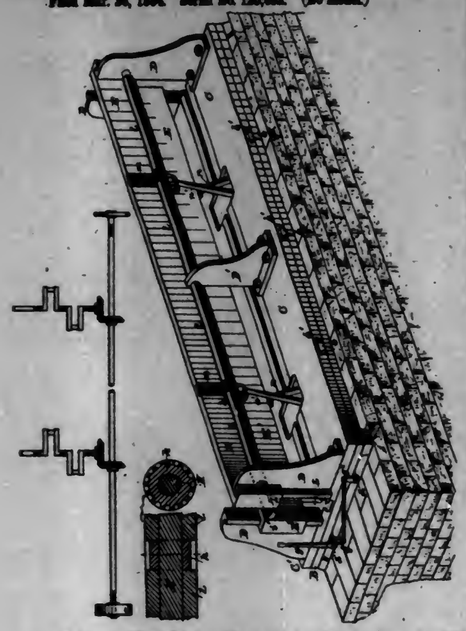
407,841.



firmly clamp the saws and cutter-heads together upon the arbor, substantially as described.

2. The combination, with the frame and feeding devices, of a hoop-cutting machine wherein the hoops are manufactured from planks by sawing them into strips, a composite cutter-head consisting of an alternating series of circular saws and planer-heads secured upon a common arbor and arranged to cut a plank into strips and plane the upper edges of said strips, and a lower planer-head provided with cutters arranged to plane the lower edges of the strips, substantially as described.

3. In a machine for the purpose described, the combination of the main frame, feed-table, feed-rollers, combined saws and planer-heads, the set of inclined saws, and the guide-strips in the planer-bed, all arranged for joint operation, as set forth.

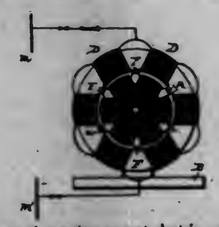


407,842. TOOL-DRIVER. ANTON SCHUERMANN, Decatur, Ill. Filed Apr. 29, 1889. Serial No. 308,043. (No model.)

Claim.—1. The tool-gripper comprising the slotted and threaded head *k*, the tapered shell *n*, the jaw *m*, having the lateral extension *m'*, the jaw *l*, adapted to the angle of jaw *m*, and the threaded shaft bearing against extension *m'*, as set forth.

2. The clutch comprising the shaft *a*, spirally grooved, the collar *c*, having the spiral ribs, the flange *e*, and the radial extensions *f*, the thimble *g*, having the enlarged bore *g'* and the recesses *h*, and the handle *i* on the thimble, as set forth.

407,843. MACHINE FOR STRAIGHTENING, ROUNDING, AND CONDENSING SHAFTS. GEORGE F. SIMONDS, Fitchburg, Mass., assignor to the Simonds Rolling Machine Company, of Massachusetts. Filed Mar. 26, 1884. Serial No. 125,692. (No model.)



Claim.—1. The bed-plate B, provided with holes through which project pinions *e e'*, and the sliding plates C C', provided with rack-bars *f f'*, in combination with the brackets D D' and reciprocating platens E E', all constructed, arranged, and operated as set forth.

2. The shaft B', provided with the double cranks *a a'* and proper driving mechanism, and connecting-rods *n n'*, in combination with the reciprocating platens E E', brackets D D', plates C C', re-enforcing shafts H H', rack-bars *f f'*, and pinions *e e'*, provided with shafts *d d'*, all constructed, arranged, and operated as described.

3. The reciprocating platens and guides therefor, and actuating mechanism for reciprocating said platens simultaneously in opposite directions, combined with re-enforcing shafts extending substantially the whole length of said platens, substantially as and for the purpose described.

407,844. ALTERNATING-CURRENT ELECTRIC MOTOR. ELIHU THOMSON, Lynn, Mass. Filed Nov. 17, 1888. Serial No. 291,165. (No model.)

Claim.—1. In an alternating-current electric motor, the combination of a field-magnet having a series of poles, four or more, and wound with coils connected to an alternating-current source in a manner to produce poles alternately north and south at the same time, and an armature having a corresponding number of poles, said armature being wound with coils forming the seat of currents induced by the field-magnet and connected in a continuously-closed uncommuted local circuit, as and for the purpose described.

2. In an alternating-current electric motor, the combination of a field-magnet core, of ring form, having internal radial projections, coils wound in the spaces between said projections and connected in proper manner to produce poles alternately north and south with any given current, a single alternating-current source connected to said coils, and an armature in the form of a cylinder having polar projections, the same in number as those of the field, and provided with half as many coils as the field, each of said coils being on closed circuit, as and for the purpose described.

3. The combination, with an alternating-current electric motor composed of a multipolar alternating field-magnet, and an armature having a corresponding number of poles and wound with coils placed on continued locally-closed circuit while the motor is running, of a mechanical starting device, as and for the purpose described.

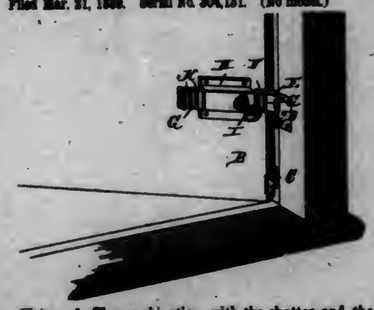
4. The combination, with an alternating-current motor, of a mechanical propelling or starting device geared thereto through a gear cut away or reduced, so as to become automatically disengaged from the motor when the latter has been brought to the desired speed.

5. The combination, with an alternating-current electric motor, of a propelling or starting power geared to the motor through a wheel or gear which is provided with a gap or cut-away portion, and a stop for bringing the gear to rest in position of disengagement, as and for the purpose described.

6. The combination, with an alternating-current electric motor, of a starting or propelling device for giving initial rotation to the same, and a switch controlled by said starting device for turning the energizing-current into the motor after the same has received its mechanical impulse, as and for the purpose described.

7. In an alternating-current electric motor, the combination of a field-magnet maintained by energizing-coils supplied with a single set of alternating currents, and an induced-current armature carrying coils which are kept on continually-closed circuit independent of the first set, and with their same ends continually connected to the same poles of the external conductor or circuit over which their closure is effected.

8. An alternating-current motor comprising a multipolar field-magnet having four or more poles alternately north and south maintained by a single alternating current in the field-magnet coils, and an armature wound with a set of coils of high self-induction on a separate local circuit continuously closed while the motor is running at speed, and having a number of poles or polar projections the same as the field, as and for the purpose described.

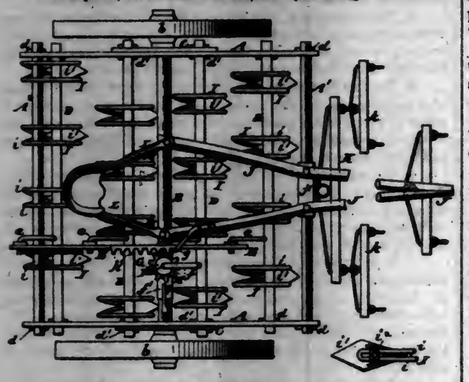


9. The combination, with an alternating-current motor, of a mechanical starting or propelling mechanism, and an electric switch controlled thereby for connecting the motor to the energizing source when the armature has been speeded.

10. The combination, with an alternating-current electric motor provided with starting devices, of a speed gage or governor, and mechanism controlled by said governor for throwing the work onto the motor when the same has reached the required speed, as and for the purpose described.

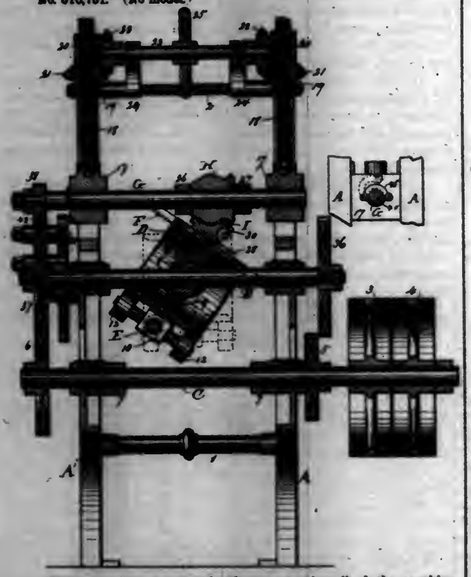
11. The combination, with an alternating-current electric motor, of a commutator connected with the local-circuit armature-coils for cutting them out of circuit at predetermined points, a speed gage or governor, and mechanism controlled by said governor for putting the armature-coils on continuously-closed circuit when the motor has reached the required speed.

12. In an alternating-current electric motor, the combination of an energizing field-magnet maintained by a series of energizing-coils supplied with a single set of alternating currents, and an armature having a set of poles alternately north and south at the same time under the influence of induced currents in armature-coils which are continually on closed uncommuted circuit while the armature is running.



407,845. SHUTTER-FASTENER. THEODORE THEIS, St. Clair, Pa. Filed Mar. 21, 1889. Serial No. 304,131. (No model.)

Claim.—1. The combination, with the shutter and the window-frame, of the keeper-plate secured to the shutter, the fastening-bar hinged to the window-frame and passing through the keeper-plate and provided with a series of vertical ribs on its outer side, and the set-screw mounted in the keeper-plate and having its inner end engaging between the ribs on the fastening-bar, as set forth.



2. The combination, with the shutter having a rubber-lined recess J, and the window-frame, of the keeper-plate secured on the shutter, the fastening-bar pivoted to the window-frame, playing in the recess J and passing through the keeper-plate, and the set-screw mounted in the keeper-plate and bearing upon the fastening-bar, as set forth.

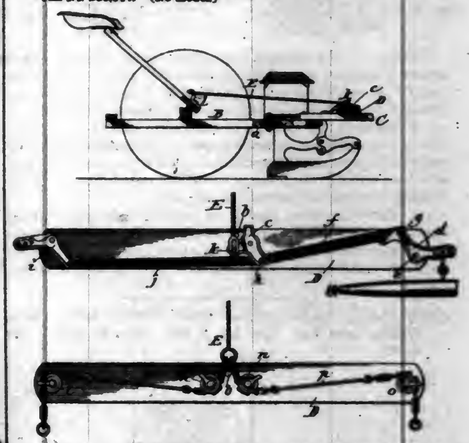
407,846. HARROW. ARVIL T. VAN SLYKE, Hermitage, N. Y. Filed Sept. 28, 1888. Serial No. 286,657. (No model.)

Claim.—The combination, with the harrow-frame and the tooth bars D, journaled in the said frame, of the operating racked bar E, parallel with the side bars of the frame, the arms *e*, connecting the tooth-bars with the bar E, the axle, the plate *f'* on the axle, the plate G, the brace-rods *g* therefor, and the vertical shaft F, journaled in the said plate *f'* and having a bearing in the plate G and carrying at its lower end a pinion H, meshing with the rack of the bar E, all substantially as and for the purpose set forth.

407,847. MACHINE FOR COATING AND EMBOSSING MOLDINGS. HERMANN ZITKEWITZ, Chicago, Ill. Filed May 14, 1889. Serial No. 310,781. (No model.)

Claim.—1. In a machine for the purpose described, the combination, with the vertically-adjustable shaft G, carrying the embossing-roller, of shaft B, having mounted thereon spherical collar 8, pulley D, pivotally mounted upon such collar to rotate therewith, and radial pins 9, engaging a laterally-circumferential groove of collar 8, whereby such pulley can assume any angular position relative to shaft B while rotating therewith, as set forth.

2. In a machine for the purpose described, the combination, with the vertically-adjustable shaft G, carrying the embossing-roller, of shaft E below shaft G and rectangular thereto, and having secured tables F to be angularly adjustable relative to shaft G, and a lever 13 for vibrating and securing shaft E, all substantially as set forth.



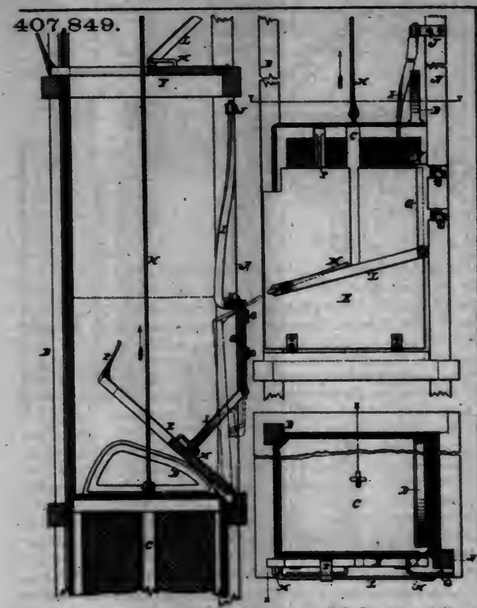
3. In a machine for the purpose described, the combination, with the vertically-adjustable shaft G, carrying the embossing-roller, of shaft B, having mounted thereon spherical collar 8, pulley D, pivotally mounted upon such collar to rotate therewith, radial pins 9, engaging a laterally-circumferential groove of collar 8, and a crank-shaft E, rectangular to shaft B and carrying wheels 12 for guiding pulley D to be held in any angular position to shaft B while rotating therewith, all substantially as set forth.

4. In a machine for the purpose described, the combination, with the vertically-adjustable shaft G, carrying the embossing-roller, of shaft B, feed-pulley D, pivotally mounted thereon, and crank-shaft E, rectangular to shaft B and provided with cross-heads 10 and 11, carrying guide-rollers 12 for pulley D, said shaft E also having secured by brackets mounted thereon feed-tables F and F', to be in line with the upper face of pulley D, and being angularly adjusted simultaneously with pulley D by a lever 13, also mounted on shaft E and secured in any desired position by bolt 14, all substantially as set forth.

5. In a machine for the purpose described, the combination, with the vertically-adjustable shaft G, carrying the embossing-roller, of shaft B, feed-pulley D, pivotally mounted thereon, and crank-shaft E, having guide-rollers for pulley D and carrying tables F and F', to be in line with the upper face of pulley D, transversely-adjustable guide-plate 28, having pivotal guide-strip 30, and the transversely-adjustable plate 31, for sustaining the strip 30 on the desired angular position, all substantially as set forth.

6. In a machine for the purpose described, the combination, with the vertically-adjustable shaft G, carrying the embossing-roller, of shaft B, feed-pulley D, pivotally mounted thereon, and crank-shaft E, having guide-rollers 12 for pulley D, carrying tables F and F', to be in line with the upper face of pulley D, and scraper 33, having V-shaped angle-plate 34, substantially as and for the purpose set forth.

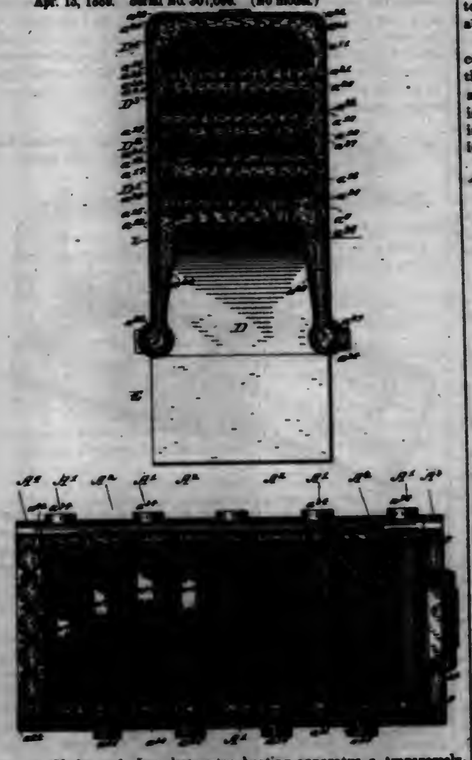
407,848. CORN-PLANTER. ROBERT H. AVERY, Peoria, Ill., assignor to the Avery Planter Company, same place. Filed July 20, 1888. Serial No. 280,517. (No model.)



Claim.—In a corn-planter having two frames hinged together, a draft-rod E, connected at one end with the rear frame of the planter, in combination with an evener provided with a system of levers or bars or their equivalents, with which the front end of the rod E is connected, substantially as set forth, whereby a part of the power applied to the whiffletree will be exerted upon the rear frame, substantially as and for the purposes specified.

407,849. DEVICE FOR OPERATING ELEVATOR-HATCHWAYS. WILLIAM BARDSLEY, Kearney, N. J., and WARREN K. CRAWFORD, New York, N. Y. Filed July 2, 1888. Serial No. 278,797. (No model.)

Claim.—1. The hatchway-door provided with the spring-plate P, acting both as a cam and as a spring to give the door a slight impetus downward, combined with the twisted bar I, the arm H, the bracket G, and the link L, the latter being pivoted at one end to the bracket G and at the other end having a sliding connection with the door, substantially as set forth.



2. In operating devices for elevator-hatchways, the hinged bracket G, carrying the outwardly-extending arm H, having an upwardly-extending twisted bar I, and having a link L pivoted to the lower end of said bracket, combined with the guide-rod M, secured

407,849.

upon the hatchway-door and engaging the link L, substantially as and for the purposes set forth.

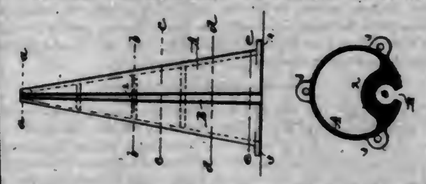
407,850. WATER-HEATER. NATHANIEL A. BOYNTON, New York, N. Y., assignor to the Boynton Furnace Company, same place. Filed Apr. 13, 1889. Serial No. 307,096. (No model.)

Claim.—1. In a hot-water heating apparatus, a transversely-placed water-section which extends from side to side of the heater, and which has two distinct sinuous water-passages, each of which extends from the lower to the upper extremity of such heating apparatus.

2. In a hot-water heating apparatus, a water-section which extends from side to side of such apparatus, which is provided with vertical water-passages and with horizontal water-passages, and which is provided, also, with right and left vertical partitions which separate such vertical and horizontal water-passages into two distinct series of passages, each series of which embraces both vertical and horizontal water-passages, substantially as described.

3. In a hot-water heating apparatus, the combination, with the intermediate water-sections, each having exterior vertical water-passages and each having horizontal water-passages, as a^{30} a^{31}, which extend inwardly from such exterior vertical water-passages, of the rear closing-section A^4, provided with eccentrically-placed smoke-exit opening a^9, substantially as and for the purposes set forth.

4. A hot-water heating apparatus in which the water-heater is composed, essentially, of a front closing-section, a rear closing-section, and a series of intermediate water-sections, each of which has right and left vertical water passages or legs, which constitute the side walls of the fuel-chamber, vertical passages above such side-wall passages, horizontal water-passages which extend inwardly from such higher vertical passages, and lateral, reduced, or cut-away portions beyond the inner extremity of such horizontal passages, which together constitute vertical smoke-passages between lower and upper smoke-spaces, the front and rear closing-plates and the sections between them being secured together, substantially as specified.



5. In a hot-water heating apparatus, the series of water-circulating sections A' and A^3, each provided with the web-like strengthening and retarding ribs a^{32} and a^{33}, extending along both the vertical and the transverse portions of such sections, as described and shown.

6. In a hot-water heating apparatus, the combination, with the intermediate water-sections, of the rear closing water-section, communicating on either side at top and bottom with such intermediate water-sections, and provided with a smoke-flue which extends longitudinally through such closing-section.

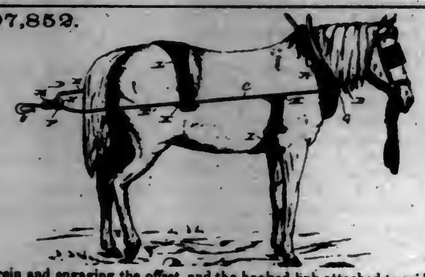
7. In a hot-water heating apparatus, the combination, with the intermediate water-sections, of the rear closing water-section having a transverse water-passage at top and at bottom, and a series of intermediate vertical tubular water-passages, which connect such top and bottom transverse water-passages.

8. In a hot-water heating apparatus, the combination, with the central or intermediate water-sections, of the front closing water-section, provided with a clearing-opening and with a fuel-supply opening, and having right and left vertical water-passages, top, bottom, and intermediate transverse or horizontal water-passages, and rear openings which are coincident with the longitudinal water-passages of the intermediate water-sections.

407,851. BLACKSMITH'S MANDREL. JAMES W. CHERRY, Indianapolis, Ind. Filed May 13, 1889. Serial No. 310,494. (No model.)

Claim.—1. A mandrel consisting of a tapering hollow block of metal having an opening through one side, substantially as set forth.

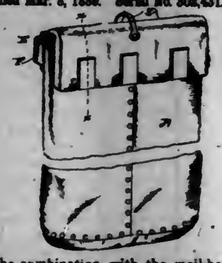
2. A mandrel consisting of a tapering hollow block of metal having an opening in one side extending its entire length, the edges of said opening being beveled, substantially as set forth.



3. A mandrel consisting of a conical hollow block of metal having a straight opening in one side extending its entire length, the edges of said opening being beveled and thickened, substantially as set forth.

4. A mandrel consisting of a conical hollow block of metal having a straight opening in one side extending its entire length and strengthening-webs extending across the openings at proper intervals, substantially as set forth.

407,852. HARNESS. GEORGE G. CRAMBERG and JOHN H. RABOW, Dallas City, Ill. Filed Dec. 22, 1888. Serial No. 294,906. (No model.)



Claim.—In a harness, the hames having the rings B, the rigid tug bent in U form and having its arms provided with the hooks engaging the rings and with the loops H K, said tug having the offset P in its rear portion, the belly and back bands attached to the loops H K, respectively, and each provided with buckles, whereby they may be adjusted, the strap or band M, having the roller N journaled

407,852.

therein and engaging the offset, and the hooked link attached to said strap and band, substantially as described.

407,853. MAIL-BAG FASTENER. LA FAYETTE CREPS, Sheridan Lake, Colo. Filed Mar. 8, 1889. Serial No. 302,431. (No model.)

Claim.—1. The combination, with the mail-bag having a series of slots near its upper end and provided with a flap adapted to be folded over its mouth to cover the said slots, of the staples carried by the said flap and adapted to enter the said slots and pass through the bag and the lock secured to the outer side of the bag and engaging the said staples, as set forth.

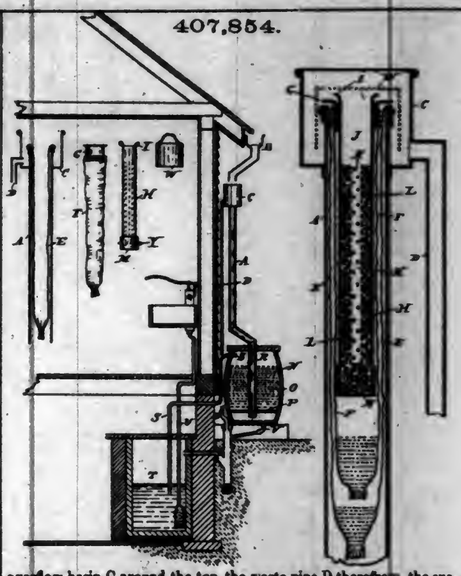
2. The combination, with the bag having a flap carrying staples and the lock, of the sheath for the lock constructed of a single piece of leather provided at its ends with the tongues H and flaps I, the said flaps I having the slots J, all arranged substantially as described.

3. The combination of the mail-bag, the staples carried thereby, and the lock secured to the bag and having a series of spring-bolts adapted to engage the staples, a sliding bar to disengage the bolts from the staples, and a series of springs adapted to bear on the ends of the staples to project them from the lock, as set forth.

4. The combination of the bag having the slots B G and provided with a flap adapted to fold over the mouth of the bag and cover the slots, the lock secured to the bag and having a series of boxes containing bolts, the staples carried by the flap of the bag, passing through the slots B G and entering the boxes of the lock, and the sheath covering the lock and secured to the bag, as set forth.

407,854. FILTER FOR RAIN-WATER. JACOB DORFBIRER, Sandusky, Ohio. Filed Mar. 9, 1889. Serial No. 302,614. (No model.)

Claim.—1. In a water-filter, the combination of a stand-pipe containing filtering devices supplied from a receiving-basin in the upper end of said stand-pipe, an overflow-basin around the top portion of said stand-pipe and extending above the same, a dependent strainer-tube from the bottom of said basin, and a waste-pipe from said overflow-basin, substantially as described.

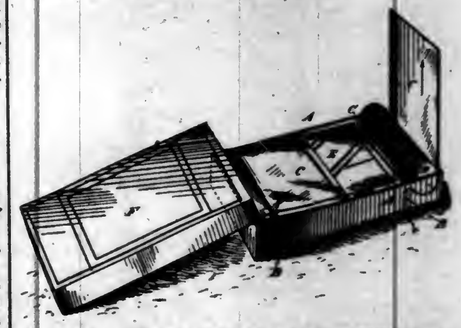


2. In a water-filter, the combination of a stand-pipe, one or more filtering-bags suspended therein, and strainer-tube similarly suspended within said bag or bags and provided with a receiving-basin in its top, and a dependent strainer-tube from the bottom of said basin, substantially as described.

3. In a water-filter, the combination of a stand-pipe, one or more filtering-bags suspended therein, a strainer-tube suspended within said bag or bags, a receiving-basin in the upper end of said strainer-tube and provided with a dependent strainer at its bottom and overflow-basin around the top of the stand-pipe, and a waste-pipe therefrom, substantially as described.

4. In a water-filter, the combination of a stand-pipe, one or more filtering-bags detachably suspended therein, a strainer-tube detachably suspended within said bag or bags and provided with a detachable cap at its lower end, a receiving-basin in the upper end of said strainer-tube, a strainer-tube depending from the receiving-basin within the aforesaid straining-tube, and a filtering material in the space between the two strainer-tubes, substantially as described.

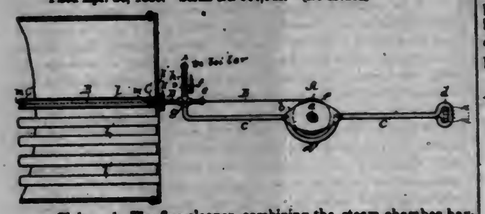
5. In a water-filter, the combination of the stand-pipe A, the



407,854.

overflow-basin C around the top, the waste-pipe D therefrom, the suspended filtering-bags E and F in the stand-pipe, the strainer-tube H, suspended within said bags, the receiving-basin J, formed in the upper end thereof, the strainer-tube K, dependent from the bottom of said basin, the filtering material L between the strainer-tubes, and the detachable cap M on the strainer-tube H, substantially as described.

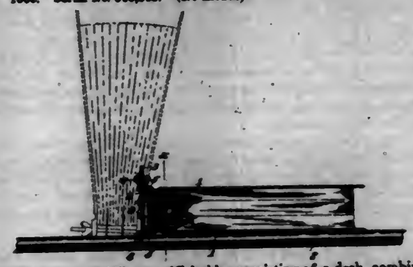
6. In a water-filter, the combination of the filtering-tank O, containing the bed of filtering material N, the stand-pipe A, extending from near the bottom of said tank to a distance above the height of the same, the filtering devices suspended from the top within said stand-pipe and provided with the receiving-basin J, the overflow-basin C around the top of said stand-pipe and provided with the waste-pipe D, and the overflow-pipe S from the filtering-tank into a storage-reservoir, substantially as described.



407,855. CARD AND CHECK BOX. BERNARD DREYFUSS, New York, N. Y. Filed Jan. 9, 1889. Serial No. 295,851. (No model.)

Claim.—1. In a card and check box having separate compartments for cards and checks, a flexible lifting device of nearly the same width as the box, having its end fastened to one side of the check-compartment and receiving the checks within the same, said flexible device being arranged to fold down upon the checks and cards to retain them, and to be raised to lift all the checks simultaneously from this compartment, all substantially as described.

2. As a new article of manufacture, a card and check box divided into separate compartments for cards and checks, and having a flexible lifting device of nearly the same width as the box fastened to one side of the check-compartment and receiving the checks within the same, the said flexible device being arranged to fold down upon the checks and cards to retain them, and to be raised to lift all the checks simultaneously from the compartment, said box being also provided with a separate detachable cover to close entirely over the entire face of the box with its contents, all substantially as described.



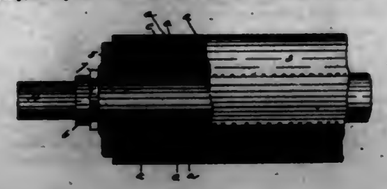
407,856. FLUE-CLEANER. JOHANNES ERICSON, Marion, Kans. Filed Apr. 20, 1889. Serial No. 307,949. (No model.)

Claim.—1. The flue-cleaner combining the steam-chamber having a valved steam-supply connection, a stuffing-box, a piston carrying a brush or cleaner, the support or handle connected to said steam-chamber, a spring-retracted drum or sheave carried by said handle and located at a distance and separate from said steam-chamber, and a flexible piston-rod having one end connected to said drum or sheave and the other passing through the stuffing-box on said steam-chamber and being connected to said piston, substantially as set forth.

2. The flue-cleaner consisting of the rod or handle having at one end a hand-hold and an offset at about the middle of its length, a steam-chamber mounted upon the end opposite said hand-hold and having a valved steam-supply connection, a stuffing-box, a piston carrying a brush or cleaner, the drum or sheave having coiled therein a spring engaging said drum, and a shaft upon which said drum or sheave independently revolves, said drum or sheave being located in the said offset of the rod or handle, plates connected to said rod forming bearings for said shaft, and the wire piston-rod passed through said stuffing-box on the steam-chamber and connected to said piston, substantially as set forth.

407,857. BILL OR TARIFF HOLDER. MATHEWS T. FREEMAN, JOSEPH S. POTTS, and STEPHEN G. COWAN, Richmond, Va. Filed May 4, 1889. Serial No. 309,595. (No model.)

Claim.—1. A bill or tariff holder consisting of a desk, combined with a clamping-bar, a fastening device, a guide bar or bolt, and a cover movable upon the fastening device and lengthwise of the same, substantially as specified.

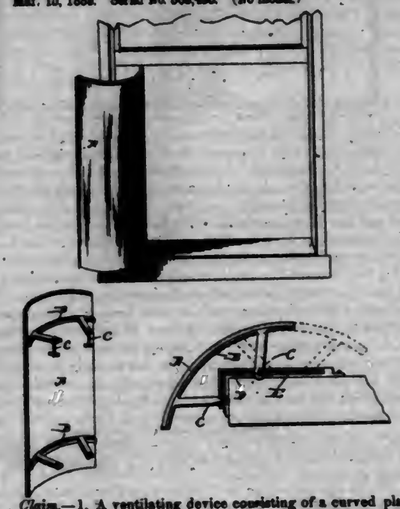


2. A bill or tariff holder adapted to be moved laterally to fold over piles of varying heights, combined with a clamping-plate, a fastening-bolt, and a desk, substantially as specified.

3. In a bill or tariff holder, the combination of the clamping-plates and fastening-bolts with intermediate vertically-movable plates, substantially as described.

4. A bill or tariff holder consisting of clamping-plates and a fastening device, combined with a table having slots to permit the fastening device to be manipulated in the same, substantially as specified.

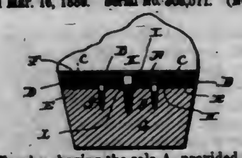
5. A bill or tariff holder consisting of clamping-plates hinged or journaled to a table and a fastening device, combined with the table having a slot adjacent to the fastening to permit its lateral movement when the holder is turned to open the file.



407,858. CLOTH-CALENDERING ROLL. WILLIAM S. GRANGER, Providence, R. I., assignor to the Granger Foundry and Machine Company, same place. Filed Sept. 12, 1888. Serial No. 285,208. (No model.)

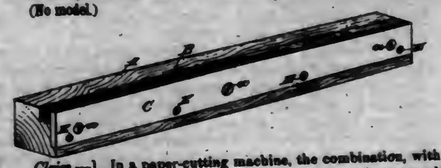
Brief.—The cotton in the roll provides the requisite finishing and surface-polishing material and the husks provide an elasticity not possessed by cotton alone, so that the threads of the fabric are not injuriously flattened, since the face of the roll permits of certain indentations, but which, owing to the action of the husks, are only temporary.

Claim.—A calendering-roll for finishing cloth, consisting of commingled corn-husks and cotton, substantially as set forth.



407,859. VENTILATOR. OSCAR B. GRANT, Austin, Minn. Filed Mar. 15, 1889. Serial No. 303,460. (No model.)

Claim.—1. A ventilating device consisting of a curved plate detachably secured to a window-frame and supported at a slight distance therefrom, and adjustable bodily along its supports, as set forth.

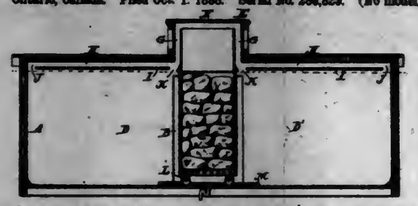


2. A ventilating device consisting of the brackets E, having slots D and secured to a window or door frame, the deflecting-plate, and the frames B, secured to the said plate and carrying bolts engaging the slots D, whereby the plate will be held out from the window, so as to leave an air-passage between the two, as set forth.

407,860. HEEL ATTACHMENT. CHARLES GRUNBACH, Houston, Tex. Filed Mar. 16, 1889. Serial No. 303,511. (No model.)

Claim.—The shoe having the sole A, provided with the plate B, having the stuck-up flange D, and U-plate E, the flange and plate forming the groove F, and the plate B being further provided with the perforation I, in combination with the heel G, provided at its upper end with the plate H, supported slightly above the same and adapted to fit the groove F, and provided with a perforation aligning with the perforation I, and the screw K, inserted downwardly through the perforation and terminating in the heel, substantially as specified.

407,861. CUTTING-STICK FOR PAPER-CUTTING MACHINES. JAMES R. HAMILTON, Two Rivers, Wis., assignor to the Hamilton Manufacturing Company, same place. Filed Apr. 2, 1888. Serial No. 197,402. (No model.)

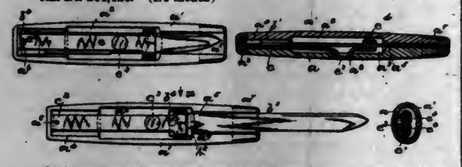


Claim.—1. In a paper-cutting machine, the combination, with a cutting-stick having a recess formed in its upper face, of a removable section fitted in said recess, and a clamping-plate secured directly to the side of the said stick for retaining said removable section in place, substantially as described.

2. In a paper-cutting machine, the combination, with a cutting-

stick recessed on its upper face, a clamping-plate, as C, secured directly to the side of the stick, a series of transverse bolts or screws passing through the stick and plate, and a removable portion fitted in said recess, substantially as described.

407,862. REFRIGERATOR-CAR. JOSEPH F. HANRAHAN, Ottawa, Ontario, Canada. Filed Oct. 1, 1888. Serial No. 286,829. (No model.)



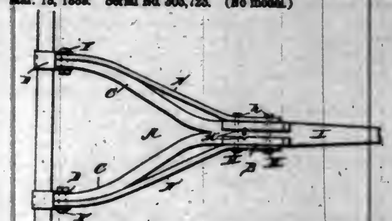
Claim.—1. In a refrigerator-car, the combination, with the body provided at or about the center with an upwardly-projecting box or hood E, of the ice-chamber C, supported upon the floor and extending upward into the box, but separated therefrom on all sides to form passages G, and diaphragms I set away from the roof of the car to form passages H, communicating with the passages G, whereby a perfect circulation of the air in both ends of the car is attained.

2. In combination with a car provided with an upwardly-projecting box or hood E, a two-part ice-chamber C, extending into said box and separated therefrom to form passages G, the upper part of said ice-chamber being fixed in position, and the lower part being movable relatively to the other part and to the car, all substantially as shown.

3. In combination with car A, having doors B in its sides midway between its ends, and also having a box or hood E, a track located in front of the doors, and a two-part ice box or chamber extending from the floor up into the hood, the upper part of the ice-box being fixed in position, all substantially as shown.

407,863. POCKET-KNIFE. HENRY C. HUNT, Newark, assignor of one-half to George B. Adams, Irvington, N. J. Filed Jan. 18, 1888. Serial No. 261,120. (No model.)

Claim.—1. A chambered tool-handle consisting of two sections held together by a ferrule or cap at one end and a rivet at the other end.



2. In combination, a hollow tool-handle having an open end and an opening in the side thereof, a tool moving through said open end and retained in said handle when not in use, and provided with a shoulder to prevent the tool from dropping out of the handle, and a stop or stops thereon, a spring-actuated plate having projections or flanges between which the tool passes when dropped within the handle, and a finger-piece projecting into the opening in the side of the handle and co-operating with the spring-plate, substantially as and for the purposes set forth.

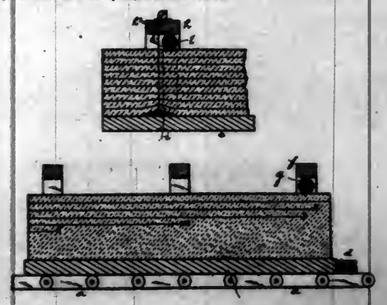
3. In combination, a hollow tool-handle composed of sections held together by a ferrule and rivet at opposite ends thereof, one of said sections having an opening in the side thereof, and the end of said handle held together by the ferrule being open, a spring-plate arranged within said handle and extending toward the open end thereof, a finger-piece projecting into the opening in the side of the handle for operating said spring-plate, for the purposes specified, and a tool adapted to move through the open end of the handle and provided with a stop thereon with which said spring-plate engages when the tool is projected from the handle, said tool being permitted to drop within the handle and be retained therein by the pressure of the spring-plate against the same, substantially as set forth.

4. In combination, a hollow tool-handle composed of two sections held together by a ferrule and a rivet at opposite ends thereof, one of said sections having an opening in the side thereof, and the other end of said handle held together by the ferrule being open, a spring-tool holding-plate arranged within and secured to one of the sections of said handle and extending toward the open end thereof, a finger-piece on a spring-plate secured to the other of said sections and projecting into the opening in the side thereof and co-operating with the spring-tool holding-plate, for the purposes specified, and a tool adapted to move through the open end of the handle and provided with a stop thereon with which the spring-tool holding-plate engages when the tool is projected from the handle and retained therein by the pressure of the said spring-plate, substantially as and for the purposes set forth.

5. In combination, a chambered or hollow handle having an opening in the end thereof through which a tool may be projected, and an opening in the side thereof, a spring-actuated plate inclosed and secured within said handle and having a free end extending toward the opening in the end of the handle and provided with a loop thereon projecting toward the opening in the side of the handle, thereby providing an open space in said loop through which the tool can drop into the handle, a tool having a stop or notch thereon with which the free end of the spring-actuated plate engages automatically when said tool is projected from the handle, and a finger-piece arranged and working in the opening in the side of the handle, and when depressed engaging with the said loop on the spring-actuated plate, for the purposes set forth.

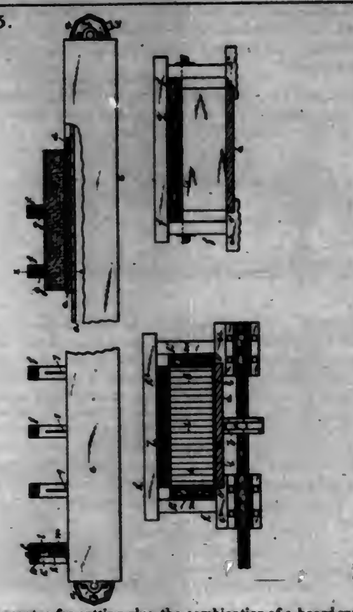
407,864. VEHICLE-TONGUE. JAMES P. JOHNSON, Girard, Ill. Filed Mar. 18, 1889. Serial No. 303,723. (No model.)

Claim.—1. The combination of the draw-iron provided at its front end with the box having a longitudinal slot extending its entire length, the adjusting-screws passing transversely through the box and adapted to engage the sides thereof and draw them tightly around a tongue, and the brace-rods secured to opposite sides of the box and extending along the sides of draw-iron and adapted to be connected to a thill-coupling, substantially as described.



2. The combination, with a draw-iron provided at its front end with a box having a longitudinal slot in its lower side and a flat bearing-surface on the upper side, and the adjusting-bolts H H, engaging registering apertures in the opposite sides of the box and passing transversely through the box, whereby the size of the box may be varied, of the tongue or pole fitting at its rear end in the said box, substantially as specified.

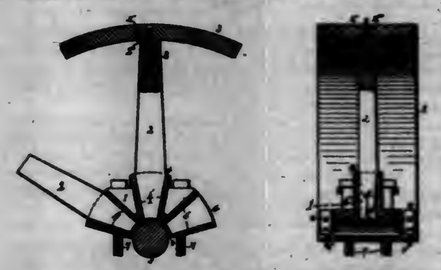
3. As an improved article of manufacture, the draw-iron for vehicle-tongues, comprising the longitudinally-slotted box B, having an aperture in its upper side and notches M M in the opposite edges of its slot, the divergent arms integral with the rear end of the box, and the adjusting-bolts engaging registering apertures in opposite sides of the box, substantially as specified.



407,865. APPARATUS FOR CUTTING GLUE. CHARLES KELLER and JOHN COSLY, Springdale, Pa. Filed Aug. 14, 1888. Serial No. 282,743. (No model.)

Claim.—1. In apparatus for cutting glue, a combination, with a board supporting the block of glue, of a traveling carrier engaging therewith and a series of cutting-wires supported at different heights, the higher wires being arranged in front of the lower ones successively and adapted to engage with the block of glue supported on such board and cut the same into sheets, substantially as and for the purposes set forth.

2. In apparatus for cutting glue, the combination of an endless chain supported and driven by sprocket-wheels and having cross-bars arranged at intervals thereon, a board carrying a block of glue with which said cross-bars engage, and a wire supported in a suitable frame and extending across the course of the block of glue, substantially as and for the purposes set forth.

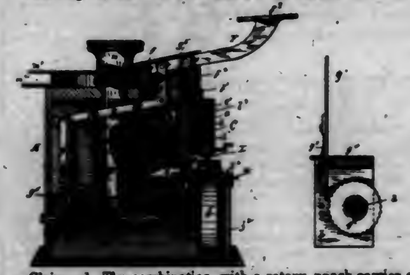


407,865.

3. In apparatus for cutting glue, the combination of a board supporting a block of glue, a traveling carrier engaging therewith, and a frame having a vertical wire arranged in the course of said block, a horizontal bar or plate extending across the frame on a higher level than the supporting-board and to which the lower end of the wire is secured and adapted to pass between said board and the block of glue, substantially as and for the purposes set forth.

407,866. PULLEY. P. V. LAWSON and WALLACE L. FIELD, Menasha, Wis. Filed Jan. 18, 1889. Serial No. 296,780. (No model.)

Claim.—1. In a separable pulley, the combination of a hub consisting of two equal parts having lugs thereon, bolts for clamping said parts together and upon a shaft, said hub having spoke-sockets formed therein, the sockets being rectangular in their cross-section, the two sides thereof lying parallel with the bore of the hub, converging rapidly as they approach said bore, and thereby limiting the entrance of said spoke, and one or both of the remaining sides being curved inwardly, whereby the sockets are made narrower in the direction parallel with the bore of the hub intermediate of their length than at either end thereof, spokes inserted in the sockets, and a wedge in the inner end of each spoke, and secured upon the outer end of the spokes a bent rim consisting of two semicircular sections, said sections being secured together at their ends with tie-plates and bolts, substantially as described.



2. In a separable pulley, the combination of a hub consisting of two equal parts having lugs thereon, bolts for clamping said parts together and upon a shaft, a bushing of paper or other slightly-elastic material interposed between said hub and shaft, said hub having spoke-sockets formed therein, the sockets being rectangular in their cross-section, the two sides thereof lying parallel with the bore of the hub converging rapidly as they approach said bore, and thereby limiting the entrance of said spoke, and one or both of the remaining sides being curved inwardly, whereby the sockets are made narrower in the direction parallel with the bore of the hub intermediate of their length than at either end thereof, spokes inserted in the sockets, and a wedge in the inner end of each spoke, their being tenons upon the outer ends of the spokes and shoulders thereto, a bent rim consisting of two semicircular sections and having spoke-seats therein corresponding in position with the spoke-tenons aforesaid, there being a hole through each spoke-seat, a coach-screw therethrough and connecting a spoke therewith, the ends of said rim-sections meeting in a tongue-and-groove joint, and tie-plates and bolts near the ends of the rim-sections for connecting one rim-section to the other, substantially as set forth.

3. In a separable pulley, the combination of a hub consisting of two equal parts having lugs thereon, bolts for clamping said parts together and upon a shaft, said hub having spoke-sockets and spokes secured therein, upon the outer end of the spokes a bent rim consisting of two semicircular sections and having holes therein corresponding in position with the outer end of said spokes, the holes aforesaid being countersunk upon the outer surface of the rim, and a coach-screw inserted in each of said holes and engaging a spoke, thereby connecting the rim and spoke together, and tie-plates and bolts near the ends of the rim-sections for connecting one rim-section to the other, substantially as set forth.

4. In a separable pulley, the combination of a hub consisting of two equal parts having lugs thereon, bolts for clamping said parts together and upon a shaft, said hubs having spoke-sockets and spokes secured therein, said spokes having tenons upon their outer ends and shoulders thereto, a bent rim consisting of two semicircular sections having spoke-seats therein corresponding in position with the spoke-tenons aforesaid, there being a hole through each spoke-seat, a coach-screw therethrough and connecting a spoke therewith, the ends of the rim meeting in a tongue-and-groove joint, tie-plates upon each section, and bolts for securing one rim-section to the other, substantially as described.

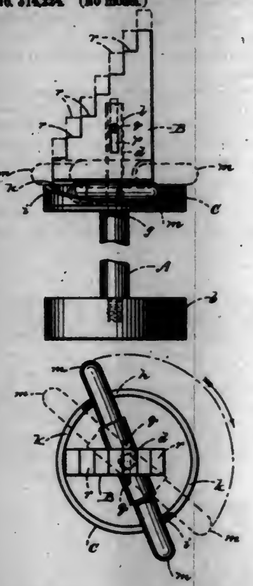
5. A separable pulley comprising a hub consisting of two equal parts having lugs thereon, bolts for clamping said parts together and upon a shaft, a bushing of paper or other slightly-elastic material interposed between said hub and shaft, said hub having spoke-sockets formed therein, the sockets being rectangular in their cross-section, the two sides thereof lying parallel with the bore of the hub, converging rapidly as they approach said bore, and thereby limiting the entrance of said spoke, and one or both of the remaining sides being curved inwardly, whereby the sockets are made narrower in the direction parallel with the bore of the hub intermediate of their length than at either end thereof, spokes inserted in the sockets, and a wedge in the inner end of each spoke, their being tenons upon the outer ends of the spokes and shoulders thereto, a bent rim consisting of two semicircular sections and having spoke-seats therein corresponding in position with the spoke-tenons aforesaid, there being a hole through each spoke-seat, a coach-screw therethrough and connecting a spoke therewith, the ends of said rim-sections meeting in a tongue-and-groove joint, and tie-plates and bolts near the ends of the rim-sections for connecting one rim-section to the other, substantially as set forth.

407,867. CHECK-PUNCH. EDWARD L. LIEDER, Sandusky, Ohio. Filed Aug. 13, 1888. Serial No. 282,587. (No model.)

Claim.—1. The combination, with a rotary punch-carrier and a series of punches carried thereby, of pivotal punch-actuating lever F, and punch-engaging plunger f', pivoted to said lever, substantially as set forth.

2. The combination, with rotary vertical spindle B and sectors C C', rigid therewith, said sector C carrying punches c, said sector C' carrying dies c^3, said spindle having at its upper end the handle w, of pivotal lever F, leg f, in which the latter is fulcrumed, plunger f', pivoted to said lever, and spring f^3, substantially as set forth.

3. The combination, with rotary vertical spindle B, having knob s on its upper end, sector C, carrying punches c, and sector C', carrying dies c^3, both said sectors rigid with said spindle, of lever F, plunger f', index-finger x', rigidly secured to said spindle, and index-plate n^3, substantially as set forth.



4. The combination, with pivotal lever F, rocking lever G, and link g, having its opposite extremities respectively pivoted to said two levers, of ratchet f', having its upper end pivoted to lever G by a joint which permits a certain independent play of said two parts, ratchet-wheel f^6, shaft h, and feed-wheel j', substantially as set forth.

407,868. BORING-BIT. JOSEPH C. MIDDLETON, Norristown, Pa. Filed May 20, 1888. Serial No. 275,444. (No model.)

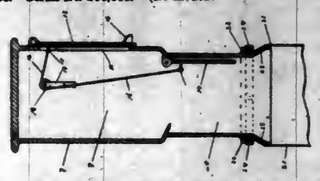
Claim.—The herein-described bit, consisting of the straight semi-cylindrical shank A, provided with a clearance-groove *a*, extending from near the butt of the shank to its extremity, the edges of the groove being parallel for a portion of their lengths and converged to form an entering-point D, and semi-spiral threads B, formed in the convex surface of the shank and extending from near the upper end of the groove to near the tip and from edge to edge of the groove, substantially as specified.

407,869. CARRIAGE-JACK. LUTHER S. MOSS, Bridgeton, Me., assignor of one-half to Daniel J. Head, Hanover, Mass. Filed June 14, 1889. Serial No. 314,234. (No model.)

Claim.—1. In a carriage-jack, a standard, a vertical spindle thereon, a horizontal cam-plate, a lifting-bar working in the tracks thereof, and a lifting-block on said spindle actuated by said bar, substantially as described.

2. In a carriage-jack, the combination of a standard, a cam-plate thereon having two inclined tracks, the upper ends of which are horizontal, a lifting-block fitted to slide vertically on said standard, and a lifting-bar rotating on said standard and working in said tracks, substantially as and for the purpose set forth.

3. In a carriage-jack, the combination of a standard, a vertical spindle thereon, a horizontally-arranged two-track cam-plate on said standard, a lifting-bar rotating on the spindle and working in said tracks, and a lifting-block sliding vertically on the spindle in engagement with said bar, substantially as described.



4. In a carriage-jack, a standard having a foot-piece and vertical spindle, a horizontally-arranged cam-plate on said standard provided with two inclined tracks having horizontal upper ends, a lifting-bar rotating on said spindle and working in said tracks, a lifting-block sliding vertically on the spindle and provided with axle-steps, and a pin for preventing said block from rotating, substantially as described.

5. In a carriage-jack, the standard A, in combination with the cam-plate C, bar *m*, and block B, substantially as described.

6. In a carriage-jack, the standard A, having the spindle *d*, in combination with the plate C, bar *m*, block B, provided with the chamber *l*, and slots *p*, and the pin *q*, arranged substantially as described.

7. In a carriage-jack, the standard A, foot-piece *b*, and spindle *d*, in combination with the cam-plate C, provided with tracks *h i* and horizontal portions *k*, the bar *m*, the block B, having steps *r*, chamber *l*, and slots *p*, and the pin *q*, all being arranged to operate substantially as described.

407,870. LETTER-BOX. EVERETT D. MOORE and THOMAS C. CHAPPELL, Baltimore, Md.; said Moore assignor to said Chappell. Filed Jan. 6, 1888. Serial No. 260,011. (No model.)

Claim.—In a mail-parcel box, the combination of a casing provided with a receiving-opening 11, the bottom of said casing being open and terminating in the swelled end 23, the flange 22, encircling the said casing near the bottom thereof, a door 12, hinged to the casing to protect the opening 11 and constructed to swing outward, the inner door 14, hinged on the inside of the casing below the opening 11 therein and swinging downward, the rope 16, connecting the doors 12 and 14, whereby when the door 12 is opened the inner door 14 will be closed, and a mail-sack provided with the hinged band 24 around the mouth thereof for securing said sack to the lower open end of said casing, substantially as shown, and for the purpose set forth.

407,871. LOOM SHUTTLE. GEORGE C. MOORE, Easthampton, Mass., assignor to Joseph W. Green, Jr., and the Glendale Elastic Fabric Company, both of same place. Filed Aug. 13, 1888. Serial No. 282,824. (No model.)

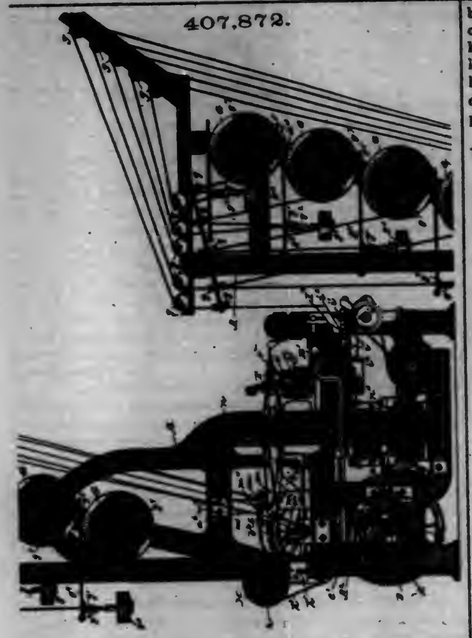
Brief.—The invention relates to the tension devices and to the devices for securing the cop-holding spindle to the shuttle-body.

Claim.—1. The combination, with the loom-shuttle body A, of the spindle B, having a tang B', provided with a hook *b* and a downwardly-extending projection *b'*, and the locking-plate D, having the recess or slot *d*, and the cross-bars *d'* and *d²*, bridging the front of said recess or slot, substantially as set forth.

2. The combination, with the loom-shuttle body A, of the wire support *g*, the tension bow-spring *e*, having notched or forked ends embracing said support, and the pin *h*, substantially as set forth.

3. The combination, with the loom-shuttle body A, of the tension device consisting of the wire support *g*, the bow-springs *e* and *f*, and the pin *h*, substantially as set forth.

407,872. NARROW-WARE LOOM. GEORGE C. MOORE, Easthampton, Mass., assignor to Joseph W. Green, Jr., and the Glendale Elastic Fabric Company, both of same place. Filed Aug. 13, 1888. Serial No. 282,825. (No model.)



Brief.—The invention relates to the shuttle-driving mechanism, the let-off devices, and the means for actuating the harness-frames.

Claim.—1. The combination, with the lay and a shuttle-driving bar fitted to reciprocate therein, of a horizontal lever pivoted near its center, a pitman connecting the forward end of said lever with the said driving-bar, a cam at the rear end of said lever for operating the same, and a shaft by which the said cam is carried, substantially as set forth.

2. The combination, with the lay and a shuttle-driving bar fitted to reciprocate therein, of a horizontal lever pivoted near its center and provided at its rear end with bowls or anti-friction rolls, a pitman connecting the forward end of said lever with said driving-bar, a flange-cam the edge of which is received between said bowls or rolls, and a shaft by which said cam is carried, substantially as set forth.

3. The combination, with the lay and its operating mechanism, of a shuttle-driving bar fitted to reciprocate in the said lay, a lever having a roller-slide provided with bowls or anti-friction rolls, a pitman positively connecting said lever with said driving-bar, a plate or bracket having a guiding-slot in which said roller-slide works, a flange-cam the edge of which is embraced by said bowls or anti-friction rolls, and a shaft by which said cam is carried, substantially as set forth.

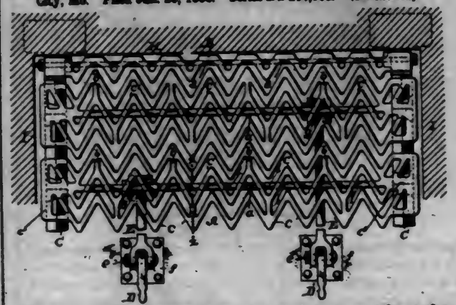
407,872.

4. The combination, with the lay provided with cam-slots and the shuttle-driving bar reciprocating in said lay, of the vibrating shuttle-driving pins having universal-joint connections with said driving-bar and flattened or elliptical portions working in said slots, substantially as set forth.

5. The combination, with the cam-slotted lay and its operating mechanism, of the shuttle-driving bar fitted to slide back and forth in the lay, operating mechanism for said driving-bar, the ball-headed shuttle-driving pins having flattened or elliptical portions, and the plates attached to said bar and having sockets to receive the heads of said pins and slotted projections for guiding said pins in their back-and-forth vibrations, substantially as set forth.

6. The combination, with the lay having the cam-slots *c'*, of the shuttle-driving bar C', having the plates c^3 c^3, the former having the slotted projections or standards c^5, the shuttle-driving pins c^3, having elliptical or flattened portions c^2 and ball-heads c^4, the latter socketed in said plates, and the shuttles F, having the open slots f^3 to receive the ends of said pins, substantially as set forth.

7. The combination, with the tension-pulleys g^4, having in their inner sides round holes to receive the stud on which they can turn and having in their outer sides square holes for the reception of square warp-beam shafts, of friction bands or straps passing around said pulleys and tension-levers with which said straps are connected, substantially as set forth.



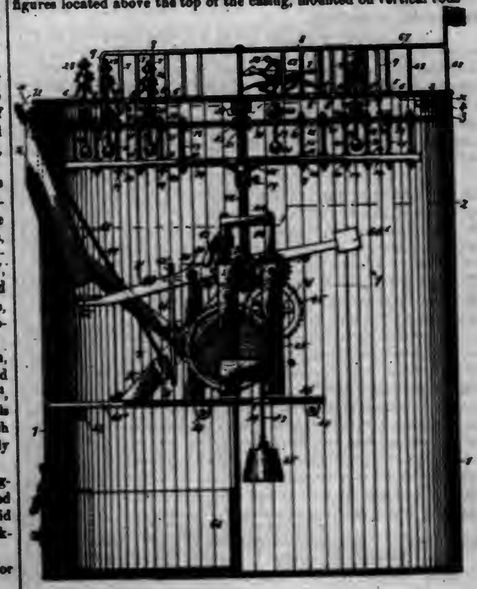
8. The combination, with the warp-beam-supporting standards provided with round studs, of the tension-pulleys having on their inner sides round holes to fit said studs and on their outer sides square holes, the square warp-beam shafts fitting in the said square holes, the tension-levers supported by said standards, the friction-bands connected with said levers and passing around said pulleys, the pulleys g', the weighted brackets or blocks g^3, by which said pulleys are carried and which are arranged below the longer or outer ends of said levers, and the overhead guide-pulleys g, over which the warps pass, substantially as set forth.

9. The combination, with the lay and its operating mechanism, of the sliding bar I^3, the bell-crank lever K, operatively connected with the said lay and sliding bar and having a series of collars i^3, the pawls i^4, pivoted to said collars, the shafts i^2, having ratchet-wheels i^3 and worms i^5, the worm-wheels i, the take-up rolls I', with which said worm-wheels are connected, and the pressure-rolls I, substantially as set forth.

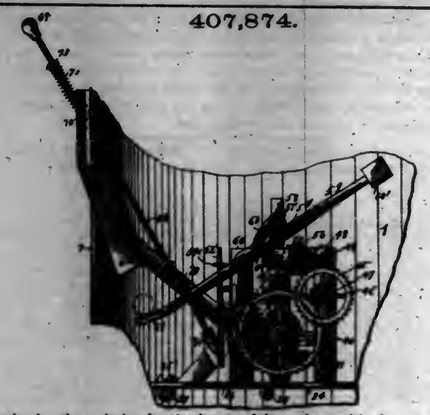
10. The combination, with the machine-frame, of the bearing-plates *m*, having the curved slots m^2, the warp-guide rolls L, journaled in said plates, the brackets m', and the bolts m^4, passing through said curved slots and adjustably securing said bearing-plates to said brackets, substantially as set forth.

11. The combination, with the harnesses, of the rigid links or bars n', connected with the opposite ends of the harness-frames, each of said links or bars being formed in parts and having right and left hand screws, whereby said parts are adjustably joined together, the levers n^3 n^3, positively connected to each other at their inner ends and having the said links connected at their outer ends, and the grooved cams, with which engage projections on one lever of each connected pair of levers n^3 n^3, substantially as set forth.

407,873. FURNACE-GRATE. MAXIMILIAN H. MOSKOVITZ, Kansas City, Mo. Filed Jan. 28, 1888. Serial No. 297,903. (No model.)



Claim.—1. The improved grate-bar having an upper fire-surface composed of a series of zigzag webs *c c*, which are united at their ends, the end web-pieces *c' c'*, and the lower straight longitudinal supporting-web cast integral with the upper zigzag webs and the end pieces, said supporting-web being connected with the series of zigzag webs by means of connecting-pieces *c'*, whereby a series of air-passages *h h* are formed between said upper series of webs and the said supporting-web, substantially as described.



2. The improved grate-bar having an upper fire-surface composed of a series of zigzag webs *c c*, which are braced at points intermediate of their lengths by short transverse webs *b b* and united at their ends, the end web-pieces *c' c'*, and the lower straight longitudinal supporting-web cast integral with the upper zigzag webs and the end pieces, said supporting-web being connected with the series of zigzag webs by means of connecting-pieces *c'*, whereby a series of air-passages *h h* are formed between said upper series of webs and the supporting-web, substantially as described.

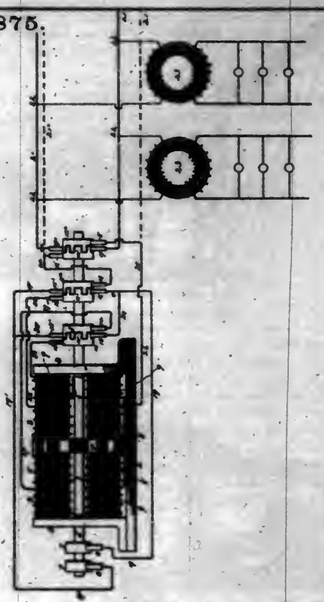
407,874. TOY RACE-TRACK. WILLIAM H. MCMAHON, New York, N. Y. Filed Nov. 14, 1888. Serial No. 290,626. (No model.)

Claim.—1. A toy race-track consisting of a casing having its top formed with a series of concentric slots, a rotary plate mounted on a vertical shaft beneath the top of the casing and having slots coinciding with the slots in the top of the casing, a number of miniature figures located above the top of the casing, mounted on vertical rods

407,874.

projecting through the slots in the top of the casing and in the rotary plate and having rollers loosely resting at their ends beneath the plate, and a driving mechanism consisting of the drum 32, with cord 33, having suspended weight 35, the large gear-wheel 40, loosely mounted on the shaft 36 of drum 32, and meshing with a pinion 47 on a shaft 46, a large gear-wheel 45 on shaft 46, meshing with a pinion 48 on a shaft 49, a gear-wheel 50 on shaft 49, meshing with a pinion 51 on a shaft 52, and a bevel gear-wheel 53, meshing with a bevel gear-wheel 54 on the vertical shaft 16, on which the rotary slotted plate is mounted, in combination with a ratchet-wheel 56 on shaft 52, a pawl adapted to engage with ratchet-wheel 56, and a tilting counter-weighted lever operated by a coin deposited upon it, substantially as described.

2. A toy race-track consisting of a casing having its top formed with a series of concentric slots, a rotary plate mounted on a vertical shaft beneath the top of the casing and having slots coinciding with the slots in the top of the casing, a number of miniature figures located above the top of the casing, mounted on vertical rods projecting through the slots in the top of the casing and in the rotary plate, and having rollers loosely resting on the plate and weights at their ends beneath the plate, a driving mechanism consisting of a drum with rope and suspended counter-weight connected by a train of gearing with the vertical shaft on which the rotary slotted plate is mounted, a ratchet and pawl for governing the train of gearing, a counterweighted coin-operated tilting lever for tripping the pawl out of engagement with the ratchet-wheel, and a spring-actuated hooked lever for holding the tilting lever and pawl in engagement with the ratchet, and a rod for moving the hooked lever out of engagement with the tiling lever, substantially as described.

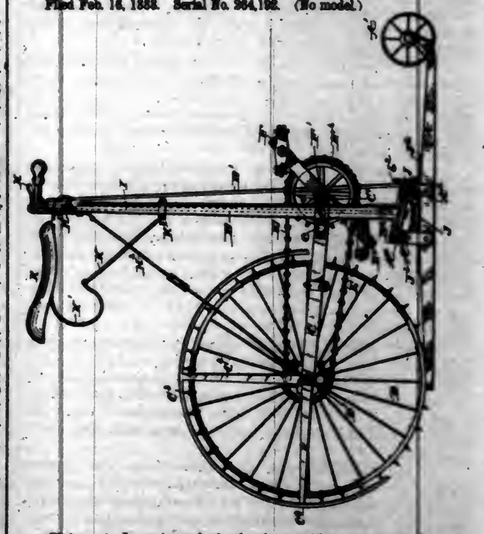


3. In a toy race-track, the casing 1, having removable top 2, with concentric slots 6, the vertical shaft 16, with arms 14, having their hub 15 detachably secured to shaft 16 by set-screw 17, a rotary plate 10, loosely mounted on shaft 16 and having a series of concentric strips 11 and slots 12 coinciding with the strips 5 and slots 6 above them in top 2, and the plate 10, mounted on bolts 13, connecting it with arms 14, and secured by nuts 19, substantially as described.

4. In a toy race-track, a driving mechanism consisting of a drum 32, with rope 33, having suspended counter-weight 35, and connected by a train of gearing, substantially as described, with vertical shaft 16, in combination with the ratchet-wheel 56 on one of the shafts of the train of gearing, the pawl 57, engaging the ratchet-wheel 56 and having an arm 63, and the tilting lever 59, having a counter-weight 60′ at one end, a plate 61 at the other located beneath a coin-chute 62, and a pin 64 on the lever 59 forward of its pivotal point and engaging arm 63 of lever 57, substantially as described.

5. In a toy race-track, a set of gearing consisting of a drum with rope and suspended counter-weight connected by a train of gearing with a vertical shaft, the ratchet-wheel 56 on one of the shafts of the train of gearing, a pawl 59, engaging ratchet-wheel 56 and having an arm 63, a tilting coin-operated lever having counter-weight 60′ at one end and plate 61 at the other, an inclined coin-chute 62, with its lower end projecting over plate 61, in combination with a pivoted spring-actuated lever 61′, having a hook 62′, adapted to engage lever 59, and a sliding rod 69, with retracting-spring 72, and a tapering head 71, adapted to engage the lower end of lever 61′ and move it out of engagement with lever 59, substantially as described.

407,875. ALTERNATING-CURRENT DYNAMO. GISBAY PFANNKUCHE, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Filed Dec. 2, 1887. Serial No. 256,315. (No model.)



407,875.

Claim.—1. In a self-exciting alternating-current compound dynamo, the combination, with the armature, of field magnets having two sets of field-coils wound to act cumulatively in energizing the field, one coil being in series with the working-circuit and the other in a derived circuit, and a separate commutator for each set of coils, said commutators being constructed to straighten the alternating current generated by the dynamo and transform it into two continuous currents for use in energizing the two sets of field-coils, substantially as set forth.

2. In a self-exciting alternating-current dynamo, the combination, with a generating-armature and collectors for taking the alternating electrical impulses from the same, of two sets of field-coils and a separate commutator for each set for straightening the alternating exciting-currents to each coil, and an independent commutator for resolving the straightened current into alternating impulses to the line, substantially as described.

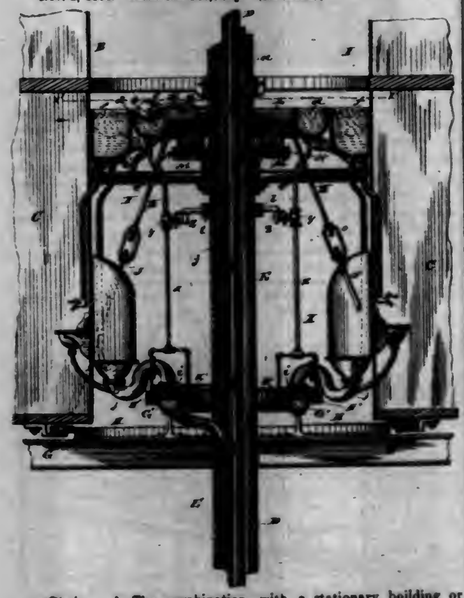
407,876. ICE-VELOCIPEDE. JOSEPH R. ROBINSON, Oil City, Pa. Filed Feb. 16, 1888. Serial No. 264,102. (No model.)

Claim.—1. In an ice-velocipede, the combination of a horizontal frame having runners, an upright frame, so as to turn horizontally

thereon, pivoted to said horizontal frame, a guiding apparatus pivoted in said upright frame and operating upon said horizontal frame, a propelling-wheel journaled in a frame pivoted to the said upright frame, a lifting device for lifting said driving-wheel frame, and a treadle device for imparting motion to said driving-wheel.

2. In an ice-velocipede, the combination of a horizontal frame having runners and an inclined disk or plate A^4, an upright frame having at its base an inclined plate or disk B^2, which sets upon and moves pivotally on the plate A^4, a universally-jointed stem I, extending from the plate A^4 to the top of said upright frame, and arms for working said stem I pivotally in said upright frame and turning the said horizontal frame pivotally upon the said upright frame.

3. In an ice-velocipede, the combination of a horizontal frame having runners, an upright frame carrying the propelling apparatus, which is pivoted to said horizontal frame so as to turn horizontally thereon, and a steering apparatus for turning said horizontal frame, which is pivoted longitudinally in said upright frame.



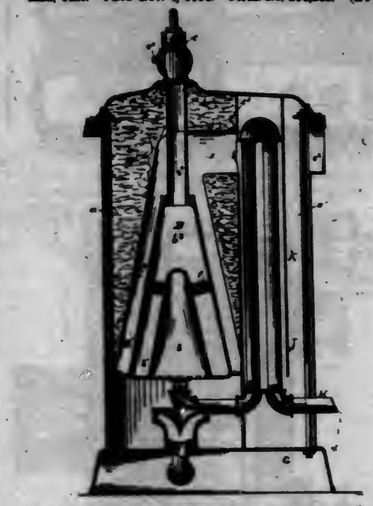
4. In an ice-velocipede, the combination of a horizontal frame having runners, wheels at the points of said runners, an upright frame pivoted to said horizontal frame, and a propelling apparatus mounted on said upright frame.

5. In an ice-velocipede, the combination of a horizontal frame having runners, a tilting frame having guard-runners pivoted to said horizontal frame between said runners, an upright frame pivoted to said horizontal frame, and gearing for tilting said tilting frame when the horizontal frame is moved pivotally on the upright frame.

6. In an ice-velocipede, the combination of a horizontal frame having runners, an upright frame mounted pivotally on said horizontal frame so as to turn horizontally thereon, a propelling-wheel mounted in a frame which is pivoted on said upright frame, and a lifting device for lifting said propeller-wheel.

7. In an ice-velocipede, the combination of a horizontal runner-frame, an upright frame supporting the rider's seat, which is pivoted to the said horizontal frame so as to turn horizontally thereon, a pedal apparatus supported by said upright frame, a driving-wheel supported in a frame which is pivoted to said upright frame, gearing for driving said drive-wheel from said pedal apparatus, and a lifting device for lifting said driving-wheel.

407,877. REVOLVING JAIL. EDWARD ROWE, Indiana, Pa. Filed Nov. 2, 1886. Serial No. 217,840. (No model.)



Claim.—1. The combination, with a stationary building or structure provided with a central ventilating-shaft, an incased smoke-flue and soil-pipes located in said ventilating-shaft, of the revolving cells, the flushing-tank, a service-tank having a valve-and-ball float, the down pipes, closet-basins having flushing-pipes, the water-sealed pans, and the connecting soil-pipes leading to the incased soil-pipes, substantially as specified.

2. The combination, with the building provided with the revolving cells, basins, and the incased soil-pipe, of the annular water-sealed pans, the caps i, the flushing-pipes connected to the closet-basins, the annular tank *d*, the service pipe and float, the branched pipe provided with a cock and lever, and the cam secured to the ventilator-pipe, substantially as specified.

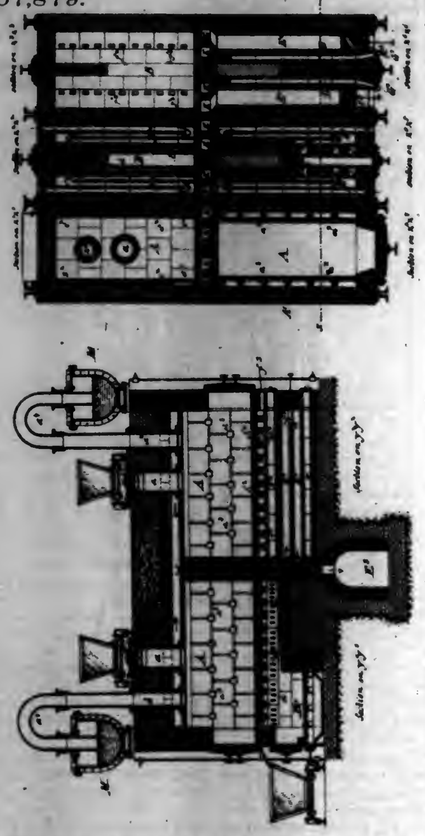
3. The combination, with the stationary annular pan having a water-channel cast thereon, of a rotary cap for sealing the soil-pipe, substantially as specified.

407,878. HOT-WATER GENERATOR. PETER G. VAN WIE, Cleveland, Ohio. Filed Nov. 7, 1888. Serial No. 290,202. (No model.)

Claim.—1. In a water-heater, the combination, with water-reservoir B, having its lower portion *b′* made in conical ring form and having its upper portion b^3 made as a continuous chamber in horizontal plane, of the flue E^3, surrounding said reservoir, the lower portions of said flue E^3 being open and located substantially in the same horizontal plane with the bottom of said water-leg *b′*, said reservoir being provided with one or more cross-flues *f*, connecting interior central opening *b* with said flue E^3 in a cross-sectional plane passing through the upper portion of said water-leg *b′*, substantially as set forth.

2. In a water-heater, the combination, with water-reservoir B, having its lower portion formed as an annular conical water-leg *b′* and having its upper portion b^3 formed as a continuous chamber in cross-section, and central vertical outlet-pipe b^5, connecting with the central upper extremity of said central reservoir portion b^3, of flue E^3, surrounding said reservoir and connecting portion of said pipe b^5, and said water-leg *b′*, having upper cross-sectional portion provided with one or more cross-cutting flues *f*, connecting the upper portion of the central conical depression *b* with said flue E^3, substantially as set forth.

3. In a water-heater, the combination, with cone-shaped reservoir B and jacket E′, of non-radiating material, located intermediate of the reservoir and the outer wall of the heater, of flue E^3, formed intermediate of said jacket and the reservoir, said jacket inclosing said reservoir on the top and sides, substantially as set forth.



4. In a water-heater, the combination of cone-shaped reservoir B, provided with depending annular water-leg *b′*, vertical outlet-pipe b^5, connecting with said reservoir, jacket E′, formed intermediate of the stove-wall and the reservoir, said jacket inclosing said reservoir on the top and sides and surrounding said discharge-pipe b^5, the interior shape of said jacket and the exterior shape of said reservoir where lying in the same horizontal plane being substantially in counterpart of each other, and flue E^3, being formed intermediate of the jacket and the reservoir, whereby the products of combustion are caused to pass close to the reservoir, and are kept in contact with the same, substantially as set forth.

5. In a water-heater, the combination of cone-shaped reservoir B, shaper E, having its body portion of conical form and provided with the outlet-flue *c*, located above the top of the reservoir, and mineral-wool jacket E′, intermediate of the shaper and the outer wall of the heater, said jacket inclosing said reservoir at top and sides, substantially as set forth.

407,879. COKE-OVEN. ADAM WEBER, New York, N. Y. Filed Sept. 25, 1888. Serial No. 286,332. (No model.)

Claim.—1. The combination of a coking-chamber, a combustion-chamber provided with a grate, each side wall of the combustion-

407,879.

chamber having separate series of horizontal gas-heating flues, gas-supply pipes connecting with the front end of the lowermost gas-heating flue, and lateral channels connecting the uppermost gas-heating flues with the combustion-chamber, and means for supplying air to the combustion-chamber, substantially as set forth.

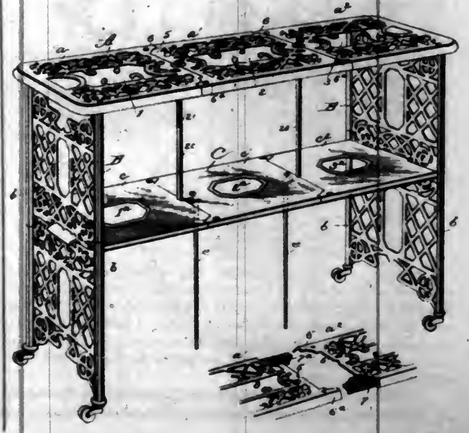
2. The combination of a coking-chamber, a combustion-chamber provided with a grate, each side wall of the combustion-chamber having separate series of gas-heating flues connected with a source of gas-supply and smoke-flues arranged side by side, a mantel having a flue therein extending around the coking-chamber, a rear wall for the oven provided with descending flues, and a chimney connecting with the smoke-flues, substantially as set forth.

3. The combination of a coking-chamber, a combustion-chamber provided with a grate the side walls whereof are provided with gas-heating flues and air-heating flues located side by side, and gas-supply pipes connecting with the lowermost gas-heating flues, the uppermost ones being provided with lateral eduction-channels connecting with the combustion-chamber, said air-heating flues having also eduction-channels communicating with the combustion-chamber, substantially as set forth.

4. The combination, with a coking-chamber, of a combustion-chamber located below the coking-chamber, each side wall whereof is provided with a series of gas-heating flues and a series of air-heating flues located side by side therein, gas-supply pipes connecting with the lowermost gas-heating flues, the uppermost gas-heating flues having lateral eduction-channels connecting with the combustion-chamber, said air-heating flues being also provided with eduction-channels communicating with the combustion-chamber, a mantel surrounding the bottom, sides, and top walls of the retort, having a flue therein, substantially as set forth, a rear wall for the oven having a descending flue therein, partition-walls between the several ovens having horizontal smoke-flues for the products of combustion and air-heating flues above them, and a chimney connecting with the smoke-flues, substantially as set forth.

5. The combination, with a coking-chamber, of a combustion-chamber located below the coking-chamber, each side wall whereof is provided with a series of gas-heating flues, the lowermost ones whereof connect with gas-supply pipes and the uppermost ones whereof are provided with lateral eduction-channels connecting with the combustion-chamber, the walls of the combustion-chamber being also provided with a primary series of air-heating flues located sidewise of and below the gas-heating flues, and provided with lateral eduction-channels communicating with the space below the grate of the fire, said walls being also provided with a second series of air-heating flues located sidewise of the uppermost gas-heating flues and provided with eduction-channels connecting with the combustion-chamber, said walls also having smoke-flues located between the primary and second series of air-flues, a mantel having a flue surrounding the coking-chamber, a rear wall to the oven having descending smoke-flues, and a chimney connected with the smoke-flues, substantially as set forth.

407,880. WITHDRAWN.



407,881. WASHING-MACHINE. WILLIAM WHITE, Westfield, Pa. Filed July 21, 1888. Serial No. 280,624. (Model.)

Claim.—1. The combination of the tub, the transverse roller journaled therein, the frame pivoted in the tub and carrying a presser-bar adapted to hold the clothes upon the roller, and a check-bar secured transversely in the tub above the roller and bearing on the same to prevent the clothes being carried around thereby, as set forth.

2. The combination of the tub, the roller journaled therein, the check-bar secured transversely in the tub above the roller, the frame pivoted in the tub, carrying a presser-bar having a concave under face, and provided with an arm projecting over the side of the tub, and a stirrup suspended from said arm, as specified.

407,882. OIL-STOVE RANGE. WILLIAM H. WILDER, Gardner, Mass. Filed Feb. 8, 1889. Serial No. 299,144. (No model.)

Claim.—1. The frame for supporting oil-stoves to make an oil-stove range, consisting of a top, the legs, and the shelf C, the said top and shelf being made up of detachable sections, whereby the length of the frame may be varied, substantially as described.

2. In combination, the sectional top, the sectional shelf, the legs, and the suspending-rods extending between the top and shelf, substantially as described.

3. In combination, the sectional top, the sectional shelf, the suspending-rods, and the supplemental legs secured to the sections of the shelf, substantially as described.

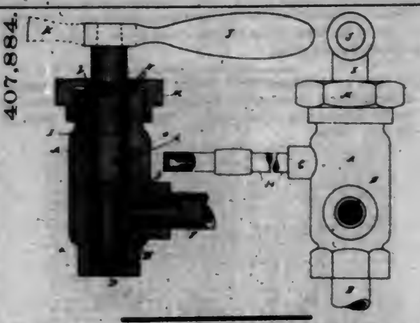
4. In combination, the top, the shelf, and the legs B B, formed in sections, the said shelf having projections adapted to fit between said sections, substantially as described.

5. In an oil-stove, the top, the supporting-shelf, and the legs, the said top and shelf both being made of detachable sections, the end sections of each part being made interchangeable, substantially as described.

6. In combination, the horizontal top grate, the horizontal supporting-shelf, the legs, and the connection between the legs and one of the horizontal parts, consisting of the notched flanges and the screws, substantially as described.

407,883. LIGHTING DEVICE. WILLIAM H. WILDER and HARLAN P. WILDER, Gardner, Mass. Filed Mar. 20, 1889. Serial No. 304,065. (No model.)

Claim.—1. A match-holder consisting of a handle and a socket at the end thereof formed of a coiled wire reduced or tapered from the front end, said end being open and free for receiving the match, substantially as described.



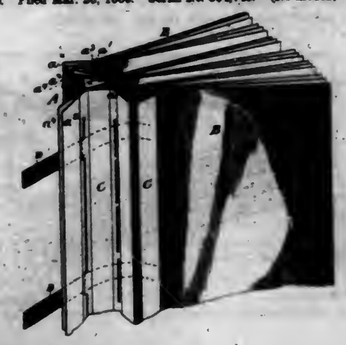
2. A holder for a match or the like, consisting of a socket of coil-wire which is tapered or reduced from the enlarged open front end, the wire at the narrow end of the coil being continued to form a handle, substantially as described.

407,884. COCK FOR SELF-LIGHTING GAS-FUEL BURNERS. LOUIS P. WILLING and CHARLES F. KIEWEL, Erie, Pa.; said Kiefer assignor to said Willing. Filed Dec. 1, 1888. Serial No. 292,413. (No model.)

Claim.—The combination, in a shut-off cock for self-lighting gas-burners, of a body A, having openings D, E, and G therein, with a hollow plug-valve I, having lateral openings *f* and *d*, and the groove *e* from the opening *d*, substantially as and for the purpose set forth.

407,884.

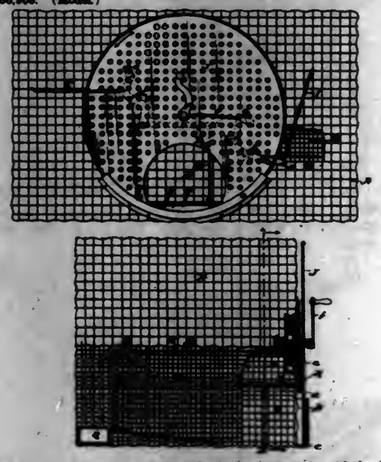
407,885. FEEDING-CRUSHER FOR CRUSHING AND GRINDING MILLS. JAMES F. WISHNELL, Springfield, Ohio, assignor to the Foos Manufacturing Company, same place. Filed Feb. 25, 1888. Serial No. 265,293. (No model.)



Claim.—1. In a crushing and grinding mill, a feeding-crusher consisting of a cylinder-like body having integral longitudinal peripheral ribs terminating in comparatively sharp edges, and integral radial protuberances, the latter projecting beyond the former.

2. In a crushing and grinding mill, a feeding-crusher consisting of a cylindrical body, longitudinal peripheral ribs approximately V-shaped in cross-section, and radial protuberances extending from the ribs.

3. In a crushing and grinding mill, a feeding-crusher constructed of a cast-iron cylindrical body and a shaft upon which it is secured, and having longitudinal peripheral ribs terminating in a reduced edge, and radial protuberances extending from the ribs, the said ribs and protuberances being integral with the body.

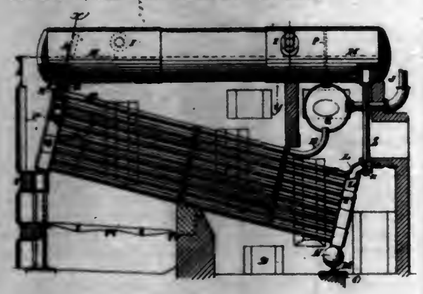


4. In a crushing and grinding mill, a feeding-crusher consisting of a body, longitudinal peripheral ribs terminating in reduced edges, and radial protuberances extending from the ribs, and so arranged that the protuberances at diametrical points stand in the same vertical plane with respect to each other, but out of the same plane with the next set of protuberances.

407,886. BLANK-BOOK. ROBERT A. W. WIEKENBURG, St. Louis, Mo. Filed Mar. 25, 1889. Serial No. 304,743. (No model.)

Claim.—A blank-book having the stubs A folded at a a' a^2, sewed to sections of the blank leaves at folds a' and to one another at folds a^2, as shown and described.

407,887. ANIMAL-TRAP. HENRY BARRY, Chicago, Ill., assignor of two-thirds, by direct and mesne assignments, to Dennis Norton and Charles Franke, both of same place. Filed Oct. 1, 1888. Serial No. 286,909. (Model.)



Claim.—1. In an animal-trap, the body thereof provided with a blind entrance-way projecting therein, and a spring-actuated revolving door provided with one or more openings and a corresponding number of blind portions between said openings, adapted and arranged to alternately register with said entrance, in combination with a passage leading from the entrance-way to the body of the trap, stops for alternately engaging the door, and triggers located in the entrance-way and passage, respectively, for operating said stops, substantially as described.

2. In an animal-trap, the body thereof provided with an entrance, a spring-actuated revolving door having one or more openings, and a corresponding number of blind portions between said openings, and a stop on said door, in combination with trips projecting into the path of said stop, an entrance-way for said body, an elevated passage connecting said entrance-way with the body of the trap, a platform-trigger located in the entrance-way for operating one of said trips, and a spring-supported trap-door in said passage for operating the other trip, substantially as described.

3. In an animal-trap, the body thereof provided with a blind entrance-way projecting therein, a spring-actuated revolving door provided with one or more openings, and a corresponding number of blind portions between said openings, adapted and arranged to alternately register with said entrance, stops upon said door, a shaft journaled on the body of the trap, a spring-controlled trip thereon projecting into the path of said stops, a pivoted platform in said entrance-way, and a rod and crank-arm connection between said platform and shaft, in combination with a passage leading from the entrance-way into the body of the trap, a pivoted trap-door in said passage, and a trip attached to the pivot thereof, also projecting into the path of said stops, substantially as described.

407,888. STEAM-BOILER. JOHN A. CALDWELL, Bay Ridge, N. Y. Filed Dec. 17, 1886. Serial No. 221,823. (No model.)

Claim.—1. In a sectional steam-boiler, the combination, with a box or header having tubes communicating with the same and an opening giving access to the said tubes, of a cover V, adapted to close the said opening and bolted to the said box from the outside by bolts passing through the said cover and the side castings at points outside of the said opening, substantially as and for the purpose set forth.

2. In a sectional steam-boiler, the combination, with a box or header having tubes communicating with the same and an opening giving access to the said tubes, of a cover V, adapted to close the said opening and bolted to the said box from the outside at points intermediate to the location of the said tubes by bolts passing through the said cover and the side casting at points outside of the said opening, substantially as and for the purpose set forth.

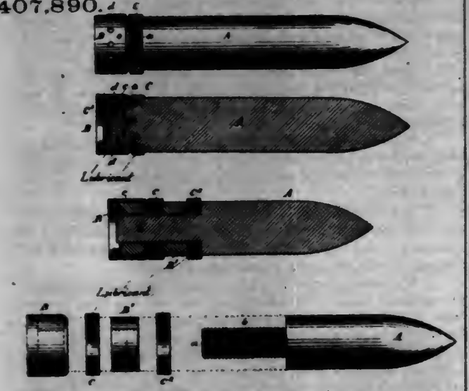
3. In a sectional steam-boiler, the combination, with a box or header having tubes communicating with the same and an opening giving access to the said tubes, and having exterior pockets adapted to receive and retain bolts e, inserted from the front of the said box, of a cover to close the said opening and having holes at its edge in front of the said pockets, and bolts e, held by their heads in the said pockets and passing through the holes in the said cover, for the purpose of tightening the latter against the box without the use of steam-packing around the bolts, substantially as specified.

4. In a sectional steam-boiler, the combination, with a box or header having tubes communicating with the same and an opening giving access to the said tubes, and having exterior pockets adapted to receive and retain bolts e, inserted from the front of the said box, of a cover adapted to close the said opening and having holes at its edge in front of the said pockets, a spider-frame W, bridging the said cover and secured to the box by the same bolts e which directly secure the cover, the said spider having a bolt or set-screw A pressing upon the said cover V, substantially as specified.

5. In a sectional steam-boiler, the combination, with the header L and with the steam and water drum H and circulating-tubes S, of the neck or extension K upon the said header, the said extension receiving the lower end of the said circulating-tubes and being provided opposite to the same with a removable plug or cover k, to gain access for cleaning of the said tubes, substantially as specified.

6. The superheater consisting in the combination of tubes E, steam-drum G, receiving one end of the said tubes, header C, receiving the other end of the said tubes, and steam-circulating pipes P and A, communicating with the steam-space in the steam and water drum H, the upper headers D of the water-leg Q being connected by nipples R directly to the water-space of the drum H, substantially as specified.

407,889. ANT-TRAP. EDWIN R. DAVIS, Bluff Dale, Tex. Filed Apr. 11, 1889. Serial No. 306,832. (No model.)



Claim.—1. An ant-trap consisting of an open endless curb having inclined sides and arranged in the upper end of an opening in the ground, the body arranged in the said opening in the ground beneath the open curb, and the hopper supported by the body and adapted to conduct the ants from the curb into the body, as set forth.

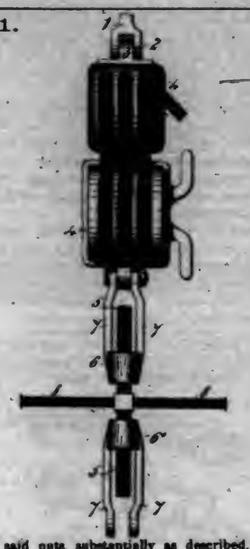
2. The curb for ant-traps having inclined sides and an annular horizontal flange, as set forth.

407,890. LUBRICATING-PROJECTILE. SELDEN A. DAY, Bowling Green, Ohio, assignor to the Day Projectile Company, New York, N. Y. Filed Mar. 6, 1889. Serial No. 302,175. (No model.)

Brief.—A base is connected to a projectile by means of a screw-thread. A lubricant is placed between the base and projectile, and the lubricant is squeezed out by the base, which is screwed up in the operation of firing.

Claim.—1. A projectile having a separate base or sabot connected to it through the medium of a screw-thread and normally

partly unscrewed, said base being adapted to engage the rifle-grooves in firing and to be rotated thereby, and by reason of such rotation and the inertia of the body of the projectile to be screwed up to the latter.



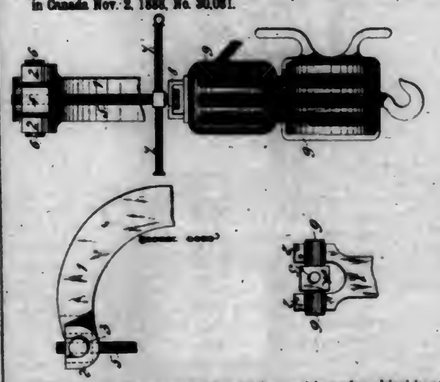
2. A projectile having a separate base or sabot connected to it through the medium of a screw-thread and normally partly unscrewed, and with a partially-resisting substance or filling between a shoulder or face on the front of said base, and a shoulder or face at the rear of the body of the projectile adapted to partially resist the screwing up of the base in the operation of firing, and by such resistance to communicate the rotary movement of the base gradually to the body of the projectile in order to gradually overcome the inertia of the latter and impart to it an accelerating rotation.

3. A projectile having a separate base or sabot connected to it through the medium of a screw-thread and normally partly unscrewed, and provided with a lubricating substance between said base and the body of the projectile adapted to be gradually squeezed out by the screwing up of the base during the operation of firing.

4. A projectile consisting of a body portion and a separate base or sabot, the one formed with a screw-threaded neck and the other with a screw-threaded socket engaging said neck, a cavity formed within the socket and provided with holes extending from said cavity to the exterior, combined with a filling of lubricating substance in said cavity, whereby it is adapted to be squeezed out through said holes by the screwing up of the base against the body portion of the projectile, and means for operating said base.

5. A projectile having its body portion formed with a contracted screw-threaded neck at its rear, and a separate base formed with internal screw-threads screwing upon said neck, normally partly unscrewed, and formed to project beyond the diameter of the body in order to engage the rifle-grooves, whereby it is adapted to be screwed up to the body during the operation of firing.

407,891. APPARATUS FOR RAISING AND LOWERING BOATS. FERDINAND A. L. DE GEUTTER, Amsterdam, Holland. Original application filed July 24, 1888, Serial No. 280,924. Divided and this application filed Jan. 2, 1889. Serial No. 295,917. (No model.) Patented in England May 24, 1888, No. 7,631; in France June 25, 1888, No. 191,415; in Sweden July 2, 1888, No. 1,582; in Norway July 9, 1888, No. 1,088; in Belgium July 10, 1888, No. 82,514; in Italy Sept. 30, 1888, XLVII, 119; in Spain Oct. 2, 1888, No. 2,482; in Austria-Hungary Oct. 26, 1888, No. 30,047, and in Canada Nov. 2, 1888, No. 30,061.



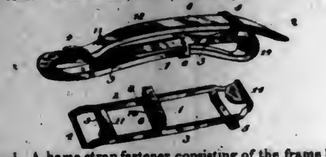
relatively to said nuts, substantially as described, for the purpose specified.

4. In apparatus for raising and lowering ships' boats, the combination of a davit, pulley-blocks adapted to raise and lower a boat and suspended from said davit, and screw-gearing carried by said blocks and provided with means for connecting said gearing to a boat, said gearing comprising a right-and-left-handed screw-threaded rod and correspondingly-formed nuts thereon, said rod being capable of rotation relatively to said nuts, substantially as described, for the purpose specified.

5. In apparatus for raising and lowering ships' boats, the combination of a davit, lowering-tackle suspended from said davit, a rod 5, formed with right-and-left-handed screw-threads, a lever for rotating the said rod, and nuts 6 6°, adapted to work on said rod, but prevented from turning with reference thereto, one of said nuts being connected to said lowering tackle and the other being adapted to be connected with a boat to be raised or lowered.

407,892. APPARATUS FOR RAISING AND LOWERING BOATS. FERDINAND A. L. DE GEUTTER, Amsterdam, Holland. Filed July 24, 1888. Serial No. 280,924. (No model.) Patented in England May 24, 1888, No. 7,631; in France June 25, 1888, No. 191,415; in Sweden July 2, 1888, No. 1,582; in Norway July 9, 1888, No. 1,088; in Belgium July 10, 1888, No. 82,514; in Italy Sept. 30, 1888, XLVII, 119; in Spain Oct. 2, 1888, No. 2,482; in Austria-Hungary Oct. 26, 1888, No. 30,047, and in Canada Nov. 2, 1888, No. 30,061.

Claim.—1. In apparatus for raising and lowering ships' boats, the combination of a tackle-block, a screw-threaded rod connected to said block by a swivel, a correspondingly-threaded nut through which said rod works, said nut being adapted to be pivotally connected to a support in such a manner as to permit said rod to swing in a vertical plane, for the purpose specified.

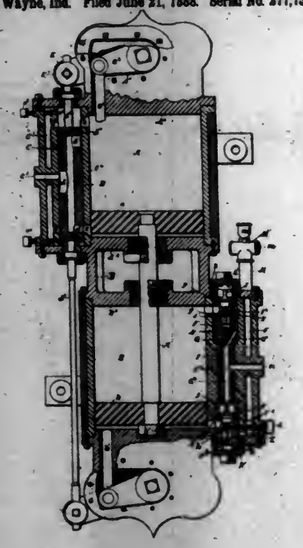


2. In apparatus for raising and lowering ships' boats, the combi-

nation of a davit, a screw-threaded rod, a correspondingly-threaded nut journaled to said davit, and through which said rod extends and in relation to which said rod is adapted to be turned, and lowering-tackle suspended from said rod by a swivel connection, substantially as herein described, for the purpose specified.

3. In apparatus for raising and lowering ships' boats, the combination, with a davit and a lowering-tackle, of a screw-threaded rod adapted to be turned about its axis, and a correspondingly-threaded nut or nuts journaled to said davit, prevented from turning relatively to said rod and through which said rod works, said lowering-tackle being suspended from said rod by a swivel-joint, substantially as described, for the purpose specified.

4. In apparatus for raising and lowering ships' boats, the combination of a davit; screw-gearing comprising a screw-threaded rod, a correspondingly-formed nut journaled to said davit, and pulley-blocks suspended from said rod by a swivel-joint and adapted to lower a boat, said rod being adapted to be turned relatively to said nut, substantially as described, for the purpose specified.

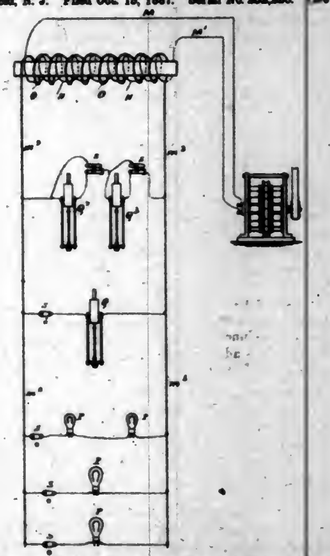


407,893. HAME-STRAP FASTENER. ROBERT M. DILLARD, Goodland, Kans., assignor of one-half to Calvin P. Russell, same place. Filed Apr. 12, 1889. Serial No. 306,926. (No model.)

Claim.—1. A hame-strap fastener consisting of the frame having the longitudinal side bars and the cross keeper-bars located at both ends of said longitudinal bars and at the middle thereof, the cross-bar 8, located close to the middle keeper-bar of the frame and having a stud which projects therefrom at right angles to the longitudinal axis of the frame, another cross-bar 9, arranged near one of the end keeper-bars of the frame and having a stud which projects therefrom at right angles to the axis of the frame and in an opposite direction from the stud on the other cross-bar 8, and a curved plate at the opposite end of the frame from the cross-bar 9, substantially as and for the purpose described.

2. A hame-strap fastener consisting of the longitudinal side bars having a curved plate at one end, the keeper-bars located at opposite ends and the middle of said side bars on different horizontal planes with respect to each other and the curved plate, a cross-bar 8, located at the middle of the side bars and having a stud which projects toward the upper keeper-bar 6, at the middle of the frame, and another cross-bar 9, located near one end of the side bars and the keeper-bar 4, and having a fixed stud which projects in the reverse direction from its bar 9 to that of the stud on the bar 8, all of said parts being cast in a single piece, substantially as and for the purpose described.

407,894. VALVE FOR STEAM-ENGINES. THEODORE H. HARRISON, Fort Wayne, Ind. Filed June 21, 1888. Serial No. 277,739. (No model.)



Claim.—1. The combination, with a steam-chest having a cylindrical bore and ports and a hollow plunger-valve fitting snugly within said bore and provided with ports, of valve-rods attached to the ends of the valve, and devices for shifting the valve-rods by the movement of the piston, the ports in the steam-chest being so arranged relatively to the valve whereby a continued movement of the valve to the end of its throw is caused by exhaust-steam admitted behind the valve, substantially as set forth.

2. The combination, with cylindrical steam-chamber, and hollow plunger-valve operating therein, with ports, substantially as indicated, of vent-holes c^3, arranged substantially as described, and for the purpose set forth.

3. The combination, with cylindrical steam-chamber, hollow plunger-valve operating therein, and ports, substantially as indicated, of vent-holes c^3, and means, substantially as shown, for graduating the openings of such vent-holes, substantially as set forth.

4. The combination of cylindrical steam-chamber, hollow plunger provided with steam-ports operating therein, with steam and exhaust ports in valve-chamber, and mechanism, substantially as described, for moving the valve part way of its throw, substantially as indicated, the arrangement of ports being substantially as described, whereby a continued movement of the valve to the end of its throw is caused by exhaust-steam admitted from the cylinder behind the valve, substantially as set forth.

407,895. ELECTRIC-LIGHTING SYSTEM. FRANK B. KIDDER, Plainfield, N. J. Filed Oct. 13, 1887. Serial No. 252,220. (No model.)

Claim.—1. The combination, with the primary and secondary circuits and the converter therewith connected, having a small wire in the primary and a large wire in the secondary, of an arc lamp having a carbon-holder, a helix in the secondary circuit, and a tubular core divided longitudinally and projecting below the helix, and mechanism for connecting the carbon-holder and core for regulating the carbon-holders, substantially as set forth.

2. The combination, with the primary and secondary circuits and a converter in such circuits, of an electric-arc lamp and regulating mechanism having an electro-magnet the helix of which is in the secondary circuit, and a tubular core for the same through which the carbon-holder passes, substantially as specified.

3. The combination, with the primary and secondary circuits and the converter therewith connected, having a small wire in the primary and a large wire in the secondary, of incandescent and arc lamps in the secondary circuit and a helix also in the secondary circuit, and a core and mechanism acted upon by the same for moving and regulating the carbon-holder of the arc lamp, substantially as specified.

407,896. INSULATING COMPOSITION. FRANK MARSHARD, New York, N. Y. Filed Dec. 3, 1888. Serial No. 292,510. (No specimens.)

Claim.—1. The insulating compound herein described, consisting of wood pulp, extract of logwood, bichromate of potash, sulphate of iron, animal glue, rosewood sawdust, an albuminous substance, and vegetable fiber, substantially as set forth.

2. The insulating compound herein described, the same consisting of the following ingredients, in about the following proportions: twenty pounds of wood pulp, one pound of extract of logwood, one-eighth of a pound of bichromate of potash, one-eighth of a pound of sulphate of iron, four pounds of animal glue, ten pounds of rosewood sawdust, and two and one-half pounds of an albuminous substance substantially as specified.

3. The insulating compound herein described, the same consisting of the following ingredients, in about the following proportions: twenty pounds of wood pulp, one pound of extract of logwood, one-eighth of a pound of bichromate of potash, one-eighth of a pound of sulphate of iron, four pounds of animal glue, ten pounds of rosewood sawdust, and two and one-half pounds of an albuminous substance, and a quantity of vegetable fiber, such as flax, hemp, &c., substantially as specified.

407,897. BURIAL-CASKET. THOMAS MCGOVERN, New York, N. Y. Filed Mar. 27, 1889. Serial No. 304,972. (No model.)

Claim.—1. The combination, with the casket, of the lid of the same, said lid having a fixed foot-section *a* and a sliding head-section *b*, and grooves in said lid, whereby the latter section slides over and above the former when displaced.

2. The combination, with the casket, of the removable lid or cover of the same, provided with a fixed foot-section, a sliding head-section, which slides over and above the foot-section when displaced, and guiding-grooves in said cover for said sliding section, said grooves being deepest at the head end of said cover to permit the sliding section to descend to a level with the fixed section when in place, as and for the purposes set forth.

407,898. HANDLE. EDWARD P. NORRIS, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Mar. 6, 1889. Serial No. 302,113. (No model.)

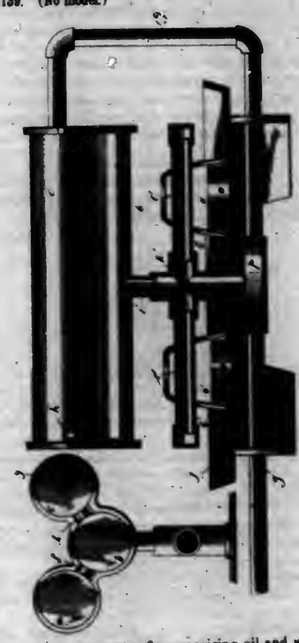
Claim.—1. The combination, with the drawer handle or pull, of two eyes, each of which is formed of one piece of wire having a screw-threaded shank 3, an eye 2, and a stop 4, the latter being at one side of the shank and extending backwardly from the eye, and the end forming an abutment or a stop, substantially as set forth.

2. The combination, with the plate A and handle C, of the handle-eyes, each formed with a screw-threaded shank 3, an eye 2 for the reception of the handle, and a stop 4 entirely at one side of and parallel with the shank 3, there being recesses in the plate B for the reception of the ends of the stops 4, substantially as set forth.

3. The combination, with drawer-handles, of handle-eyes, each formed of one piece of wire screw-threaded on the shank and bent to form an eye, and a rearward stop parallel with and entirely at one side of the shank, and the plate B, against which the end of the stop rests, substantially as specified.

407,899. VEHICLE-SPRING. NAPOLEON B. PHELPS, New York, N. Y. Filed Apr. 9, 1889. Serial No. 306,560. (No model.)

Claim.—In a vehicle, a continuous spring E and a continuous metal cushion, each extending in one stretch across the vehicle, and each having a short central bearing attached to the body with the portions adjacent to such bearing extending outward and downward in straight inclines, and the outer portions curved upward, in combination with each other and with means for attaching the cushion ends to the carriage-body and the spring ends to shackles C, connecting to side bars B, all arranged to serve as herein specified.



407,900. MANUFACTURE OF BRUSHES. JAMES A. READ, Arlington, N. J., assignor to the Rubber and Celluloid Harness Trimming Company, of New Jersey. Filed Sept. 15, 1888. Serial No. 285,561. (No model.) Patented in England Aug. 10, 1885, No. 9,502, and in France Aug. 16, 1886, No. 170,669.

Claim.—1. A brush having the interstices between the ends of its bristles filled with vulcanite, and having said bristles united to a handle by a section of vulcanite, substantially as described.

2. A brush having the interstices between the ends of its bristles filled with vulcanite, by means of which the individual bristles are cemented to each other, substantially as described.

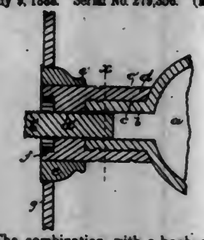
407,901. APPARATUS FOR VAPORIZING OIL AND WATER AND SUPERHEATING AND BURNING THE SAME. NEWTON ROGERS and JAMES A. WHARRY, Terre Haute, Ind. Filed Mar. 21, 1889. Serial No. 304,139. (No model.)

Claim.—1. In an apparatus for vaporizing oil and water and superheating and burning the same, the combination of an oil-vaporizing retort provided with an oil-supply, a water-vaporizing retort provided with a water-supply, a separate and distinct mixing and superheating retort communicating directly by suitable means with said vaporizing-retorts and located in a lower plane than the vaporizing-retorts, whereby intervening spaces are formed for the flame, a gas-pipe leading from said mixing-retort, and one or more burners below the superheating-retort, substantially as described.

2. In an apparatus for vaporizing oil and water and superheating and burning the same, the combination of the parallel oil and water vaporizing retorts, a separate mixing and superheating retort located between and in a plane below said vaporizing-retorts, pipes connecting the superheating-retort and the vaporizing-retorts, a vapor-pipe extending down from the mixing-retort and provided with burners located beneath said retorts, and a base, substantially as described.

3. The combination, with the oil and water vaporizing retorts and a separate mixing and superheating retort located in a lower plane than and into which the gases from said vaporizing-retorts are passed, of a

vapor-pipe leading down from the bottom of said mixing-retort, burners supplied from said pipe, and a trap or reservoir removably secured on the lower end of said pipe, whereby the residuum is drained from said retorts into said reservoir, substantially as described.



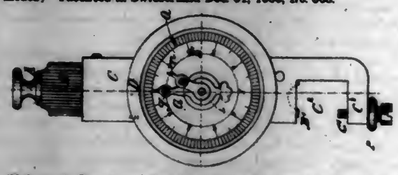
4. In an apparatus for vaporizing and burning oil and water, the combination of a base having air-supply openings therethrough, water and oil vaporizing retorts, a vapor mixing and superheating retort above the base and in communication with said vaporizing-retorts, a vapor-exit pipe leading from the mixing-retort to the base and provided with lateral burner-pipes extending therefrom over the base, and burner-caps straddling said burner-pipes, having their lower open ends resting on the base over said air-supply openings and having flame-openings above the burners, whereby mixing and combustion chambers are formed around the burners, substantially as described.

5. The combination of separate water and oil vaporizing retorts, supply-pipes for the same, a mixing-retort, pipes connecting the vaporizing-retorts with the mixing-retort, yokes securing said retorts together, a vapor-exit pipe extending down from the mixing-retort and provided with one or more burner-pipes extending from the same beneath the retorts, substantially as described.

6. The combination of an oil-vaporizing retort provided with a supply-pipe, a water-vaporizing retort provided with a supply-pipe, a mixing and superheating retort located between and parallel with said two retorts and in a plane below the same, pipes extending down from the vaporizing-retorts to the mixing-retort, a pipe extending downwardly from the bottom of the mixing-retort and having its lower end provided with a trap or chamber, and burners extending laterally from said pipe beneath the retort, substantially as described.

7. The combination of a pan, an oil-vaporizing retort provided with a supply, a water-vaporizing-retort provided with a supply, a mixing-retort in communication with the vaporizing-retorts, said retorts being secured together and supported above the pan, a gas-pipe extending down from the mixing-retort and provided with a removable trap or reservoir on its lower end, pipes extending laterally from the gas-pipe beneath the retorts and provided with apertures, and burner caps or hoods surrounding said apertures, substantially as described.

407,902. KNOB ATTACHMENT. JOHN SCHADE, Brooklyn, N. Y., assignor to the Hopkins & Dickinson Manufacturing Company, of New York. Filed July 9, 1888. Serial No. 279,356. (Model.)



Claim.—1. The combination, with a knob and a spindle, of a sleeve held upon said knob and provided with lugs or pintles, an escutcheon-plate, and a rose-plate arranged upon said escutcheon and around said sleeve, the latter extending through said rose-plate, and said rose-plate being provided with recesses adapted to engage said pintle, said parts being arranged and combined substantially as and for the purposes set forth.

2. The combination, with an escutcheon-plate, of a rose-plate held in pivotal relation to said escutcheon, and provided with a burr *d*, substantially as and for the purposes set forth.

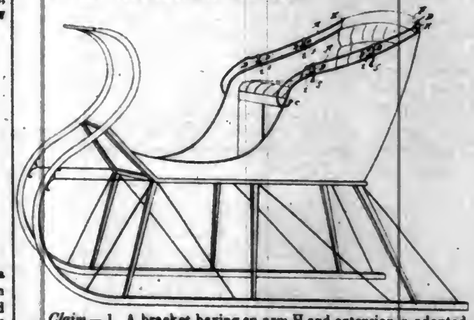
3. In combination with a knob, a threaded spindle and sleeve, an escutcheon-plate and pivoted rose-plate projecting through said escutcheon, and providing frictional bearings, substantially as and for the purposes set forth.

407,903. MICROMETER-GAGE. FRIEDERICH SCHLATTER, Madretsch, Switzerland. Filed Feb. 18, 1889. Serial No. 300,493. (No model.) Patented in Switzerland Dec. 31, 1888, No. 308.

Claim.—1. In a measuring-instrument, the combination of a casing provided with a dial, a slide in said casing provided with a rack, an arbor in said casing provided with a pinion which is engaged by said rack, an arm fixed on said arbor, a hand mounted on said arbor over the dial and provided with a pin which is engaged by said arm, and a spring disposed in a slot in said slide and connected at one end to said casing, substantially as described.

2. In a measuring-instrument, the combination, with a casing and a slide in the same, of a dial on the casing, an arbor in the casing, which arbor is rotated by the slide, an arm fixed on said arbor and provided with a swinging spring-finger, a hand mounted to swing over the dial and provided with a pin on which the spring-finger of the arm can act, and a spring abutting against a fixed point of the casing and pressing the slide upward, substantially as set forth.

3. In a measuring-instrument, the combination of the casing B and the slide C, having the slots B^4 and *b*, the latter having the rack *b*′ formed on one edge, the arbor L, the pinion K on the same engaging the rack *b*′, the spring M in the slot B^3, the dial E on the casing, the arm H on the arbor L, the finger *n*, pivoted on said arm, the spring *i*, secured to the arm H, acting on the finger *n*, and the hand G, mounted to rotate over the dial and provided with the pin *g*, on which the finger *n* can act, substantially as set forth.



407,904. TOP-PROP NUT. ARBON SEARLS, Newark, N. J., assignor to the Searls-Randall Company, same place. Filed Apr. 9, 1889. Serial No. 306,630. (No model.)

Claim.—1. The combination of a nut B and a cap D, a covering E, and molding A, as and for the purpose set forth.

2. The nut B and cap D, in combination with coverings E and F and molding A, as and for the purpose set forth.

407,905. ARM-RAIL FOR SLEIGHS. ARBON SEARLS, Newark, N. J., assignor to the Searls-Randall Company, same place. Filed Apr. 19, 1889. Serial No. 307,768. (No model.)

Claim.—1. A bracket having an arm H and extension *g*, adapted to span a sleigh-panel molding, in combination with a sleigh-arm rail, substantially as set forth.

2. A bracket provided with a catch *i*, in combination with a sleigh-arm rail, substantially as set forth.

3. The cup C, in combination with a sleigh-rail A, substantially as and for the purpose set forth.

4. The combination of a socket E and stud F with a sleigh-rail, substantially as and for the purpose set forth.

5. The combination of the rail A, bracket B, and cup C with end finishers D and E, as and for the purpose set forth.

407,906. PROCESS OF MAKING PARAOXYBENZOIC ACID. BRUNO R. SEIFERT, Radebeul, near Dresden, Saxony, Germany, assignor to Dr. F. von Heyden Nachfolger, same place. Filed Nov. 27, 1888. Serial No. 292,006. (No specimens.)

Claim.—As an improvement in the process of manufacturing paraoxybenzoic acid, the heating of potassium phenate and dry carbonic acid in a closed vessel under a pressure above that of the atmosphere to 180° Celsius or more, substantially as herein described.

407,907. APPARATUS FOR DRAWING OFF AND MIXING THE GRAIN FROM ELEVATORS. WILLIAM H. SPRAGUE, Horwich, County of Lancaster, England. Filed Feb. 12, 1889. Serial No. 299,569. (No model.) Patented in England May 21, 1888, No. 6,940.

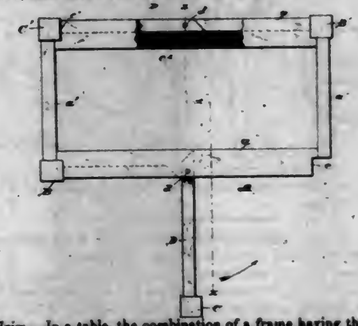
Claim.—1. Apparatus for drawing off and mixing grain, comprising a bin or vessel with vertical passage or passages having free openings or ports in the wall or walls thereof adapted to establish

407,907.

communication between the interior of said bin or vessel and said vertical passage or passages, a chute or delivery-tube, and an inclined converging passage or passages arranged to deliver grain from said vertical passage or passages to said chute or delivery-tube, substantially as herein described, for the purposes specified.

2. Apparatus for drawing off and mixing grain, comprising a bin or vessel provided at or near its lower end with one or more openings, one or more passages having free openings or ports adapted to place the interior of said bin in communication with said passages, one or more inclined passages arranged to converge toward the opening or openings in the lower part of said bin or vessel, and a delivery chute or tube in communication with said passages and with the interior of said bin at or near its lower end, substantially as herein described, for the purposes specified.

3. Apparatus for drawing off and mixing grain, comprising a bin, one or more passages having free openings or ports adapted to place the interior of said bin in communication with said passages, the bottom of said bin being formed with one or more openings and arranged to incline toward the delivery ends of said vertical passages, and a delivery chute or tube in communication with the outlets of said bin and passages, substantially as herein described, for the purpose specified.



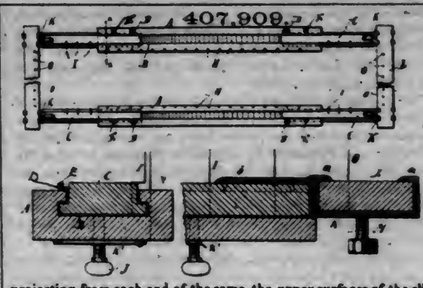
4. Apparatus for drawing off and mixing grain, comprising a bin or vessel, one or more passages therein with free openings out of same into said bin, a delivery-tube, and one or more tubes between said passages and said tube, substantially as herein described, for the purposes specified.

5. Apparatus for drawing off and mixing grain, comprising a bin or vessel open at or near its lower end, one or more passages in said bin with free openings into the same, a delivery-tube, and a tube or tubes between said passages and said delivery-tube, substantially as herein described, for the purpose specified.

6. Apparatus for drawing off and mixing grain, comprising a bin or vessel *a*, open at its lower end, passages *d*, partly formed by partitions *b*, provided with free openings or ports *c*, converging tubes *e*, and chute or delivery-tube *k*, all substantially as described.

7. Apparatus for drawing off and mixing grain, comprising a bin or vessel *a*, open at its lower end, passages *d*, partly formed by partitions *b*, provided with free openings or ports *c*, converging tubes *e*, a pyramidal structure *g*, with converging tubes *h* and *i*, and chute or delivery-tube *k*, all substantially as described, for the purposes specified.

407,908. TABLE. LAWRENCE STOCKMAN, Philadelphia, Pa. Filed Sept. 1, 1888. Serial No. 284,376. (No model.)

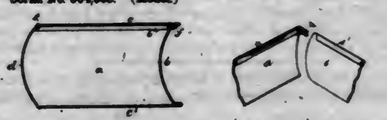


Claim.—In a table, the combination of a frame having the fixed legs B B′ at diagonally-opposite corners and the recesses *c c*′, formed therein at the remaining corners thereof, each side bar of said frame having a longitudinal slot extending from a point near the middle of said bar to one of said recesses, the tie-bars each pivoted at one end in one of said slots, at the inner end thereof, and adapted to be folded within the same to lie flush with the side bars of the frame, the adjustable legs fixed to the free unconfined ends of said tie-bars and adapted to fit in the recesses *c c*′ when said bars are folded in the slots, and a top fixed to the frame and having the hinged leaves, substantially as described.

407,909. FRAME FOR DRYING CURTAINS. JOHN C. TEMPS, New York, N. Y. Filed Apr. 6, 1889. Serial No. 306,241. (No model.)

Claim.—1. A curtain stretching and drying frame composed of grooved side bars, of sliding bars in the grooves of said side bars and

407,909.



projecting from each end of the same, the upper surfaces of the sliding bars being slightly above the upper surface of the side bars, end bars uniting the outer ends of the sliding bars, rows of pins on the side bars and rows of bent pins on the sliding bars, and pins on the end bars, substantially as set forth.

2. In a curtain stretching and drying frame, the combination, with grooved side bars, of sliding bars in the grooves of said side bars and projecting from each end of the same, the upper surface of the sliding bars being slightly above the side bars, end bars uniting the outer ends of the sliding bars and held on the same by screw-clamps, rows of pins on the side bars, rows of bent pins on the sliding bars, pins on the end bars, and screws for locking the sliding bars in place on the side bars, substantially as set forth.

3. In a curtain stretching and drying frame, the combination, with longitudinally-grooved side bars, of sliding bars in said side bars and projecting from the ends of the same, the places of said sliding bars being slightly above the places of the side bars, cross-bars uniting the outer ends of the sliding bars, and rows of pins projecting from the upper surface of such side bars along the inner edge, a row of pins projecting from the inner edge of each sliding bar along the inner edge, said pins on the sliding bars being bent so as to be adjacent to and parallel with the pins on said bars and pins on the cross-bars, substantially as set forth.

407,910. UTILITY PACKAGE. ARTHUR B. WALLER, Kingsland, N. J., assignor to Burger & Lee, New York, N. Y. Filed Mar. 26, 1889. Serial No. 304,663. (Model.)

Claim.—As a new article of manufacture, a utility package in the form of a book with embossed sides and back and lacquered surfaces, one side *c* forming a lid hinged at *c* to the back and having a turned-over clamping-edge *f*, and the ends *a*, having tangs at *h*, adapted to be secured to the concave portion to strengthen the union of the edges at the angles, substantially as and for the purposes set forth.

407,911. SAFETY CHECK-VALVE. MARIUS WARREN, Rochester, N. Y. Filed Oct. 4, 1888. Serial No. 287,151. (No model.)

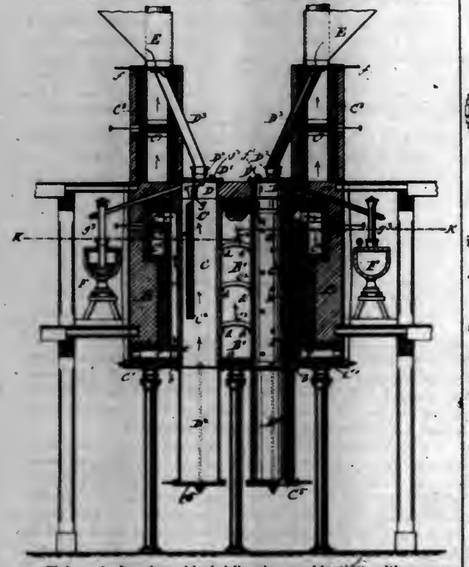
Claim.—1. In a safety check-valve, the closed case having an inlet and a separate outlet, a flexible diaphragm secured in said case and closing one end of the same, the valve-support secured directly to the diaphragm and provided with the spring-holding yoke, the stem 17, normally held against an inward lengthwise movement, and the spring between said stem and the movable yoke, the latter being connected to the valve-support, substantially as specified.

2. In a safety check-valve, the closed case having an inlet and a separate outlet, a flexible diaphragm secured in said case and closing one end of the same, the valve-support secured directly to the diaphragm and provided with the spring-holding yoke, an adjustable stem normally held against an inward lengthwise movement, guides for the inner end of the stem adapted to prevent its rotation, and the spring between said stem and the movable yoke, the latter being connected to the valve-support, substantially as specified.

3. In a safety-valve apparatus, the closed case, the flexible diaphragm secured between a valve-seat support and a clamping-plate,

the extension of the support having a screw-thread connection with said plate, and a washer resting in a recess in said plate and bearing against the diaphragm and adapted to protect the diaphragm from injury when the plate is screwed down upon the diaphragm and washer, substantially as specified.

4. In a safety-check-valve apparatus, the closed case, combined by means of an inlet or inlet-tube with a beer-cask or like vessel containing gas under pressure, the flexible diaphragm having fixed thereto the valve-seat and adapted to be exposed to gas-pressure within the case and cask in both the open and closed positions of the valve, the spring-holding yoke secured to the support, the outlet-tube entering the side of the case and bent near its inner end in the direction of the valve, the spring tending to move the diaphragm and valve toward the outlet, and a distinct gas-inlet, substantially as specified.



5. In a safety-valve apparatus, the combination of the closed case having an inlet and a separate outlet, a valve for the outlet, the flexible diaphragm having affixed thereto a valve-seat and adapted to be moved by gas-pressure, and also adapted to be exposed to the pressure in the case and in the inlet or inlet-tube in both the open and closed positions of the valve, and the spring adapted to move the diaphragm and valve toward the outlet to close the same, with a pipe provided with a relief-valve, substantially as specified.

6. In a safety-valve apparatus, the combination of the closed case having an inlet, a separate outlet, a valve for the outlet, the flexible diaphragm having affixed thereto a valve-seat and adapted to be moved by gas-pressure, and also adapted to be exposed to the pressure in the case and in the inlet or inlet-tube in both the open and closed positions of the valve, and the spring tending to move the diaphragm and valve toward the outlet to close the same, with a pipe provided with a relief-valve and a gage, substantially as specified.

7. In a safety-valve apparatus, the combination of the closed case having an inlet, a separate outlet, a valve for the outlet, the flexible diaphragm having affixed thereto a valve-seat and adapted to be moved by gas-pressure, and also adapted to be exposed to the pressure in the case and in the inlet or inlet-tube in both the open and closed positions of the valve, and the spring tending to move the diaphragm and valve toward the outlet to close the same, with a pipe provided with a relief-valve and a gage, said relief-valve and gage connecting with a cylinder or receiver, substantially as specified.

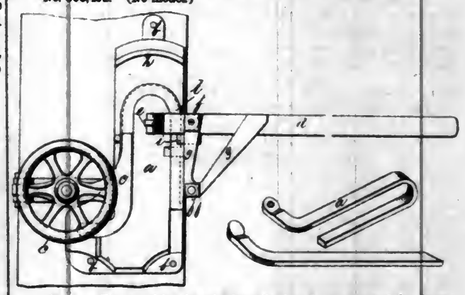
8. In a safety-valve apparatus, the combination of a cask, a main pipe having a safety or relief valve, a valve-seat secured to the diaphragm and inclosed in a case communicating with the cask, said diaphragm being exposed to gas-pressure from the cask in both the closed and open positions of the valve, and a spring adapted to close the valve in opposition to the gas-pressure, substantially as specified.

407,912. FURNACE FOR BURNING BONE-BLACK. ADAM WEBER, New York, N. Y. Filed Oct. 9, 1888. Serial No. 287,645. (No model.)

Claim.—1. In a bone-black kiln, the combination, with rows or series of retorts arranged in the same, said retorts being provided with projecting lugs at the sides and inner ends, of transverse saddle-tiles resting on the inner lugs and vertical division-blocks abutting against the opposite ends of the retorts, substantially as set forth.

2. In a bone-black kiln, the combination of the combustion-chamber, rows of retorts in the same, vertical division-blocks abutting against the ends of the retorts, projecting tiles near the bottom of the kiln for supporting said blocks, flues formed below said blocks, flues formed between the ends of the retorts and the division-blocks, and flues located in the side walls of the kiln and communicating with the flues between the division-blocks, substantially as set forth.

3. In a bone-black kiln, the combination of the combustion-chamber, rows of retorts in the same, said retorts having abutting side lugs, and transverse saddle-tiles resting on lugs at the inner ends of the retorts, substantially as set forth.



4. The combination of a bone-black furnace or kiln having cast-metal bottom plates provided with sockets or flanges integral therewith, retorts supported in said sockets, hoppers supported above the kiln, inclined feed-pipes connecting the bottom of the hoppers with the heads of the retorts, regulating-slides for said feed-pipes, and coolers located vertically below the retorts and provided with dampers at their lower ends, substantially as set forth.

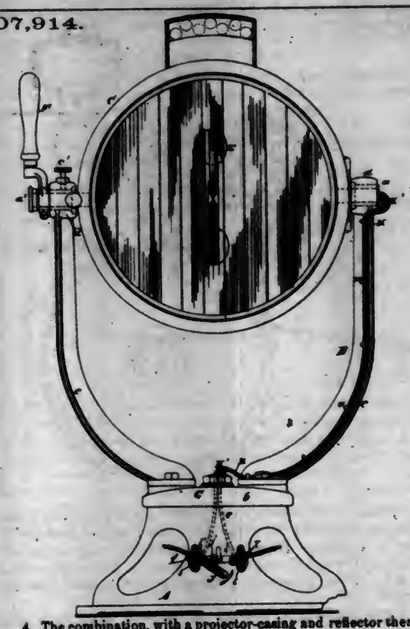
5. The combination, in a bone-black furnace or kiln, of a series of retorts located in the same, mouth-pieces at the upper ends of the retorts, provided with transverse partitions forming spaces at one side thereof, inclined pipes communicating with said spaces, and hydraulic mains connected with said pipes, substantially as set forth.

6. In a bone-black kiln, the combination of the retorts located in the same, mouth-pieces at the heads of the retorts, transverse partitions in said mouth-pieces, forming spaces, perforated tubular pipes secured to the partitions of the mouth-pieces, inclined pipes communicating with the spaces formed in the partitioned mouth-pieces, and hydraulic mains connected with said inclined pipes, substantially as set forth.

7. The combination, with a bone-black furnace or kiln, of rows of retorts located in the same, a gas-generating furnace located in front of the kiln, provided with a rear channel or throat, hydraulic mains located at both sides of the kiln, tubes for connecting the mouth-pieces of the retorts with the said hydraulic mains, pipes leading from the hydraulic mains to a saturator, and gas-return pipes leading from the saturator to the kiln and connecting with supply-openings in the throat of the gas-generating furnace, substantially as set forth.

407,913. MACHINE FOR MAKING SIDE-BAR SPRINGS. MARQUIS D. L. WILLIAMS, Poughkeepsie, N. Y. Filed Apr. 24, 1889. Serial No. 308,492. (No model.)

Claim.—The machine herein described and represented for forming said springs.

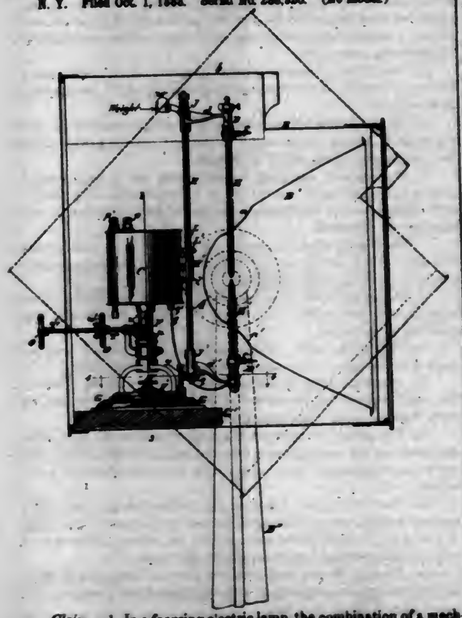


407,914. ELECTRIC PROJECTOR. JAMES J. WOOD, Brooklyn, N. Y. Filed Oct. 1, 1888. Serial No. 286,919. (No model.)

Claim.—1. The combination, with a projector casing, of a base supporting it and a swivel-joint between the base and casing having an axial opening, an electric lamp within the casing, and the circuit-leads thereof passing from the base through the axial opening in the swivel and into the casing, and stops on the respective members of the swivel adapted to limit the rotation of the casing on the base, and thereby prevent the excessive twisting of the leads.

2. The combination, with a projector-casing, of a base supporting it and a swivel-joint between the base and casing having an axial opening, and stop projections on the respective members of said swivel located normally diametrically opposite one another, whereby the rotation of the casing on the base is limited to half a revolution in either direction.

3. The combination of a projector-casing hung on trunnions, one of which is tubular, a supporting-frame having bearings for said trunnions, and stops to limit the rotation of the casing on said trunnions, with the circuit-leads entering the casing through said tubular trunnion.



407,914.

4. The combination, with a projector-casing and reflector therein, of a fastening for the reflector, consisting of clamping-brackets engaging the periphery of the reflector at intervals around its circumference and connected to the casing through the medium of a longitudinally-sliding connection, whereby the adjustment of the reflector to the proper focal position within the casing is facilitated.

5. The combination, with a supporting-frame formed with a web and rib, of conducting-leads traversing said frame and arranged in the angles at the junction of the web and rib, and a fastening therefor consisting of pins fixed in transverse holes in said rib and their ends bent over and embracing the conductors.

407,915. FOCUSING ARC LAMP. JAMES J. WOOD, Brooklyn, N. Y. Filed Oct. 1, 1888. Serial No. 286,920. (No model.)

Claim.—1. In a focusing electric lamp, the combination of a mechanism-case, regulating mechanism inclosed therein, vertical guides borne by the case fastened to the exterior thereof and extending above and below the case, the positive and negative carbon-holders constructed to slide on said guides, racks exterior to the case attached to the respective carbon-holders and extending vertically past each other, pinions engaging said racks, and a feeding-shaft on which said pinions are fixed, extending into the case and forming part of the regulating mechanism.

2. In a focusing electric lamp, the combination of a mechanism-case, regulating mechanism inclosed therein, vertical guides borne by the case fastened to the exterior thereof and extending continuously from top to bottom above and below the case, positive and negative carbon holders constructed with slides engaging and sliding on said guides, the one engaging the upper part of the guides and the other the lower part of the same guides, and each slide movable from its end portion of the guides toward the other slide and to the middle portion of the guides, racks exterior to the case attached to the respective carbon-holders and extending vertically past each other, pinions engaging said racks, and a feeding-shaft on which said pinions are fixed, extending into the case and forming part of the regulating mechanism.

3. The combination, with the mechanism-case, fixed vertical guides, and carbon-holders constructed to slide on said guides and having brackets projecting outwardly and carrying the carbon-clamps, of a counter-weight for the carbon-holder mounted on an arm on the side of the slide opposite to the bracket and clamp.

4. The combination, with the mechanism-case C, of exterior vertical guides consisting of rods H H, fastened at their middle portion to the case, and fastened together by cross-heads at their top and bottom ends, and the positive and negative carbon holders D and D', formed with slides J and J', respectively, each of said slides engaging both rods H H, the slide J, movable over the portion of the rods above the fastening to the case, and the slide J', movable over the portion of the rods below such fastening, racks *e e'*, fastened at their ends to the respective holders and extending vertically past each other parallel with the guide-rods, and a feeding-shaft K, near the middle fastening of the guide-rods, having pinions *f f'* meshing with said racks.

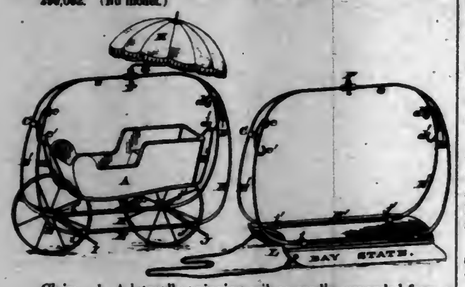
5. In a focusing electric lamp, the combination, with the mechanism-case, and the positive and negative carbon holders and their racks arranged exterior to said case, of exterior pins engaging said racks, a feeding-shaft on which said pinions are fixed, which extends thence within the case and which is mounted in stationary bearings, a feeding-train having a terminal detent-wheel and arranged with its leading pinion meshing with a gear on said shaft and movable bodily up and down, and an electro-magnet having its movable member connected to said train and adapted to impart up or down movement thereto, whereby during said up or down movement the leading pinion of the train meshes tangentially with said gear-wheel and turns the latter after the manner of a rack.

6. The combination, with the mechanism-case and carbon-holders in an axis outside thereof, of a supporting-standard beneath said case terminating in a bottom plate, and a stationary base-plate beneath said bottom plate, with a concentric swiveled connection between said standard and base-plate, whereby the mechanism-case can be partially rotated axially to move the carbons laterally, in order to readjust their focal position, and a clamping-screw for tightening said standard after adjustment.

7. The combination, with a focusing electric lamp having the axis of its carbon-holders outside of the mechanism-case, of a vertical standard on which its mechanism-case is mounted, said standard terminating in a bottom plate, a stationary base-plate on which said bottom plate rests, and a combined swiveled and sliding connection between the standard and base-plate, consisting of a slot through the bottom plate extending in a direction toward and from the axis of the carbon-holders, and a clamping-screw passing through said slot and engaging the base-plate, whereby the standard may be slid bodily to move the carbons forward or back, or oscillated to displace them laterally, the focal adjustment of the axis of the carbons being thus adjustable by the manipulation of a single screw.

8. The combination, with a focusing electric lamp and its base-plate, of a horizontally-adjustable connection between them, whereby the axis of the carbons may be shifted, a vertical adjustment for the lamp, whereby the arc may be raised or lowered, a laterally-projecting shaft geared to the vertical adjusting devices for imparting motion thereto, and a supplemental shaft connected to said shaft through the medium of a universal joint, whereby the mechanism for effecting the vertical adjustment is not influenced by the horizontal adjustment of the lamp.

9. The combination, with a focusing electric lamp, of a telescopically-extensible vertical standard on which it is mounted, a nut turning on one section of said standard and engaging a screw-thread on the other for extending the standard and formed with bevel gear-teeth, and a laterally-projecting shaft having a bevel-pinion engaging the teeth on said nut for communicating rotary movement thereto



with a bearing-arm for supporting said shaft, and a clamping-sleeve embracing the fixed member of the telescopic standard, and adjustable around the latter in order to bring the laterally-projecting shaft to any position around the vertical axis.

10. In a focusing electric lamp, the combination, with the mechanism-case, of a telescopically-extensible vertical standard on which it is mounted, constructed with a stationary section, a vertically-movable section fixed to the mechanism-case, and a nut turning on one of said sections and engaging a screw-thread on the other, exterior guides for preventing the turning of the mechanism-case, constructed with one member fixed to the stationary section of the standard and the other member connected to the mechanism-case, and with stops in connection with said exterior guides for limiting the vertical adjustment of the mechanism-case.

11. In a focusing electric lamp, the combination, with the mechanism-case, the carbon-holders, and vertical guides therefor arranged exterior to the case and fastened thereto, of a telescopically-extensible standard on which the case is mounted, and guides for preventing the turning of the mechanism-case, constructed with one member fixed to the stationary section of the standard and the other member fixed to the lower portion of the carbon-holder guides.

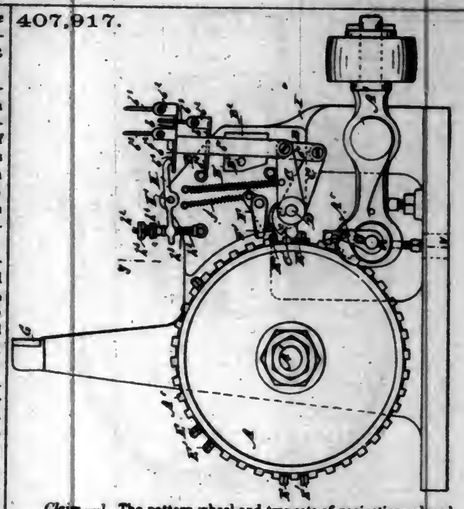
12. In a focusing electric lamp, the combination, with the mechanism-case C, the carbon-holders, and vertical guides H H therefor fixed to the exterior of the case, of the telescopically-extensible standard F, on which the case is mounted, consisting of a movable upper member fixed to the case and a stationary lower member mounted on the bottom plate F', and guides for preventing the turning of the case, consisting of a pin *y*, fixed to said bottom plate, and a socket-piece *v*, fixed to the lower portion of the guides H H.

407,916. CHILD'S CARRIAGE. Abner Woodward, Shelburne Falls, Mass. Filed Nov. 23, 1886. Renewed Feb. 7, 1889. Serial No. 299,092. (No model.)

Claim.—1. A laterally-swinging crib or cradle suspended from a supporting-frame composed of a pair of side bars having rounded ends, said bars being drawn together at top to form a single central bar extending longitudinally of the vehicle, said frame having means for attachment either to a sleigh or to the running-gear of a child's carriage, substantially as described.

2. The frame E E', provided with means for attachment either to a running-gear or sleigh, and having an upper pair of hooks *c d* and a lower pair of hooks *c' d'*, upon either of which set the body A can be supported, substantially as described.

3. As a suspension device for mounting a vehicle-body either upon a sleigh or a pair of carriage-axles, the frame E E', having parallel horizontal members and rounded ends, and being united at top to form a single bar *e*, substantially as herein described.



4. A laterally-swinging crib or cradle suspended from a supporting-frame composed of a pair of side bars having rounded ends, said bars being drawn together at top to form a single central bar extending longitudinally of the vehicle, said frame having means for attachment either to a sleigh or to the running-gear of a child's carriage, and said central bar being provided with an adjustable canopy, for the purpose described.

5. A supporting-frame for a laterally-swinging crib or cradle, which frame is composed of a pair of side bars having rounded ends, said bars being drawn together at top to form a single central bar extending longitudinally of the cradle, and said frame having means for attachment either to a sleigh or to the running-gear of a child's carriage, as herein described.

407,917. CIRCULAR-KNITTING MACHINE. Charles E. Dean, Scranton, Pa., assignor of one-half to the Lackawanna Mills, same place. Filed Jan. 14, 1889. Serial No. 296,308. (No model.)

Brief.—The invention relates particularly to the construction of the yarn-guides and the means for operating them, to the construction of the stitch-wheel, to the devices for cutting the yarn, and to the construction of the pattern-wheel and the means for locking and releasing the yarn-guides.

407,917.

Claim.—1. The pattern-wheel and two sets of projections placed therein out of line with each other, the levers C, having extensions C', and the yarn-guides B, attached to the said levers, in combination with the triggers F, adapted to lock the levers C and to be disengaged from said levers by the projections in the pattern-wheel, substantially as described.

2. The combination, with the guides B and means for moving them vertically, and the stitch-wheel J, having points *i*, of the finger or rod P', reaching to a lower level than the lower edge of the stitch-wheel, and the cutter K, arranged beyond the stitch-wheel, substantially as described.

3. The pattern-wheel A and pins E E', the levers C, notched at *c* and held in range of the pins E, and the triggers F, arranged to engage notch *c* and held in range of the pins E', in combination with the yarn-guides B, attached to levers C, tension-plates H, stitch-wheel J, having points *i*, and rotating cutter K, all arranged to operate substantially as described.

4. The guide-depressing levers and the notched extension thereof, and the spacing-pieces *c'*, in combination with the triggers, formed with a catch *f* and having an offset arm standing above the spacing-pieces between the said levers, and the pattern-wheel provided with pins to simultaneously operate the said levers and the said triggers, substantially as described.

5. The guide B, formed with the upright bar *b'* and beat plate *b*, having apertured lip b^2 and upwardly-projecting pin b^3, substantially as described.

6. The guide-block B^3, pivoted on the pin B^4, in combination with the guide B, having vertical bar *b'*, the lever C, and the pattern-wheel and pattern-pins, substantially as described.

7. The guide B, composed of the vertical bar *b'*, angle-plate *b*, having apertured lip b^2, and the pin b^3, in combination with the pivoted tension-plate H, overhanging the end of the angle-plate *b*, substantially as described.

8. The tension-plate H, pivoted on the rod H', in combination with the vertical rod h^3, spring h^5, nut h^4, and the vertically-movable guides B, substantially as described.

9. The tension-plate H, pivoted at H', and having slot *h*, in combination with the guide B and means for moving it vertically, substantially as described.

10. The stitch-wheel J, having inclined plates *j* formed with the teeth i^4 at the upper outer corner, substantially as described.

11. The stitch-wheel J, having plates *j* formed with the point *i* at the upper inner corner, the point *i'* at the lower outer corner, and the teeth i^4 at the upper outer corner, substantially as described.

12. The plate *j*, formed with the projection i^3 at the inner edge, the point *i* at the upper inner corner, the point *i'* at the lower outer corner, and the teeth i^4 at the upper outer corner, substantially as described.

13. The stitch-wheel J, having the inclined plates *j* and intermediate inclined plates *j'*, the latter formed with upper inclined edge j^2 and point j^3 at the lower outer corner, the plates *j* being formed with opposite points *i i'*, substantially as described.

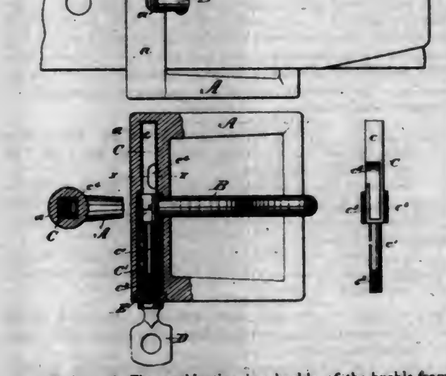
14. The axle N, provided with the plate O, having the flange P secured thereto, in combination with the stitch-wheel placed on said axle, substantially as described.

15. The axle N, having pin *n* and plate O, provided with the flange P and finger P', in combination with the stitch-wheel placed on said axle, substantially as described.

16. The cutter-wheel K, having a cutting edge or blade and provided with a series of circularly-arranged inclined plates *k'*, substantially as described.

17. The cutter-wheel having the circular blade *k* and the circularly-arranged plates *k'*, in combination with the knitting-cylinder and its needles, substantially as described.

407,918. PACKING AND SALES CASE. Alvin E. Berlin and Parvin Wright, Denver, Colo. Filed Feb. 13, 1889. Serial No. 299,809. (Model.)



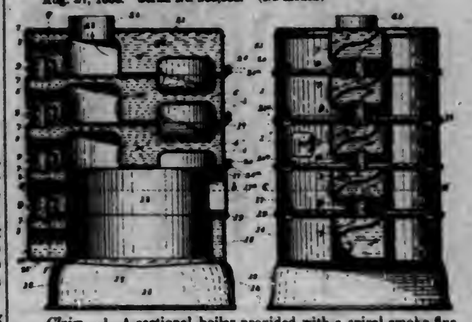
Claim.—1. A show and sales case having an opening therein, a door pivoted in said opening, and sectors or cheek-pieces attached to the side frame of said door and extending within said case to serve as guards in the withdrawal of its contents, substantially as described.

2. A show and sales case having a door pivoted in an opening therein, sectors or cheeks secured to the side edges of the said doors and extending within the case, and an auxiliary door hinged to the outer edge of the main door and provided with a glass through which the contents of the case may be observed, substantially as described.

3. A show and sales case having a door pivoted in an opening therein, sectors or cheek-pieces secured to the sides thereof, an auxiliary door-frame hinged to the outer edge of the main door and having a glass through which the contents of the case may be observed, a hinged flap located within the case to prevent the case overrunning of its contents, pivoted detent to bear against said flap to retain it in a vertical position, and a sliding bolt on the main door, and a recess in said door for the bolt-ring, substantially as described.

4. A show and sales case having a door, a sliding bolt therein, a recess in said door, and a ring attached to the bolt and falling in said recess to be protected by a sealing-sheet over said opening to prevent the contents of the case being tampered with while in transit, substantially as described.

407,919. BUCKLE. William Blum, Newark, N. J. Filed Apr. 20, 1889. Serial No. 308,016. (No model.)



Claim.—1. The combination, in a buckle, of the buckle-frame provided with a pivoted tongue and having the front bar thereof made hollow, the spring-actuated locking-bar longitudinally movable in said bar, and formed with a longitudinal slot and with a notch or recess leading to said slot, for allowing entrance of the buckle-tongue, substantially as described.

2. In a buckle, the combination, with the buckle-frame having its front bar made hollow and its tongue pivoted to swing against said hollow bar, the latter having a notch for receiving the point of the tongue, of the longitudinally-movable spring-actuated locking-bar fitted in said hollow bar and having a round threaded end and made angular in cross-section for a portion of its length, and formed also with a longitudinal slot and a notch or recess leading to said slot and allowing entrance of the tongue thereto, substantially as described.

3. A buckle comprising the following elements in combination: a buckle-frame, a tongue pivoted thereto, the front bar of the frame being hollow, a longitudinally-movable spring-actuated locking-bar fitted in said hollow bar and held against rotation, one end of the said locking-bar being threaded, and a washer or ring secured at the open end of the hollow bar and acting to maintain the locking-bar and its spring in place, substantially as described.

407,920. SECTIONAL BOILER. Joseph Bond, Buffalo, N. Y. Filed Aug. 27, 1883. Serial No. 283,932. (No model.)

Claim.—1. A sectional boiler provided with a spiral smoke-flue surrounded on all sides by water for conducting the products of combustion from the fire-chamber to the outlet spirally up through the water within the boiler, substantially as described.

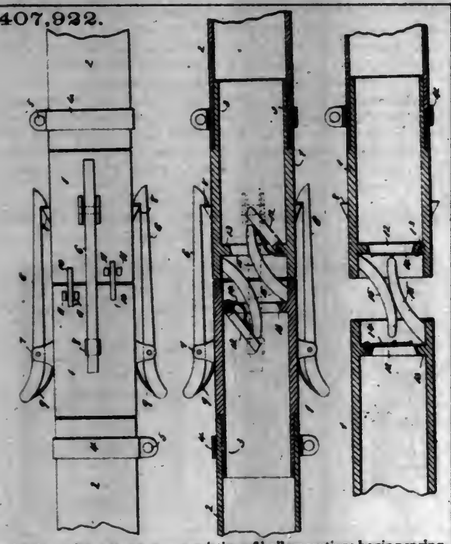
2. In a boiler composed of sections each having a spiral water-passage, the combination therewith of extension portions connected by screw-threaded nipples for connecting the spiral passage of each section, thereby forming a spiral passage in a continuous forward and upward direction around the boiler from the inlet to the outlet, substantially as described.

3. A sectional boiler provided with a spiral smoke-flue for conducting the products of combustion from the fire-chamber up through or around the boiler, in combination with a spiral water-passage for conducting the water between or around the heating-surfaces from the inlet to the outlet of the boiler, substantially as described.

4. In a sectional boiler, a series of sections, duplicates of each other, above the fire-chamber, forming a spiral smoke-flue within the boiler, in combination with a spiral water-way surrounding the smoke-flue on all sides, except the inlet and outlet, substantially as described.

5. In a sectional boiler, a boiler-section having a spiral recess on each side forming a portion of a spiral smoke-flue and an intermediate spiral water way or passage, in combination with an extension-chamber provided with a diaphragm interposed between the inlet and outlet openings to prevent the water from reaching the outlet until after it has made a circuit around the section, substantially as described.

6. In a sectional boiler, a series of sections having an annular water-chamber and extension water-chambers provided with diaphragms for causing a circulation of the water, a base portion carrying the grate, and screw-threaded tubular nipples for producing a water-tight joint and securing them together, the whole forming the combustion-chamber, in combination with a series of sections each having a spiral or half-spiral smoke-flue on opposite sides, and an intermediate spiral water-chamber communicating with an extension water-chamber having a diaphragm for causing the water when it enters the section to pass around it before it passes through the outlet, screw-threaded tubular nipples for securing the extension water-sections, and bolts for securing the main sections, whereby a combined spiral smoke-flue and water-way is provided, substantially as and for the purposes described.



407,921. COMPOUND FOR PURIFYING IRON IN BLAST AND PUDDLING FURNACES. Nathaniel Booth, Hollidaysburg, Pa., administrator of Nathaniel Booth, Sr., deceased. Filed Mar. 20, 1889. Serial No. 304,041. (No specimens.)

Claim.—The herein-described composition of matter to be used for purifying iron in blast or puddling furnaces, consisting of red prussiate of potash, bichromate of potash, bicarbonate of soda, salt, and black oxide of manganese, substantially as specified.

407,922. PIPE-COUPLING. William M. Brown, Jr., Sacramento Cal. Filed Apr. 19, 1888. Serial No. 307,940. (No model.)

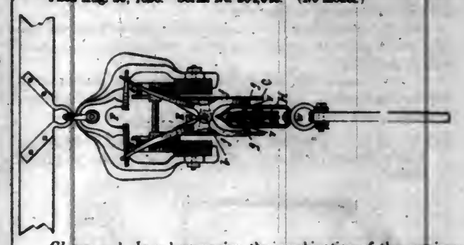
Claim.—1. A steam-pipe coupling for connecting the main sup-

407,922.

ply-pipes of passenger-cars, consisting of hollow sections having spring-actuated coupling-hooks pivoted to and projecting beyond the ends of the hollow sections, guide-bars and engaging-lugs, and spring-actuated inwardly-opening valves, and arms projecting from the open ends of the hollow sections to bear against and hold the valves open when the coupling is closed, substantially as shown and described.

2. In a steam-pipe coupling, hollow sections having spring-actuated coupling-hooks projecting beyond the ends of the hollow sections, inclined lugs on the sections with which the coupling-hooks automatically engage, inwardly-opening valves in the hollow sections, with springs for holding the valves in closed position, and arms projecting out of the ends of the hollow sections to bear against and hold the valves open when the hollow sections are coupled together, substantially as shown and described.

3. In a steam-pipe coupling as herein described, a hollow section 1, containing an inwardly-opening valve 12, with a closing-spring 14, a curved arm 15, projecting forward out of the end of hollow sections 1, hooked lever-coupling arms 6, projecting forward of the hollow section 1 and having an actuating-spring 9 located beneath their rear end, inclined lugs 8, guide-arms 10, projecting beyond the end of the hollow section, and sets of guide-lugs 11, located at the end of the hollow section, substantially as shown and described.



407,923. COVERING FOR INTERIOR WALLS. THEODORE W. BURGER, Dunellen, N. J. Filed Sept. 2, 1887. Serial No. 248,593. (No model.)

Claim.—1. The ornamental metallic sheet for walls or ceilings, having a varnished or lacquered surface, and designs or patterns printed upon the same and embossed in figures harmonizing with the previously-printed designs, substantially as set forth.

2. The ornamental metallic sheet for walls or ceilings, having a surface lacquered or varnished, and printed upon with designs or ornaments in two colors and embossed with patterns and figures harmonizing with the designs printed upon the surface of the sheet, substantially as set forth.

407,924. HAY-CARRIER. JEROME A. CROSS, Fultonville, N. Y. Filed Aug. 29, 1888. Serial No. 284,043. (No model.)

Claim.—1. In a hay-carrier, the combination of the carriage consisting of the frame C, supported by trolley-wheels resting on the track A, the pulley-wheels D D, and the latch E, having the legs *e e*, extending above the rest of the carriage, and also having the lower parts *f f*, the catch F, with inclined edges *k k*, throat *l*, and shoulders *m m*, supported above the track, the rope G, and the traveling pulley H, as and for the purpose described.

2. In a hay-carrier, the combination of the carriage consisting of the frame C, supported by trolley-wheels resting on the track A, the pulley-wheels D D, and the latch E, composed of the two jaws, the spring, and the pivot-bar *b*, whereby the jaws are united and secured to the frame C, said jaws having the legs *e e*, extending above the rest of the carriage, and the lower parts *f f*, the catch F, with inclined edges *k k*, throat *l*, and shoulders *m m*, located above the track, the rope G, and the traveling pulley H, as and for the purpose described.

3. In a hay-carrier, the combination of the carriage consisting of the frame C, trolley-wheels, pulley-wheels D D, and latch E, having the legs *e e*, extending above the rest of the carriage, and the lower parts *f f*, the rope G, the traveling pulley H, and the catch F, with inclined edges *k k*, throat *l*, and shoulders *m m*, pivoted to a support above the track, and in one position engaging with the latch E and in another position allowing the carriage to pass freely by it, substantially as and for the purpose described.

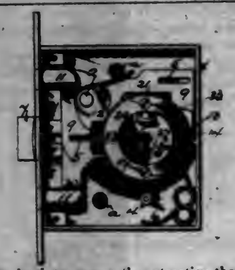
4. In a hay-carrier, the combination of the carriage having the frame C, pulley-wheels D D, and pawls *p p*, and the rope G, having the enlargements *y y*, constructed and operating substantially as described.

5. In a hay-carrier, the combination of the carriage consisting of the frame C, having the pawls *p p*, with stops *r r* and springs *s s*, the trolley-wheels, the pulley-wheels D D, and the latch E, having the legs *e e*, extending above the rest of the carriage, and the lower part *f f*, the catch F, with inclined edges *k k*, throat *l*, and shoulders *m m*, located above the track, the rope G, having the enlargements *y y*, and the traveling pulley H, constructed and operating substantially as shown and described.

6. In a hay-carrier, the combination of the carriage provided with pulley-wheels D D, the rope G, having the enlargements *y y*, the traveling pulley H, and the catch F above the track, the frame C of the carriage being constructed with lugs *a a*, to which are pivoted the pawls *p p*, having stops *r r* and springs *s s*, and which also form bearings for the pivot-bar *b* of the latch E, the legs *e e* of which extend above the rest of the carriage and engage with the catch F, substantially as and for the purpose described.

407,925. DOUBLE SULPHATE OF ANTIMONY. CARL J. E. DE HAEN, Linden, near Hanover, Prussia, Germany. Filed Sept. 9, 1887. Serial No. 249,259. (Specimens.)

Claim.—1. The herein-described process of manufacturing the double salt of fluoride of antimony, consisting in mixing fluoride of antimony and sulphate of ammonia and then evaporating the mixture, substantially as specified.



2. As a new article of manufacture, the double salt of fluoride of antimony and sulphate of ammonia having the formula $SbF_3(NH_4)_2SO_4$, substantially as described.

407,926. LOCK AND LATCH COMBINED. CHARLES W. FOLSOM and AUGUSTUS B. DAVIS, Wakefield, Mass. Filed Feb. 21, 1889. Serial No. 300,764. (Model.)

Claim.—1. A lock having a latch, a latch-locking slide, rotatable disks having bearing within the front and rear plates of the lock-case and connected together by transverse connections having bearing against the latch, so as to retract the latch upon the disks being rotated, and a slide supported in position in guideways upon one of said disks and adapted to engage the latch-locking slide and hold the same in projected position.

2. A lock having a latch, a slide having guide-bearing upon and adapted to reciprocate upon the latch, disks having rotary bearing within the respective face-plates of the lock-case, posts or pins connecting said disks to adapt them to rotate in unison, said posts having

407,926.

bearing against the latch to secure the retraction thereof upon the disks being rotated, a disk having independent rotary bearing centrally within one of said disks, a slide having bearing within guideways on said central disk and the disk surrounding the same, said slide and latch-locking slide having lugs on their respective faces to engage the one with the other, and a knob-spindle adapted to engage the central disk, substantially as and for the purposes set forth.

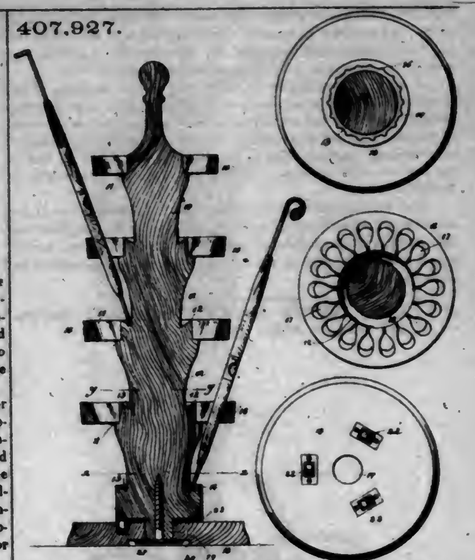
3. In a lock, the combination, with suitable latch and bolt or latch-locking mechanism, of a central disk adapted to rotate independently of the locking mechanism, a slide connected with the latch-locking mechanism and with said central disk and adapted to be slid into or out of engagement with said central disk and hold the same from rotation while the latch is unlocked and permit of the independent rotation thereof when the latch is locked, and a knob-spindle connected with said central disk, whereby said spindle may be freely rotated when the lock mechanism is locked without interfering with or straining the lock mechanism.

4. In a lock, the combination, with the latch and locking mechanism, of a pair of rotary disks having bearing, respectively, in the opposite faces of the lock-case and connected together to rotate in unison and thereby secure the retraction of the latch mechanism, a disk having independent rotary bearing centrally within one of said disks, guideways on or in the inner face of said central disk and the disk adjacent thereto, a slide adapted to slide within said guideways, suitable devices, as lugs, connecting said slide and the latch-locking mechanism, a hook on the outer face of said central disk and a hole or holes extending transversely through said disk, and a knob-spindle having a hook and pins on its inner end to engage the hook and holes in said central disk to connect said disk and spindle and secure the knob-spindle together and the free rotation of said spindle when the lock is locked, substantially as set forth.

5. In a lock, a pair of rotary disks having bearing within the lock-case and connected together to rotate in unison and to secure the retraction of the latch, a central disk carried by one of said disks, a slide connected with said central disk and the disk adjacent thereto and adapted to engage the lock mechanism and reciprocate therewith and thus alternately lock and unlock said central disk, and a knob-spindle adapted to engage said central disk and having a keyway longitudinally therethrough and a concaved knob, substantially as and for the purposes set forth.

407,927. UMBRELLA-TREE. JONATHAN HAIGHT, Pittsfield, Mass. Filed Feb. 9, 1889. Serial No. 299,292. (No model.)

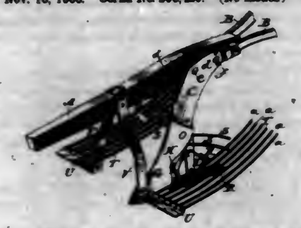
Claim.—1. In an umbrella-tree, the combination, with a vertical body having a series of graduated disks attached thereto, provided with a series of openings therein, and a groove above the lower bearing-surface of each of the said disks, of a base in which the body of the tree is pivotally secured, whereby the said body may be revolved upon the said base, substantially as shown and described.



2. The combination, with a body provided with a series of shoulders graduated in diameter from the base upward, and a second series of shoulders having a groove produced in the upper face, of disks secured upon the first-named shoulders, provided with a series of openings therein having inwardly-inclined outer walls, substantially as shown and described.

3. The combination, with a body provided with a series of shoulders graduated in diameter from the base upward and a second series of shoulders having a groove produced in the upper face, of disks secured upon the first-named shoulders, provided with a series of openings therein having inwardly-inclined outer walls, and a base containing vertical rollers, in which the said body is pivotally held, substantially as shown and described.

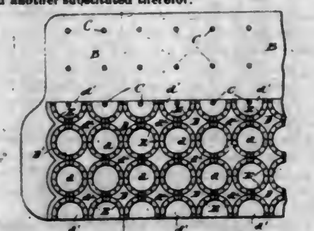
4. The combination, with a vertical body provided with a series of graduated shoulders 11, and reduced shoulders 12 above the same, having a groove produced in the upper face, and a base grooved shoulder at or near the lower end, of a series of disks 16, supported upon the shoulders 11, having a series of openings therein, all combined for operation substantially as shown and described.



5. The combination, with a vertical body provided with a series

407,927.

of graduated shoulders 11, reduced shoulders 12 above the same, having grooves therein provided with vertical cavities in the upper wall, and a base-shoulder 14, of a series of graduated disks supported upon the shoulders 11, provided with a series of diagonal openings, and a base-plate having friction-rollers, in which the body is pivotally secured, substantially as shown and described.



407,928. POTATO-DIGGER. DANIEL Y. HALLOCK, Southold, N. Y. Filed Nov. 10, 1888. Serial No. 290,429. (No model.)

Claim.—The combination, with the beam and plowshare of a potato-digger, of a supporting-bar V, attached to the beam, and a lateral horizontal screen T, suspended by said bar and extending alongside of the share above its lower edge and from the point thereof rearwardly, substantially in the manner and for the purpose herein set forth.

407,929. CRACKER-CUTTING DIE. CARL HERRMANN, New York, N. Y. Filed Apr. 24, 1889. Serial No. 308,434. (No model.)

Brief.—The die-face as a whole is built up of renewable sections, whereby if one of the sections be defaced or broken it may be removed and another substituted therefor.

Claim.—1. A cracker-cutting die provided with a face consisting of removable or renewable sections having their joints on lines bisecting the openings of the individual cracker-dies, and means for fastening the removable sections to the die box or body, substantially as herein set forth.

2. A cracker-cutting die provided with a face consisting of re-

movable or renewable sections each made with scrap-openings at its center, and provided at opposite edges with halves or sections of the individual cracker-dies, and means for fastening the removable sections to the die box or body, substantially as herein set forth.

3. A cracker-cutting die provided with a face consisting of removable or renewable sections having their joints on lines bisecting the openings of the individual cracker-dies, and provided at the walls of the individual dies with radial or projecting cutters giving scalloped or ornamental marginal form to the crackers, and means for fastening the removable sections to the die box or body, substantially as herein set forth.

4. A cracker-cutting die provided with a face consisting of removable or renewable sections having their joints on lines bisecting the openings of the individual cracker-dies, and fastening-screws passed through the walls of the die into the sections, substantially as herein set forth.

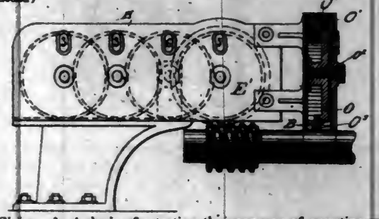
407,930. **BICYCLE.** LOUIS A. HILL, Philadelphia, Pa. Filed Dec. 11, 1888. Serial No. 293,261. (No model.)

Claim.—1. In a bicycle-fork, the combination of the fork A, provided with the inclined shoes *a*, the base-plates D, hinged to the shoes *a* and provided with the downwardly-projecting bearing-arms H, and the spring interposed between the shoes and base-plates, substantially as herein shown and described.

2. In a bicycle or similar machine, the combination, with a wheel-fork having its members terminating in a downwardly-inclined shoe projecting outward therefrom, of a base block or plate adapted for connection with the wheel-axle, hinged to one end of said shoe, and a spring uniting the opposite ends of the said shoe and plate, substantially as and for the purpose specified.

407,931. **GALVANIC BATTERY.** CHARLES J. HIRLIMANN, Fort Lee, N. J. Filed May 6, 1889. Serial No. 309,695. (No model.)

Claim.—1. In a galvanic-battery cell, a carbon element consisting of two rectangular carbon boxes, one placed within the other, and the two connected together at one end.



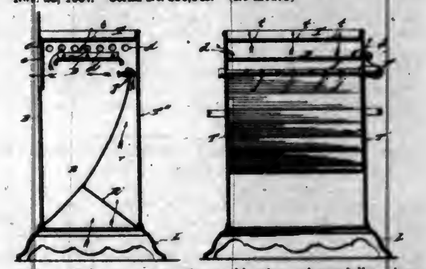
2. In a galvanic-battery cell, a carbon element consisting of two rectangular carbon boxes, one placed within the other, and the two connected together at one end, a free passage or chamber being provided throughout the inner box.

3. In a galvanic-battery cell, a carbon element consisting of two rectangular carbon boxes, one placed within the other, and the two connected together at one end, thus forming a chamber between the two boxes, in combination with a depolarizing agent placed within the chamber.

4. In a galvanic-battery cell, a carbon element consisting of two rectangular carbon boxes, one placed within the other, and the two connected together at one end, a free passage or chamber being provided throughout the inner box, in combination with a zinc element occupying said chamber.

5. In a galvanic battery, a carbon element having a rectangular shape, and provided with two ears extending above the mouth of the cell, in combination with an outer rectangular jar and a cover for the same, the latter having cut-away portions to accommodate the ears on the carbon element.

407,932. **TESTING DEVICE FOR COUNTING MECHANISMS.** PAUL C. ILLIES, Leipsic, Saxony, Germany, assignor of one-half to Paul Eduard Kürsten, same place. Filed Jan. 29, 1889. Serial No. 297,912. (No model.)

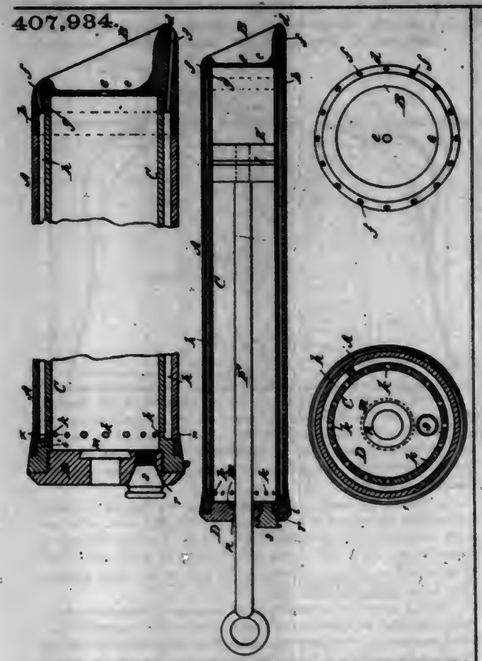


Claim.—1. A device for testing the accuracy of counting mechanism, comprising a moving part, as a rotating shaft, numbered counting-disks operated by said moving part to count the movements of said moving part, a numbered and divided supplementary disk moved at each movement of said moving part a distance corresponding to one of its divisions, whereby the accuracy of the number shown on the counting-disks may be determined by observing whether, after dividing the said number by the number denoting the sum of the divisions of the supplementary disk, the remainder, if any, is the same as the number exposed on the said supplementary disk, substantially as described.

2. The combination, with the driving-shaft of a counting mechanism and a finger carried by said shaft, of a supplementary counting-disk mounted to rotate at a right angle to said counting mechanism, and having a series of pins at its periphery adapted to be engaged by the finger on said shaft, substantially as shown and described.

3. The combination, with a series of counting-disks mounted and geared for rotation one with another, the units-disk having teeth at its periphery, and a driving-shaft having a worm thereon meshing with the teeth of said units-disk, of a supplementary counting-disk mounted to rotate at a right angle to the principal counting-disks and having a series of pins at its periphery, a casing open at its bottom and apertured at its front inclosing said supplementary disk, and a radial finger carried by the driving-shaft of the counting mechanism, adapted to engage the pins on the supplementary counting-disk, substantially as shown and described.

407,933. **GAS-STOVE.** LANDON KETCHUM, Saugatuck, Conn. Filed Nov. 25, 1887. Serial No. 256,043. (No model.)



Claim.—1. In a gas-stove, the combination, substantially as hereinbefore set forth, of the radiating-plate R, extending the entire length of the stove, so that no air is admitted at either end of the same, the gas-pipe J, with the jets *j j* placed at the back of the stove and immediately above the plate R, with the jets directed outward, and the front plate C, provided with the openings *c*, directly in front of the gas-jets, for the purposes set forth.

2. In a gas-stove, the combination, substantially as hereinbefore set forth, of the radiating-plate R, extending the entire length of the stove, the passage *r*, whereby air is admitted at the rear only, the gas-pipe J, with the jets *j j* placed at the back of the stove and directly above the plate R, with the jets directed outward, the face-plate provided with the openings *c c* directly in front of the gas-jets the draft-plate D, placed above the jets, and the top and end walls provided with the openings *d d* and *f f*, for the purposes set forth.

407,934. **SYRINGE.** JAY W. KIRKWOOD, Silver Mountain, Idaho, assignor to himself and Edwin Bartsch, same place. Filed Feb. 26, 1889. Serial No. 301,181. (No model.)

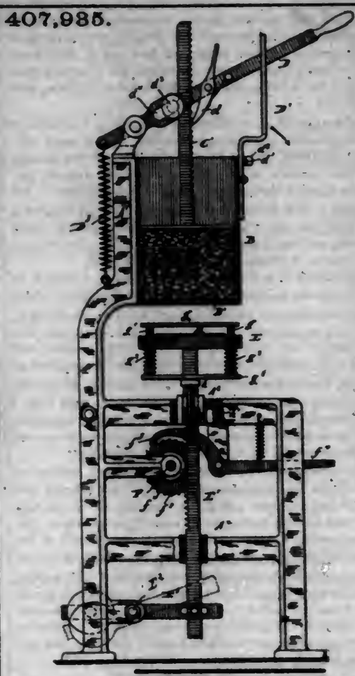
Claim.—1. A medical syringe having inner and outer chambers connected with each other at or near their rear ends and both having

407,934.

openings through the forward end of the syringe, in combination with a piston fitted to work within the inner chamber, whereby said syringe operates simultaneously to discharge a diluting or medicated fluid and to remove by suction foreign matter adhering to the mouth or neck of the womb, also the inner chamber of the syringe serves as a vessel to carry off the foreign matter, substantially as specified.

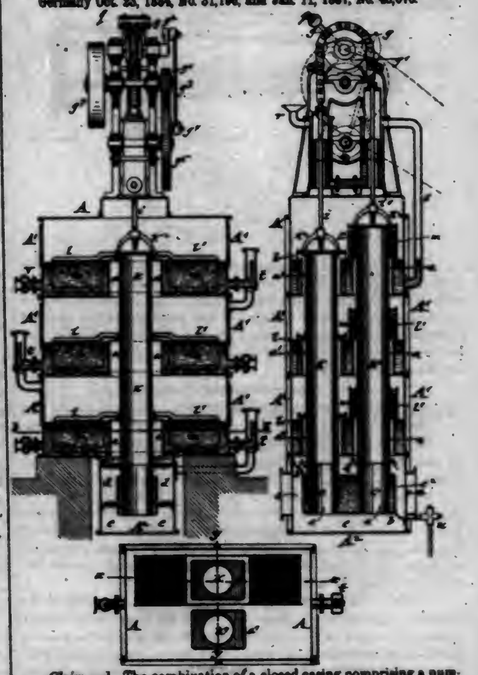
2. In a medical syringe, the cup-shaped nozzle adapted to fit the mouth of the womb and provided with a series of discharge-apertures outside of the suction-cavity in the nozzle, and with a suction-aperture in the back of the nozzle, whereby a sucking action is combined with a discharging action of water or other fluid in jets, substantially as specified.

407,935. **MACHINE FOR MAKING CONFECTIONERY.** PHILLIP KNORPP and GUSTAV A. MAYER, Stapleton, N. Y. Filed Apr. 19, 1889. Serial No. 307,730. (No model.)



Claim.—1. In a machine for making confectionery, the combination of a paste-receptacle having a perforated bottom and a follower guided in said receptacle, a vertically-guided table below the receptacle, transverse and spring-actuated keepers at the ends of the table, and fixed stops below said keepers, so as to raise the same against the tension of the springs when the table is lowered, substantially as set forth.

2. In a machine for making confectionery, the combination, with a paste-receptacle having a perforated bottom, of a follower the follower-rod of which is provided with a rack-bar, a fulcrumed and spring-actuated lever, a hinged fork for guiding the front end of the lever, a pivoted and spring-actuated pawl on said lever for engaging the rack of the follower-rod, and means for guiding the follower-rod along the lever, substantially as set forth.



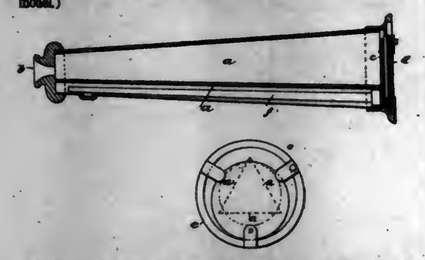
3. In a machine for making confectionery, the combination, with a vertically-guided table having a vertically-adjusting rack-bar, a fulcrumed and weighted lever connected with the lower end of said rack-bar, a pinion engaging said rack-bar, a hand-wheel on the shaft of the pinion for turning the shaft and lowering the table, and a pawl-and-ratchet device for locking the pinion and rack-bar in position, substantially as set forth.

ABCDEF

407,936.

407,936. **GAS-WASHING APPARATUS.** ERNST LEUSE, Chemnitz, Saxony, Germany, assignor of one-half to Bruno Terno, Philadelphia, Pa. Filed Aug. 27, 1888. Serial No. 283,910. (No model.) Patented in Germany Oct. 23, 1884, No. 31,196, and Jan. 11, 1887, No. 40,070.

Claim.—1. The combination of a closed casing comprising a number of superimposed sections for containing water, said casing being provided at its lower end with inlet and outlet chambers for the pas-



sage of gas, each of said sections having two vertical gas-channels, gas-conducting tubes passing through said vertical gas-channels of the sections and opening at their lower ends into one of said chambers, means for vertically reciprocating said tubes, and boxes attached to said tubes, said boxes being provided with a series of plates, substantially as set forth.

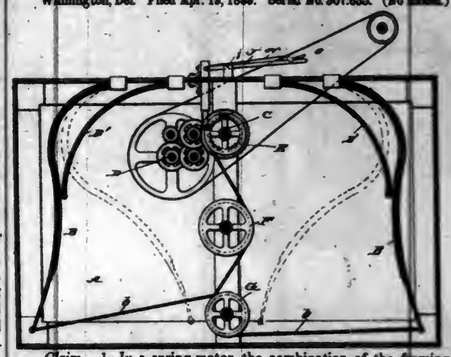
2. The combination of a closed casing comprising a number of superimposed sections for containing water, said casing being provided at its lower end with inlet and outlet chambers for the passage of gas, each of said sections having two vertical gas-channels, gas-conducting tubes passing through said vertical gas-channels of the sections and opening at their lower ends into one of said chambers, water seals at the lower ends of said tubes, means for vertically reciprocating said tubes, and boxes attached to said tubes, said boxes being provided with a series of plates, substantially as set forth.

3. The combination of a closed casing comprising a number of superimposed sections for containing water, said casing being provided at its lower end with inlet and outlet chambers for the passage of gas, each of said sections having two vertical gas-channels, gas-conducting tubes passing through said vertical gas-channels of the sections and opening at their lower ends into one of said chambers, boxes attached to said tubes, said boxes being provided with a series of plates, suspension-rods for said tubes, a link chain connected to said rods, a sprocket-wheel for said link chain, and a crank-motion for imparting oscillating motion to the sprocket-wheel and vertically-reciprocating motion to the gas tubes and boxes, substantially as set forth.

4. The combination of a closed casing comprising a number of superimposed sections for containing water, said casing being provided at its lower end with inlet and outlet chambers for the passage of gas, each of said sections having two vertical gas-chambers, gas-conducting tubes passing through said vertical gas-channels of the sections and opening at their lower ends into one of said chambers, boxes attached to said tubes, said boxes being provided with a series of plates, suspension-rods for said tubes, a link chain connected to said rods, a sprocket-wheel for said link chain, a crank-motion for imparting oscillating motion to the sprocket-wheel and vertically-reciprocating motion to the gas tubes and boxes, and water seals for said suspension-rods, substantially as set forth.

407,937. KALEIDOSCOPE. JOSEPH W. LOVIBOND, Salisbury, County of Wilts, England. Filed July 6, 1888. Serial No. 279,233. (No model.)

Claim.—The combination, with a kaleidoscope, of two or more disks placed in front of one another and independently movable by rolling, as described, in the field of view of the instrument, one or more of the disks being translucent and party-colored or made of differently-colored segments united together to form a solid disk, and one or more of the disks being opaque with through-apertures, as and for the purpose specified.



407,938. INSULATING COMPOSITION. FRANK MARQUARD, New York, N. Y. Filed Dec. 3, 1888. Serial No. 292,511. (No specimens.)

Claim.—1. The insulating compound herein described, composed of rosewood sawdust, extract of logwood, bichromate of potash, sulphate of iron, and an albuminous substance, substantially as set forth.

2. The insulating compound herein described, composed of the following ingredients, in about the following proportions: twenty pounds, by weight, of fine rosewood sawdust, one pound of extract of logwood, one-eighth of a pound of bichromate of potash, one-eighth of a pound of sulphate of iron, and five pounds of an albuminous substance, substantially as set forth.

3. The insulating compound herein described, composed of the following ingredients, in about the following proportions: twenty pounds, by weight, of fine rosewood sawdust, one pound of extract of logwood, one-eighth of a pound of bichromate of potash, one-eighth of a pound of sulphate of iron, and five pounds of an albuminous substance, and a vegetable fiber, such as hemp, flax, &c., substantially as set forth.

407,939. SPRING-MOTOR. LUDWIG MELCHIOR and GEORGE HAAS, Wilmington, Del. Filed Apr. 19, 1889. Serial No. 307,835. (No model.)

Claim.—1. In a spring-motor, the combination of the framing, the gear-train therein having a power-shaft, the spring-arms secured at one end to the framing, extended thence downward on opposite sides of the gear-train, cords or connections between said free ends and the power-shaft, and guides for said cords or connections, substantially as set forth.

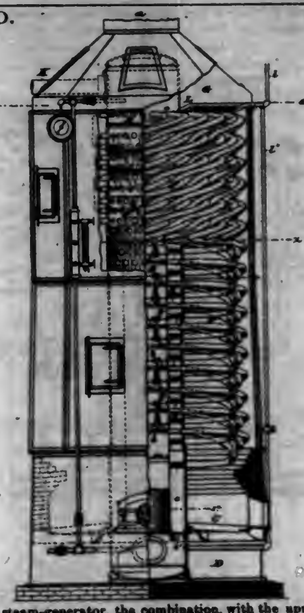
2. In a spring-motor, the combination of the framing, a spring-arm secured at one end to the framing and adapted at its other end to be connected with the power-shaft, and the auxiliary spring-arm secured at one end to the framing and arranged at its free end to bear against the first spring-arm between the ends of the latter, substantially as set forth.

3. In a motor, the combination of the framing, the power-shaft, the spring-arms arranged on opposite sides of the power-shaft, secured at one end to the framing, and having their free ends arranged opposite each other, such free ends being movable inward toward each other and outward apart, and connections between said free ends and the power-shaft, substantially as set forth.

4. The improved spring-motor, substantially as described, comprising the framing, the power-shaft therein, the guide-pulleys F and G below such power-shaft, the spring-arms B, arranged on opposite sides of such shaft and pulleys, connections between the free ends of springs B and the power-shaft, such connections being disposed around pulleys F and G, and the auxiliary springs B', secured at one end to the framing and bearing at their opposite or free ends against the inner sides of the spring-arms B at about the centers of such arms, substantially as set forth.

5. In a spring-motor, the combination, with the power-shaft, the springs connected with such shaft, and the ratchet-wheel M, of the lever J, the link or bar K, connected with lever J, the pawl pivoted to bar K and arranged to engage the wheel M, the spring for holding such pawl normally out of such engagement, and the cord or connection by which the pawl may be drawn into engagement with the wheel M, substantially as and for the purpose specified.

6. In a spring-motor, the combination, with the framing and the spring-arm B, secured at one end to such framing, of the auxiliary spring-arm secured at one end rigidly to the framing, provided at its free end with an anti-friction roller, and arranged at such end to engage and bear against the spring-arm B at about the middle thereof, substantially as set forth.



7. The combination, in a spring-motor, of the framing, the power-shaft, the guide-pulleys F and G, a spring bar or bars secured at one end rigidly to the framing, and a connecting cord or cords extended between the power-shaft and the free end of the spring or springs, substantially as set forth.

407,940. STEAM-GENERATOR. THOMAS F. MORRIN, Jersey City, N. J. Filed Aug. 1, 1888. Serial No. 281,677. (No model.)

Claim.—1. A steam-generator having an upright cylindrical generator, provided with tiers of double-branched radial obliquely-arranged generating-tubes, both branches of which enter the said generator, the upper ends extending farther into the interior of said cylinder than the lower ends, and said tubes being arranged about the whole periphery of the cylinder, whereby an upward current is established at the axis of the latter, as set forth.

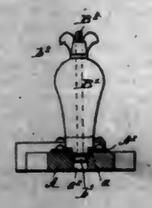
2. In a steam-generator, the combination, with the upright generator-cylinder and the lesser inner cylinder E, closed at its bottom, of the double-branched generating-tubes arranged below the water-level, the lower branches of which enter the generator-cylinder, and the upper branches of which connect with the said inner cylinder, substantially as described and shown, and for the purposes set forth.

407,940.

3. In a steam-generator, the combination, with the upright generator-cylinder and the double-branched generating-tubes, of the inner cylinder E, constructed of sections provided with angle-pieces, as *b*, at their ends, whereby said cylinder may be conveniently built up within the generator-cylinder.

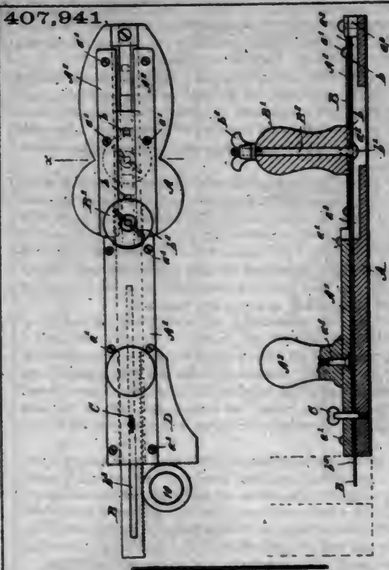
4. In a steam-generator, the combination, with the generator-cylinder provided with diaphragms or partitions arranged above the water-level, of the double-branched radial steam drying and superheating tubes arranged about the entire periphery of the cylinder, the lower ends of the tubes tapping said cylinder below one of said partitions and the upper ends tapping it above the same, as set forth.

5. The combination, with the upright generator-cylinder and the radial tubes connecting therewith, of the feed-water-supply pipe arranged in the form of a flat coil about the upper part of said cylinder above said radial tubes and communicating at one end with said cylinder, substantially as set forth, whereby it forms a baffle and is exposed to the heat of the ascending gases.



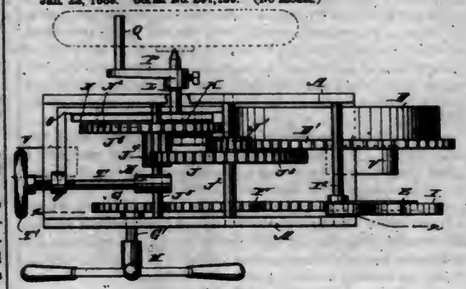
407,941. SAW FOR PLUMBERS' USE. ROBERT MCALPINE and CHARLES MCALPINE, Trenton, N. J. Filed Apr. 29, 1889. Serial No. 308,935. (No model.)

Claim.—1. The combination, in a saw, of a stock or frame and the reciprocating saw-blade held to said stock and arranged to be projected by its free end beyond the end of the same, substantially as described.

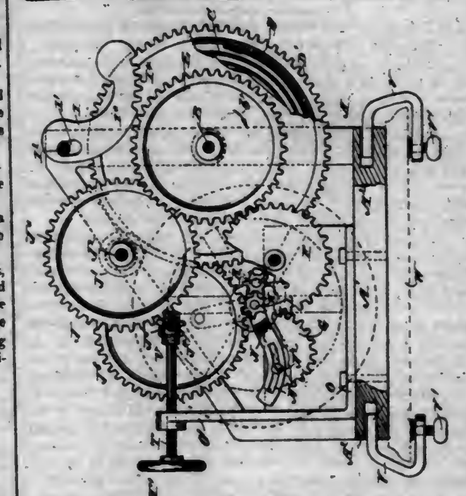


2. The combination, with the stock or frame, of the reciprocating saw-blade held thereto and an adjustable stop for regulating the extent of movement of the blade, substantially as described.

3. The combination, with the stock or frame provided with a handle, of a reciprocating blade held thereto and also provided with a handle, substantially as described.



4. The combination, with the stock formed with a vertical slot, of a reciprocating saw-blade having a series of apertures therein, and a detachable handle formed with a vertical aperture, and a spindle fitting the aperture of the handle for securing the latter to the blade at any of the apertures therein, the vertical slot of the stock enabling the spindle to be withdrawn from the said handle to change its position, substantially as described.



407,941.

407,942. MOTOR. EVANDER B. NEWCOMB, Parsons, Kans. Filed Jan. 22, 1889. Serial No. 297,139. (No model.)

Claim.—1. In a motor, the combination, with a spring-shaft and a gear-wheel secured thereon, of a segmental pawl held in contact at its periphery with the teeth of the said gear-wheel, said periphery being partly smooth and partly provided with gear-teeth adapted

to mesh into gear-teeth of the said gear-wheel, said pawl being provided with a slot through which passes the pin forming the fulcrum for the pawl, substantially as shown and described.

2. In a motor, the combination, with a spring-barrel and a coiled spring, of a shaft connected with the said spring, a gear-wheel held on the said shaft, and a segmental pawl having its contacting lower edge partly smooth and partly provided with gear-teeth adapted to mesh into the gear-teeth of the said gear-wheel, substantially as shown and described.

3. In a motor, the combination, with a spring-barrel and a coiled spring, of a shaft connected with the said spring, a gear-wheel held on the said shaft, a segmental pawl having its contacting lower edge partly smooth and partly provided with gear-teeth adapted to mesh into the gear-teeth of the said gear-wheel, said pawl being provided with a slot, and a fixed pin passing through the said slot and forming the fulcrum for the pawl, said slot permitting an upward motion of the said pawl, substantially as shown and described.

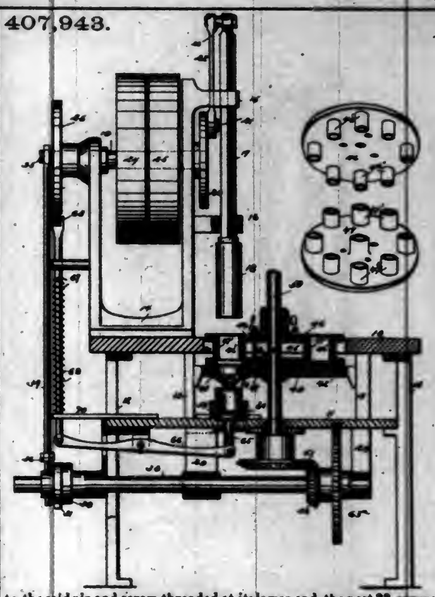
4. In a motor, the combination, with a shaft, a spring-barrel provided with a gear-wheel and held loosely on the said shaft, and a coiled spring secured by its ends to the said shaft and the said barrel, of a train of gear-wheels connected with the said barrel gear-wheel, a pinion engaging one of the wheels of the said train of gear-wheels, a shaft carrying the said pinion, and a crank-arm held on the said shaft and engaging the wheel to be driven, substantially as shown and described.

5. In a motor, the combination, with a shaft, a spring-barrel provided with a gear-wheel and held loosely on the said shaft, and a coiled spring secured by its ends to the said shaft and the said barrel, of a train of gear-wheels connected with the said barrel gear-wheel, an adjustably-pivoted frame carrying a pinion engaging one of the wheels of the said train of gear-wheels, and a second pinion meshing into the first-named pinion, substantially as shown and described.

6. In a motor, the combination, with a shaft, a spring-barrel provided with a gear-wheel and held loosely on the said shaft, and a coiled spring secured by its ends to the said shaft and the said barrel, of a train of gear-wheels connected with the said barrel gear-wheel, an adjustable frame carrying a pinion engaging one of the wheels of the said train of gear-wheels, a second pinion meshing into the first-named pinion, and a shaft interchangeable with the said pinions and provided with a crank at one end, substantially as shown and described.

7. In a motor, the combination, with a shaft, a spring-barrel provided with a gear-wheel and held loosely on the said shaft, and a coiled spring secured by its ends to the said shaft and the said barrel, of a train of gear-wheels connected with the said barrel gear-wheel, a pinion engaging one of the wheels of the said train of gear-wheels, a second pinion meshing into the first-named pinion, and an adjustable frame carrying the said shafts and serving to raise and lower the first-named pinion, at the same time holding it in mesh with its gear-wheel, substantially as shown and described.

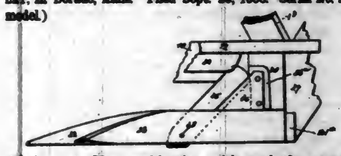
407,948. CAN-FILLING MACHINE. FRANCIS M. NICHOLS, Chillicothe, Ohio. Filed May 10, 1888. Serial No. 273,435. (No model.)



Claim.—1. In a can-filling machine, a measure-carrier consisting of the upper and lower disks secured together, each provided with a series of tubes or cylinders open at both ends, the tubes of one disk sliding within those of the other, substantially as set forth.

2. In a can-filling machine, the measure-carrier consisting of the upper and lower disks, their telescoping tubes or cylinders open at both ends, and the screws or bolts turning at their lower ends in the lower disk and passing at their threaded upper ends through screw-threaded apertures in the upper disk, and the binding-nuts on the upper ends of said bolts or screws, substantially as set forth.

3. A can-filling machine comprising the frame, the rotary horizontal measure-carrier, the vertical shaft 50, the horizontal main shaft 30, geared to shaft 50, the vertically-reciprocating plunger 18, operated by the upper shaft 19, having an eccentric 20, connected with the plunger, a cam-disk 26, also on said shaft 19, a rod 34, connected at its upper end to said cam-disk, a pawl-and-ratchet mechanism connecting the lower end of said rod with the shaft 30, the trough 53, the frame 44, the shaft 61 at right angles to the trough and geared to the shaft 30, the carriage 54 in the outer end of the trough, an eccentric and rod operating the carriage from the shaft 61, the vertically-rocking lever 66, the table 64 at the inner end thereof in the bottom of the trough under the funnel, the vertical rod 67, pivoted at its lower end to the outer end of lever 66, and a spring throwing the rod upward against the periphery of the cam-disk 26, all combined and operating substantially as and for the purpose set forth.



4. In a can-filling machine constructed substantially as set forth, the combination, with the shaft 50, measure-carrier 45, shaft 30, and connecting-gear, of the ratchet 31, fast on shaft 30, slotted arm 32, loose on said shaft and provided with a spring-pawl, the cam-disk 26, having pin 35, and the adjustable rod 34, connected at its upper end

407,943.

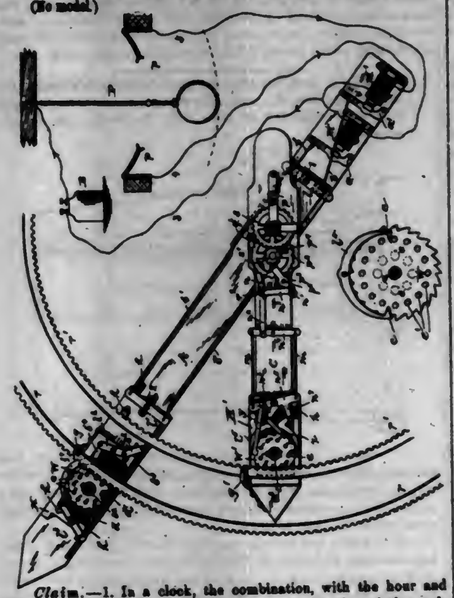
to the said pin and screw-threaded at its lower end, the post 33, secured in the slot of the arm 32, and having a transverse aperture through which the lower end of the rod 34 passes, and the nuts 36 37 on the screw-threaded end of the rod above and below the post, substantially as shown and described.

407,944. CORN OR SORGHUM HARVESTER. JOSEPH J. SIDELEY, El Dorado, Kans. Filed Sept. 29, 1888. Serial No. 286,724. (No model.)

Claim.—1. The combination, with a platform and vertically-aligning guide-fingers secured thereto at one side, the upper finger being laterally adjustable, of a knife detachably held between the lower finger and platform, substantially as shown and described.

2. The combination, with a platform, vertically-aligning guide-fingers secured thereto at one side, the upper finger whereof is adjustable, of a detachable knife passed diagonally through the lower finger, and a pin passing through the finger and knife, substantially as shown and described.

3. The combination, with a platform, vertically-aligning guide-fingers secured thereto at one side, and a detachable knife diagonally secured to the lower finger, and extending inward to the platform, of a bed inclined downward toward the rear and side, and supported upon the platform provided with a longitudinal opening, and a notched stacking-bar sliding in the bed-opening, substantially as shown and described.



4. The combination, with a platform, vertically-aligning guide-fingers secured thereto at one side, and a detachable knife diagonally secured to the lower finger and extending inward to the platform, of a bed inclined downward toward the rear and side, supported upon the platform, and provided with a longitudinal opening, and a notched stacking-bar sliding in the bed-opening, substantially as set forth, a latch spanning the bed-opening, a rack-wheel engaged thereby and prevented by it from rotating, a foot-lever, and a spring-actuated lever connecting the foot-lever and latch, substantially as set forth.

5. The combination, with a platform, vertically-aligning guide-fingers secured thereto at one side, and a detachable knife diagonally secured to the lower finger and extending inward to the platform, of a bed supported on the platform and provided with a longitudinal opening, a notched stacking-bar sliding in said opening, a spring-actuated latch spanning the bed-opening, a rotary rack-wheel engaging the latch, and means, substantially as shown and described, for actuating the latch, as and for the purpose specified.

6. The combination, with a bed provided with a longitudinal

opening, a latch spanning the opening, and a notched stacking-bar sliding in the said bed-opening, of a rotatable rack-wheel engaging the latch, a foot-lever, and a spring-actuated lever connecting said latch and foot-lever, substantially as shown and described.

407,945. ELECTRIC CLOCK FOR USE IN EXPOSED PLACES. ALFRED SYDER, Passaic, N. J. Filed Sept. 22, 1888. Serial No. 286,115. (No model.)

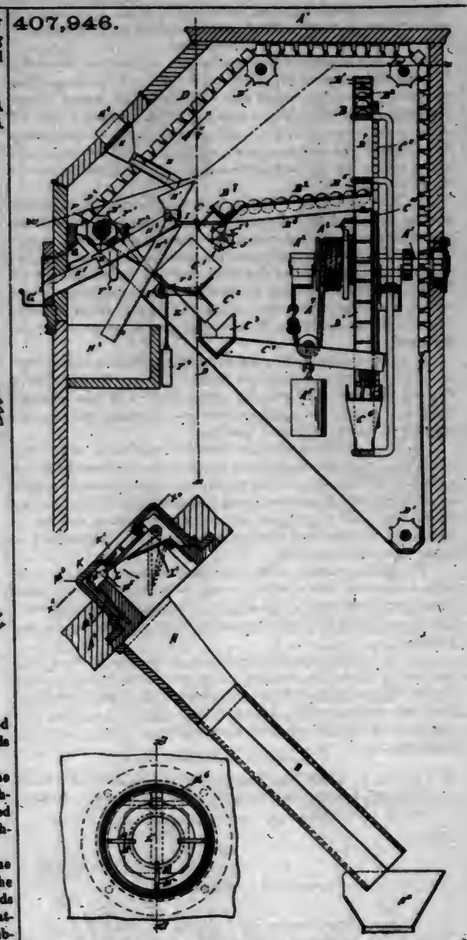
Claim.—1. In a clock, the combination, with the hour and minute hands, of propelling mechanism attached to the pointing ends of the hands, substantially as specified.

2. In an electric-clock movement, the combination, with the clock hands and dial, of electrically-operated pawl-and-ratchet mechanism carried near the outer ends of the hands and tracks attached to the dial and adapted to be engaged by the hand-propelling mechanism, substantially as specified.

3. In an electric clock, the combination, with the hand A, of the magnets M M', attached to the hand A, the armature-levers *a a'*, the levers *l l'*, the levers l^2 l^2, the pawls *d d'*, the ratchet-wheel W, the studs *e*, carried by the ratchet-wheel, and the toothed circular rack *r*, attached to the pawl and adapted to be engaged by the studs *e*, substantially as specified.

4. In an electric clock, the combination, with the hand A, of the magnets M M', attached to the hand A, the armature-levers *a a'*, the levers *l l'*, the levers l^2 l^2, the pawls *d d'*, the ratchet-wheel W, the studs *e*, carried by the ratchet-wheel, the detent l^2, and the toothed circular rack *r*, attached to the dial and adapted to be engaged by the studs *e*, substantially as specified.

5. The combination, with the minute-hand A, provided with electro-mechanical propelling mechanism, of the spur-wheel p', carried by the hand A, the hand C, the pinion p^2, spur-wheel p^3, and pinion p^4, carried by the hand C, the crank *n'*, attached to the pinion p^3, the levers n^2 n^3, the toggle formed of the bars *n n*^{3}, the connecting-rod n^4, the pawls *x y*, pivotally attached to the lever n^3, the ratchet-wheel W', the studs *e'*, carried by the said ratchet-wheel, and the rods *m*, substantially as specified.



6. The combination, with a pair of clock-hands propelled electrically from their extremities, of a time electric-circuit maker and breaker, substantially as specified.

7. The combination, with the circular racks *r r'* and hands A C, of the rollers *g g'*, substantially as specified.

8. The combination, with a pair of clock-hands, of electro-magnetic driving mechanism carried by one of the hands and mechanism for communicating motion from the electrically-operated hand to propelling mechanism at the extremity of the other hand, substantially as specified.

407,946. AUTOMATIC SELLING-MACHINE. JOHN W. VARNEY, Jersey City, N. J. Filed July 13, 1888. Serial No. 279,205. (No model.)

Claim.—1. In an automatic selling-machine, the combination, with a ball-elevator and a motor for operating the same, of one or more independent box-link chains for receiving the articles to be delivered by the machine, motors for moving said box-link chains, and retaining devices for the said motors of the box-link chains, which retaining devices are to be operated by the balls raised by the ball-elevator, substantially as herein shown and described.

2. In an automatic selling-machine, the combination, with a ball-elevator and a motor for the same, of a box-link chain for receiving the articles to be delivered by the machine, a motor for moving said chain, a retaining device for said motor, and a coin-operated ball-retainer, substantially as herein shown and described.

3. In an automatic selling-machine, the combination, with a ball-elevator and a motor for the same, of a chute into which the balls can pass from the ball-elevator, a ball-outlet tube on said chute, a coin-operated ball-retainer, a box-link chain for receiving the articles to be delivered by the machine, a motor for said chain, and a chain-motor retainer operated by the balls released by the coin-operated ball-retainer, substantially as herein shown and described.

4. In an automatic selling-machine, the combination, with a ball-elevator and a motor for the same, of a chute into which the balls pass from the ball-elevator, an outlet-tube for the balls on said chute, a coin-operated ball-retainer at said outlet-tube, a box below said outlet-tube, a box-link chain for receiving the articles to be delivered by the machine, a motor for said chain, and a retaining-lever for said motor, the ends of said retaining-lever projecting into the box below the ball-outlet tube on the above-mentioned chute, substantially as herein shown and described.

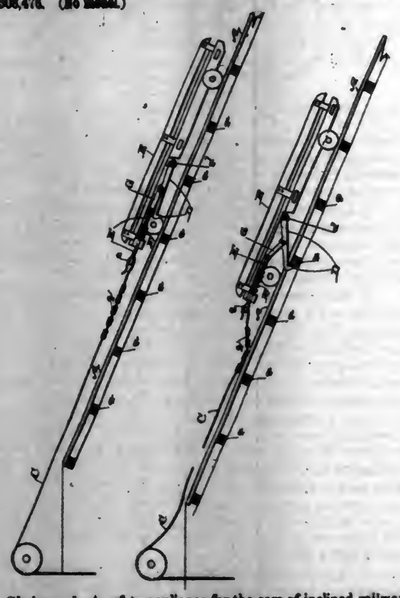
5. In an automatic selling-machine, the combination, with a ball-elevator and a motor for the same, of a chute into which the balls can pass from the ball-elevator, a box-link chain for receiving the articles to be delivered by the machine, a motor for said chain, a retaining-lever for said motor, which lever is in the path of the dropping balls,

and a chute for conveying the dropped balls back to the ball-elevator, substantially as herein shown and described.

6. In an automatic selling-machine, the combination, with a box-link chain for receiving the articles to be delivered by the machine, of a series of sprocket-wheels over which said chain passes, a rope-drum on one sprocket-wheel, a rope and weight connected with said drum, an escapement-wheel on said sprocket-wheel, an escapement-fork engaged with said escapement-wheel, and a ball-elevator for elevating balls to operate said escapement-lever, substantially as herein shown and described.

7. In an automatic selling-machine, the combination, with a ball-elevator and a motor for the same, of a chute into which the balls can pass, a series of ball-outlet tubes on said chute, a spider-wheel at each outlet-tube, levers for locking the spider-wheels, coin-chutes into which said levers project, box-link chains for receiving the articles to be delivered, motors for operating the chains, and retaining-levers for said motors, which retaining-levers are operated by the balls as they drop from the guide-tubes of the chute, substantially as herein shown and described.

8. In an automatic selling-machine, the combination, with a chute, of an outlet-tube, a spider-wheel projecting into the outlet-tube, a disk on the same shaft with the spider-wheel with pins arranged singly or in groups, and a coin-actuated lever engaging said pins, substantially as herein shown and described.



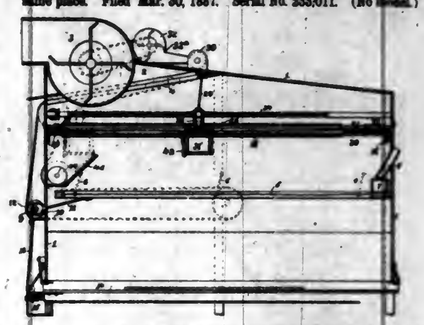
9. In an automatic selling-machine, the combination, with a ball-chute, of an outlet-tube on the same, a spider-wheel projecting through a slot of said outlet-tube, a disk secured on a sleeve mounted to slide on and turn with the shaft of the spider-wheel and having pins arranged singly and in groups in different circumferential rows on its rim, and a coin-actuated lever engaging said pins, substantially as herein shown and described.

10. In an automatic selling-machine, a mouth-piece for a coin-chute constructed with a casing having an opening in its top plate, sliding spring-actuated jaws in said top plate, and a spring-actuated gate hinged below said top plate, substantially as herein shown and described.

11. In an automatic selling-machine, a mouth-piece for a coin-chute constructed with a casing having an opening in its top plate, beveled sliding springs, actuated jaws in the edges of said plate, which jaws have bevels on their top and bottom edges, and a spring-actuated gate below said top plate, substantially as herein shown and described.

407,947. SAFETY-CATCH FOR CARS OF INCLINED RAILWAYS.

WILLIAM C. D. ROOT, Grass Valley, Cal. Filed Apr. 24, 1889. Serial No. 308,476. (No model.)



Claim.—1. A safety appliance for the cars of inclined railways, consisting of the combination of the pivoted gravity-hook D, carried by the car, the sliding draw-head bar E, carried by the car and to which the hoisting-cable is attached, and the pivoted link G, connecting the draw-head bar with the safety-hook, whereby when the cable is taut the hook is held up, and when the cable breaks the hook is dropped to its engagement, substantially as described.

2. A safety appliance for the cars of inclined railways, consisting of the combination of the pivoted gravity-hook D, carried by the car, the sliding draw-head bar E, carried by the car and to which the hoisting-cable is attached, the pivoted link G, connecting the rear head of the draw-head bar with the hook D, and the spring F about the draw-head bar for retracting it when the cable breaks and assisting the drop of the gravity-hook, substantially as described.

407,948. DUST-COLLECTOR FOR MIDDLINGS-PURIFIERS.

JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company same place. Filed Mar. 30, 1887. Serial No. 233,011. (No model.)

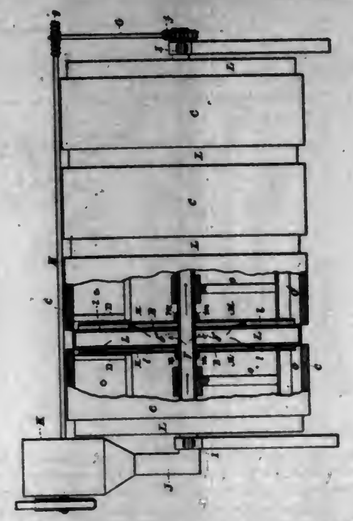
Claim.—1. In a dust-collector, the combination, with the dust-arresting cloth and means for dislodging the dust therefrom, of a dust-catching receptacle, means for moving it along the cloth, and rollers carried by the receptacle and bearing against the cloth, substantially as set forth.

2. In a dust-collector, the combination, with the flat dust-arresting cloth and means for dislodging the dust therefrom, of a dust-catching receptacle placed beneath and having continuous contact with the under side of the cloth, whereby the air is prevented from entering said receptacle except through the cloth, and means for moving said receptacle over the under surface of the cloth, substantially as set forth.

3. In a dust-collector, the combination, with the flat dust-arresting cloth, of a dust-catching receptacle placed beneath the cloth and having its open top side constantly in contact therewith, a cleaner in contact with the upper side of the cloth and immediately over the dust-receptacle for dislodging the dust, and means for moving the dust-receptacle and cleaner together, substantially as set forth.

4. In a dust-collector, the combination of a flat dust-arresting cloth, a dust-catching receptacle consisting of an open box having its open side in constant contact with the under side of the cloth, a pipe or tube having a minute jet-orifice in contact with the upper side of the cloth, a fan, and means for moving said tube and dust-receptacle together, substantially as set forth.

5. The combination of the flat cloth, a tube placed in contact with the upper side thereof and having a minute jet-orifice at the point of contact, a fan, suitable connections between said tube and fan, a dirt-receptacle having its open side in continuous contact with the under side of the cloth, so as to prevent the air from entering or leaving said receptacle except through the cloth, and means for moving said tube and receptacle together over the surface of the cloth, substantially as set forth.



6. The combination, with the cloth, of a tube having a jet-orifice placed in proximity thereto, means for moving said tube, a fan, a flexible tube forming communication between said fan and tube, a drum upon which said tube is wound, and a spring actuating the drum in a direction to wind the tube thereon, substantially as set forth.

7. The combination, with the cloth, a blast-tube having a jet-orifice placed in proximity thereto, and means for moving said tube, of a fan, a hollow drum with which said fan communicates, a flexible tube communicating at one end with said drum and at the other with said blast-tube, and means for turning said drum in a direction to wind the tube thereon, substantially as set forth.

8. In a dust-collector, the combination of the cloth, a tube having a jet-orifice, a fan having connection therewith, a board placed transversely of the cloth and in proximity to the upper face thereof, having a central longitudinal slot for the reception of said tube and a slot at each side thereof, for the purpose set forth, a practically air-tight dust-receptacle placed in proximity to the under side of the cloth directly beneath said board, and means for moving the tube, board, and receptacle together along the cloth, substantially as set forth.

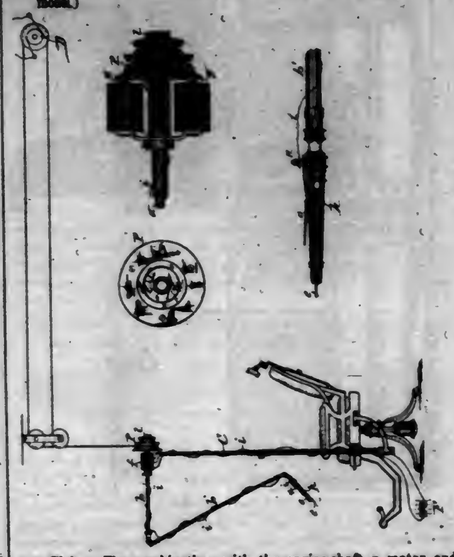
407,949. DUST-COLLECTOR.

JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed June 21, 1887. Serial No. 242,080. (No model.)

Claim.—1. The combination, with the casing and dust-arresting cloth, of a shaft, an air-tube secured thereto so as to move in close proximity to the surface of the cloth and having a slit for projecting air against said cloth, a fan having communication with said air-tube, and a shield secured to the shaft inside the cloth and situated directly opposite the air-tube, substantially as and for the purpose set forth.

2. The combination, with the casing and the dust-arresting cloth, of a hollow shaft, a fan communicating with said shaft, an air-tube secured to said shaft and having communication with the interior thereof, said tube having an aperture through which air is directed against and through said cloth, and a shield secured to the shaft on the opposite side of the cloth and directly opposite the air-tube, substantially as set forth.

3. The combination, with a number of casings situated at suitable distances apart and having dust-arresting cloth arranged on their adjacent sides, of a hollow shaft passing through all of said casings, a fan communicating with said hollow shaft, a single air box or tube secured to the shaft between each two casings so as to have contact with the cloth on the adjacent sides of said casings, each box having openings in its opposite sides for directing a current of air against and through said cloth, and a shield located opposite each air-box on the insides of the casings, substantially as set forth.

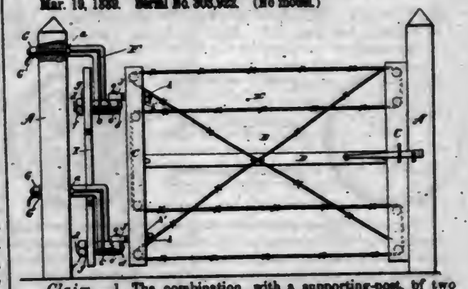


4. The combination, with a plurality of casings situated at suitable distances apart and having cloth arranged, substantially as described, for arresting the dust, of a hollow sectional shaft common to all of said casings, a fan communicating with said shaft, air boxes or tubes secured to said shaft so as to have contact with the dust-arresting cloth and having communication with the interior of said shaft, slits formed in the sides of said boxes which have contact with the cloth, shields situated inside the casings and secured to the shaft opposite the air-boxes, means for rotating said shaft, and means for disconnecting the sections of said shaft whereby the rotation of a portion of the shaft may be checked while the whole of it is available as an air-conduit, substantially as set forth.

5. The combination, with the drum C, having the discharge-aperture *c'*, and the end walls A, having openings for the egress of air, of the dust-arresting cloth secured over said openings, a shaft passing through the casing concentrically with the drum, means secured to said shaft for dislodging the dust from the cloth, and a scraper secured to said shaft for scraping the dirt to the discharge-aperture, substantially as set forth.

6. The combination, with the drum C and the dust-arresting cloth situated at the end thereof, of the shaft passing through said cloth concentrically with the drum, a cloth-cleaner secured to said shaft extending diametrically across the cloth, and a shield secured to the shaft and having contact with the cloth on opposite sides of the cleaner for preventing the egress of air through that portion of the cloth which is for the time being being operated upon, substantially as set forth.

407,950. STOP-MOTION FOR DENTAL ENGINES.



ANDREW R. COOKE, Syracuse, N. Y. Filed Apr. 8, 1889. Serial No. 306,331. (No model.)

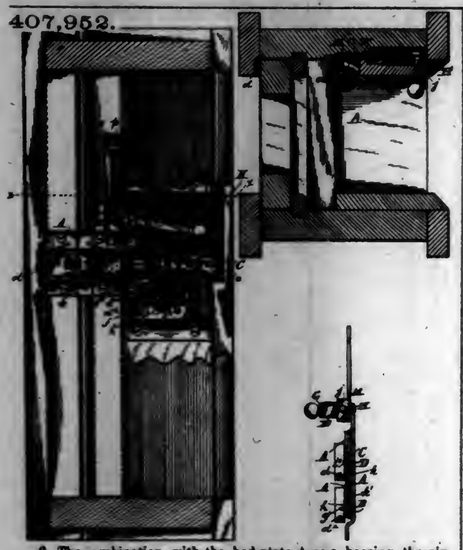
Claim.—The combination, with the engine-shaft *a*, motor, and driving-belt, of a clutch member fixed to said shaft, a sliding pulley on the same shaft, a clutch member fixed to the side of the pulley, a spring forcing the two clutch members apart, an armature on the same side of the pulley to which the clutch member is affixed, electro-magnets facing said armature, an electric circuit, including said magnets, and a circuit maker and breaker connected to the handle of the dental instrument and normally in its open position, allowing the two clutch members to be held separated by the action of the spring, substantially as set forth.

407,951. GATE.

WILLIAM L. HAAS, Charles City, Iowa. Filed Mar. 19, 1889. Serial No. 303,922. (No model.)

Claim.—1. The combination, with a supporting-post, of two crank-arms journaled in the said post and clamped adjustably thereto, pintles secured adjustably to these arms, and a gate supported upon the pintles.

2. The combination of a post, crank-arms supported thereby and carrying eyes at their ends, pintles bolted to these eyes, the adjacent faces of the pintles and eyes being serrated to prevent turning, and a gate hung upon the said pintles.



3. The combination of a post, crank-arms supported by the said post and provided with eyes *c c*, pintles, bolts for securing the pintles to the eyes *c*, spacing-sleeves on these bolts, nuts for clamping the spacing-sleeves, and a connecting-bar.

407,952. SASH-HOLDER.

SAMUEL R. HARRINGTON, North Amherst, Mass. Filed May 1, 1888. Serial No. 309,208. (No model.)

Claim.—1. The combination, with bar B, having jaw *d*, arm C, and the link connecting said bar and arm, and the bar B, provided with jaw *d'*, and upper and lower sashes of a window, of the lever D, pivoted to said bars B B', operated in the manner substantially as described, whereby the said sashes may be locked together against the parting-bead of the window, as and for the purpose specified.

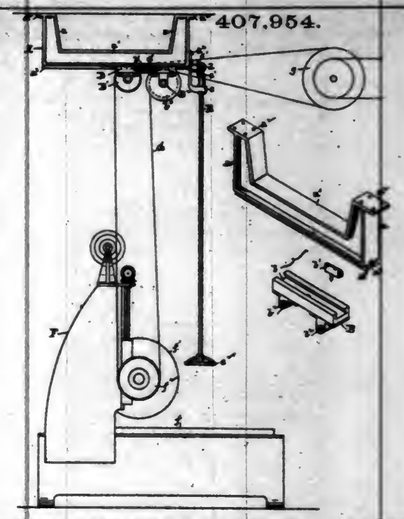
407,952.

2. The combination, with the bed-plate A as a bearing, the pivoted lever D, the arm C, and clamp B, united by a compensating link, the clamp B', and pivots *i i'*, and the window-sashes, of the swivel-nut *j*, pivoted to said pivoted lever D, the crank F and G, and the screw-threaded arm H, as and for the purpose set forth.

3. The combination, with the holding device for the sashes and the square collar F, as described, of the locking device composed of the pivoted tumbler-plate, having slots at opposite ends, and the key to operate said tumbler, substantially as and for the purpose set forth.

4. The combination, with the double holding and locking device composed of clamps B *d* B' *d'*, arm C, linked to said clamp B *d* and lever D, of the bed-plate composed of parts A A', adjustably arranged with reference to each other and the window hanging-stile by slots and holding-screws, as and for the purpose set forth.

407,953. PROCESS OF ORNAMENTING GOLD SURFACES. LOUIS JAGIELKY, New York, N. Y. Filed Mar. 8, 1889. Serial No. 302,522. (No model.)



Claim.—The process herein described of ornamenting the surfaces of gold plates, which consists of the following steps successively performed: first, producing a raised design by cutting out the stock around the design; secondly, matting the cut-out ground; thirdly, gilding the entire surface; fourthly, polishing the surface of the raised parts, and, lastly, inserting precious stones into the raised parts and engraving the surface of the raised parts, substantially as set forth.

407,954. HANGER FOR PULLEYS. ELWIN R. HYDE and RICHARD C. HORNER, Springfield, Mass., assignors to the Springfield Glue and Emery Wheel Company, same place. Filed Aug. 27, 1888. Serial No. 283,923. (No model.)

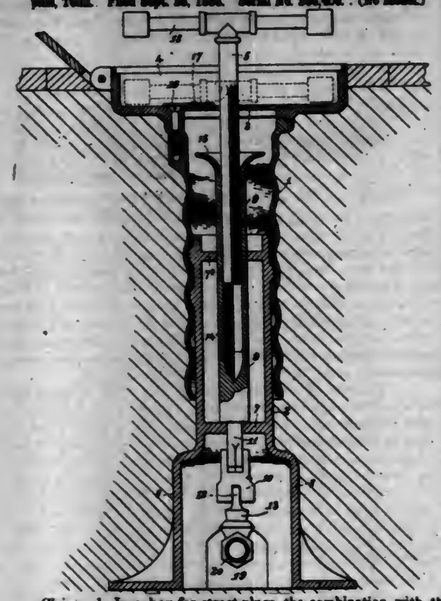
Claim.—1. The compensating hanger for pulleys herein described, comprising two brackets adapted to be suspended parallel with each other from the ceiling or other suitable support, a block movably mounted upon each of said brackets, one or more pulleys located between said blocks and carried thereby, a screw-shaft mounted upon each of said brackets and engaging a threaded hub on each of said blocks, and a cross-shaft and suitable connecting-gear for revolving said shafts simultaneously, whereby said blocks can be caused to move in unison upon said brackets, substantially as and for the purpose set forth.

2. The compensating hanger for pulleys herein described, comprising two brackets adapted to be suspended parallel with each other from a suitable support, a sliding block mounted upon each of said

407,954.

brackets, one or more pulleys having their axes mounted in bearings upon said blocks, a screw-shaft mounted in such manner as to revolve without endwise progression upon each of said brackets, each of which screw-shafts operatively engages one of said blocks, at one end and is provided at its opposite end with a bevel-gear, a cross-shaft carrying at each end bevel-gears which mesh with the bevel-gears on said screw-shafts, whereby the three shafts are compelled to revolve in unison, and a manually-operated shaft and gear arranged, substantially as described, for imparting a revolving movement to one of said shafts, substantially as set forth.

3. The compensating hanger for pulleys herein described, consisting of two brackets suspended from the ceiling and parallel with each other, a block movably mounted upon each of said brackets, a pulley-shaft mounted at each end in one of said blocks, a pulley carried by said shaft, two screw-shafts having bearing in said brackets, each of which shafts operatively engages one of said blocks at one end and carries a bevel-gear at its opposite end, a cross-shaft carrying at each end bevel-gears which mesh with the gears on said screw-shafts, and a vertical shaft having at its upper end a gear which meshes with one of the gears on said screw-shafts and having at its lower end a hand-wheel, whereby it can be revolved manually, combined and operating substantially as and for the purpose described.



4. In a compensating hanger for pulleys, the brackets A A', having the dovetail ribs b^2, blocks B, having dovetail grooves *b*, shaft B^2, having its ends mounted in said blocks, and pulleys b^2 loosely mounted upon said shaft, combined and operating substantially as described.

5. The combination, with brackets A A', having dovetail ribs a^2 and grooves a^3, of blocks B, each having dovetail grooves *b* therein, and threaded hub *b'*, located within said groove, a pulley-shaft mounted at its ends on said blocks, and screw-shafts C C', mounted at or near one end in bearings on said brackets and engaging said hubs *b'* at their opposite ends, substantially as set forth.

6. The combination, with brackets A A', each having a dovetail rib a^2 extending along its lower edge and having groove a^3 within said rib, of blocks B, each having dovetail grooves *b* in its upper surface and having threaded hub *b'* located within said groove, a pulley-shaft carried at each end by one of said blocks, screw-shafts C C', mounted in bearings at one end of said brackets, each of said shafts entering one of said hubs *b'* at one end and having a gear *c'* at its opposite end, cross-shaft D, carrying gears *d* at its ends, which gears mesh respectively with one of the gears *c'*, and vertical shaft E, carrying at its upper end gear *d'*, which meshes with one of the gears *c'*, and having at its lower end hand-wheel e^2, arranged and operating substantially as set forth.

7. The combination, with brackets A A', of plate a^5, secured to said bracket A, said plate having the bearings *e d' e* thereon, plate a^5, secured to bracket A' and having bearings *e d'* thereon, shafts C C', mounted, respectively, in said bearings *e e*, and having gears *c'* at one end thereof, shaft D, mounted in said bearings *d' d'* and having at its ends gears *d*, meshing with said gears *c'*, and shaft E, mounted in said bearing *e* and having at its upper end gear *d'*, which meshes with the gear *c'* on said shaft C, arranged and operating substantially as and for the purpose described.

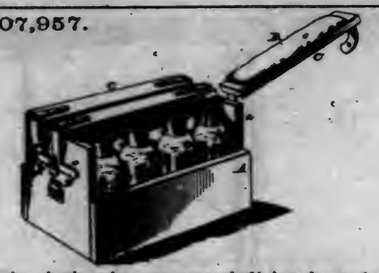
407,955. EXTENSION BOX AND KEY FOR STREET GAS OR WATER PLUGS. MICHAEL J. KALLAHER and JOHN MULROONEY, Memphis, Tenn. Filed Sept. 26, 1888. Serial No. 286,402. (No model.)

Claim.—1. In a box for street-plugs, the combination, with the lower section 2 and the plug-key 12, of a wrench adapted to engage the plug-key 12, a round handle for turning said wrench having an elongated prismatic key-socket, a flaring mouth on said handle for guiding an elongated prismatic key into said socket, and a collar in said section for restricting the vertical movement of said handle, as set forth.

2. In a box for street-plugs, the combination, with the upper and lower sections of the telescopic box and the plug-key 12, of a wrench for engaging the plug-key 12, a handle for turning said wrench journaled in the lower section and having an elongated prismatic key-socket, the perforated diaphragm of the upper section, a removable prismatic key, and a flaring mouth on said handle for guiding said key to said socket, as set forth.

3. In a box for street-plugs, the combination, with the upper and lower sections 1 2 and the plug-key 12, of the wrench, the upper and lower internal flanges or diaphragms in said lower section, the round handle projecting through the upper diaphragm and resting upon the lower diaphragm, the attenuated journal projecting through the lower flange and being secured to the wrench, said handle having an elongated prismatic key-socket with a flaring mouth, and a prismatic key for fitting in said socket, as set forth.

407,956. GRAIN-SEPARATOR. WILLIAM P. KERR, Mason City, Iowa. Filed Nov. 3, 1888. Serial No. 289,890. (No model.)



Claim.—The combination of the casing D, crank-shafts B B, the rising, falling, and reciprocating beams A A, tables C C, having forwardly-inclined slats on top and the two sets *c c'* of slats, said slats in each table being arranged at an obtuse internal angle, and uprights rigidly supporting said tables from the beams A, substantially as described.

407,957. SHIPPING-CASE. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Kookogey Electric Company. Filed June 8, 1887. Serial No. 240,845. (No model.)

Claim.—In a shipping-case, the combination of a box or body A, divided by partitions B into cells or compartments, each adapted to

407,957.

receive a bottle, and a cover composed of independent sections, each section extending over one row of compartments and provided on its under face with a cushion having an impervious facing or covering to rest upon and close the mouths of the bottles in the row of compartments beneath.

407,958. LOOM-SHUTTLE. PLINY T. LITCHFIELD, Southbridge, Mass. Filed Apr. 2, 1889. Serial No. 305,690. (No model.)

Claim.—The combination, with a shuttle-spindle having a shoulder or stop to support one end of the cop-tube, of a cop-tube-holding finger to clamp the said cop-tube between itself and the shuttle-spindle, substantially as described.

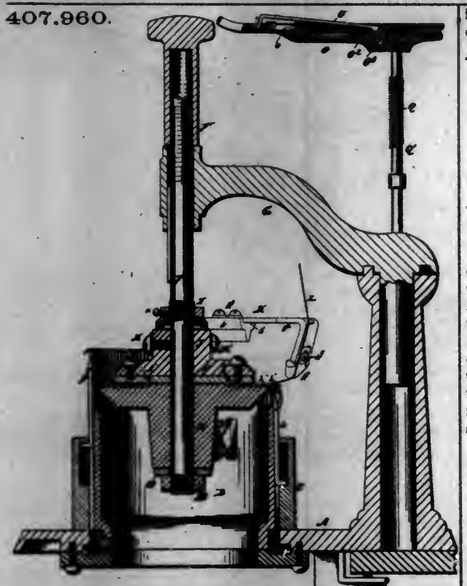
407,959. CARRIAGE-BOW. GEORGE V. MONTGOMERY, Amsterdam, N. Y., assignor of one-half to Appleton S. Bridgman. Filed Mar. 1, 1889. Serial No. 301,721. (No model.)

Claim.—1. As an article of manufacture, a carriage-bow composed wholly of compressed paper-pulp, substantially as described.

2. A carriage-bow composed of an outer surface of paper-pulp, having its ends and exposed portions compressed to a high degree to receive a polish, and its upper unexposed surface of a less degree of compactness, for the purpose described.

407,960. KNITTING-MACHINE. EDWARD MURRY, Detroit, Mich. Filed Dec. 28, 1886. Serial No. 222,835. (No model.)

Claim.—1. The combination of a vibratory yarn-guide, a looper attachment comprising a stationary cam-grooved plate and a rotatable disk provided with a series of radiating points or fingers having heels that engage the cam-groove, and a central stem on which said guide and looper attachment are located, substantially as described.



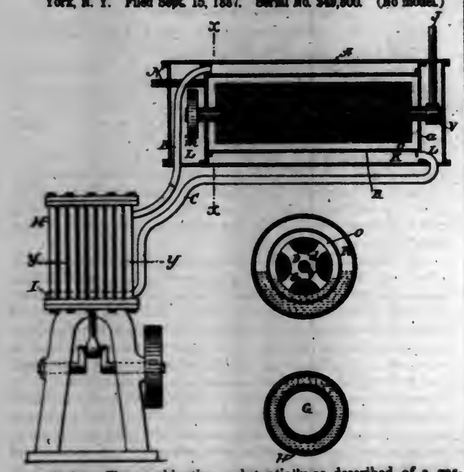
2. The combination, with the central stem F and a vibratory yarn-guide swiveled about said stem, of a looper attachment supported on said stem and comprising a stationary cam-plate provided with a cam-groove, a rotatable radially-grooved disk, and a series of radiating points or fingers having heels that engage the cam-groove, substantially as described.

3. The combination, with a centrally-supported looper attachment comprising a stationary cam-grooved plate, a rotatable disk, and a series of radiating points or fingers carried by said disk and having heels that engage the cam-groove, of a yarn-guide provided with a guide-point, means for adjusting said point in a vertical direction, and means for adjusting it in a direction toward and from the center of motion of the looper attachment, substantially as described.

4. The combination, with a looper attachment comprising a stationary cam-grooved plate and a rotatable disk having a series of radiating points or fingers engaged with the cam-groove, a vibratory yarn-guide, and the central stem on which said guide and looper attachment are located, of a collar surrounding said stem and provided with stops to limit the vibration of said guide, substantially as described.

5. The combination, with a looper attachment comprising a sta-

407,960.



tionary cam-grooved plate, a rotatable disk, and a series of radiating points or fingers engaged with the cam-groove, of a vibratory yarn-guide and a take-up device, substantially as described.

6. The combination, with the central stem F and a vibratory yarn-guide located on said stem, of a binding device to hold said guide in any required position, substantially as described.

7. The combination, with the stem F, of a vibratory guide engaged thereon, said guide comprising an arm *k*, an arm k^3, adjustably mounted on the arm *k* by set-screws, and the point k^4, adjustably engaged upon the arm k^3 by a set-screw, substantially as described.

8 The combination, with the needles and a stationary yarn-guide E for feeding yarn to the needles, of a centrally-supported looper attachment comprising a stationary cam-grooved plate, a rotatable disk, and a series of radiating points or fingers carried by said disk and having heels that engage the cam-groove, and an independent vibratory yarn-guide K for feeding a separate looping-yarn to the needles, substantially as described.

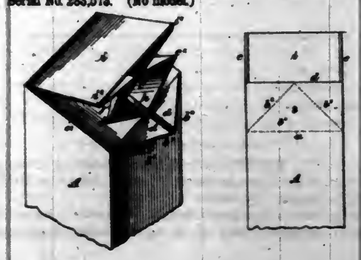
407,961. COMBINED GAS-ENGINE AND CARBURETOR. LYMAN F. MCNETT, Yonkers, assignor to the American Motor Company, New York, N. Y. Filed Sept. 15, 1887. Serial No. 249,800. (No model.)

Claim.—The combination, substantially as described, of a gas-generator, a jacket therefor, a gas-engine having a cooling-jacket, and circulating-pipes, as described, for circulating a heating and cooling fluid through the jacket of the engine and the jacket of the generator.

407,962. MANUFACTURE OF TYPE-PLATES. CHARLES E. PERRY, Oneida, assignor of one-half to Thomas R. Proctor, Utica, N. Y. Filed Mar. 25, 1888. Serial No. 304,671. (No model.)

Claim.—1. The method of forming a pattern for a type-plate, consisting in preparing a block of the same diameter and contour as that of the type-plate to be made, then drilling through said block holes in the same relative position as the types are to be disposed on the type-plate, then supporting the said block over a suitable bed with a space between them equal in depth to the projection of letters or characters from the body of printers' types, then inserting printers' types in the holes in the block and causing the faces of said types to rest on the aforesaid bed, and finally, while holding the types in their requisite positions in the aforesaid block, fastening the types therein, substantially as set forth.

2. The method of forming a pattern for a concavo-convex spherical type-plate, consisting in preparing a concavo-convex block of the same diameter and contour on its convex side as that of the type-plate to be made, and of a thickness approximately equal to the length of printers' types, then drilling through the block holes in lines radiating from the center of the sphere of which the block is a segment, then supporting the said block over a bed with a space between them equal in depth to the projection of the letters or characters from the body of printers' types, then inserting printers' types in the holes in the block and causing the faces of said types to rest upon the aforesaid bed, and then, while holding the types in their requisite positions in the block, fastening the types therein, substantially as described.

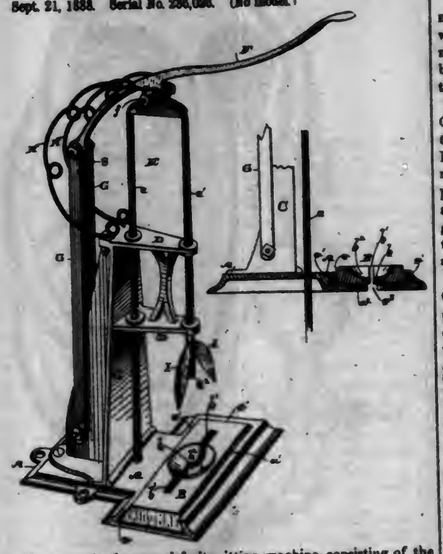


3. The method of constructing type-plates, consisting in first forming a pattern by preparing a block of the same diameter and contour as that of the type-plate to be made, then drilling through said block holes in the same relative positions as the types are to be disposed on the type-plate, then supporting the said block over a suitable bed with a space between them equal in depth to the projection of letters or characters from the body of printers' types, then inserting printers' types in the holes in the block and causing the faces of said types to rest on the aforesaid bed, then, while holding the types in their requisite positions in the said block, soldering the types therein, then impressing the face of said pattern in a mold of wax or analogous suitable material, and then removing the pattern from the mold, applying to the face of the mold a coating of plumbago or black-lead, and then depositing the said mold in an electric bath and depositing thereon the metal by electrolysis, substantially as set forth.

407,963. PRODUCTION OF INCANDESCENT MANTLES. FREDERICK L. RAWSON and WILLIAM S. RAWSON, London, England. Filed Aug. 21, 1888. Serial No. 283,360. (No model.) Patented in England Sept. 1, 1886, No. 11,161; in Germany July 24, 1887, No. 43,013, and in France Nov. 2, 1887, No. 186,722.

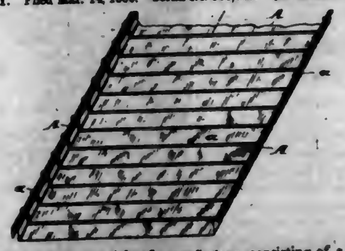
Claim.—1. The herein-described improvement in strengthening incandescent mantles, consisting in coating the completed mantle with paraffine or other suitable material, substantially as set forth.

2. In the manufacture of incandescent mantles, the method of forming said mantles, which consists of first stretching the impregnated knitted mantle upon a mandrel, then burning the mantle, then shaping the mantle against the mandrel by means of a blow-pipe flame, and finally coating the mantle with paraffine or other similar material, substantially as set forth.



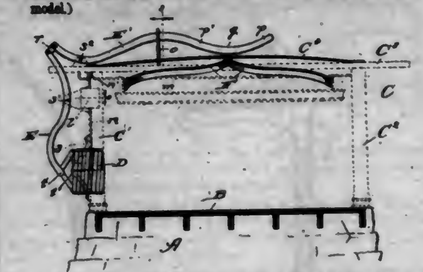
407,964. PAPER BOX. HUGO ROESNER, Habelschwert, Germany, assignor to August Schilling, San Francisco, Cal. Filed Aug. 23, 1888. Serial No. 283,573. (No model.)

Claim.—1. A box composed of the front *b*, having the crease-line *a*, and sides *c*, having crease-line *a*, and diagonal crease-lines *f* extending from opposite corners thereof, horizontal lines *h* and vertical lines *g*, both of which lines *g* and *h* meet in the line *f*, and the back *i*, having crease-line *a*, the sides *c* folding inward toward each other, the lines *g h* on said sides coming near each other, the back *i* folding upon the sides *c*, substantially as described.



2. A box composed of the front *b*, having crease-lines *a* b^4, forming a triangular field or flap b^4, the sides *c*, having crease-line *a* and diagonal crease-lines *f*, extending from opposite corners thereof, horizontal lines *h* and vertical lines *g*, both of which lines *g* and *h* meet in the line *f*, and the back *i*, having crease-line *a*, the sides *c* folding inward toward each other, the lines *g h* coming near each other, the back *i* folding upon the sides *c*, and the flap b^4 folding over upon the back *i*, substantially as described.

407,965. FRUIT-PITTING MACHINE. JOHN ROSASCO, Healdsburg, assignor of one-half to Joseph Cuneo, San Francisco, Cal. Filed Sept. 21, 1888. Serial No. 286,026. (No model.)



Claim.—An improved fruit-pitting machine consisting of the combination of a bed-plate having an apertured and slitted socket-seat with beveled surrounding flanges and a fixed standard with guide-arms, a cushion having beveled sides fitted in the socket-seat and having an aperture and side slits and a recess-seat for the fruit, a vertically-movable beat rod fitted in the guide-arms of the standard and having one end slitted and provided with a punch, and a beat winged knife fitted in the slitted end of said rod and having its wings projecting below the punch, a lever pivotally connected with the top of the beat rod, links pivoted at their lower ends to the standard and at their upper ends to the rear end of the lever, and springs secured to the standard and to the top of the beat rod, substantially as described.

407,966. METALLIC ROOFING-SHEET. LONGLEY L. SAGENDORPH, Cincinnati, Ohio, assignor of one-half to Charles N. Harder, Philmont, N. Y. Filed Mar. 14, 1888. Serial No. 306,325. (No model.)

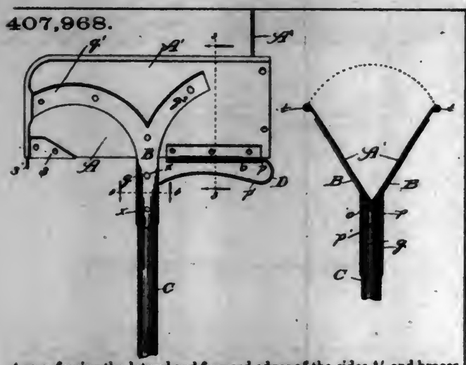
Claim.—A new article of manufacture, consisting of a sheet of roofing provided with a series of continuous crosswise depressions and corresponding ribs *a* and side hooked flanges A, said ribs extending entirely across said sheet and flanges, substantially as set forth.

407,967. SAFETY-GATE FOR SWING-BRIDGES. NICHOLAS SCHLESSER, Chicago, Ill. Filed Apr. 23, 1889. Serial No. 308,238. (No model.)

Claim.—1. In combination with a swing-bridge and its abutment, a safety-gate comprising horizontally-disposed lazy-tongs, a weight connected with the lazy-tongs and tending to maintain it normally distended across the approach to the bridge, and an arm on the bridge operating with the closing thereof to lift the weight and fold the lazy-tongs, substantially as described.

2. In combination with a swing-bridge and its abutment, a frame C upon the abutment, a vertically-oscillating lever E', supported above the frame normally at the lowest limit of its oscillation, a safety-gate D upon the frame comprising horizontally-disposed lazy-tongs connected with the lever E' to be maintained distended by the normal position of the latter and become folded by the rise thereof, and an arm on the swing-bridge operated by the closing of the latter to engage and raise the lever E' to open the gate, and by the opening of the bridge to release the lever to close the gate, substantially as described.

3. In combination with a swing-bridge and its abutment, a frame C upon the abutment, vertically-oscillating lever E', pivotally supported above the frame, with its long arm normally at the lowest limit of its oscillation, a safety-gate D upon the frame comprising horizontally-disposed lazy-tongs, a lever E, pivoted to the frame and loosely connected toward opposite ends, respectively, to the short arm of the lever E' and gate D, whereby, when the long arm of the lever E' is down, the lazy-tongs are distended and become folded with the rise of the said arm, and an arm on the swing-bridge operated by the closing of the latter to engage and raise the lever E' to open the gate, and by the opening of the bridge to release the lever to close the gate, substantially as described.

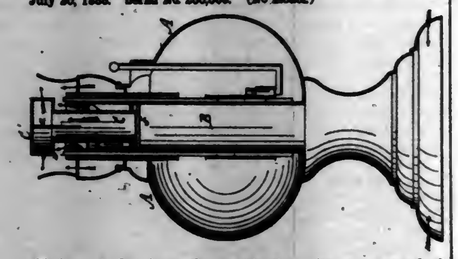


4. In combination with a swing-bridge and its abutment, a frame C upon the abutment, vertically-oscillating lever E', pivotally supported above the frame, having a long arm bent to afford a depressed part *q*, and elevated portions *p p'*, the said arm being normally at the lowest limit of its oscillation, a safety-gate D upon the frame, comprising horizontally-disposed lazy-tongs, a lever E, pivoted to the frame and loosely connected toward opposite ends, respectively, with the short arm of the lever E' and gate D, whereby, when the long arm of the lever E' is down, the lazy-tongs are distended and become folded with the rise of the said arm, a track C^6 upon the frame, and an arm F, pivotally supported on the swing-bridge and operated by the closing of the latter to slide toward its free end upon the track C^6 and engage and raise the long arm of the lever E' to open the gate, and by the opening of the bridge to release the lever to close the gate, substantially as described.

5. In combination with a swing-bridge and its abutment, a frame C upon the abutment, vertically-oscillating lever E', pivotally supported above the frame, having a long arm bent to afford a depressed part *q*, and upwardly-inclining portions *p p'*, the said arm being normally at the lowest limit of its oscillation, a safety-gate D upon the frame comprising horizontally-disposed lazy-tongs, a track *m* above the gate, a pulley *n'* upon the track connected with the lazy-tongs by a connecting medium *n*, carrying a lantern *l*, a housing *l'* for the lantern, a lever E, pivoted to the frame and loosely connected toward opposite ends, respectively, with the short arm of the lever E' and gate D, whereby, when the long arm of the lever E' is down, the lazy-tongs are distended and become folded with the rise of the said arm, a track C^6 upon the frame, and an arm F, pivotally supported on the swing-bridge and operated by the closing of the latter to slide toward its free end upon the track C^6 and engage and raise the long arm of the lever E' to open the gate, and by the opening of the bridge to release the lever to close the gate, substantially as described.

407,968. HOD. LOUIS L. SCHUBERT and FREDERICK MAIERHOFER, Chicago, Ill. Filed Apr. 23, 1889. Serial No. 308,246. (No model.)

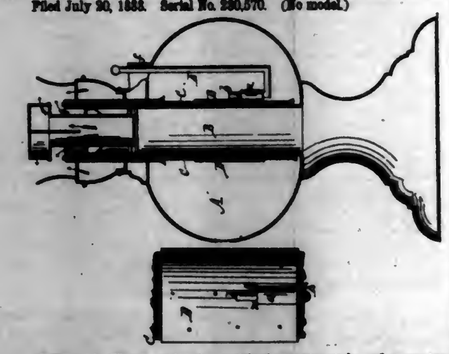
Claim.—1. In a hod, the combination of the sheet-metal body portion A, formed with sides A', having flanged edges, a continuous spring



407,968.

f, re-enforcing the lateral and forward edges of the sides A', and braces B, terminating in a socket for the handle C and provided with curved arms *g'*, extending to the forward ends of the sides about midway between the upper and lower edges of the latter, and maintained against the spring *f* by the flanged edges of the sides, and arms g^2, extending toward the rear edges of the sides, substantially as described.

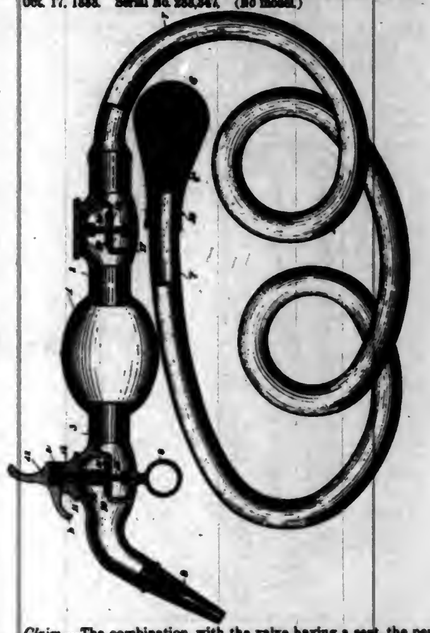
2. In a hod, the combination, with the body portion and handle, of a sheath *o*, extending longitudinally of the lower edge of the body portion toward the rear end thereof, and an adjustable and removable spring-rest D, having an arm *p* extending into the sheath at its rear end and a curved free arm *p'* extending below the sheath, with its free end toward the handle, substantially as and for the purpose set forth.



407,969. LAMP. HENRY R. SHAFFER, Rochester, N. Y. Filed July 30, 1888. Serial No. 280,569. (No model.)

Claim.—1. In a lamp, the combination, with the center-draft tube, of the attachment consisting of the tube C, the hollow perforated head C', projecting over the wick, and the divider *a*, extending up centrally through the interior of the head, as and for the purpose specified.

2. In a lamp, the combination, with the center-draft tube, of the attachment consisting of the tube C, the hollow head C', made separate from the tube and fitted therein, and the divider *a*, extending up centrally through the interior of the head, as and for the purpose specified



407,970. WICK-RAISER. HENRY R. SHAFFER, Rochester, N. Y. Filed July 30, 1888. Serial No. 280,570. (No model.)

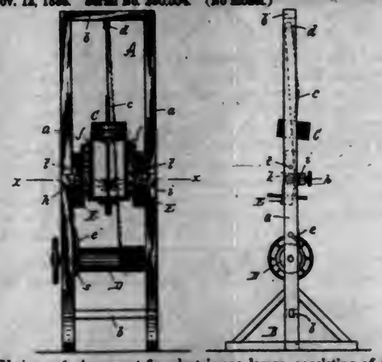
Claim.—1. The combination, with the center tube of a center-draft lamp, of a handle located permanently inside the lamp and provided with an upwardly-turned stem at its lower end, a wick-holder sliding on the center tube and provided with an open socket on one side, said socket engaging with the stem when the wick-holder is forced down, and a suitable fastening device securing the socket to the stem, the whole so arranged, as herein described, that the wick-holder and wick can be removed from the lamp without removing the handle, as specified.

2. In a center-draft lamp, the combination of the center draft-tube B, the tubular holder D, provided with the socket *a*, the handle E, provided with the stem *b*, that engages with the socket, and the spring-pin *c*, passing through an elongated hole in the stem above the socket, securing the parts and making a tight connection, as shown and described.

407,971. SIPHON. MICHAEL STERNDORFER, Louisville, Ky. Filed Oct. 17, 1888. Serial No. 288,347. (No model.)

Claim.—The combination, with the valve having a seat, the perforated box 12, having a flat top and a spring for closing said valve, of the thumb-lever having a flat face resting upon said box 12 and a flat face *a*, projecting at an angle thereto, the valve-stem projecting through said box and pivoted to said lever at unequal distances from its said flat faces, and said lever being provided with two arms, whereby either of said faces may be thrown into contact with the top of said box, as set forth.

407,972. TOOL HOLDER AND REST FOR LATHES. LEWIS S. SPRINGER, Baltimore, Md. Filed May 31, 1889. Serial No. 312,667. (No model.)

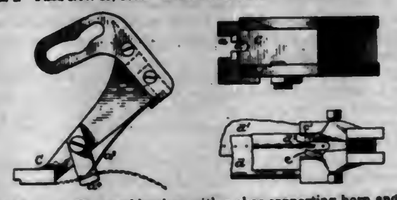


Claim.—1. The combination of the holder-block B, having a longitudinal channel and provided at one end with a tapped plate *l*, a tool occupying the channel and having at one end a yoke, and an adjusting-screw passed through the said tapped plate on the holder-block and engaging with the tool-yoke.

2. An attachment for lathes having, in combination, the tool-holder block provided with a channel for a tool and a back-rest attached to said holder-block and movable with it, so as to follow with the tool, as set forth.

3. An attachment for lathes having, in combination, the tool-holder block provided with a channel for a tool, a back-rest arm attached to the said holder-block, and bearings for the work to be turned adjustably attached to the said arm.

407,973. ELECTRIC-LAMP SUPPORT. ALBERT T. THOMPSON, Boston, Mass., assignor to Albert T. Thompson & Co., same place. Filed Nov. 12, 1888. Serial No. 290,504. (No model.)



Claim.—1. A support for electric-arc lamps, consisting of two vertical standards, twin rocking guides pivoted to said standards, and a lamp-frame having a sliding connection with said guides and vertically adjustable therein, whereby the lamp and its pencil-carbons can be maintained in a vertical plane or inclined therefrom, substantially as set forth.

2. The combination of a supporting-frame, and an electric lamp and lamp-frame pendent therein, with a drum, pawl, ratchet, and chain for raising and lowering said lamp and lamp-frame to any required position, and rocking guides pivoted to said frame and arranged for sliding connection with said lamp-frame, whereby said lamp and its pencil-carbons can be maintained in an inclined or vertical position, substantially as set forth.

3. In a support for electric lamps, the supporting-frame A, in combination with a lamp and lamp-frame hung therein, guides pivoted to said supporting-frame and having sliding connection with said lamp-frame, the drum, pawl, ratchet, and chain, whereby said lamp-frame is raised and lowered and held in any desired position of adjustment, the sleeve-nuts *k k* within said guides, and the actuating screw-rods *h h*, the said guides allowing said lamp and its pencil-carbons to occupy either a vertical or an inclined position, substantially as set forth.

407,974. SHOE-WELT-SEWING MACHINE. JOSEPH S. TURNER, Rockland, Mass., assignor to the Campbell Machine Company, Pawtucket, R. I. Filed Nov. 15, 1888. Serial No. 290,834. (No model.)

Claim.—1. The combination, with a shoe-supporting horn and a welt-guide, of a feeder provided with two feed-points and having a space between said points to be occupied by the means employed in uniting a welt, an insole, and the upper of a shoe, substantially as described, whereby during the operation of uniting the said parts of a shoe the latter will be fed or moved upon the horn by the thrusting action of the feeder on both sides of the line of union and by engaging with the welt closely adjacent to that portion thereof which was last united to the upper and insole.

2. The combination, with a shoe-supporting horn, stitch-forming mechanism, and a welt-guide, of a feeder which is above said horn and has two feed-points for engaging with a welt and affords between them a space for the reception of a needle, substantially as described, whereby in securing welts to uppers and insoles said feed-points may be caused to engage with the welt at both sides of the stitch-line and closely adjacent to the stitch last formed during their thrusting action in moving a shoe on the horn.

3. The combination, with stitch-forming mechanism and a shoe-supporting horn, of a pair of feed-points affording a space between them for occupation by a needle and the thread carried thereby, and a presser-foot serving as a welt-guide and slotted for the reception of said feed-points and needle, substantially as described.

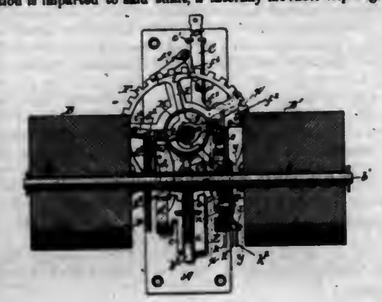
407,975. COVER FOR MILK-CANS. JOSEPH C. VAIL, Maple's Mill, assignor to himself, and Thomas M. Mercer, Lewistown, Ill. Filed Jan. 22, 1889. Serial No. 297,134. (No model.)

Claim.—1. In a milk-can cover, the combination, with an upper solid plate, of a lower apertured plate and spacing-strips arranged between the plates, substantially as described.

2. In a milk-can cover, the combination, with the upper plate, of a lower apertured plate and spacing-strips arranged between the plates at opposite sides thereof, the space between the plates being open upon the other sides, substantially as described.

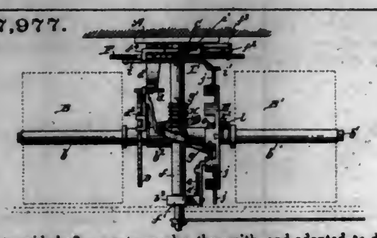
3. In a milk-can cover, the combination, with an upper plate, of a lower plate formed with a central aperture *c*, spacing-strips 12, arranged between the plates upon opposite sides thereof, the other sides of the structure being open, and wire-netting secured to the lower plate to cover the aperture *c*, substantially as described.

407,976. KILN FOR BURNING BONE-BLACK. ADAM WEBER, New York, N. Y. Filed Feb. 9, 1889. Serial No. 299,275. (No model.)



Claim.—1. In a bone-black kiln, the combination of two rows of coolers located below the retorts and provided with bottoms having openings, inclined discharge-spouts below said coolers, dampers having openings registering with the openings of the bottoms, a rotary shaft located intermediately between said coolers, grooved cams on said shaft connected to the dampers, and a rotary screw conveyer located below the discharge-spouts of the coolers, substantially as set forth.

2. In a bone-black kiln, the combination of two rows of coolers located below the retorts and provided with bottoms having openings, dampers having openings registering with the openings of the bottoms, inclined discharge-spouts below said dampers, a rotary shaft located intermediately between the coolers, grooved cams on said shaft connected to said dampers, a rotary screw conveyer below the discharge-spouts of the coolers, and a cooling-trough surrounding the screw conveyer, substantially as set forth.



407,977. CALENDAR-CLOCK. HARRIS F. WELLS, Friendship, N. Y., administrator of Albert F. Wells, deceased. Filed Jan. 22, 1889. Serial No. 297,107. (No model.)

Claim.—1. The combination, with the revolving mouth-cylinder provided with a toothed actuating-wheel, of a detent whereby the same is held against turning, a revolving actuating-shaft, means whereby an intermittent rotary motion is imparted to said shaft, and a revolving trip-finger attached to said shaft and adapted to disengage said detent from said actuating-wheel, substantially as set forth.

2. The combination, with the revolving mouth-cylinder provided with a toothed actuating-wheel, of a detent engaging with said wheel, a revolving actuating-shaft, means whereby an intermittent rotary motion is imparted to said shaft, a laterally-movable trip-finger piv-

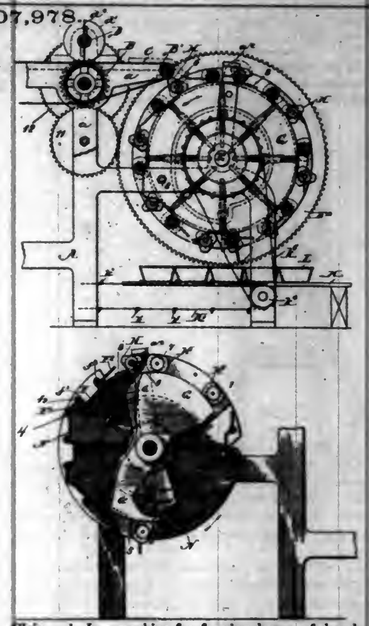
407,977.

oted to said shaft, so as to revolve therewith, and adapted to disengage the detent from said wheel, and a cam whereby said trip-finger is guided to said detent, substantially as set forth.

3. The combination, with the revolving mouth-cylinder provided with a toothed actuating-wheel, of a detent engaging with said wheel, a revolving actuating-shaft, means whereby an intermittent rotary motion is imparted to said shaft, a laterally-movable trip-finger pivoted to said shaft, so as to revolve therewith, and adapted to disengage the detent from said wheel, a cam whereby said trip-finger is guided to said detent, and a spring whereby said trip-finger is held against the cam and the finger and month-wheel are shifted when the trip-finger clears said cam, substantially as set forth.

4. The combination, with the revolving mouth-cylinder provided with a crown-wheel having twelve teeth, of a vertically-swinging detent engaging with said teeth, a revolving shaft provided with an actuating-wheel having thirty-one teeth, a laterally-movable trip-finger pivoted to said shaft, a spiral cam whereby said trip-finger is guided to the detent, and a spring whereby said trip-finger is held against the cam, substantially as set forth.

5. The combination, with a horizontal shaft, of a main actuating-wheel attached to said shaft and having thirty-one teeth, pawl mechanism, whereby an intermittent rotary motion is imparted to said wheel, a detent engaging with said wheel, a movable detent-releasing frame arranged on said actuating-wheel, a month-cylinder having an actuating-wheel, which is operated from said horizontal shaft, and pins arranged on said actuating-wheel, and with which said detent-releasing frame engages, substantially as set forth.



6. The combination, with a horizontal shaft, of a main actuating-wheel attached to said shaft and having thirty-one teeth, an actuating rod and pawl whereby an intermittent rotary motion is imparted to said wheel, a detent engaging with said wheel, a movable detent-releasing frame pivoted to said wheel and consisting of a segment adapted to cover several teeth of the actuating-wheel and a lifting foot or arm, a month-cylinder provided with an actuating-wheel having twelve teeth, pins attached to said actuating-wheel, whereby said lifting-foot is actuated, a detent engaging with said wheel, and a revolving trip-finger attached to said horizontal shaft, whereby said detent is disengaged from the actuating-wheel of the month-cylinder, substantially as set forth.

7. The combination, with a horizontal shaft, of a main actuating-wheel attached to said shaft and having thirty-one teeth, pawl mechanism whereby an intermittent rotary motion is imparted to said wheel, a detent engaging with said wheel, a movable detent-releasing frame pivoted to said actuating-wheel and consisting of a segmental plate and a lifting-foot, a month-cylinder provided with an actuating-wheel having twelve teeth and operated from said horizontal shaft, one or more stationary pins arranged on the actuating-wheel of the month-cylinder in the path of said lifting-foot, and a movable pin, also arranged on said actuating-wheel adjacent to said stationary pin or pins, substantially as set forth.

8. The combination, with a horizontal shaft, of a main actuating-wheel attached to said shaft and having thirty-one teeth, pawl mechanism whereby an intermittent rotary motion is imparted to said wheel, a detent engaging with said wheel, a movable detent-releasing frame pivoted to said actuating-wheel and consisting of a segmental plate and a lifting-foot, a month-cylinder provided with an actuating-wheel having twelve teeth and operated from said horizontal shaft, one or more stationary pins arranged on the actuating wheel of the month-cylinder in the path of said lifting-foot, a movable pin arranged on said actuating-wheel adjacent to said stationary pin or pins and capable of standing in line with one of said stationary pins when released, a revolving cam bearing against said movable pin, a revolving four-armed wheel connected with said cam and journaled on the actuating-wheel of the month-cylinder, and a stationary disk having a tooth or projection engaging with the arms or teeth of said four-armed wheel, whereby the latter is turned the distance of a tooth at every revolution of the month-cylinder, substantially as set forth.

407,978. MACHINE FOR FORMING LOAVES OF DOUGH. FREDERICK WESTERMAN, Chicago, Ill. Filed July 9, 1888. Serial No. 279,379. (No model.)

407,978.

Claim.—1. In a machine for forming loaves of dough, a receptacle for shaping the loaf having folding wings or portions adapted to double or fold over the layer of dough, substantially as described.

2. In a machine for forming loaves of dough, a series of movable receptacles having folding wings adapted to double or fold over the layer of dough, substantially as described.

3. In a machine for forming loaves of dough, a series of movable receptacles having centrally-folding wings adapted to double or fold over the layer of dough, substantially as described.

4. In a machine for forming loaves of dough, a series of movable receptacles having fixed bottoms and centrally-folding wings adapted to double or fold over the layer of dough, substantially as described.

5. In a machine for forming loaves of dough, a series of receptacles having fixed bottoms and having wings hinged to the sides of said receptacles, substantially as described.

6. In a machine for forming loaves of dough, the combination, with a suitable delivery-belt, of a series of movable receptacles having folding wings adapted to double or fold on the layer of dough, substantially as described.

7. In a machine for forming loaves of dough, the combination, with a series of movable receptacles having inwardly-folding wings or portions adapted to double or fold over the layer of dough, of a central shaft for bringing said receptacles successively into position to be filled, substantially as described.

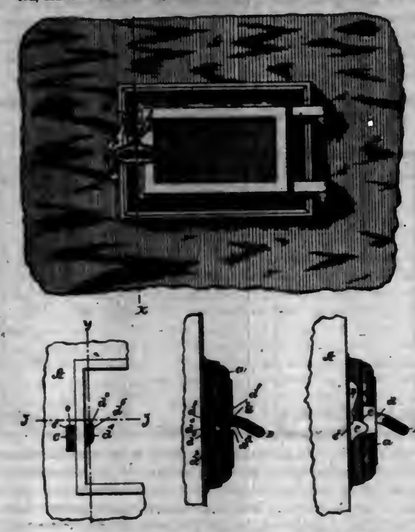
8. In a machine for forming loaves of dough, a series of receptacles having folding wings adapted to double or fold over the layer of dough, in combination with a series of rods to which said wings are connected, cog-wheels fixed upon said rods, and suitable segmental racks for turning said cog-wheels, substantially as described.

9. In a machine for forming loaves of dough, the combination, with a series of movable receptacles having folding wings adapted to double or fold over the layer of dough, of pivot-rods on which said wings are fastened and guard-blocks for temporarily guarding said rods against rotation, substantially as described.

10. In a machine for forming loaves of dough, the combination, with a series of movable receptacles having folding wings adapted to double or fold over the layer of dough, of pivot-rods for turning said wings, guide-blocks affixed to said pivot-rods for temporarily checking the movement thereof, and suitable flanged plates whereon said guide-blocks will ride, said plates being provided with cut-away spaces to permit the guide-blocks to rotate, substantially as described.

407,979. DIP-NET FRAME. CHARLES E. WHEELER, Farmington, Me. Filed Mar. 1, 1888. Serial No. 265,964. (No model.)

Claim.—1. In a folding dip-net ring or bow, the combination of a ring or bow in two sections or pieces, with the two upper ends of the same connected and secured by a socket or slots around screw-heads, and the two lower ends of the ring or bow loosely riveted or



407,979.

bolted to the sides of a forked or short-armed head in such manner that the two lower ends of the sections or pieces of the ring or bow, when disconnected at the upper socket, may be turned back on the loosely riveted or bolted joints and rest in or upon slots on the sides of the staff or handle without removing the net from the rings or bows, thereby holding the said upper ends of the ring or bow in place upon the staff or handle, substantially as described.

2. In a dip-net, the combination of a socket or ferrule on the staff thereof, a sliding collar on said socket provided with an integral tabular enlargement or offset for clamping the inner extremities of the separable bows of said net, substantially as described.

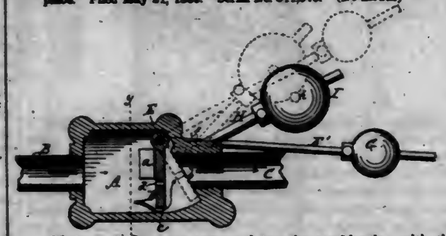
407,980. FURNACE OR OTHER DOOR. GEORGE R. WILBUR, Taunton, Mass. Filed Jan. 28, 1889. Serial No. 297,764. (No model.)

Claim.—1. In combination with a door having a latch adapted to be disengaged from a catch by the vertical movement of the door, the catch and a door disengaging or unlatching device comprising a bar or lever pivoted to the door, one end of which extends to engage a lug and the other end of which to a position outside the door and said fulcrum-lug, substantially as described.

2. The combination, in a door adapted to be moved vertically to disengage its latch from its holding-catch, of said latch, the catch, and a handle attached to or connected with the door-lifting lever, said door-lifting lever, and a fulcrum or surface upon which said lever is caused to be brought into contact by the movement of the handle, substantially as described.

3. The combination, in a door adapted to be moved vertically to disengage its latch from its holding-catch, of said latch, said catch, a disengaging lever or bar, and a fulcrum-lug upon the frame of the door, as and for the purposes described.

4. The combination, in a door adapted to be moved vertically to disengage its latch from its holding-catch, of said latch, said catch, a disengaging lever or bar, and a fulcrum-lug upon the frame of the door having a surface slightly inclined and rounded at its front edge, the said surface being of sufficient extent to act as a bearing for the end of the said lifting lever or bar while the latch is being moved horizontally out of line with the catch, substantially as described.

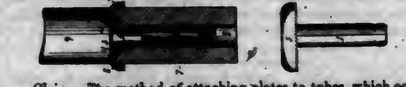


5. The combination, in a door adapted to be moved vertically to disengage its latch from the holding-catch, of said latch, the holding-catch, a fulcrum-lug, and a handle having an arm or bar pivoted to the door, the outer end of said arm or bar being heavier than the inner end, and the end of said bar extending into operative position with said fulcrum-lug when the door is closed, substantially as described.

6. The combination of the door having the hole or aperture *d* therein, the fulcrum-lug d^3, and the bar or lever *d*, pivoted in said hole or aperture, having the handle D, substantially as described.

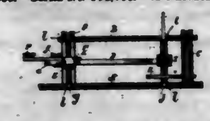
7. The combination of the door *a*, the pivoted lever or bar *d*, having the handle D, the fulcrum-lug d^3, and the stop d^5, substantially as described.

8. The combination of the door having the latch B, catch C, the fulcrum-lug d^3, and the lifting bar or lever *d*, pivoted to the door, having the handle D and the stop d^5, substantially as described.



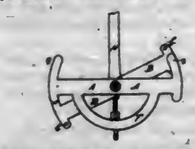
407,981. WATER-PRESSURE REGULATOR. HENRY R. WILLIAMS, Rochester, N. Y., assignor of five-eighths to Lemuel A. Jeffreys, same place. Filed May 21, 1888. Serial No. 311,573. (No model.)

Claim.—1. In a pressure-regulator, the combination, with the case A and induction and eduction pipes B C, of the valve D, adapted to close against a seat *b*, and provided with a hole *d*, and the weighted arm E', connected with the valve, as and for the purpose specified.



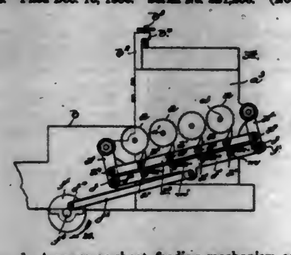
2. In a pressure-regulator, the combination, with the case A and induction and eduction pipes B C, of the swinging valve D, provided with the hole *d*, the weighted arm E', connected with the valve, and the supplemental weighted arm H, pivoted to the case and provided with a pin A, resting over arm E', the whole arranged to operate in the manner and for the purpose specified.

407,982. METHOD OF ATTACHING PLATES TO TUBES. SAMUEL R. WILMOT, Bridgeport, Conn., assignor to the Wilmot & Hobbs Manufacturing Company, same place. Filed Jan. 28, 1889. Serial No. 297,760. (No model.)



Claim.—The method of attaching plates to tubes, which consists in forming a bead at the end of a tube and a central opening in a plate, the metal around said opening being depressed, substantially as shown and described, then passing the tube through the opening in the plate until the bead rests upon the depressed portion thereof, and then closing the metal of said depressed portion inward upon the tube, substantially as described.

407,983. STEAM-GAGE. CHARLES WIETHER, Boston, Mass., assignor to the Star Brass Manufacturing Company, same place. Filed Mar. 1, 1888. Serial No. 301,718. (No model.)

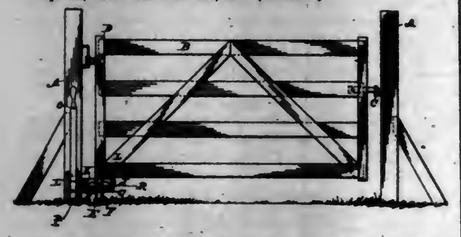


Claim.—A steam-gage, the staff, arbor, pinion, and pinion-spring whereof are composed of nickeline silver, and the bronze plates A B whereof are provided with staff and arbor bushings of nickeline silver, substantially as described.

407,984. FIFTH-WHEEL FOR VEHICLES. JAMES WOODS, Strathroy, County of Middlesex, Ontario, Canada, assignor of one-half to Alexander Johnston, same place. Filed Aug. 17, 1888. Serial No. 282,902. (No model.) Patented in Canada Apr. 5, 1888, No. 28,916.

Claim.—The combination, with the head-block, bed-piece, axle, and reach, of the top circle A F, provided with extended bearings *d d* and arcs *c c*, and the bottom plate B, provided with extended bearings *e e* and arcs *b b*, substantially as described.

407,985. MECHANISM FOR FEEDING PAPER OR OTHER SHEETS FROM A PILE. BRASTUS WOODWARD, Somerville, Mass., assignor to the Waters Wrapping and Mailing Machine Company, Portland, Me. Filed Dec. 10, 1888. Serial No. 291,208. (No model.)



Claim.—1. A paper or sheet feeding mechanism comprising a box or receptacle to contain a pile of papers or sheets, and a series of feeding-rollers to act against a paper or sheet of the said pile, combined with pawl mechanism, substantially as described, adapted to rotate the feeding-rollers positively in one direction only to feed a sheet or paper but partially out of the box or receptacle, and adapted to thereafter become inactive with relation to the said feed-rollers, to permit the said rollers to be rotated by the paper or sheet as the latter is being drawn out of the said box or receptacle, substantially as described.

2. In a paper or sheet feeding mechanism, the combination, with the feed box or receptacle, of a series of independent feed-rolls constituting the supporting-bed for the pile of papers or sheets therein, pawl mechanism, substantially as described, to engage and rotate the said rolls in one direction only, and means, substantially as described, to disconnect the pawl mechanism and rolls, to thereby permit the rolls to be moved independently at a faster speed by the action of the paper against them as the paper is being drawn from the feed box or receptacle, substantially as described.

3. In a paper or sheet feeding mechanism, the combination, with a box or receptacle, of an inclined series of feeding-rollers constituting the supporting-bed for a pile of papers or sheets to be fed out of the box or receptacle, each roller of the said inclined series being adapted to be rotated in one direction only to feed the papers or sheets out of the box or receptacle, substantially as described.

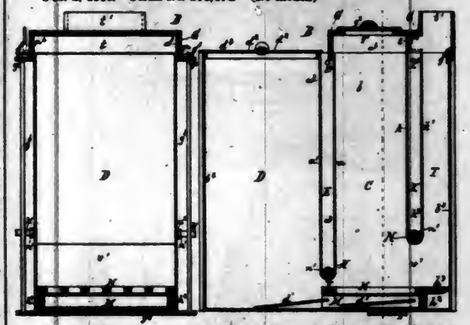
407,986. GATE. ERNEST O. ALDRICH, Lock Haven, Pa. Filed Apr. 22, 1889. Serial No. 308,134. (No model.)

Claim.—1. The combination, with the rear post of a gate, of a pivotal support therefor, rollers upon the end of the said post and the top of said support, and a separate cam between the two, substantially as set forth.

2. The combination, with the rear post of a gate, of a pivotal support therefor, rollers upon the top of said support and the bottom of said post, and a cam between the two, said cam being provided with surfaces of alternate inclination, substantially as set forth.

3. The combination, with the rear post of a gate having rollers journaled in the lower end thereof, of a pivotal support beneath said post provided with rollers, a separate cam between said support and said post, hand-levers on each side of the gate, and connections between the levers and said cam, whereby the gate may be opened and closed, substantially as set forth.

4. In a gate-hinge, the combination, with a support and rollers journaled therein, of an upper part adapted to be secured to a gate, rollers journaled therein, and a separate cam provided with ways of alternate inclination, substantially as set forth.



407,987. COMBINED WELT AND UPPER GUIDE. GEORGE AMBORN, Jr., Pawtucket, R. I., assignor to the Campbell Machine Company, same place. Filed Nov. 15, 1888. Serial No. 290,864. (Model.)

Claim.—1. The combined welt and upper guide consisting of a presser-foot provided at its base with a rigidly-projecting block containing an adjustable slide which affords a welt-guiding surface cooperating with a fixed welt-guiding surface on and beneath the presser-foot, and also containing a second slide or upper-gage, which affords a surface for gaging or guiding a boot or shoe during its movement on a supporting-horn by its contact with the upper opposite the edge of the insole, and a cam-lever mounted on said block for moving said upper-gage toward and from the presser-foot and welt-guide, substantially as described.

2. In a combined welt and upper guide, the combination, with a lever for moving the upper-guide toward and from the welt-guide, of an adjustable stop for variably restricting the movement of said upper-guide toward the welt-guide, substantially as described, whereby, while uniting a welt, an insole, and an upper, the line of union may be assuredly located at a distance never too near the edge of the insole.

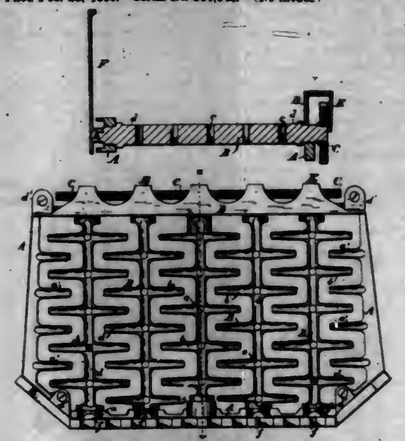
407,988. TANK-HEATER. GEORGE ARMSTRONG, Elmira, Ill. Filed Feb. 2, 1888. Serial No. 298,474. (No model.)

Claim.—1. A tank-heater comprising in its construction an attendant's chamber having means for admission of air, a combustion-chamber having feed-door and draft-flue, one or more hollow water-heating partitions having a horizontal space or spaces beneath them, and circulation-pipes, in combination with a surrounding water-tank, in which it is partly immersed, substantially as and for the purpose described.

2. A tank-heater comprising a high vertical combustion-chamber having a fuel-supply door, an attendant's chamber, a draft-register applied to the attendant's chamber, a direct-draft flue, an indirect-draft flue-chamber, the partitions having horizontal spaces beneath them between said chambers, a sliding grate, and a draft-controlling damper applied to the combustion-chamber, substantially as and for the purpose described.

3. The combination, in a tank-heater, of the attendant's chamber, the combustion-chamber, a water-heating chamber between the attendant's and combustion chamber, and circulation-pipes, substantially as and for the purpose described.

4. The combination, in a tank-heater, of the attendant's chamber, a draft-register applied to the attendant's chamber, combustion-chamber, an indirect-draft flue-chamber, water-heating chamber between the combustion and indirect-flue chambers, the partitions between the attendant's, combustion, and indirect-flue chambers, having horizontal spaces beneath them, a grate, and a draft-controlling damper applied to the combustion-chamber, substantially as described.

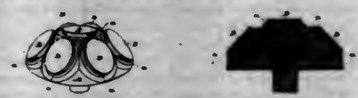


5. The combination, in a tank-heater, of the attendant's chamber, a draft-register applied to the attendant's chamber, a combustion-chamber, a direct-draft flue, an indirect-draft flue-chamber, water-heating chambers between the attendant's, combustion, and direct-draft flue-chambers, circulation pipes or tubes, the partitions of the chambers having horizontal spaces beneath them, a grate, and a draft-controlling damper applied to the combustion-chamber, substantially as described.

6. A tank-heater comprising the attendant's chamber, the combustion-chamber, the partition between said chambers with a space below it, draft-register, and the direct-flue passage, substantially as and for the purpose described.

7. A tank-heater comprising an attendant's chamber having means for admission of air, a combustion-chamber having a supply-door and a controlling-damper in its draft-flue, hollow water circulating and heating partitions having horizontal spaces beneath them, and circulation-tubes, substantially as described.

8. In a tank-heater, the combination, with the outer wall, of one or more hollow water-heating partitions, screw-threaded circulation and tie tubes, and binding-nuts, substantially as described.

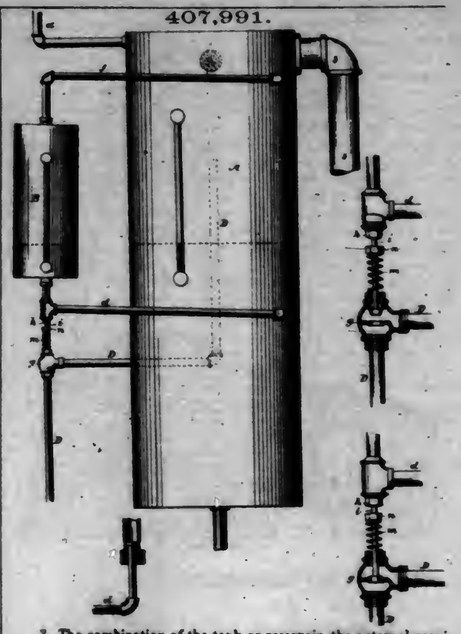


407,989. FIRE-PLACE GRATE. JAMES C. BARRY, Rochester, N. Y. Filed Feb. 25, 1889. Serial No. 301,043. (No model.)

Claim.—1. The combination, with the main frame having the open bearings having the angular rear ends, the intermeshing gears mounted on said ends, the rear plate secured to the frame co-operating with the grate-sections to hold them in their bearings, and having the fingers thereon extending over the gears and projecting in proximity to the ends of the sections for holding the gears in position on them, and the front plate secured to the frame, having the lugs co-operating with the sections to hold them in their bearings, substantially as described.

2. The combination, with the main frame having the open bearings, of the grate-sections resting in said bearings and geared together for simultaneous operation, the front plate covering the front of the frame, having the rearwardly-projecting lugs adapted to be secured to the frame, and the series of lugs projecting over the ends of the sections for holding them in their bearings, substantially as described

407,990. LENS-BLOCKING. JOHN J. RAUSCH, Rochester, N. Y. Filed Apr. 20, 1889. Serial No. 307,970. (No model.)



Claim.—1. A holder to support a series of lenses while being ground, the same having in general outline a spherical form with a series of facets *a* thereon to sustain the respective blanks or lenses.

2. A holder for lenses while grinding the same, consisting of a spherical body with a series of distinct elevated facets, each having its face formed to fit the surface of a corresponding lens.

407,991. WATER-REGULATOR FOR BOILERS. RICHARD B. BROWN, Philadelphia, Pa. Filed Apr. 19, 1889. Serial No. 307,681. (No model.)

Claim.—1. The combination of a tank or reservoir and an external gravitating vessel having a swinging pipe-connection with said tank or reservoir above and below the normal water-level therein, and a feed-controlling valve closing against the pressure and having a projecting stem supporting the regulating-vessel and its load, substantially as specified.

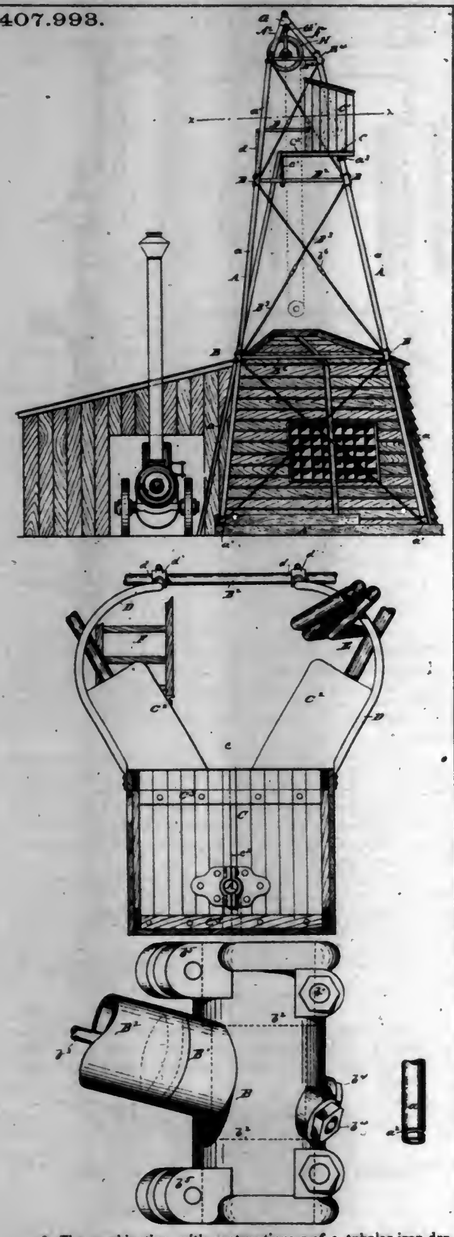
2. The combination of the tank or reservoir and the external gravitating vessel having a swinging pipe-connection with said tank or reservoir above and below the normal level of water therein, a pipe for supplying the tank with water under pressure, and a valve closing against the pressure in said pipe and having a projecting stem which supports the gravitating vessel and its load, substantially as specified.

3. The combination of the tank or reservoir, the external gravitating vessel having a swinging pipe-connection with said tank above and below the normal water-level of the same, a feed-pipe having a valve closing against the pressure in said pipe and having a projecting stem supporting said regulating-vessel, and a spring acting on said stem to aid in the support of the regulating-vessel, substantially as specified.

4. The combination of the tank, a vacuum-pipe communicating with the upper portion of the tank, an external gravitating vessel having a swinging pipe-connection with the tank above and below the normal level of liquid therein, and a supply-pipe communicating with the tank and having a valve closing against the pressure in the pipe, and having a projecting stem for supporting said external gravitating vessel, substantially as specified.

5. The combination of the tank, a pipe for returning water of condensation thereto, a vacuum-pipe communicating with the upper portion of the tank, an external gravitating vessel having a swinging pipe-connection with the tank above and below the normal level of water therein, and a water-supply pipe having a valve controlled by the rise and fall of the external gravitating vessel, substantially as set forth.

407,992. DANDY-ROLL FOR PAPER-MAKING MACHINES. ROBERT BROWN, Penicuick, County of Mid-Lothian, Scotland, assignor of one-half to George Dinwoodie, New York, N. Y. Filed Aug. 13, 1888. Serial No. 282,563. (No model.) Patented in England May 4, 1887, No. 6,563.



Claim.—1. A dandy-roll having a woven-wire cover over the frame and laid wires on this woven cover.

2. A dandy-roll having a woven cover on the frame, a wire wound spirally on the woven cover, and wires running longitudinally of the roll, substantially as set forth.

407,993. PORTABLE DERRICK. MILAN C. BULLOCK, Chicago, Ill. Filed Aug. 15, 1887. Serial No. 247,043. (No model.)

Claim.—1. The combination, with the post-sections of a tubular iron derrick and couplings joining said sections, of tubular cross-girts between opposite couplings and tie-rods passing through said cross-girts and engaged with the couplings, the latter being provided with nipples which project into the ends of said cross-girts, substantially as described.

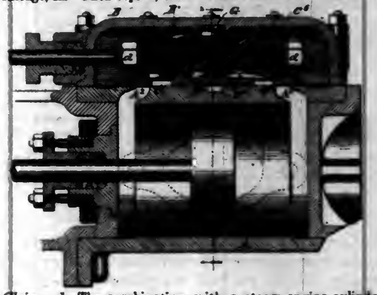
407,993.

2. The combination, with post-sections *a* of a tubular iron derrick and couplings having a clear space therein between the ends of said sections, of tubular cross-girts between opposite couplings and tie-rods passing through said cross-girts and through said couplings between the ends of the post-sections, said couplings being provided with nipples which project into the ends of said cross-girts, substantially as described.

3. The combination, with the post-sections *a*, of vertically-split couplings joining said sections, whereby the sections and couplings are readily detachable, substantially as described.

4. The combination, with the sections *a* of the derrick-posts A, of longitudinally-split couplings B, provided with clamp-bolts, substantially as and for the purposes set forth.

5. The combination, with the sections *a* of the derrick-uprights A, of longitudinally-split couplings B, provided with interior shoulders to limit the entrance of the post-sections, and provided also with clamping devices, substantially as described.



6. The combination, with a skeleton derrick having uprights A, of an elevated platform made in two parts removably joined to each other on opposite sides of one of said posts, substantially as described.

7. In combination with a skeleton derrick provided with a tool hoist or fall, an elevated platform extending on three sides of a space *c* in vertical line with a tool-hoist, substantially as described.

8. The combination, with a skeleton derrick provided with a hoist or fall for raising and lowering the drill-rods, and with an elevated platform, of a cradle or rail arranged to laterally support the upper ends of drill-rods, substantially as described.

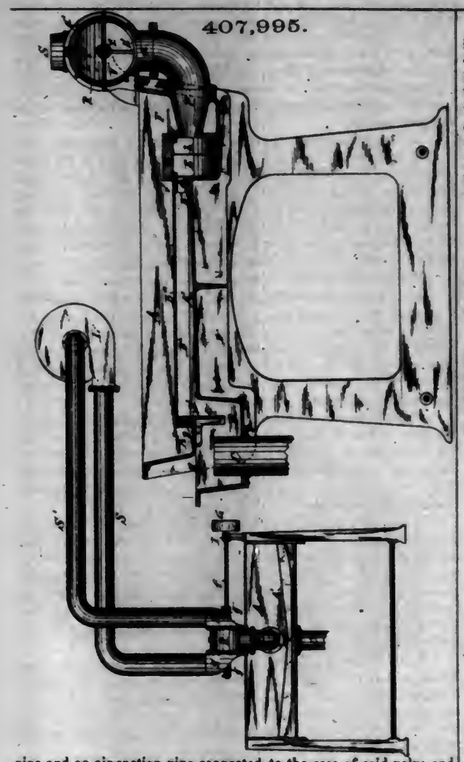
9. The combination, with the uprights or posts A, connected at their upper ends by horizontal ties, of the converging members A^3, a single-branched coupling uniting the upper ends of said members, and a hoisting and lowering tackle suspended from said branched coupling, substantially as described.

407,994. VALVE FOR STEAM-ENGINES. MILAN C. BULLOCK, Chicago, Ill. Filed Sept. 6, 1887. Serial No. 248,942. (No model.)

Claim.—1. The combination, with a steam-engine cylinder provided with a flat valve-seat having transversely-arranged ports A^2 A^2 near the ends of the cylinder and a longitudinally-arranged exhaust-port A^3, located at one side of the valve-seat and communicating with an exhaust-passage cast in the metal of the cylinder, of a chambered slide-valve having a flat bearing-face in contact with the valve-seat, and provided in said bearing-face with ports C' C' and C^3, operating in connection with the ports A^2 A^2 A^3, substantially as described.

2. The combination, with a steam-engine cylinder provided with a flat valve-seat having transversely-arranged ports A^2 A^2 near the ends of the cylinder and a longitudinally-arranged exhaust-port A^3, located at one side of the valve-seat, of a chambered slide-valve having a flat bearing-face in contact with the valve-seat, provided in said bearing-face with transverse ports C' C' near its ends and an intermediate longitudinally-arranged port C^2 at one side, and having a central recess or chamber C^3, located in the flat face of the valve between said ports and in communication with the steam-space of the valve-chest at the side of the valve opposite the said port C^2.

3. The combination, with a steam-engine cylinder provided with a flat valve-seat having transversely-arranged ports A^2 A^2 near the ends of the cylinder and a longitudinally-arranged exhaust-port A^3, located at one side of the valve-seat, of a chambered slide-valve having a flat bearing-face in contact with the valve-seat, and provided in said bearing-face with transverse ports C' C' and with a longitudinally-arranged port C^2, located at one side of the valve-seat, said valve being also provided with a recess C^4, extending through the valve from top to bottom surface thereof in the side of the same opposite said port C^2, substantially as described.



4. The combination, with a valve-seat provided with steam-ports A^2, a side exhaust-port A^3, and a central transverse recess A^4, of a slide-valve having a chamber C^3, and a passage C^4, communicating with said chamber and with the recess A^4, substantially as described.

407,995. PAPER-PULP SCREEN. CHARLES H. CAMPBELL, Watertown, N. Y., assignor to the Bagley & Sewall Company, same place. Filed Apr. 12, 1889. Serial No. 306,923. (No model.)

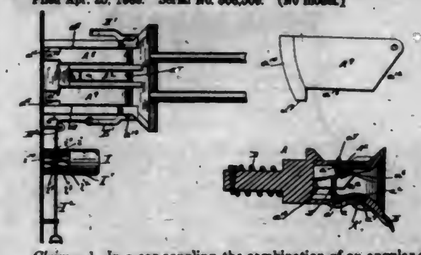
Claim.—1. The combination, with the pulp-vat and screen in said vat, of an air-space under the screen, an air-blast pipe and an air-suction pipe communicating with said air-space, and an air-blowing and air-exhausting apparatus connected to the aforesaid pipe, as set forth.

2. The combination, with the pulp-vat and screen in said vat, of an air-space under said screen, an air-pipe communicating with the said air-space, a two-way valve connected to said air-pipe, an air-blast pipe and an air-suction pipe connected to the case of said valve and respectively in communication with the two ways of the valve, and an air-blowing and air-exhausting apparatus connected to the said blast and suction pipes, as set forth.

407,995.

3. The combination, with the pulp-vat and screen in said vat, of an air-space under said screen, an air-duct extending along one side of the vat and having ports communicating with the aforesaid air-space, an air-blast pipe and an air-suction pipe communicating with the aforesaid air-duct, and an air-blowing and air-exhausting apparatus connected to the said blast-pipe and suction-pipe, substantially as set forth.

4. The combination, with the pulp-vat and screen, of an air-space under said screen, an air-duct extending along one side of the vat and having ports communicating with the said air-space, an air-pipe communicating with the aforesaid air-duct at the center of its length, a baffle-plate in front of the air-pipe, a two-way valve connected to said air-pipe, an air-blast pipe and an air-suction pipe connected to the case of said valve and respectively in communication with the two ways of the valve, and an air-blowing and air-exhausting apparatus connected to the said blast and suction pipes, substantially as described and shown.

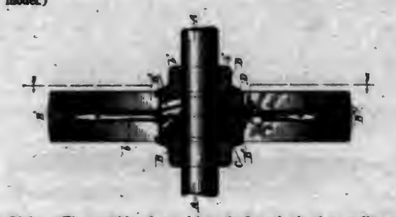


5. The combination of the pulp-vat formed with a bottom inclining from one side of the vat and with an air-duct along the elevated side of the bottom and a pulp-trough along the lower side of the same, the screen arranged over the inclined bottom with an air-space between them and communicating with the aforesaid air-duct, an air-blast pipe and an air-suction pipe communicating with the air-duct in the vat, and an air-blowing and air-exhaust apparatus connected to the said blast and exhaust pipes, as set forth.

6. The combination of the pulp-vat formed with a bottom inclining from one side of the vat and with an air-duct along the elevated side of the bottom and a pulp-trough along the lower side of the said bottom, the screen arranged over said bottom with an air-space between them and communicating with the aforesaid air-duct, an air-pipe communicating with the said air-duct at the center of its length, a baffle-plate in front of the discharge end of said air-pipe, a two-way valve connected to the air-pipe, an air-blast and an air-suction pipe connected to the case of the said valve and respectively in communication with the two ways of the valve, and an air-blowing and air-exhausting apparatus connected to the said blast and suction-pipes, substantially as described and shown.

7. In combination with the pulp-vat and screen arranged with an air-space under said screen, the air-pipe P, communicating with said air-space, the valve-case R, of cylindrical form, connected to the said pipe axially at right angles and having open ends and provided with the port *a*, communicating with the pipe P, the pipes S S', connected to the open ends of the valve-case, the valve V, consisting of a cylindrical shell arranged to rotate in the aforesaid case and having the diaphragm V' extended diagonally across the interior of the shell and ports *b b'* through the shell respectively at opposite sides of the diaphragm, and an air-blowing and air-exhausting apparatus connected to the pipes S S', substantially as described and shown.

8. In combination with the pulp-vat and screen arranged with an air-space under the screen, and the pipe P, communicating with said air-space, the valve-case R, of cylindrical form, connected to said pipe axially at right angles and having open ends, and provided with the port *a*, communicating with the pipe P and waste-port *a'*, diametrically opposite the port *a*, the blast and suction pipes S S', connected, respectively, to the two open ends of the valve-case, the valve V, consisting of a cylindrical shell arranged to rotate in the aforesaid case and having the diaphragm V' extended diagonally across the interior of the shell, and blast and suction ports *b b'* through the shell respectively at opposite sides of the diaphragm, said suction-port being longer in the direction of the circumference of the valve than the blast-port, and an air-blowing and air-exhausting apparatus connected to the pipes S S', substantially as described and shown.

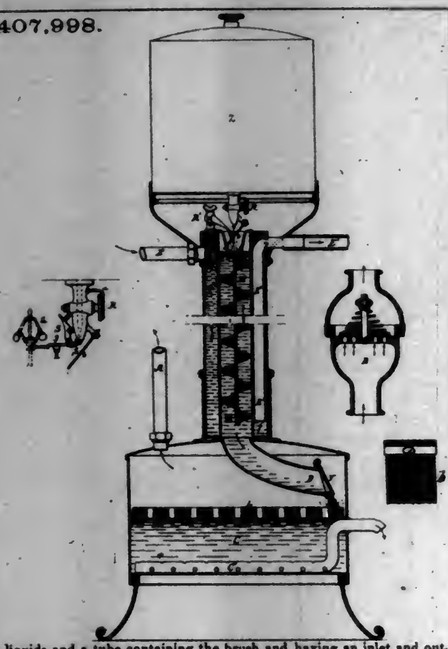


407,996. CAR-COUPLING. JOHN R. DAVIS, Jr., West Point, Miss. Filed Apr. 25, 1889. Serial No. 308,509. (No model.)

Claim.—1. In a car-coupling, the combination of an angular dog pivoted at the elbow to the bottom of the draw-head, a pivoted locking-cam projecting into the draw-head in front of the vertical arm of the dog, and the pivoted weights on each side of the locking-cam and having the inclined front ends to guide the link to the dog, substantially as described.

2. The combination of a draw-head, a guide-plate having arms and pivoted to the draw-head, a buffer having a passage provided with a spring and a slotted washer, a pull-rod having a cross-head and extending through said passage, and a chain passing over a pulley and connected with the guide-plate arms and the end of the pull-rod.

407,997. YIELDING CONNECTION FOR PULLEYS. WILLIAM E. DAVIS, Racine, Wis. Filed Apr. 4, 1889. Serial No. 305,944. (No model.)



Claim.—The combination, with a shaft and wheel or pulley, of a hub surrounding the shaft and provided with a recess extending inwardly from one side of the hub to a point past the shaft-aperture, a gib inserted in said recess and bearing against the shaft, and a set-screw inserted through the side of the hub into the inner end of said recess and bearing against said gib, substantially as described.

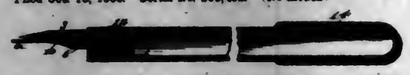
407,998. APPARATUS FOR CARBURETING AIR. EDOUARD D. DESCOUTEVILLE and LEON P. G. MALANDIN, Fontaine-le-Bourg, France. Filed Oct. 5, 1888. Serial No. 215,384. (No model.) Patented in France June 29, 1886, No. 174,641; in England July 26, 1886, No. 9,506, and in Germany Nov. 4, 1886, No. 37,560.

Claim.—1. The combination of a hydrocarbon-supply vessel and hot-water-supply pipe with a dividing or distributing brush for the

407,998.

liquide and a tube containing the brush and having an inlet and outlet for the air to be carbureted, substantially as specified.

2. The combination of a hydrocarbon-supply vessel and hot-water-supply pipe with a jacketed tube having an inlet and outlet for the air and a distributing-brush within the tube, and onto which the hot water and hydrocarbon may be directed, substantially as set forth.



3. The combination of the hydrocarbon-supply vessel and hot-water-supply pipe with a jacketed tube containing a spiral brush, onto which the hot water and hydrocarbon may be directed, said tube having an inlet and outlet for the air, substantially as set forth.

4. The combination of the hydrocarbon-supply vessel, the hot-water-supply pipe having discharge-cocks, with a tube T open at opposite ends and containing a spiral brush M, and a brush *b*, onto which the hot water and hydrocarbon may be projected, substantially as described.

5. The combination of the hydrocarbon-supply vessel, having a discharge cock and valve S therefor, with a tube containing a distributing-brush, onto which the hydrocarbon may be projected, and with the governor of a carbureted-air engine controlling said valve, substantially as described.

6. The combination of the hydrocarbon-supply vessel and tube having a distributing-brush for the hydrocarbon, and a check-valve V at the lower end of the tube, with a receiving-tank, into which the check-valve end of the tube projects, and a pipe for the exit of the carbureted air from the tank, all substantially as set forth.

407,999. FOUNTAIN-PEN. DEWITT C. DEMAREST, Denver, Colo. Filed Oct. 18, 1888. Serial No. 288,462. (No model.)

Claim.—1. In a fountain-pen, the pen-holding plug having its central opening divided into the top ink-feeding openings 5 5 above the pen and into the bottom air-vent opening 6 below the pen, by means of the inner end of the pen and the inner bent end of the ink-feeding stem 10, in combination with the flat tongue 3, whereby to form two side passages 11 11, leading from the said top ink-feeding openings to the point of the pen and prevent the outflow of the ink at the air-vent, substantially as described, for the purpose stated.

2. The combination, in a fountain-pen, of a plug having a cylindrical and a semi-cylindrical part 1 2, a groove 4 passing through both parts open at the ends, and a tongue 3, with an ink-feeder 10, and a pen, both arranged to cross the outer end opening of the said plug at right angles to each other, substantially as described, for the purpose specified.

3. A fountain-pen provided with a pen-holding plug having a bevel joint-forming end 2, and a semi-cylindrical part 1, having a groove 4, which extends through and opens at the front end of the cylindrical part, a tongue 3, which extends from the latter over said opening, and an ink-feeder 10, placed beneath the tongue, arranged to pass through the upper part of the said opening and crossing the latter just back of the joint-bearing part 2, substantially as described, for the purpose specified.

4. In a fountain-pen, the combination, with a pen-holding plug having a semi-cylindrical part 1 and a cylindrical part 2, the latter forming the joint-bearing within the open end of the reservoir, and the former having a groove 4, open at both ends and extending through the joint-forming part, and a tongue 3, projecting from the latter, of an ink-feeder 10, placed beneath the tongue extending into said groove and turned down at its inner end to the bottom of said groove, thereby crossing the outer end, opening just back of the joint-forming part, substantially as described, for the purpose specified.

5. In a fountain-pen, the pen-holding plug provided with grooves 9 on each side, a central groove 4 and end opening, and a tongue 3, in combination with a pen having a bifurcated shank, and an ink-feeder 10, the rear edge 8 of the pen crossing the outer end of the plug-opening and the rear end of the feeder crossing said opening in the rear of the division edge of the pen, substantially as described, for the purpose stated.

6. In a fountain-pen, the combination, with a cylindrical plug having grooves 9 in its walls, and a central opening forming both a feed for the ink to the pen and an air-vent for the reservoir, of a pen having prongs 7, adapted to be secured within side grooves of the plug, and an edge 8, adapted to divide the central opening of the plug, substantially as described.

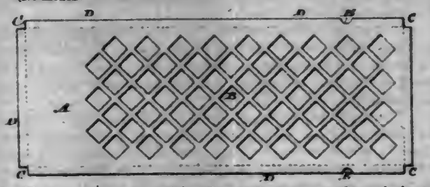
7. In combination, in a fountain-pen, the reservoir-handle, the plug or stopper 1 therefor, the feeder 10, and the pen, the said plug having its front end 2 perforated to form an air-vent and an ink-outlet, and the rear end of the pen and the rear end of the feeder arranged to cross each other and dividing the said front plug-opening into the lower air-vent 6, and into the upper side ink-passages 5 5, for the flow of the ink over the pen, substantially as described, and for the purpose specified.

8. An ink-feeding device for a fountain-pen, consisting of a plug having a central opening, a pen crossing said opening at the outflow, a feeding-stem extending from the outflow-opening over and back of the pen, and a tongue extending from said opening over the feeding-stem having a width and a length greater than that of the feeding-stem, substantially as described.

408,000. FOUNTAIN-PEN. DEWITT C. DEMAREST, Denver, Colo. Filed Nov. 23, 1888. Serial No. 291,654. (No model.)

Claim.—1. The combination, with the hollow handle of a fountain-pen, having its end beveled on its inner wall, of a hollow plug having its outer end conical to fit and close the said beveled end of the handle, and having a circular split from said conical end crossing its diameter to receive and hold the pen in connection with the hollow of said plug, whereby the pen is firmly clamped by the action of the beveled end of the handle upon said split conical end of the plug, substantially as herein set forth.

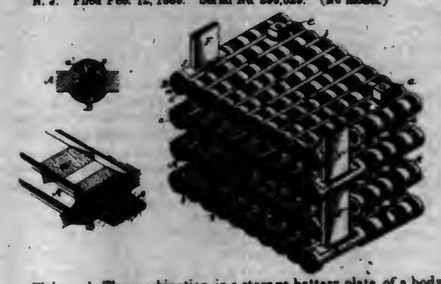
2. In a fountain-pen, the ink-feeding device herein described, consisting of the hollow plug 1, having a feed-tube of less diameter, provided with a top slit open at both ends and an air-vent on its under side, and a rod-feeder pinned to the outer open end of said tube, as herein set forth.



3. The combination, with the hollow handle of a fountain-pen, of a pen-holding ink-feeding device consisting of a hollow plug split diametrically a portion of its length from its outer end, and having a feed-tube provided with a top slit opening into said plug-split, whereby to form a clamp for the pen and a capillary feed for the ink, substantially as described.

4. An ink-feeding device for a fountain-pen, consisting of a hollow plug part 1 and a slitted tubular feed part 3 of less diameter, the said plug part being split lengthwise from its front to near its inner end with a circular cut on a level with the upper slitted side of the feed-tube, so that the said plug-split opens into said tube-slit, for the purpose stated.

5. An ink-feeding device for a fountain-pen, consisting of a hollow plug part split at its outer end by a circular cut opening into said plug, a feed-tube projecting from the split end of said plug, provided with a capillary top slit opening into said circular cut and into the flat open end of said tube, the latter having an air-vent on its under side, and a rod-feeder, in combination with the holder adapted to form a clamp for the split end of said feed-tube, for the purpose stated.



6. An ink-feeding device for a fountain-pen, consisting of a hollow plug part forming the stopper for the reservoir, having the interior end bevel 10, the exterior conical end 2, a feed-tube provided with a capillary top slit and a flat open end, and a rod-feeder, substantially as described.

408,001. METALLIC BOTTOM PLATE FOR PIGEON-HOLES. ISAAC L. DUNN, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Mar. 20, 1889. Serial No. 303,950. (No model.)

Claim.—As a new article of manufacture, a perforated sheet-metal bottom for pigeon-holes, provided with a downward projection on its side notched to receive a rod or pin for holding said bottom in place, substantially as set forth.

408,002. SECONDARY BATTERY. VICTOR H. ERNST, Jersey City, N. J. Filed Feb. 12, 1889. Serial No. 299,639. (No model.)

Claim.—1. The combination, in a storage-battery plate, of a body of active material indestructible by the acid of the battery, substantially as described.

2. The combination, in a storage-battery plate, of a body of active material with an absorbent core of material indestructible by the acid of the battery, substantially as described.

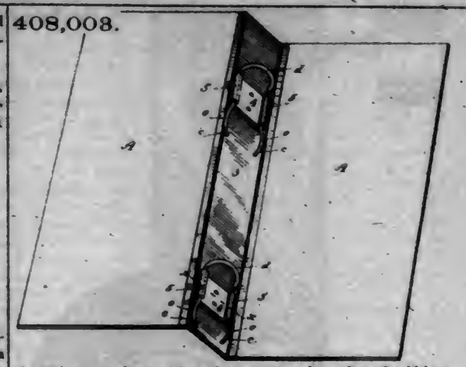
3. The combination, in a storage-battery plate, of a body of active material with a core of material indestructible by the acid of the battery and having a yielding and absorbent nature, substantially as described.

4. A storage-battery plate having a body of active material with a yielding or absorbent core of material indestructible by the acid of the battery, and having a series of fibrous ends or leaders projecting from the core into the active material of the plate, substantially as described.

5. A storage-battery plate having transverse openings or vents in portions of the plate, said openings or vents having tapered mouths, whereby the bubbles are carried from the under side of the plate through the openings, substantially as described.

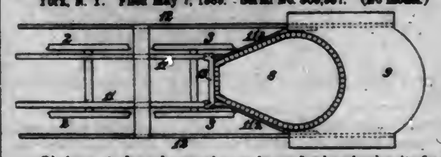
6. A storage-battery plate having longitudinal grooves in one or both faces, with transverse openings or vents in said grooved portions of the plate, substantially as and for the purpose described.

7. The combination of a series of battery-plates, each having a terminal orifice at one side and a notch at the opposite side, the notches of the negative plates being above the orifices of the positive plates, with a single positive terminal adapted to be passed through and be secured to the positive plates and a single negative terminal adapted to be passed through and be secured to the negative plates, substantially as described.



8. A battery-plate arched or convex in cross-section, substantially as and for the purpose described.

408,003. TEMPORARY BINDER. ALFRED G. FISHER, Springfield, Mass. Filed Aug. 13, 1888. Serial No. 282,633. (No model.)



Claim.—1. A temporary binder consisting of a base having opposing turned-over lips at its sides, whereby grooves are formed, and a binder-yoke consisting of an intermediate arch-shaped portion and the spring-arms disposed in a plane at an angle to that of said intermediate portion and adapted to have a sliding engagement with the said groove-forming lips, substantially as and for the purposes described.

2. A temporary binder consisting of a base-plate having opposing turned-over lips at its sides, whereby grooves are formed, and a binder-yoke consisting of an intermediate arch-shaped portion and the spring-arms disposed in a plane at an angle to that of said intermediate portion and provided with the curved portions *c* near their extremities, and said arms adapted to have a sliding engagement with said groove-forming lips, substantially as and for the purpose described.

408,008.

408,004. LOCOMOTIVE-ENGINE. MATTHIAS N. FORNEY, New York, N. Y. Filed May 7, 1889. Serial No. 309,967. (No model.)

Claim.—1. In a locomotive-engine, a fire-box having its front end of less width than the distance between the tires of the driving-wheels, and its rear end of greater width than the distance between said tires, and having each of its sides outwardly inclined between its front and its rear end, substantially as set forth.

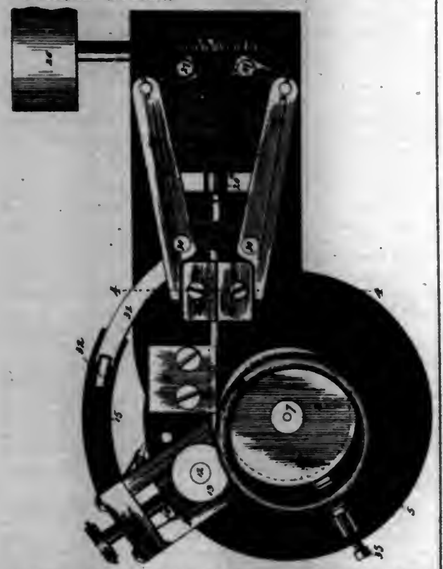
2. In a locomotive-engine, the combination of a fire-box having its front end of less width than the distance between the tires of the driving-wheels, and its rear end of greater width than the distance between said tires, and having each of its sides outwardly inclined between its front and its rear end, and inside frames extended rearwardly beyond the rear driving-axle, substantially as set forth.

3. In a locomotive-engine, the combination of a fire-box having its front end of less width than the distance between the tires of the driving-wheels, and its rear end of greater width than the distance between said tires, and having each of its sides outwardly inclined between its front and its rear end, main frames located between the driving-wheels, supplemental frames located outside of the wheels and fire-box, and diagonal connections extending along the sides of the fire-box and secured to the main and the supplemental frames, substantially as set forth.

4. In a locomotive-engine, the combination of a fire-box having its front end of less width than the distance between the tires of the driving-wheels, and its rear end of greater width than the distance between said tires, and having each of its sides outwardly inclined between its front and its rear end, main frames located between the driving-wheels, diagonal frames fastened to the rear ends of the main frames and extending rearwardly along the sides of and behind the fire-box, and transverse braces connecting the rearward extensions of the frames in front and in rear of the fire-box, respectively, substantially as set forth.

5. In a locomotive-engine, the combination of a fire-box having its front end of less width than the distance between the tires of the driving-wheels, and its rear end of greater width than the distance between said tires, and having each of its sides outwardly inclined between its front and its rear end, main frames located between the driving-wheels, and diagonal frames secured to the rear ends of the main frames and extending rearwardly along the sides of and behind the fire-box, and forwardly in X-shaped diagonal position between the main frames, to which the diagonal frames are secured at the opposite ends of the X-shaped diagonals, substantially as set forth.

408,005. ART OF BENDING AND COILING PIPE. HERBERT R. FOWLER, New Haven, Conn., assignor to the United States Pipe Bending and Coiling Company, Chicago, Ill. Filed Apr. 1, 1889. Serial No. 305,610. (No model.)



Claim.—The herein-described improvement in the art of bending and coiling pipe, which consists in intermittently pushing forward a continuous length of pipe through or between bending devices—each

408,005.

as rolls or dies—whereby the pipe is formed into a series of convolutions.

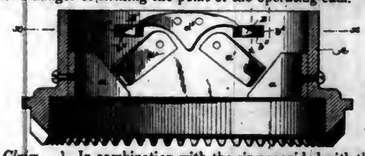
408,006. MACHINE FOR BENDING AND COILING PIPE. HERBERT E. FOWLER, New Haven, Conn., assignor to the United States Pipe Bending and Coiling Company, Chicago, Ill. Filed Apr. 1, 1889. Serial No. 305,611. (No model.)

Claim.—1. In a pipe bending and coiling machine, the combination, with suitable dies for forming the coil or bend, of means for feeding the pipe to the dies, comprising gripping-jaws adapted to engage the straight portion of the pipe and means for causing said engagement and for reciprocating the jaws to force the pipe between the bending-dies, substantially as described.

2. In a pipe bending or coiling machine, the combination, with suitable bending-dies, of means for forcing the pipe between said dies to form the coil, said means comprising, in combination, gripping-jaws carried by a sliding block and toggle-arms, and suitable gearing for operating said arms to cause them to impinge upon the gripping-jaws to secure its engagement with the pipe, and means for reciprocating the block to cause the jaws to advance the pipe, substantially as described.

3. In a pipe-bending machine, the combination, with dies for bending or coiling the pipe, of a pair of grooved gripping-jaws mounted upon a sliding block, a second block adapted to be moved by suitable gearing into engagement with the first, and a system of toggle-levers pivotally connecting said blocks and adapted to bear upon said gripping-jaws to cause their engagement with the pipe, substantially as described.

4. In a pipe-bending machine, the combination, with reciprocating clamping-jaws for feeding forward the pipe, of a rotatable bending-die, a second bending-die mounted upon a swinging plate, and means, substantially as described, connecting said plate with the feeding mechanism.



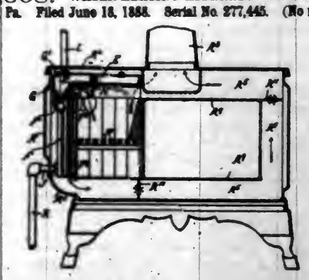
5. In a pipe-bending machine, the combination, with reciprocating clamping-jaws for feeding forward the pipe, of a rotatable bending-die, a second bending-die mounted upon a swinging plate, means, substantially as described, connecting said plate with the feeding mechanism, and means for locking said plate to a stationary part of the machine, substantially as described.

6. In a pipe-bedding machine, the combination, with the bending-dies, of a guide over which the forming-coil passes, said guide being vertically adjustable, whereby the pitch of the coils may be varied, substantially as described.

7. In a pipe-bending machine, the combination, with the bending-dies, of a guide for the forming-coils, said guide being vertically adjustable, whereby the pitch of the coils may be varied and laterally adjustable, whereby it is adapted for use with coils of varying diameters, substantially as described.

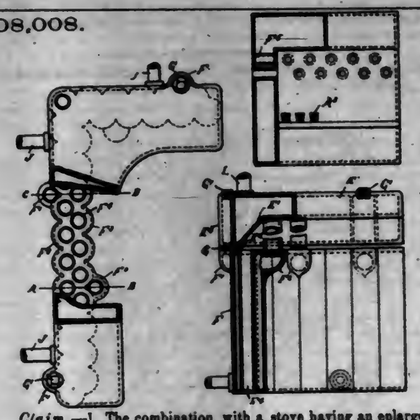
408,007. CIRCULAR-KNITTING MACHINE. CHRISTIAN FREDERICK, Wilmington, Del., and JOHN C. BEALY, Philadelphia, Pa.; said Bealy assignor to Thomas A. Pearce, Philadelphia, Pa. Filed Apr. 13, 1889. Serial No. 307,084. (No model.)

Brief.—The object of the invention is to provide an improved guard or safety cam designed to act upon the heels of such needles as are in danger of striking the point of the operating-cam.



Claim.—1. In combination with the ring provided with the usual needle-operating cams, the spring and the spring-actuated guard-cam pivoted to swing outward and provided at the inner end with surfaces b^3 b^4, inclined one upward and the other downward in the direction of rotation.

2. In combination with the ring having the usual needle-operating cams, the outwardly-movable spring-pressed guard-cam having at its inner end an upwardly and a downwardly inclined surface, one having its forward end carried past the level of the other, whereby the outward motion of the cam is caused to expose to the needle-heels the surface which was previously guarded by the other surface.

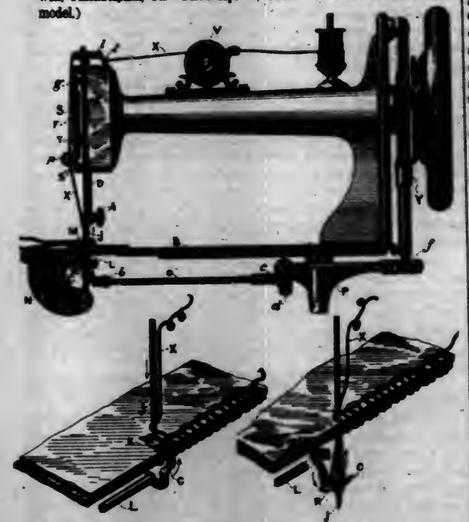


3. The ring having the usual needle-operating cams, in combination with the spring and the pivoted spring-pressed guard-cam having the surfaces b^3 b^4, shoulder b^5, and notch b^6.

4. In combination with the ring and the usual needle-operating cams, the pivoted spring-pressed guard-cam having, first, an upper inclined face normally in the path of those needle-heels which would abut against the point of the operating-cam; second, the shoulder against which said heels act to swing the cam outward, and third, the under inclined surface which is exposed to the heels by the outward motion.

408,008. WATER-HEATING APPARATUS. JACOB FRIES, Reading, Pa. Filed June 16, 1888. Serial No. 277,445. (No model.)

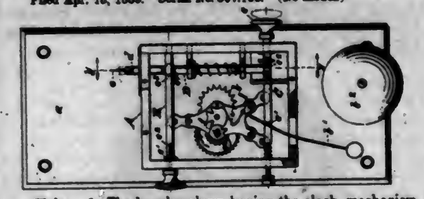
408,008.



Claim.—1. The combination, with a stove having an enlarged fire-chamber, a smoke-outlet communicating directly with said fire-chamber, a damper between said chamber and outlet, and a smoke-flue underneath the fire-grate, all substantially as described, of a water-heating apparatus having a vertical water-chamber forming a wall or walls of the fire-pot and extending below the grate, the products of combustion being brought in contact with said water-chamber when diverted downward to pass through said lower smoke-flue, substantially as and for the purpose set forth.

2. The combination, with a stove having an enlarged fire-chamber, a smoke-outlet communicating directly with said fire-chamber, a damper between said chamber and outlet, and a smoke-flue underneath the fire-grate, all substantially as described, of a water-heating apparatus having a vertical section forming a wall or walls of the fire-pot and extending below the grate, a horizontal section overhanging the grate, and passage-ways below said horizontal section between the fire-box and said lower smoke-flue, whereby the products of combustion are brought in contact with said vertical section when diverted downward to pass through said lower smoke-flue, substantially as and for the purpose set forth.

3. The combination, with a stove having an enlarged fire-chamber, a smoke-outlet communicating directly with said fire-chamber, a damper between said chamber and outlet, and a smoke-flue underneath the fire-grate, all substantially as described, of a water-heating apparatus having a vertical tubular section connected to a separate horizontal section, the two being in contact on their outer edge and the horizontal section projecting over the open top of the tubular section, substantially as and for the purpose set forth.

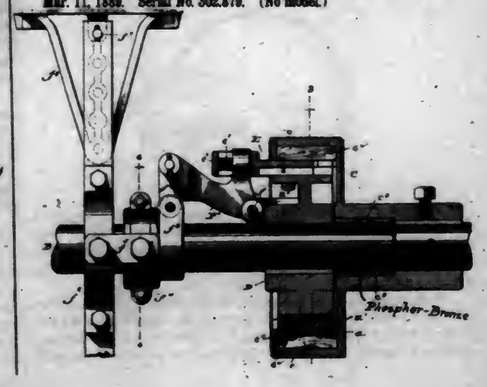


408,009. OVERSEAMING SEWING-MACHINE. JULIUS C. GOODWIN, Philadelphia, Pa. Filed Apr. 7, 1887. Serial No. 234,008. (No model.)

Claim.—1. In an overseaming sewing-machine, the combination, with a reciprocating eye-pointed needle and means for operating the same, of a horizontal shaft L, journaled in the bed-plate parallel with the direction of the feed, a single hook C, rigidly mounted on said shaft in front of and contiguous to the line of travel of the needle and provided with a laterally-projecting horn K, and means, substantially as described, for rotating the shaft, whereby the hook is reciprocated above and below the material to be operated on and in close proximity to the front side only of the needle, for the purpose specified.

2. In an overseaming sewing-machine, the combination, with a reciprocating eye-pointed needle carrying a single thread and means for operating the said needle, of a horizontal shaft L, journaled in the bed-plate parallel with the direction of the feed, a single hook C, rigidly mounted on one end of said shaft in front of and contiguous to the line of travel of the needle and provided with a laterally-projecting horn K, a pinion M, mounted on the other end of said shaft, a toothed segment N, meshing with said pinion, a bell-crank lever P, pivoted on the bed-plate, an adjustable rod O, connecting the bell-crank and the toothed segment, and means, substantially as described, for oscillating the bell-crank lever, for the purpose specified.

408,010. BURGLAR-ALARM. THOMAS J. GORDON, Olathe, Kans. Filed Apr. 13, 1889. Serial No. 307,100. (No model.)



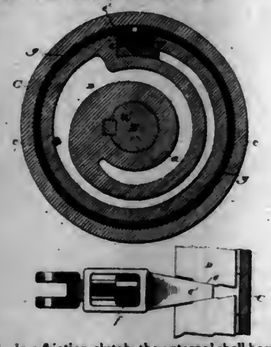
Claim.—1. The burglar-alarm having the clock mechanism, the bell or gong hammer and gong or bell, in combination with the plate or bar having a shoulder acting upon the hammer, and a slot or aperture, the spring-pressed locking bar or rod engaging with the said slot or aperture and having connection with the windows and doors of a dwelling, &c., substantially as specified.

2. The combination, with the spring-pressed locking-rod engaging a slot or aperture in the spring-pressed plate or bar engaging with the bell or gong hammer rod, of the rotary rod or bar having a notch or recess facing the aforesaid locking-rod, substantially as specified.

3. The combination, with the spring-pressed locking-rod engaging a slot or aperture in the spring-pressed hammer-locking bar or plate, of the rotary rod having a notch or recess facing the aforesaid locking-rod, said latter-referred-to rod also having a notch or recess receiving the convex or rounded portion of the rotary rod, substantially as set forth.

4. In a burglar-alarm, the combination, with the alarm mechanism, comprising the spring-pressed locking-rod, the spring-pressed slotted plate or bar engaged by said rod, the bell or hammer rod engaged by said plate, and the rotary rod or bar having a notch or recess facing said locking-rod, and the alarm-transmitting wire or medium, of the branch wire or its equivalent having a drop-hook engaging a catch or projection on the door and having connected to it a manipulating-cord, or its equivalent, passing over a suitably-disposed pulley, and means for holding the drop-hook away from the door, substantially as shown and described.

408,011. SHAFT-COUPLING. WILLIAM D. GRAY, Milwaukee, Wis., assignor to the Edward P. Allis & Company, of Wisconsin. Filed Mar. 11, 1889. Serial No. 302,879. (No model.)



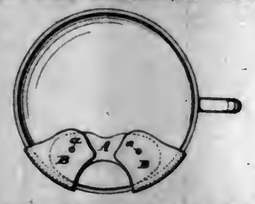
Claim.—1. The flanged shell and the independent internal hub having the grooves in its opposite sides, in combination with the expansible friction-ring encircling the hub and having the rib or key *d* seated loosely in one of the grooves and the wedge seated in the other groove and acting between the ends of the ring, whereby the ring is enabled to move radially and expand uniformly throughout its length.

2. The flanged shell, the independent hub, and the extensible ring, in combination with the wedge having the opening in its end, the lever, and the wedge operating and adjusting screw seated in the lever and bearing at its ends against the opposite walls of the wedge-opening, whereby the lever is enabled to positively advance and retract the wedge.

3. In a friction-clutch, the outside rim, the internal hub having the eccentric periphery, the tapered expansible ring, and means, substantially as shown, for expanding said ring.

4. In combination with the shell, hub-expanding ring, wedge, and wedge-operating lever, the sliding collar and link to operate said lever, the non-rotating ring f^4, the hand-lever to actuate the same, the hanger f^5, and the adjustable pivot connecting the hand-lever and hanger, whereby the parts are adapted for use with shafts at different distances from the ceiling or wall.

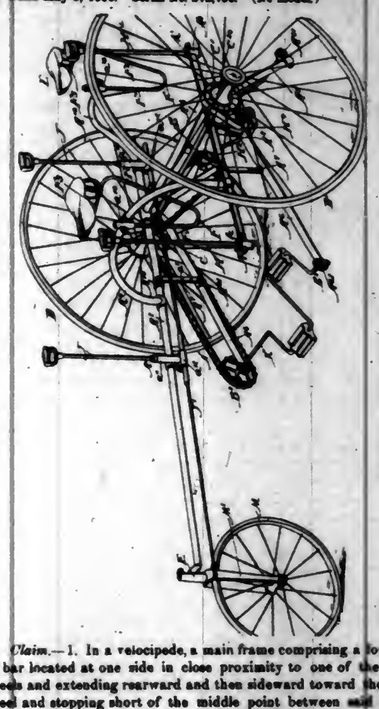
408,012. FRICTION-CLUTCH. William D. Gray, Milwaukee, Wis., assignor to the Edward P. Allis & Company, of Wisconsin. Filed Apr. 22, 1889. Serial No. 308,179. (No model.)



Claim.—1. In a friction-clutch, the external shell having the overhanging flange, the central shaft revoluble independently of the shell, the intermediate driving-spring fixed to the shaft and coiled in a plane at right angles to the axis, and an expanding device, substantially as shown, mounted between the outer convolutions of the spring, whereby the spring may be positively enlarged to frictionally engage the shell.

2. The external flanged shell and the central shaft revoluble independently of said shell, in combination with the intermediate driving-spring fixed at its inner end to the shaft and provided at the outside with the shoulder opposing its end, and the wedge acting between said shoulder and end.

3. In a friction-clutch, the combination of the shell C, the coiled expansible driving-spring with its central shaft-receiving hub *d* and ears f^3 thereon, the lever pivoted to said ears, and the wedge connected to the lever and acting within the spring to expand the same.



408,013. MUSTACHE-PROTECTOR. John O. Hibbard, Hartwell, Ohio. Filed Nov. 15, 1888. Serial No. 290,885. (No model.)

Claim.—1. A mustache-protector consisting of a central plate A, having circular slots *b* therein, and clamp-plates B B, having the lugs *a* pivotally connected thereto, said lugs projecting through said slots *b*, and suitable spring-connection between said central plate and lugs *a*, substantially as set forth.

2. A mustache-protector consisting of a central plate A, having the circular slots *b* and upturned flanges *b'*, the latter having the slots b^2 cut therein, and the clamp-plates B B, having the lugs *a* pivotally connected thereto, and downwardly-turned flanges b^3 and springs D, the latter being secured at one end in the slots b^2 and at the other end attached to the lugs *a*, substantially as set forth.

408,014. VELOCIPEDE. Thomas B. Jeffery, Ravenswood, Ill. Filed May 3, 1888. Serial No. 272,736. (No model.)

Claim.—1. In a velocipede, a main frame comprising a fore-and-aft bar located at one side in close proximity to one of the drive-wheels and extending rearward and then sideward toward the other wheel and stopping short of the middle point between said wheels, and a seat secured upon said sideward extension, substantially as set forth.

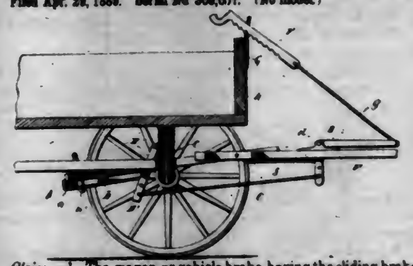
2. In a velocipede, a main frame comprising two side bars adjacent to the drive-wheels, respectively, the longer one of said side bars extending forward and constituting a reach to the steering-head, and extending rearward and then sideward and stopping short of the middle, a cross-bar connecting said side bars forward of the axle, and two seats, one supported upon the sideward extension of the said longer side bar nearer to the vertical plane of said longer bar than to the vertical plane of the shorter bar, and the other seat supported on said cross-bar nearer the vertical plane of the shorter side bar, substantially as set forth.

3. In a velocipede, a main frame comprising two side bars and a cross-bar connecting them in the vicinity of the axle, one of said side bars extending upward in the rear of the vertical plane of the axle and then sideward toward the vertical plane of the other side bar, but stopping short of the middle point between said bars and a second bar connecting said side bars forward of the axle and arched upwardly between them, and two seats, one secured on the elevated sideward extension of the first-mentioned side bar and located nearer said bar and the other secured upon the upwardly-arched cross-bar nearer to the other side bar, substantially as set forth.

4. In a velocipede, in combination, substantially as set forth, a pair of rear drive-wheels, a forward steering-wheel, a main frame, and two seats, the said seats being out of line fore and aft with each other, and the steering-wheel being out of line with both drive-wheels and both seats and being located between the vertical plane of one of the seats and the vertical plane of the drive-wheel which is nearest thereto.

5. In a velocipede, in combination with the main frame and the main axle journaled therein, the pedal-crank-shaft frame-bars A^2, pivoted to the main frame in the vicinity of the axle and extending thence forward, the pedal crank-shaft journaled at the forward part of said frame-bars, the sprocket-wheels on the main axle and crank-shaft, respectively, and the drive-chain connecting them, said frame-bars being adjustably secured to the main frame at a point other than their pivot, whereby the height of the pedal crank-shaft may be varied at will without materially changing its position fore and aft or materially slackening or tightening the drive-chain, substantially as set forth.

6. In a velocipede, in combination with the main frame comprising two side bars located in proximity to the drive-wheels, respectively, the forward pedal-crank-shaft frame-bars located in the vertical planes of said side bars, respectively, whereby said frame is rendered open front, substantially as set forth.



7. In a velocipede, in combination with the main frame having side bars located in proximity to the drive-wheels, respectively, the front and rear pedal-crank-shaft frame-bars located in the vertical planes, respectively, of the said side bars, whereby said frame is rendered open both front and rear, substantially as set forth.

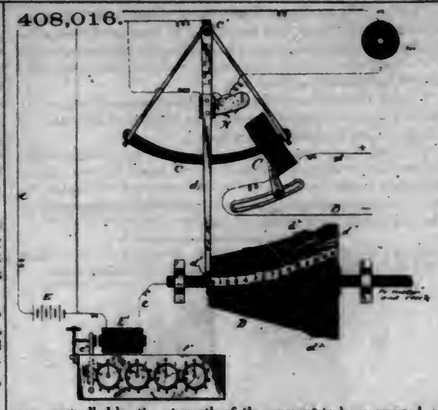
8. In a velocipede, the seat-support consisting of a spring-rod having the vertical straight part F' and the oblique part F^2 extending upward and rearward from the lower end of the vertical part, and the part F^3 extending forward from the upper end of the oblique part and adapted to receive the saddle, substantially as set forth.

9. In combination with the frame having the vertical socket a^{10}, a seat-support having the vertical part F' inserted in said socket, oblique part F^2 extending upward and rearward from the lower end of the vertical part, and the part F^3 extending forward from the upper end of said oblique part, and the saddle secured upon said part F^3, substantially as set forth.

10. In a two-seated velocipede, in combination with the main frame and the main axle journaled therein, two brake handle-rods journaled in the main frame, cranks on said handle-rods, respectively, and a link or rod which connects said cranks, and a brake-lever and suitable brake operated thereby, said lever extending in proximity to the connecting-rod, and said rod being provided with adjustable stops to engage said lever upon both sides, substantially as set forth.

408,015. WAGON-BRAKE. Solomon Kauffman, Union Grove, Ill. Filed Apr. 29, 1889. Serial No. 308,677. (No model.)

Claim.—1. The wagon or vehicle brake having the sliding brake-bar provided with shoes or blocks, in combination with the suspended bail-lever, the right-angled lever having rod or chain connection with said bail-lever and the ratchet or notched hand-lever, substantially as set forth.



2. The wagon or vehicle brake having the sliding brake-bar provided with shoes or blocks, in combination with the bail-lever, the right-angled lever having adjustable rod or chain connection with the bail-lever, the hand-ratchet or notched slide-lever having rod or chain connection with said right-angled lever, and the spring to effect the automatic release of the brakes, substantially as specified.

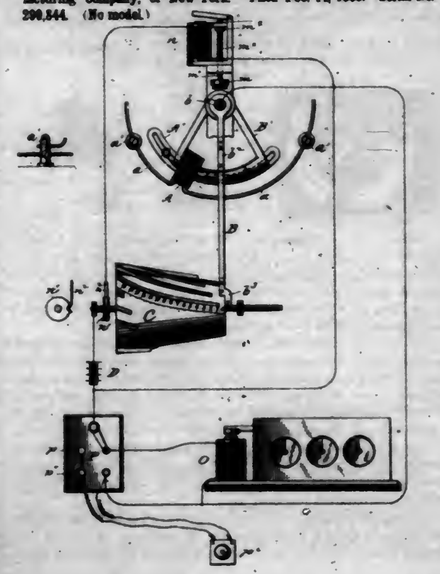
408,016. ELECTRIC METER. Edward R. Knowles, Brooklyn, N. Y., assignor, by mesne assignments, to the Mutual Electric Manufacturing Company, of New York. Filed Oct. 20, 1888. Serial No. 289,414. (No model.)

Claim.—1. In an electric meter, a periodically-moving element provided with a series of continuous flanges or wings of regularly-graduated length, in combination with an element moved by the strength of the current to be measured, the movement of the last-mentioned element always being in a substantially parallel plane to the surface of the contacts upon the first-mentioned element, as set forth.

2. In an electric meter, a contact-arm moved by the strength of the current to be measured, in combination with a rotating drum bearing contact-points upon its surface whose axis is parallel to the plane of movement of said contact-arm, and whose surface is conical, whereby the space between the arm and the surface will be constant for all positions of the drum or arm, substantially as described.

3. In an electric meter, a rotating drum bearing upon its surface the division-marks of a scale, and also a series of continuous contact flanges or wings, the length of the flanges being graduated, so that the beginning of the first one is in line with the first mark on the scale, and the beginning of the succeeding ones, respectively, in line with the succeeding cardinal marks upon the scale, and all ending in line with the last division-mark, in combination with a moving contact-

arm controlled by the strength of the current to be measured and adapted to make contact with the flanges on the drum when the latter rotates, whereby an electric circuit is closed, for the purpose described.



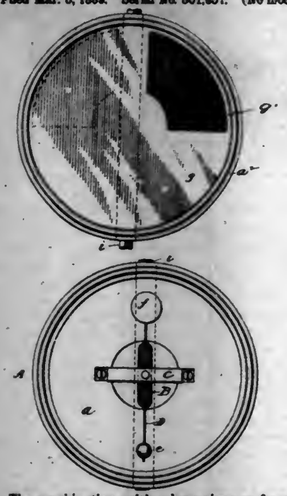
4. In an electric meter, the combination, with the drum D, having a fixed location, the solenoid-core *c*, and frame and arm *d*, connected therewith, of the solenoid-magnet C, adjustably mounted with respect to said core, frame, and arm *d*, for the purpose described.

5. In an electric meter, an element adapted to be moved by the strength of the measured current, another element adapted to be moved periodically, the said second element bearing contact points or flanges which are adapted to make contact with the first-mentioned element, all in combination with a device for preventing abnormal movement of one of the elements during the movement of the contact points or flanges past the first-mentioned element.

6. The combination, with the drum having inclined flanges and the arm *d*, moved by the strength of the measured current, of an armature attached to said arm, an electro-magnet in juxtaposition to said armature, and an electric circuit including said magnet.

7. The combination, with the periodically-rotating drum having inclined flanges and the arm *d*, moved by the strength of the measured current, of an armature attached to said arm, an electro-magnet in juxtaposition to said armature, an electric circuit, including said magnet, and a circuit-closer operated by the drum-motor when the drum rotates to close said circuit, substantially as described.

408,017. ELECTRIC METER. Edward R. Knowles, Brooklyn, N. Y., assignor, by mesne assignments, to the Mutual Electric Manufacturing Company, of New York. Filed Feb. 14, 1889. Serial No. 299,844. (No model.)



Claim.—1. In an electric meter, the terminals of the main solenoid formed of rigid metal and bent so as to form arc-shaped strips, in combination with binding-posts which adjustably support said strips, and also form the terminals of the circuit carrying the current to be measured, substantially as described.

2. In an electric meter, the main solenoid mounted upon an adjustable bracket, in combination with the arc-shaped terminals and the binding-posts in which they are held.

3. In an electric meter, an arm moved by the strength of the measured current hung upon a shaft, a brake-shoe located adjacent to said shaft, an armature-lever operatively connected with said brake-shoe, and an electro-magnet for causing said brake to bear upon said shaft, substantially as described.

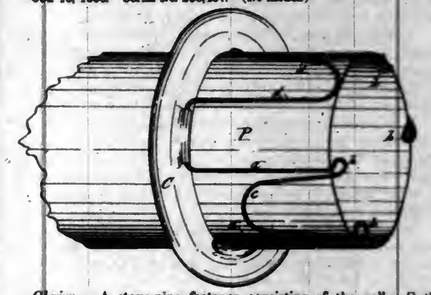
408,018. ELECTRICAL INDICATOR. EDWARD R. KNOWLES, Brooklyn, N. Y. Filed Mar. 5, 1889. Serial No. 301,857. (No model.)

Claim.—1. The combination, with a base-piece or frame A, provided with a slot to receive the conductor in which the operating-current flows, of a magnetic needle mounted on pivots in said base-piece or frame.

2. In a current-indicator, the combination, with a casing provided with a slot passing vertically through its center for the accommodation of an electric conductor, of a needle or pointer pivoted centrally therein and adapted to swing in a vertical plane and a weight attached to one end of said needle tending to maintain it in a vertical position.

408,019. SEWING-MACHINE. ARTHUR M. LESLIE, Chicago, Ill. Filed Nov. 14, 1887. Serial No. 255,153. (No model.)

Claim.—1. In combination with a rotary shuttle and a shuttle-race for the same, a shuttle-driver disk provided on its face with a shuttle-driver movable thereon, and a stud upon which said driver is pivoted, the said stud occupying a re-entrant curve behind the nose of the shuttle, while the free end of the driver engages with the shuttle-heel, substantially as hereinbefore set forth.



2. In combination with a rotary shuttle and a shuttle-race for the same, a shuttle-driver disk provided on its face with a shuttle-driver movable thereon and having a rearwardly-projecting stud-pin, and a stationary cam engaging with said stud-pin, whereby said shuttle-driver is periodically retracted as the shuttle rotates to release the needle-loops, in the manner set forth.

3. A rotary shuttle having in its face and back near its perimeter grooves concentric with its periphery, in combination with stationary race-guards having points which project into said grooves, substantially as hereinbefore set forth.

4. In combination with a rotary shuttle and a stationary shuttle-race having a groove which embraces the perimeter of the shuttle, a shuttle-race cap forming one side of said groove, screws which attach said cap, and springs interposed between the heads of said screws and said cap, substantially as hereinbefore specified, for the purpose set forth.

5. In combination, a loop-taker guide, a rigid segmental cap therefor, headed screws for securing the cap to the guide, and springs arranged between the cap and the heads of the screws, substantially as hereinbefore specified.

408,020. STOVE-PIPE FASTENER. JACOB LINDENMAYER, Syracuse, N. Y., assignor of one-half to Peter A. Kratz, same place. Filed Oct. 18, 1888. Serial No. 288,487. (No model.)

Claim.—A stove-pipe fastener consisting of the collar C, the spring-arms *a a*, secured to the collar and formed with overhanging loops *b b*, and united by the reversed and outwardly-inclined loop *c*; substantially as described and shown.

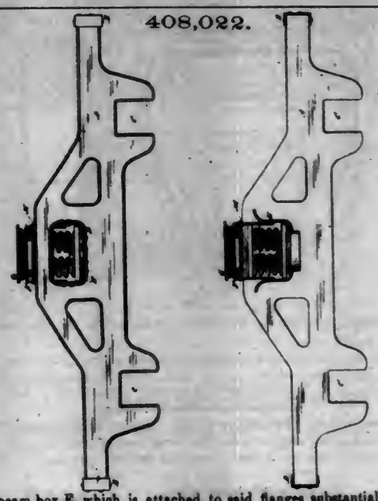
408,021. BRAKE-BEAM. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Dec. 26, 1888. Serial No. 294,684. (No model.)

Claim.—1. A hollow box brake-beam pressed from a flat plate of steel directly into the form of a box having sides, ends, and back, substantially as described.

2. A hollow box brake-beam pressed from a flat plate of steel directly into the form of a box having sides, ends, and back, and having the closed sides of the box curved from G to F, as shown, substantially as described.

3. A hollow box brake-beam pressed from a flat plate of steel directly into the form of a box having sides, ends, and back, and a strap surrounding the same and in contact with the back of the box, substantially as described.

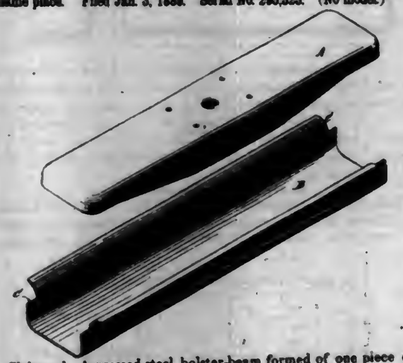
4. A hollow box brake-beam pressed from a flat plate of steel directly into the form of a box having sides, ends, and back, and a strap surrounding the same and in contact with the back of the box, and the brake-heads D and brake-shoes E, substantially as described.



408,022. TRUCK FOR RAILWAY-CARRIAGES. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Jan. 3, 1889. Serial No. 295,322. (No model.)

Claim.—1. The combination, in a railway-truck, of the pressed-steel truck-frames provided with a flanged opening for the reception of a bolster-beam box, a pressed-steel bolster-beam box fitting the flange of said opening and extending transversely from truck-frame to truck-frame and having its exterior ends supported by the flanges of said truck-frames and fastened thereto, and a pressed-steel bolster-beam vertically movable in said box, substantially as described.

2. The combination of the pressed-steel box, bolster-beam M, the pressed-steel bolster-beam box E, the spring-plates H H, and the springs inclosed in said pressed-steel box, and the truck-frames A, provided with flanges D, integral therewith and forming supports for the bol-



408,022.

ster-beam box E, which is attached to said flanges, substantially as described.

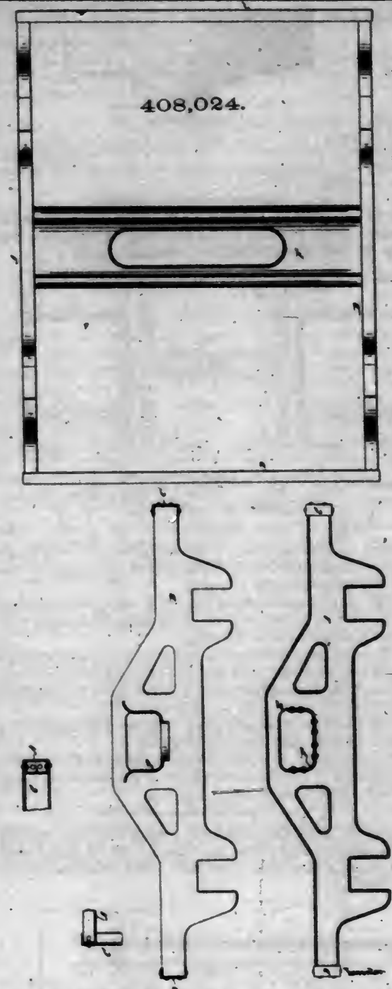
3. The combination of the pressed-steel truck-frames A A, the pressed-steel cross-pieces B B, having closed box ends surrounding and fitting the ends of the truck-frames A, the pressed-steel bolster-beam box E, the pressed-steel bolster-beam M, and the pressed-steel journal-plates F G, substantially as described.

408,023. BOLSTER-BEAM FOR CARS. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Jan. 3, 1889. Serial No. 295,323. (No model.)

Claim.—1. A pressed-steel bolster-beam formed of one piece of metal and in the shape of an inverted box having sides and ends integral with the remainder of the box, substantially as described.

2. The combination of the pressed-steel bolster-beam A, formed of one piece of metal, and having sides and ends integral with the beam itself, and the pressed-steel bolster-beam box B, formed of one piece of metal and having sides and ends integral with the beam-box itself, adapted to receive the same, substantially as described.

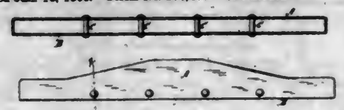
3. The pressed-steel bolster-beam box B, cut away at the end C for passage through the truck-frame, substantially as described.



408,024. TRUCK-FRAME. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Jan. 3, 1889. Serial No. 295,324. (No model.)

Claim.—1. The combination of the pressed-steel flanged side frames A and B and the pressed-steel flanged end frames C and D, the flanges of said frames accurately fitting against each other, so as to produce an accurately rectangular frame, substantially as described.

2. The combination of the pressed-steel side frames A and B, having flanges at right angles to their main plane, and the pressed-steel flanged end frames C and D, having their flanges at right angles, fitting accurately the flanges of the side frames A and B, and the whole firmly attached by riveting or welding, so as to insure a rectangular frame, substantially as described.

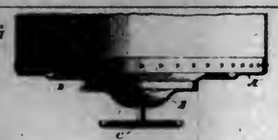


3. The combination of the pressed-steel side frames A and B, having flanges at right angles to their main plane, and the pressed-steel

408,024.

flanged end frames C and D, having their flanges at right angles, fitting accurately the flanges of the side frames A and B, and the bolster-beam box F, fitting the flanged side frames A and B, the whole firmly attached by riveting or welding, so as to insure a rectangular frame, substantially as described.

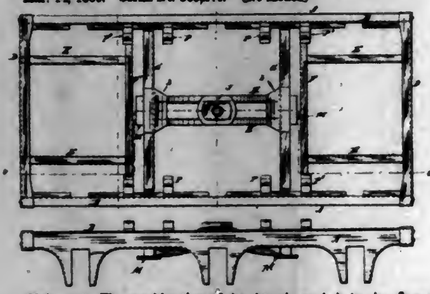
408,025. BRAKE-BEAM. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Jan. 16, 1889. Serial No. 296,457. (No model.)



Claim.—1. The pressed-steel brake-beam A, having transverse rivets C, substantially as described.

2. The pressed-steel brake-beam A, having transverse rivets C and sleeves D, substantially as described.

408,026. SMOKE-BOX FRONT DOOR. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Jan. 21, 1889. Serial No. 297,061. (No model.)



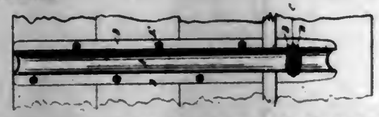
Claim.—The combination of a flexible corrugated front plate for locomotives, made of pressed steel pressed between dies, of a flexible door itself made of pressed steel pressed between dies and having an

408,026.

elastic action in connection with said front plate, thereby enabling a tight joint to be made between the door and the front plate, substantially as described.

408,027. TRUCK. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Mar. 14, 1889. Serial No. 303,270. (No model.)

Claim.—1. The combination of the side pieces A A, having flanges B and C on alternate sides thereof, with the end boxes D D, substantially as and for the purposes described.



2. The combination of the side pieces A A, having internal flanges C, with the end box D, and the transverse framing F, supported upon the flanges C, substantially as described.

3. The combination of the side pieces A A, having internal flanges C, with the end box D, the transverse framing F, supported upon the flanges C, and the longitudinal beams E E, resting on the flanges of the parts F and D, substantially as described.

4. The side frames having flanges B C, the internal flange C being folded back, as at K, substantially as described.

5. The arch-beam connections shown, consisting of the two channel arch-beams H H, and the cross-pieces G G, attached to the beams H H by plates L M, substantially as described.

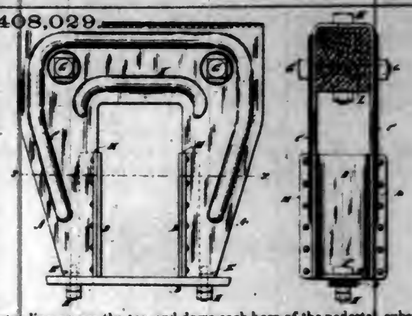
408,028. COMBINED STAKE AND POCKET FOR CARS. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Mar. 14, 1889. Serial No. 303,271. (No model.)

Claim.—1. A stake for railroad-cars, made of one piece of pressed steel and having a semi-cylindrical central part, and two flat flanges on either side thereof for supporting the wood-work of the car, substantially as described.

2. The stake for railroad-cars herein shown, made of pressed steel and having corrugations B B for supporting a locking device, substantially as described.

3. The combination of the pressed-steel stake A, having flanges D and corrugations B B, with the locking-staple C, substantially as described.

408,029. PEDESTAL FOR RAILROAD-CARS. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Apr. 2, 1889. Serial No. 305,654. (No model.)

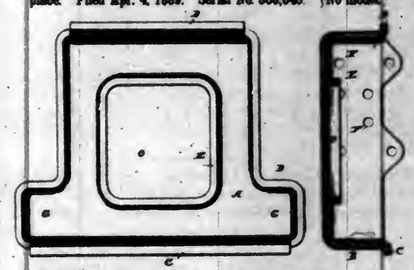


Claim.—1. The pressed-steel pedestal for railroad-cars, having plates A A approximately parallel and formed of the same piece of metal, and provided with outwardly-turned flanges for receiving the journal-box, substantially as described.

2. As a new article of manufacture, a pressed-steel corrugated pedestal for railroad-cars, substantially as described.

3. The pressed-steel pedestal shown, provided with flanges M M and wearing-plates B B, all of pressed steel and fitted thereto, substantially as described.

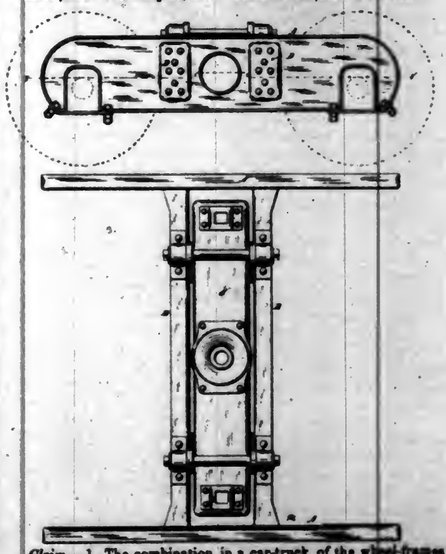
4. The corrugated pressed-steel pedestal A, provided with a corrugation K above the journal-box opening, and with a corrugation C



408,029.

extending across the top and down each horn of the pedestal, substantially as described.

5. The combination of the pressed-steel pedestal A, having wearing-plate B attached thereto, the said plate B having flange E, and the pedestal tie-bar D, bolted to the part B, substantially as described.



408,030. TRUCK-END PLATE. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed Apr. 4, 1889. Serial No. 306,040. (No model.)

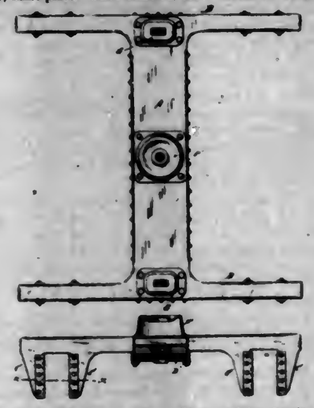
Claim.—1. A truck-end plate made of one piece of pressed steel having a central opening and a flange surrounding the same, and having an exterior flange surrounding the plate, substantially as described.

2. The pressed-steel truck-end plate A, having an opening O and flange E surrounding the same, and having an external flange B and flanges D C, bent from said flange B, all made of one piece of pressed steel, substantially as described.

408,031. PRESSED-STEEL TRUCK. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed May 23, 1889. Serial No. 311,576. (No model.)

Claim.—1. The combination, in a car-truck, of the wheel-frames

A, having a pocket D, with the pressed-steel box-transom B, the end thereof fitting the pocket D, substantially as described.



2. The combination of the wheel-pieces A A, having pockets D D D D, with the pressed-steel box-transom B B, having the ends of the boxes B B riveted in the pockets D D D D, substantially as described.

408,032. CENTER PLATE FOR RAILWAY-CARS. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed May 23, 1889. Serial No. 311,578. (No model.)

Claim.—The combination of the pressed-steel center plates A and B, having contact wearing-surfaces E C and cylindrical portions F D, the said cylindrical portions being separated by the space G, so as to allow the rocking of the plate A upon the plate B in any direction, substantially as described.

408,033. TRUCK FOR ROLLING VEHICLES. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed June 11, 1889. Serial No. 313,910. (No model.)

Claim.—1. A truck-frame for rolling vehicles, having the side frames and transom formed of one piece of metal, which affords the necessary strength and rigidity without the employment of end frames, substantially as described.

2. A truck for rolling vehicles, consisting of the box-shaped side frames and transom pressed from a single plate of metal, said transom affording sufficient strength and rigidity without the employment of end frames, substantially as described.

3. The combination of the side frames B B, the transom A, and the stiffener D, the said side frames being unprovided with end frames and relying for their support upon the transom A and stiffener D, substantially as described.

408,034. TRUCK. EDWARD W. MACKENZIE HUGHES, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed June 11, 1889. Serial No. 313,911. (No model.)

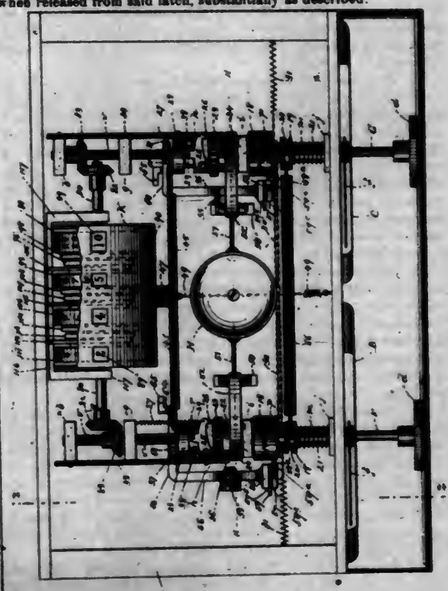
Claim.—1. A truck-frame for rolling vehicles, in which the side frames, end frames, and transom are formed of one piece of metal, substantially as described.

2. A truck for rolling vehicles, having the side frames, end frames, and transom all pressed of one piece of metal so as to form boxes, substantially as described.

3. The combination of the truck A, with the axle safety-bars G, formed of pressed steel, substantially as described.

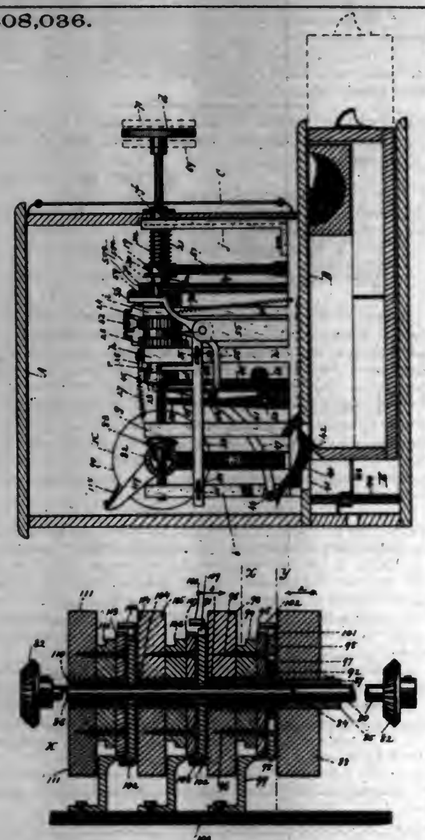
4. The truck for vehicles herein shown, having the side frames, end frames, and transom and pedestals all pressed from one piece of metal, substantially as described.

408,035. BUCKLE. CHARLES A. MANN, Buffalo, N. Y., assignor to William R. Mann, same place. Filed Nov. 16, 1888. Serial No. 290,951. (No model.)



Claim.—The combination, with a rectangular buckle-frame composed of raised side bars and depressed cross-bars connecting both end portions of the side bars, and a tongue-frame pivoted between the side bars of the buckle-frame and provided with tongues or prongs, the points or outer ends of which rest upon one of the cross-bars of the buckle-frame when the buckle is closed, of locking teats or projections *d*, formed upon the inner sides of the side bars of the buckle-frame and engaging over the lateral edges of the buckle-frame when the buckle is closed, whereby the tongue-frame is locked with its prongs or tongues in contact with one of the cross-bars of the buckle-frame, substantially as set forth.

408,036. CASH INDICATOR AND REGISTER. HARRIS A. MILES, Boston, Mass. Filed Jan. 30, 1889. Serial No. 298,102. (No model.)



Claim.—1. In a cash-register, the combination, with a sliding shaft provided with a bunter and a toothed flange, of a sliding bar, as 33, provided with upright arms projecting into the path of the bunter on opposite sides thereof and with a stop-arm for engaging the toothed flange when said shaft is pushed inward to open the money-drawer.

2. In a cash-register, a pivoted rod, as 56, provided with an arm projecting into the path of a bunter on the indicator-shaft, whereby it is prevented from being pushed inward to open the drawer, and a pivoted plate on the opposite end of said rod in position to be engaged by a pin on said shaft when revolved, whereby said arm is removed from the path of said bunter, substantially as described.

3. In a cash-register, the pivoted rod 56, provided with the arm 68, projecting into the path of a bunter on the indicator-shaft, and a pivoted plate 59, adapted to be engaged by a pin on said shaft when rotated, in combination with the lever 61, having the latch 64, for securing said rod when depressed, and the spring 70, for returning it when released from said latch, substantially as described.

408,036.

4. In a cash-register, the combination of an indicator-shaft, a bunter on said shaft, a toothed flange on said shaft, a pivoted lever provided with a stud in the path of the bunter and with a lever-arm for engaging said flange, and a spring for disengaging said lever when released from the bunter.

5. In a cash-register, a case provided with two dials for respectively indicating the dollars and cents of a sale, a sectional shaft passing centrally through each dial, a sleeve on each shaft-section provided with a crown-gear, said gears intermeshing to form a separable clutch, an index-finger and grooved ring on each forward sleeve, a chain winding onto said sleeves as the shafts are rotated, a spring connecting each chain with the case, and a horizontal bar pivoted within the case, the ends of said bar projecting into the grooves of said rings, whereby said clutches may be simultaneously separated when either of said forward shaft-sections is pulled outward, substantially as described.

6. In a cash-register of the character described, an adding device comprising a sectional shaft and indicator-shafts, one section of which bears a wheel numbered peripherally to correspond with the numbers on the cent-dial of the register and the other section bearing wheels each provided peripherally with two sets of cardinal numbers arranged consecutively and adapted to display the gross amount of dollars which have been indicated on the dials, substantially as described.

7. In a cash-register, an adding device comprising a sectional shaft actuated by the indicator-shafts, a series of wheels on said shaft, one of which is provided with numerals corresponding with those on the cent-dial of the register and the remaining wheels provided, respectively, with two sets of cardinal numbers arranged consecutively, a cover for said wheels provided with slots for exposing a single number thereon, and connecting mechanism, substantially as described, whereby said wheels are so rotated that the numbers displayed in said slot represent the gross amount indicated on said dials.

8. An adding device for cash-registers, comprising a sectional shaft, one section of which is actuated by the indicator-shaft of the dollar-dial, a series of wheels on said shaft-section provided, respectively, with two sets of cardinal numbers, a ratchet on said shaft-section for actuating one of said wheels conjointly with said indicator-shaft, ratchets secured to the succeeding wheels of the series, and diametrical pallets on said wheels for engaging the ratchet of the succeeding wheel at each semi-revolution and advancing said wheel one numeral, substantially as and for the purpose set forth.

9. In an adding device for cash-registers, a sectional shaft, one section of which bears a wheel numbered to correspond with the cent-dial of the register and is actuated by the indicator-shaft thereof, and the other section bearing a series of wheels provided, respectively, with two sets of cardinal numbers, said section being actuated by the indicator-shaft of the dollar-dial, a ratchet secured to each wheel, the number of teeth in said ratchets corresponding with the spaces on said dials, fixed circular partitions separating said wheels and provided with a groove at their tops, a pawl pivoted to said cent-wheel, said pawl being adapted to enter the groove on the adjacent partition and move a dollar-wheel one space at every complete revolution, diametric pallets on the dollar-wheels for entering grooves in their adjacent partitions and moving the next wheel one space for each semi-revolution, and a cover for said device provided with slots for exposing a numeral on each wheel, whereby the sum total of the amounts which have been indicated on the dials will be displayed, substantially as described.

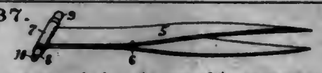
10. In a cash-register, the adding device K, comprising the sectional shaft 80, the wheel 88, secured to the section 85 thereof and numbered peripherally to correspond with the cent-dial of the register, the sleeve 91 on the section 86, provided with the ratchet 92, the wheel 93 on said sleeve, provided peripherally with two sets of cardinal numbers and the ratchet-wheel 95, the wheels 105 and 111, provided, respectively, with two sets of cardinal numbers and the ratchets 107 and 113, the pawl 97 on the ratchet 95, the partitions 98, 99, and 114, separating said wheels and having the grooves 101, and the pallets 102, for actuating adjacent wheels, all being arranged to operate substantially as described.

11. In an adding device for cash-registers, the cent-wheel 88, secured to the shaft-section 85 and provided with the pallet 102, in combination with the dollar-wheel 93, fitted to revolve on the shaft-section 86 and provided with the ratchet 95, and the partition 98, having the groove 101, whereby said pallet may be made to engage a tooth of said ratchet at each revolution of the cent-wheel, substantially as described.

12. In a cash-register, the combination of a case provided with a money-drawer, dials for indicating the dollars and cents of a sale, shafts passing centrally through said dials and provided with knobs and index-fingers, mechanism, substantially as described, disposed on said shafts for returning the index-fingers to the naught-point when said knobs are withdrawn, adjunctive mechanism actuated by said shafts for forcing out said drawer when the knobs are forced inward, a stop for preventing the drawer from being opened until a shaft is rotated, a stop for preventing the shafts from being rotated while being withdrawn, and an adding mechanism actuated by said shafts, whereby the sum total of the amounts indicated by the fingers thereon may be displayed, substantially as described.

13. In a cash-register, the sliding bar 33, provided with the arms 37 and 38, a bunter on the indicating-shaft between said arms, and the arm 36, also on said bar and adapted to engage the teeth of a flange on said shaft when pushed inward, whereby it is prevented from being rotated, substantially as described.

14. In a cash-register, the shaft F, comprising the sections *g v*, the sleeve *m* on the section *g* bearing the index-finger *f* and gear *p*, the sleeve *r*, fitted to slide on the section *v* and pinned to the section *g*, the sleeve 15, inclosing the sleeve *r* and pinned to the section *v*, the gear 18 on said sleeve intermeshing with the gear *p*, the spring 21 on the sleeve *m*, and the bunter 28 on the sleeve *r*, for actuating an adjunctive drawer-releasing mechanism, all being arranged to operate substantially as described.



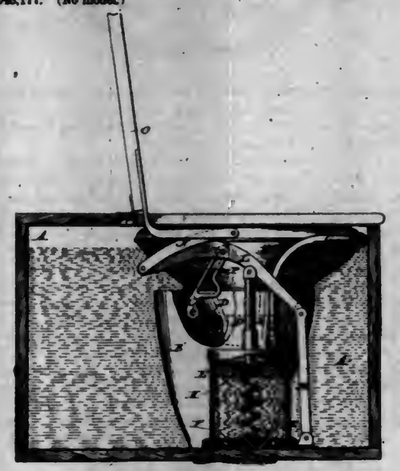
15. In a cash-register of the character described, an adding device comprising a series of wheels disposed on a sectional shaft actuated by the indicator-shafts of the register, one of said wheels being numbered peripherally to display the cents of the gross amount registered, and the succeeding wheels provided with numerals adapted to display the dollars of the gross amount registered as said wheels are consecutively rotated by their connecting mechanism, substantially as described.

408,037. WATCH-MAKERS' TWEEZERS. JOHN A. MILLER, Cairo, Ill. Filed June 23, 1888. Serial No. 277,986. (No model.)

Claim.—1. Watch-makers' tweezers provided with cylindrical projections extending beyond the plates of the tweezers at the union of the plates, adapted to push jewels into and out of their settings, as described.

2. As a new article of manufacture, tweezers provided with projecting tubes at the end where the arms of the tweezers are united to form jewel push-pieces, as described.

408,037.



3. Watch-makers' tweezers provided with jewel push-pieces, consisting of projecting tubes, one of which tubes has a flattened side, as described.

4. Watch-makers' tweezers provided with jewel push-tubes, at the union of the tweezer-arms, said arms being also provided with cuts, as described.

5. A new article of manufacture, consisting of the tweezers 5, the V-shaped cut 6, and the tubes 8 and 9, as described.

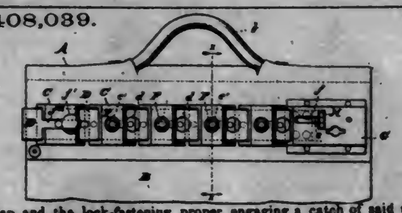
408,038. WATER-CLOSET. GEORGE D. MOFFAT, Chicago, Ill., assignor to R. P. Pattison, same place. Filed Aug. 29, 1887. Serial No. 248,177. (No model.)

Claim.—1. In a water-closet, the combination, substantially as shown, of the tank, the bowl or hopper, the intermediate piston-pump, the spring applied to actuate the pump and deliver water to the hopper, and the piston-rod to advance the piston against the resistance of the spring, whereby the spring is enabled to deliver the water gradually in successive charges from the tank to the bowl.

2. In a water-closet, the combination, substantially as shown, of a tank, a bowl or hopper, an intermediate piston-pump, a spring applied to move the piston to deliver water to the bowl, a piston-rod, a hinged lid or cover, and arms and levers, substantially as shown, connecting the lid and rod to effect the compression of the spring as the lid descends.

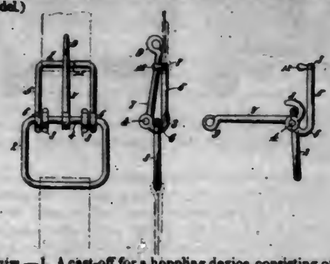
3. In a water-closet, the flushing-pump having the cylinder and piston, in combination with the spring within the cylinder to actuate the piston, the disconnected rod D, to depress the piston and compress the spring, the lever acting on said rod, and the hinged lid connected to the lever to depress the same as the lid rises.

4. In a water-closet, the hopper, the hinged pan, the pump, and the pump-actuating spring, combined with the hinged lid and intermediate arms and levers, substantially as shown, connecting the lid with both the pan and pump.



5. In a water-closet, and in combination with the spring, the valved piston-pump, the pump-operating lever, the hinged lid, the arm on the lid, and the connection between the arm and lever adapted to pass the center and thereby cause the operation of the pump as the lid rises and also as it falls.

6. In combination with the pump and its actuating-lever, the lid and its arm, the connecting-link N and the hinged pan, and the pan-operating arm P, having the irregular slot or opening into which a stud on the lever extends.



408,039. MAIL-BAG FASTENING. SETH M. MOORE, Harper, Kans. Filed Apr. 26, 1889. Serial No. 309,065. (No model.)

Claim.—The mail-bag fastening having a series of separate keepers having coincident apertures, the strap having a series of apertures provided with slots, and having the manipulating-buttons, one passing through a slot of the lock-case and the other passing through a slot of one of the keepers, the series of headed pins secured to the flap, and the lock-fastening proper engaging a catch of said strap, substantially as set forth.

408,039.

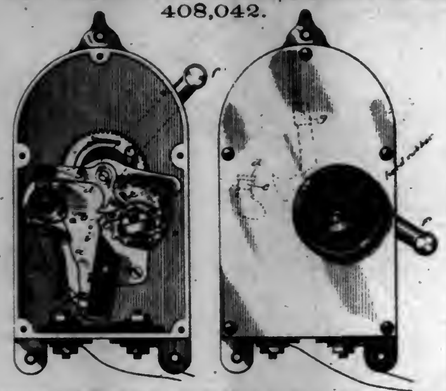
408,040. CAST-OFF DEVICE FOR HOPPLES. HENRY D. MCKINNEY, Janesville, Wis. Filed May 1, 1889. Serial No. 309,275. (No model.)

Claim.—1. A cast-off for a hoppling device, consisting of the cross-bar 8, having parallel arms 5, each formed at its extremity with a hook 6, a rock-shaft 4, journaled in the ends of the hooks on the parallel arms, a hook 3, rigidly fixed to each extremity of the rock-shaft, a lever 7, rigid on the rock-shaft and adapted to rest upon the cross-bar of the parallel arms, and a loop 2, for engaging the hooks, substantially as described.

2. In a hoppling device, the combination, with a strap or collar-band, of a rectangular metallic loop attached to one end, a pair of parallel hooked arms carried by a bar connected to the other end, a lever rigid upon said bar, and a post having a head or flange projecting from said bar in the path of the lever, the latter having an eye in its end to receive a cord, substantially as described.

408,041. CALENDAR. LOUIS H. ORR, Springfield, Mass. Filed May 3, 1889. Serial No. 309,515. (No model.)

Claim.—1. An envelope for containing therein calendar-tablets, having an opening in its front through which the face of a tablet is exposed, and provided with a flap for closing the mouth of the envelope, which also constitutes a supporting-leg, whereby the envelope may be maintained in an upright position, said flap having the folded end portions, substantially as described.



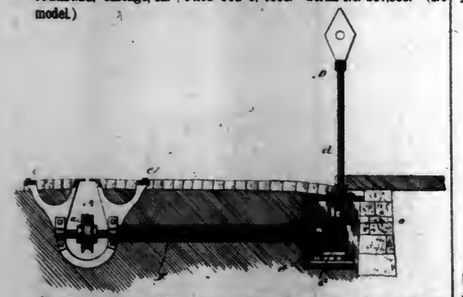
2. An envelope for containing therein calendar-tablets, having an opening in its front and provided with a flap for closing its mouth, and constituting a supporting-leg, said flap having an incision *m* therein, whereby a suspension-ear is formed, substantially as described.

3. An envelope having an opening in its front and provided with a flap for closing its mouth, and constituting a supporting-leg, combined with one or more calendar-tablets inclosed in said envelope and visible through said opening, substantially as described.

408,042. ELECTRIC SIGNAL-BOX. DON A. PALMER, Englewood, assignor of one-half to Bernard R. Sunny, Chicago, Ill. Filed Dec. 12, 1888. Serial No. 293,260. (No model.)

Claim.—1. The combination, in an electric signal-box, of a character-wheel consisting of two portions, each portion being provided with character-teeth, and one portion being fixed and the other removable, whereby on inserting the removable portion the number

408,042.



thereon and the number upon the fixed portion will be transmitted successively on turning in the box, substantially as and for the purpose specified.

2. In an electric signal-box, the combination, with the character device *k*, provided with a guide *l*, of the portable complemental segment *m*, adapted to be inserted upon said guide to act in conjunction with the portion *k*, said character device and complemental segment being each provided with character-teeth, and when united forming a disk, substantially as and for the purpose specified.

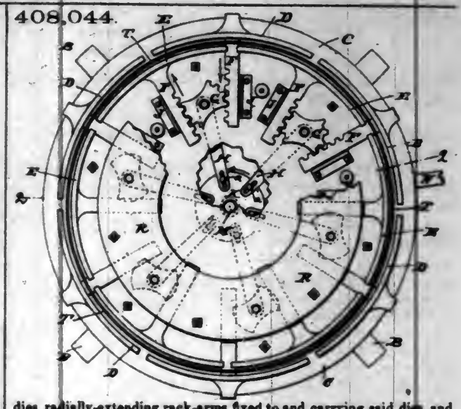
3. The character device *k*, insulated from its shaft, in combination with the complemental segment *m*, adapted to be temporarily joined to the segment *k*, whereby the character devices are insulated from the circuit and from the box, substantially as and for the purpose specified.

4. An electric signal-box provided with an insulated permanent character-segment *k* and a removable segment *m*, in combination with a bushing provided about the opening in the case of the box in front of said segments, substantially as shown and described.

408,043. AUTOMATIC SIGNAL FOR CABLE RAILWAYS. ADOLPH PFERDNER, Chicago, Ill. Filed Oct. 5, 1888. Serial No. 287,353. (No model.)

Claim.—1. In a cable-railway system, the combination, with the cable-pulley for one of two adjacent cables, of a rotary signal and a power-transmitting mechanism serving to operate the signal from said pulley, substantially as set forth.

2. In a cable-railway system, the combination, with the cable-pulley for one of two adjacent cables, of the rotary signal-rod gear connected with a rotary shaft which carries the cable-pulley, substantially as set forth.



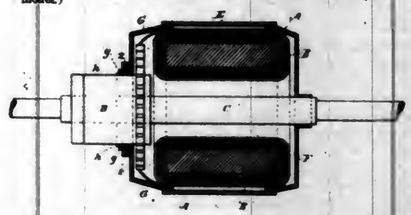
3. In a cable-railway system, the combination, with a cable-pulley for the purpose hereinbefore set forth, of a rotary-signal support, a power-transmitting connection by which said rotary-signal support is operated from the cable-pulley, and a brake applied to check the action of the signal device when the cable is lifted from the pulley, for the purpose described.

408,044. TIRE-TRUING MACHINE. THOMAS J. REID, Gananoque, Ontario, Canada. Filed Apr. 17, 1889. Serial No. 307,581. (No model.)

Claim.—1. In a tire-truing machine, the combination, with a circular series of segmental dies, of a like series of similar dies arranged concentrically and in the same plane therewith, with means—such as racks, pinions, and connections—for radially reciprocating each series of dies in opposite directions, in the manner and for the purpose described.

2. In a tire-truing machine, the combination, with a circular series of segmental dies, of a similar series of concentrically-arranged

408,044.



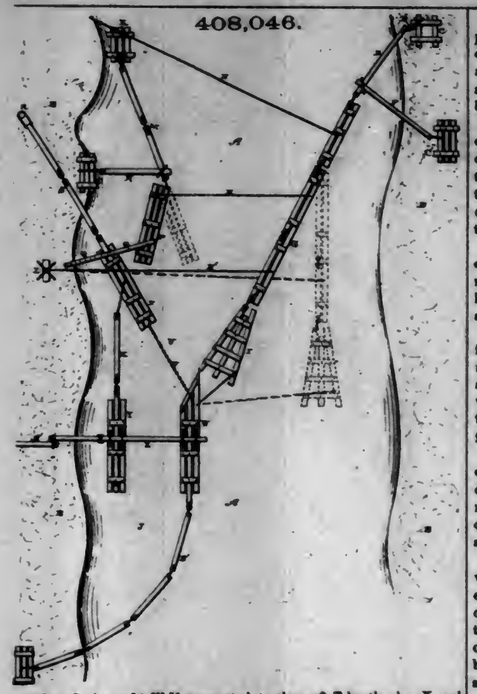
dies, radially-extending rack-arms fixed to and carrying said dies, and means—such as pinions, central disk, and connections—for simultaneously reciprocating the arms of each set in opposite directions, in the manner and for the purpose described.

3. In a tire-truing machine, the combination, with a circular series of segmental dies, of a similar series of concentrically-arranged dies, centrally-extending arms or racks fixed to and carrying said dies, racks of each series alternating with each other, pinions engaging each pair of alternating racks, and means—such as the disk K and rotating devices—for operating the pinions, in the manner and for the purpose described.

4. In a tire-truing machine, the combination, with a circular series of segmental dies, of a similar series of concentrically-arranged dies, centrally-extending racks fixed to and carrying said dies, racks of each series alternating with each other, pinions engaging each pair of alternating racks, levers operating said pinions having their inner ends slotted and fixed to a centrally-revolving disk, and means for revolving said disk, in the manner and for the purpose described.

408,045. PROTECTING-CASE FOR ARMATURES. ANDREW L. RICE, New York, N. Y. Filed Apr. 24, 1889. Serial No. 308,341. (No model.)

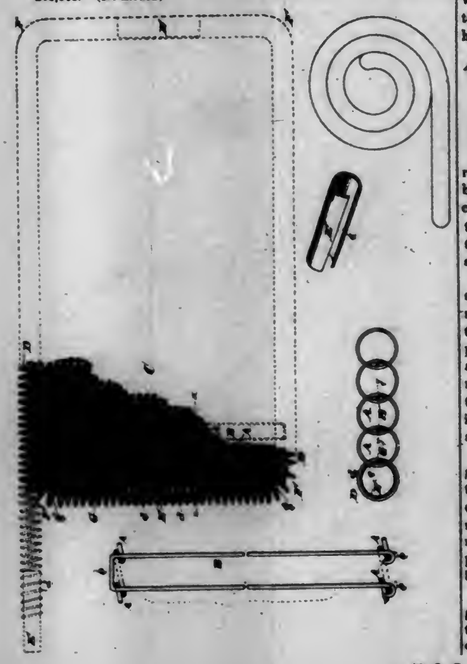
Claim.—1. A dynamo or motor having its armature protected by a hermetically-closed metallic case fitting closely around the armature, substantially as described.



2. A dynamo or motor having its armature protected by a casing consisting of a thin metallic tube fitting closely around the armature, and caps or cups at each end, that on the side of the commutator being insulated therefrom, substantially as described.

408,046. LOG-BOOM. WILLIAM H. ROAN, Williamsburg, Ky. Filed Dec. 6, 1887. Renewed May 3, 1889. Serial No. 309,545. (No model.)

Claim.—1. The combination, with the rafts W Y, which form the mouth of the boom and which are connected together by the cross-piece or log Z, which extends across their tops at an angle, and which is connected at its inner end to suitable fastenings connected to the shore, the log X and chain V, which are connected to the upper ends of the rafts W Y and to the raft T, and the sheer G, which is made jointed near its upper end and which is adapted to be moved laterally, a chain or rope H', connected to the sheer, and the windlass, whereby the sheer can be moved laterally, substantially as shown.



2. The combination of the sheer G, loosely connected at its upper end to the log E, which is suitably fastened and braced to suitable fastenings on shore, and which is jointed so that it can be adjusted laterally, the ropes or chains H H', for holding the sheer in position, the raft K, the logs M, extending therefrom and braced in position in the stream, the raft P, fastened to the lower end of the logs M, the brace Q, fastened to the rafts P T, the raft T, anchored by suitable con-

408,046.

nections S, the rafts W Y, connected to the raft T by the log X and chain V, the cross-piece Z, which extends across the tops of the rafts W Y, and the logs B', fastened to the raft W at one end and to the shore at the other, substantially as described.

408,047. WIRE MAT. SEYMOUR ROGERS, Beaver Falls, Pa., assignor to H. W. Hartman, same place. Filed July 5, 1888. Serial No. 279,063. (No model.)

Claim.—1. In a wire mat, a body part composed of a series of parallel coils united by hinge-rods, in combination with a bounding-coil made in one or more parts extending entirely around the mat and arranged transversely to the body-coils on two sides of the mat, and in which the hinge-rods are interlooped with the ends of such body-coils and bounding-coils, substantially as set forth.

2. In a wire mat, a body part formed of a series of parallel coils connected together, in combination with a bounding-coil made in one or more parts and arranged transversely to the body-coils and along their ends, and wire rods extending through the body-coils and entirely across the body of the mat and connecting the bounding-coils on diametrically-opposite sides of the mat to the body-coils, substantially as set forth.

3. In a wire mat, the body portion formed of a series of parallel coils of wire, combined with a series of staple-shaped hinge-rods connecting the adjacent coils together, and in which said staple-shaped hinge-rods are inserted from opposite sides of the mat, substantially as set forth.

4. In a wire mat, the flexible body part composed of wire coils, in combination with a bounding-coil made in one or more parts surrounding the edges of the body part and arranged partly parallel to and partly transverse with respect to the body-coils, and a hinge-wire located at the end of the mat for uniting the parallel portions of the bounding-coil to the end coil of the body part, substantially as set forth.

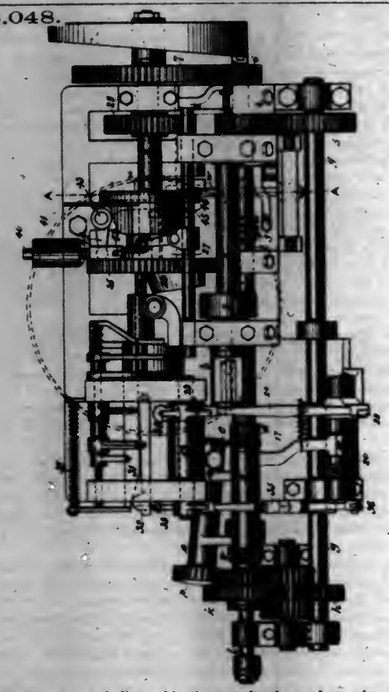
5. In a wire mat, the body part formed of a series of parallel coils, combined with staple-shaped hinge-rods connecting the parallel coils, and a flexible bounding-coil made in one or more parts and arranged transversely to the body-coils, interwoven both with the ends of the said body-coils and looped ends of the staple-shaped hinge-rods, substantially as set forth.

6. In a wire mat, a body part formed of wire-work, combined with bounding-coils D, extending along two diametrically-opposite edges of the body part and bent around the corners toward each other and made to meet, or substantially meet, on the other edge of the body part, a splice tube or piece E, arranged partly within each of the ends of the bounding-coils, and a connection between the said bounding-coils on each side of the splice-tube and the body part, substantially as set forth.

7. In a wire mat, the body part formed of parallel coils of wire united by hinge-rods, in combination with bounding-coils D, interlaced with the ends of the body-coils, and having their end portions parallel to the ends of the body part and secured thereto by connecting-rod or hinge-wire G, substantially as set forth.

8. In a wire mat, the body part formed of parallel coils of wire united by hinge-rods, in combination with bounding-coils D, interlaced with the ends of the body-coils, and having their end portions parallel to the ends of the body part and secured thereto by connecting-rod or hinge-wire G and united by a splice-tube E, substantially as set forth.

408,048. MACHINE FOR ROLLING THE THREADS ON SCREWS. JOHN SHELDON, Birmingham, County of Warwick, England. Filed Dec. 26, 1888. Serial No. 294,717. (No model.) Patented in England Mar. 1, 1888, No. 3,156; in France Dec. 3, 1888, No. 194,535, and in Belgium Dec. 3, 1888, No. 84,161.



Claim.—1. In a screw-cutting machine, the combination, with a rotary gripping spindle and jaws for holding and rotating the screw-blank, of a pressing-disk having an annular sharp edge rotating in contact with the rotating screw-blank and moving in a line parallel to the axis of the rotating blank, so that the disk in its travel along the blank displaces portions thereof to constitute a screw-thread, substantially as described.

2. In a screw-cutting machine, the combination, with a gripping spindle and jaws rotating but immovable lengthwise for holding and rotating the screw-blank, of the disk-carrying spindles, inclined relatively to each other and arranged at opposite sides of the blank, the pressing-disks mounted, respectively, on the spindles, and each having a sharp annular edge rotating in contact with the rotating blank, and means, substantially as described, for slowly moving the disks and their shafts parallel to the axis of the rotating blank, so that the disks in their travel along the blank displace portions thereof to constitute a screw-thread, substantially as described.

3. In a screw-cutting machine, the combination, with a rotating gripping spindle and jaws for holding and rotating a screw-blank, of the disk-carrying spindles mounted in sleeves inclined relatively to each other at opposite sides of the blank, the pressing-disks mounted, respectively, on the spindles, and means for closing the disks upon the rotating blank, causing the disks, spindles, and sleeves to slowly move parallel to the axis of the blank, and opening the disks to release the blank when the thread is finished, substantially as described.

4. In a screw-cutting machine, the combination, with a rotating gripping spindle and jaws for holding and rotating a screw-blank, of the disk-carrying spindles mounted in sleeves inclined relatively to each other at opposite sides of the blank, the pressing-disks mounted,

408,048.

respectively, on the spindles and having annular sharp edges, a lengthwise-movable shaft carrying the sleeves, means for moving said shaft back and forth for causing the disks to travel in a line parallel to the axis of the rotating blank, and means for closing the disks on the blank and opening them when the screw-thread is finished, substantially as described.

5. In a screw-cutting machine, the combination, with a rotating gripping spindle and jaws for holding and rotating a screw-blank, of a pair of disk-carrying spindles located at opposite sides of the blank and inclined relatively to each other, the thread-forming disks having annular sharp edges and mounted, respectively, on the spindles, mechanism for moving the spindles and disks parallel to the axis of the rotating blank, and means for closing the disks on the blank and imparting additional pressure to the disks on approaching the point end of the blank, substantially as described.

6. In a screw-cutting machine, the combination, with a gripping spindle and jaws for holding and rotating a screw-blank, of a pair of disks having annular sharp edges rotating in contact with the rotating blank and moving in a line parallel to the axis of the blank, and means, substantially as described, for increasing the pressure of the disks on the blank as they approach the point end of the latter, substantially as described.

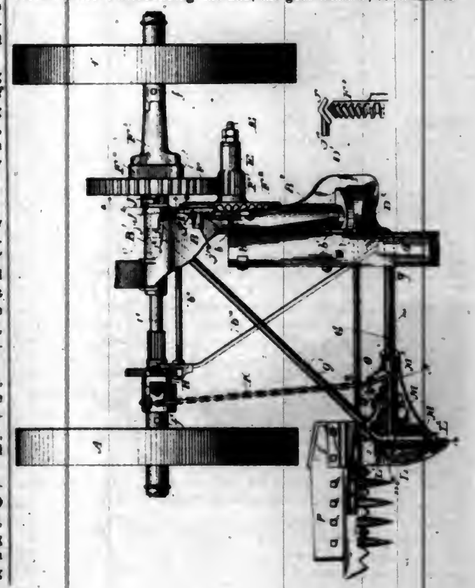
408,049. REVERSING BELT-GEAR. HAMILTON E. SMITH, New York, N. Y. Filed Sept. 20, 1887. Serial No. 251,069. (No model.)

Claim.—1. The combination of the main shaft, a speed-wheel P' thereon, the shaft K, having thereon the loosely-mounted speed-wheel P and cam J, the belt *p*, connecting the speed-wheel on the main shaft with the speed-wheel on the shaft K, and the clutch R, movable on the shaft K and adapted to engage with the hub of the speed-wheel P, whereby the shaft K and the cam J thereon are caused to revolve, substantially as described.

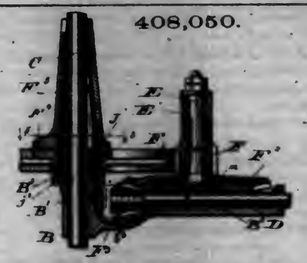
2. The combination of the main shaft, the speed-wheel P' thereon, the shaft K, having cam J and loosely-mounted speed-wheel P, the clutch R, movable on shaft K, gear *s*, meshing with the gear S on spindle *t*, gear *s'*, on the other end of said spindle, gearing with gear S', attached to the cam, whereby a slow motion is transmitted to said cam, substantially as described.

3. The combination of the main shaft A, provided with fast pulley I and speed-wheel P', the counter-shaft B, having loose pulleys D F and intermediate fast pulley E, the open belt G and crossed belt H, for alternately connecting the fast pulleys E and I, the shaft K, having mounted thereon a cam J, gears S' *s*, loose speed-wheel P, and clutch R, the belt *p*, connecting the speed-wheels P P', the spindle *t*, having

408,049.



gears S *s'*, and the slides *n* and *o*, engaged with the cam J and with the belts G and H, respectively, substantially as described.



408,050. MOWING-MACHINE. JOHN F. STEWARD, Chicago, Ill. Filed Sept. 25, 1888. Serial No. 286,243. (No model.)

Claim.—1. In a mowing-machine, the axle, and the main frame mounted on the axle and provided with the eccentric hub surrounding the axle, in combination with the eccentric sleeve mounted to revolve on the hub, and the gear-wheel mounted to revolve on the eccentric, the eccentricity of the hub and the sleeve being approximately equal, whereby the rotation of the sleeve may be caused to adjust the gear-wheel concentric with the axle or eccentric thereto, as required.

2. In a mower, the frame having the hub B^3, and the axle passing eccentrically therethrough, in combination with the revoluble eccentric sleeve surrounding the hub, the gear-wheel F, revoluble on

408,050.

the sleeve, the pinion mounted on a fixed journal and engaging the gear-wheel, and a driving-connection between the wheel F and the axle.

3. The frame having the eccentric hub and shoulders j^3, in combination with the eccentric gear-sustaining sleeve mounted on the hub, and the lever pivoted to the sleeve and provided with lips j^3, substantially as shown, whereby the lever is adapted to turn the sleeve and lock the same.

4. In combination with the frame having shoulders j^3 and a cavity to receive the lever-stud, the rotary gear-sustaining sleeve mounted on the frame, the lever pivoted on the sleeve and provided with lips j^3 and stud j^3, and the spring j^3, acting to urge the stud into the cavity in the frame.

5. In combination with the rotary axle, the gear-wheel F, encircling the same, the intermediate eccentric sleeve to sustain and shift the gear, and the coupling-sleeve F^5, engaged loosely at one end with the gear-wheel and at the other end with the axle-collar *f*.

6. The frame having the hub B^3, the axle passed eccentrically through the hub, the eccentric sleeve surrounding the hub, the gear-wheel mounted on the sleeve and provided with the angular cavity in its side, the toothed collar *f*, secured to the axle, and the conical sleeve F^5, mounted on the axle with one end toothed to engage the collar *f* and the other enlarged to fit the cavity in wheel F, said elements constructed and combined substantially as described.

7. In a mowing-machine, the coupling-frame having the transverse hinge-bar *g* and thrust-bar *g'*, in combination with the hinge-piece having the sleeve to encircle the hinge-bar, and the rigid stud m^3, to engage the thrust-bar, said parts constructed, as shown, with a space between the sleeve and stud to admit of the hinge-piece being carried endwise to its place and then secured by a rotary motion.

8. In a mower, the combination of the coupling-frame comprising the arms *g* and *g'*, the hinge-piece M, journaled on the bar *g*, the main shoe connected to the hinge-piece by the fore-and-aft axis, and the gag-lever pivoted to the hinge-piece and adapted to be operated by contact with the coupling-frame as the latter is rocked upon the arm *g*.

9. In a mower, the coupling-frame having arms *g* and *g'*, in combination with the hinge-piece M, journaled on the arm *g* and provided with the tilting arm O, the lifting-chain connected to said arm, the lifting-lever connected to the chain, the main shoe pivoted to the hinge-piece M, and the gag-lever pivoted to the hinge-piece and arranged to act at one end against the shoe and at the opposite end against the arm *g'*, whereby the operation of the lifting-lever is caused first to effect the rocking motion of the shoe and finger-bar and thereafter the action of the gag-lever and the lifting of the cutting devices.

10. In a mower, and in combination with a hinge piece or support, the main shoe connected thereto by a horizontal pivot, the gag-lever mounted on the hinge-piece and arranged to act against the shoe, and a locking device, substantially as shown, adapted to fasten the gag-lever against the shoe at will, whereby the outer end of the finger-bar may be prevented from falling in relation to the shoe and hinge-piece.

11. In combination with the coupling-frame, the hinge-piece mounted thereon, the main shoe pivoted to the hinge-piece and provided with shoulder P, and the gag-lever pivoted to the hinge-piece adapted to engage said shoulder at one end and to engage the coupling-frame at the opposite end, whereby the gag-lever is caused to automatically lock the finger-bar in an upright position.

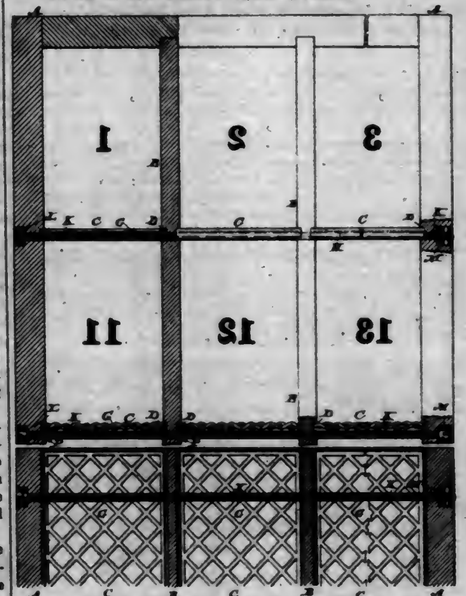
408,051. INCANDESCENT GAS-BURNER. JOHN L. STEWART, Philadelphia, Pa., assignor, by mesne assignments, to the Welsbach Incandescent Gas Light Company, Gloucester, N. J. Filed Dec. 27, 1887. Serial No. 258,026. (No model.)

Claim.—1. In an incandescent gas-burner, the combination of a burner-head having a number of fine perforations or gas-exits and provided with means for supporting a series of incandescent cylinders, a perforated crown-piece or cross-head supported above said burner-

408,051.

head, and a series of incandescing-cylinders supported by said crown-piece and burner-head, substantially as described.

2. In an incandescent gas-burner, the combination of a burner-head having a number of fine perforations or gas-exits *c'* and a series of projecting points b^m, a perforated crown-piece or cross-head supported above said burner-head, and a series of incandescing-tubes supported by said crown-piece and burner-head, substantially as described.



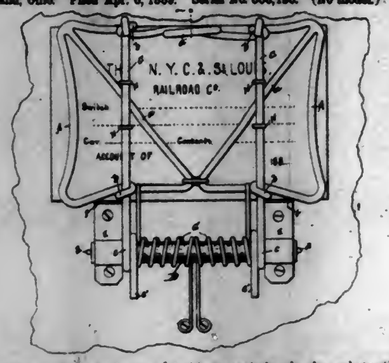
408,052. FINGER-NAIL GUARD OR PROTECTOR. JOHN J. STOLL, Brooklyn, N. Y. Filed Mar. 7, 1889. Serial No. 302,288. (No model.)

Claim.—1. A finger-nail protector consisting of the body A, having an attaching-strap and buckle and having its edge G shaped to correspond to the edge of the finger-nail, substantially as described.

2. A finger-nail protector consisting of the body A, having an attaching-strap and buckle and having its edge G shaped to correspond to the edge of the finger-nail, the attaching-strap being extended forward in front of the swell of the finger-joint to prevent the guard being pressed backward, substantially as described.

408,053. PIGEON-HOLE. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Jan. 12, 1889. Serial No. 296,179. (No model.)

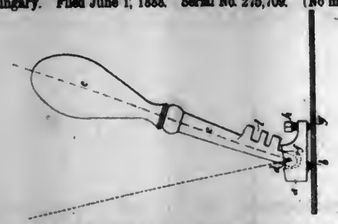
Claim.—1. A nest of pigeon-holes, with open-work partitions secured to the partitions that cross them by means of a rod or rods which pass through the pigeon-holes and engage with two or more of the open-work partitions to retain them in place, and which tend to hold them firmly together, substantially as set forth.



2. A nest of pigeon-holes provided with open-work partitions which are held or stayed in place by fastenings engaging with their under sides, so that the upper surface of said partitions is left flush and unobstructed, substantially as set forth.

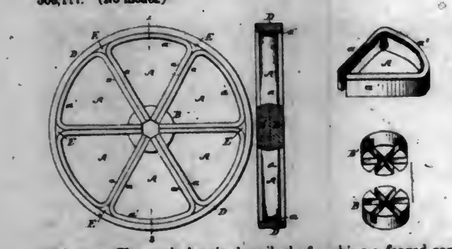
3. A nest of pigeon-holes provided with open-work partitions which are loosely held in proper relation to partitions that cross them by grooves or projections, and secured against removal by fastenings

engaging with two or more open-work partitions, substantially as set forth.



4. A nest of pigeon-holes, with partitions supporting their cross-partitions, which latter are loosely slid into place, and the whole nest held together by stiffening-rods, substantially as set forth.

408,054. CARD-HOLDER FOR CARS. WILLIAM H. THURBER, Cleveland, Ohio. Filed Apr. 6, 1889. Serial No. 306,186. (No model.)

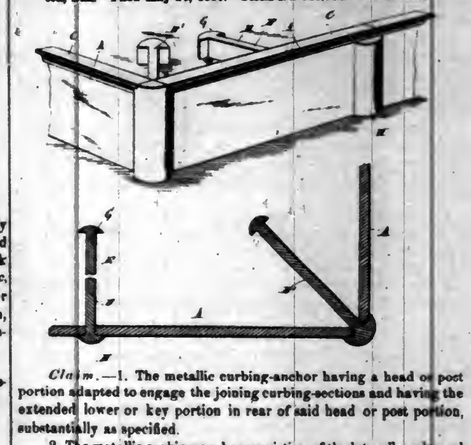


Claim.—A card clamp or holder consisting in the substantially rectangular frame A, having diagonal bars *a* and loops *b*, all formed in a single piece, in combination with rods C, extending over the back of frame A and rigidly fastened in loops *b* and provided with loops *c*, spindle D, on which the loops *c* are free to turn, forming a hinge for the frame, a spring, as G, to hold the frame A in working position, and teeth, as H, on the rods C, all constructed and arranged substantially as set forth.

408,055. GLAZIER'S DIAMOND. JOHANN URBANEK, Vienna, Austria-Hungary. Filed June 1, 1888. Serial No. 275,709. (No model.)

Claim.—A glazier's diamond consisting of a recessed head or block, a handle pivoted within said recess, and two diamonds or cutting-points, one of which is stationary and eccentrically disposed with reference to the pivot of the handle, while the other is adjustably secured to the block, substantially as described.

408,056. METHOD OF MAKING WROUGHT-IRON CAR-WHEELS. SAMUEL M. VAUCLAIN, Philadelphia, Pa. Filed Apr. 22, 1889. Serial No. 308,117. (No model.)

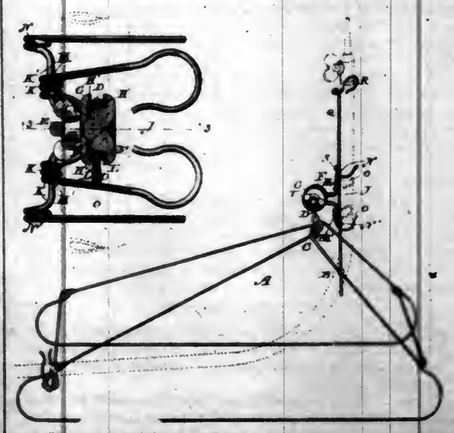


Claim.—1. The mode herein described of making a forged car-wheel, said mode consisting in first forming an outer rim-section, hub-sections, and spoke-sections, confining the inner ends of the spoke-sections by the hub-sections and the outer ends of the spoke-sections by the outer rim, heating the composite structure to a welding heat, and finally subjecting it to the action of dies, whereby it is welded into a solid mass, substantially as specified.

2. The mode herein described of making a forged car-wheel, said mode consisting in bending a series of bars so that each forms a spoke-section comprising a rim portion and spoke portions, confining the inner ends of the spoke portions by suitable hub-sections, confining the spoke-sections by an outer rim, filling the openings between the outer ends of the spoke-sections and the outer rim, and then heating the structure so formed to a welding heat and subjecting it to the action of dies, whereby its parts are welded into a solid mass, substantially as specified.

3. The mode herein described of making a forged driving-wheel, said mode consisting in bending a bar to circular form for the rim of the wheel, bending other bars to form rim portions and radiating spoke portions, forging opposite hub and crank sections and balance-weight sections, fitting the various parts together, and heating the composite structure, and then subjecting it to the action of dies, whereby the parts are welded together, substantially as set forth.

408,057. METALLIC CURBING-SECTION. HIRAM W. WHITE, Yankton, Dak. Filed May 20, 1889. Serial No. 311,381. (No model.)



Claim.—1. The metallic curbing-anchor having a head or post portion adapted to engage the joining curbing-sections and having the extended lower or key portion in rear of said head or post portion, substantially as specified.

2. The metallic curbing-anchor consisting of the laterally-enlarged head or post having the reversely-beveled shoulder in rear below its upper edge, and the rearwardly-extending key portion extending from its lower portion and terminating in an enlargement or foot at its inner end, substantially as specified.

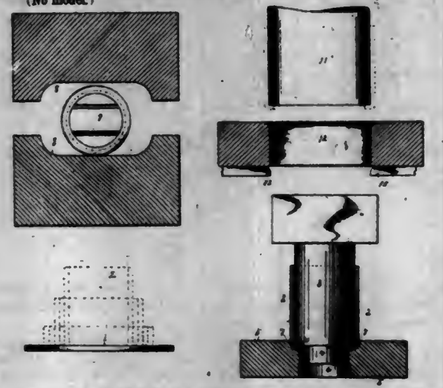
3. The combination, with metallic curbing-sections rabbeted at their ends and having acute-angled shoulders, of the anchors, their reversely-beveled shoulders, and rearwardly-extending key portion, substantially as specified.

4. The combination, with metallic curbing-sections, of the anchor-posts having rearwardly-extending key portions and adapted to engage and hold said curbing-sections in position, substantially as specified.

408,058. HOSE-HOLDER. WARREN C. WILLITS, Denver, Colo. Filed Mar. 23, 1889. Serial No. 304,421. (No model.)

Claim.—1. The combination, with a hose-supporter, of a hose clamp formed with two pieces of wire pivoted together, and mechanism for adjustably holding the jaws of said clamp in fixed relative position, substantially as set forth.

2. The combination, with a sled formed of a single piece of wire, of a hose-clamp formed of two pieces of wire pivoted together, and mechanism for adjustably securing the jaws of said clamp in fixed relative positions, substantially as set forth.



3. The combination of a sled formed of a single piece of wire and having at one end a loop D, with a wire hose-clamp provided with loops L L', the bolt E, cap H, and thumb-screw I, for attaching the hose-clamp to the sled, substantially as described.

4. The combination of a wire sled, a loop in one brace thereof, a wire hose-clamp pivotally secured to the sled, and loops N N' in the hose-clamp, with a separate removable standard Q, substantially as described.

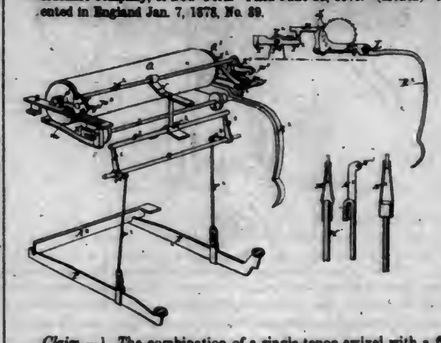
5. The combination, with a hose-clamp composed of two parts, each of which is looped at one end, of a headed bolt and cap, said bolt passing through said loops, annular grooves and notches in the head of the bolt and cap, and a thumb-screw adapted to screw upon the bolt and bind the parts together, substantially as described.

6. In a hose-clamp, the combination of two pieces of wire pivotally joined together by twisting one around the other and extending outwardly to form jaws, and mechanism for holding said jaws in fixed relative positions, substantially as set forth.

408,059. METHOD OF MAKING FLATTENED TUBES. SAMUEL R. WILMOT, Bridgeport, Conn., assignor to the Wilmot & Hobbs Manufacturing Company, same place. Filed Jan. 28, 1889. Serial No. 297,756. (No model.)

Claim.—The method of forming flattened tubes, which consists in drawing a round tube from a disk of metal in the usual manner, then punching the bottom from said tube, leaving an inwardly-turned flange, then flattening said rounded tube to substantially the shape required, and finally placing the flattened tube upon a correspondingly-flattened punch, the end of said punch resting against said flange, and then forcing said tube through a correspondingly-shaped drawing-die, substantially as described.

408,060. WATER-TUBE BOILER. JOHN WOOD, Jr., Conshohocken, Pa. Filed Mar. 12, 1889. Serial No. 302,961. (No model.)



Claim.—1. The combination, in the water-section of a steam-boiler, of the cylinders having convex heads provided with man-holes, the tube-sheet having holes drilled therein in staggered form, the tubes connecting said cylinders having their ends expanded in said holes, and brace-rods extending through the inner surfaces of said tubes and connected to said heads, substantially as described.

2. The combination, in a steam-boiler, of the steam-drum, the cylinders having convex outer heads formed with man-holes in their centers, cover-plates for said man-holes, means for securing said plates to said convex heads, the inner tube-sheets having holes arranged in staggered series therein, tubular necks connecting said drum and cylinders, and a series of tubes having their ends expanded in said holes, substantially as described.

3. The combination, with a steam-drum having a convex head provided with a man-hole, a removable cover-plate therefor, and means for securing said plate to said head, of a steam-boiler proper consisting of the barrel, the convex heads having man-holes formed in the centers thereof, the removable plates for said man-holes, means for securing said plates to said heads, the tube-sheets forming the inner heads of said barrel and having holes arranged therein in staggered series, the tubes having their ends expanded in said holes and connecting said sheets, the stay-rods having crow-feet extending through a suitable number of said tubes and rigidly secured to the inner sides of said convex heads, and necks connecting said steam drum and boiler, substantially as described.

408,061. TYPE-WRITING MACHINE. GEORGE W. N. YOST, New York, N. Y., assignor, by mesne assignments, to the American Writing Machine Company, of New York. Filed June 28, 1879. (Model.) Patented in England Jan. 7, 1878, No. 89.

Claim.—1. The combination of a single-tenon swivel with a flat-strap connection-holder F^4, key-lever embraced by said strap, connecting-rod, and type-bar of a type-writing machine, substantially as and for the purpose set forth.

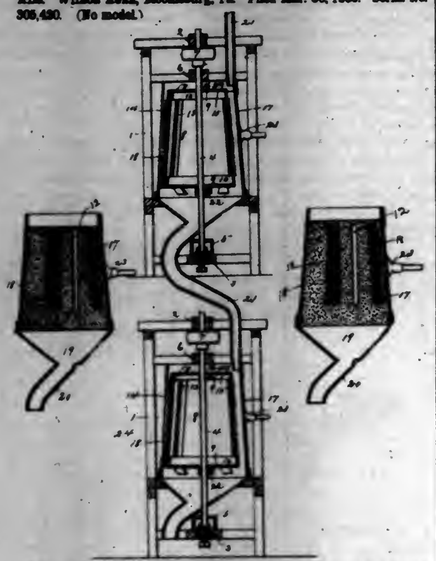
2. The combination of the type-bar of a type-writing machine, its journal D^4, secured thereto, with a connecting-rod H, and its spring-fork H^2, having bearings to receive and clasp said journal, substantially as and for the purpose described.

3. The combination, with the carriage and line-spacing apparatus of a type-writing machine, of a lever or handle extending in front of said machine and down toward the key-board, substantially as and for the purposes described.

4. The combination of two extra key-levers and connecting-rods with the platen transverse reciprocating apparatus of a type-writing machine and a series of key-levers for operating the type-bars located between said extra key-levers, substantially as and for the purpose described.

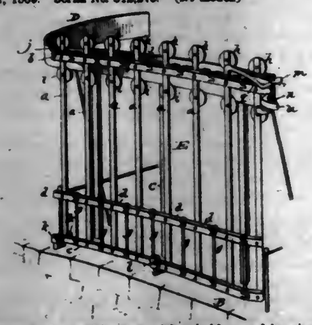
5. The combination of a trip-ratchet which has an elongated curved finger which surrounds the ratchet-bar hinge-hub with the ratchet-bar trip-pin of a type-writing machine, substantially as and for the purpose described.

6. The combination of the main spring of a type-writing machine, its shaft, and a shield loose on said shaft to prevent undue friction against said spring, as described.



408,062. TOY GUN. THOMAS ADAMS, Highland, N. Y. Filed Mar. 6, 1889. Serial No. 302,062. (No model.)

Claim.—A toy gun consisting of the barrel having the yoke pivoted to the end thereof, the stock having the spring-hammer secured thereto, the piston arranged in the barrel and adapted to be engaged by the spring-hammer, and the trigger pivoted in the stock and bearing against the spring-hammer, the action of the trigger releasing the



hammer from engagement with the piston, substantially as and for the purpose described.

408,063. METHOD OF SCOURING AND DECORTICATING CEREALS. WILSON AGER, Bloomsburg, Pa. Filed Mar. 30, 1889. Serial No. 305,430. (No model.)

Claim.—The art, method, or process herein set forth for cleaning and decorticating wheat and other cereals, consisting in first subjecting the grain to the action of a decorticator having an abrading-surface of Derbyshire stone, and then to a similar process in a mill having a facing of Seneca stone or Medina brown-stone of the character specified, substantially as described.

408,064. BRIDGE-GUARD. JAMES AYERS, Keokuk, Iowa. Filed May 27, 1889. Serial No. 312,273. (No model.)

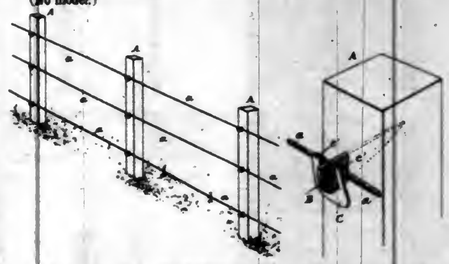
Claim.—1. In combination with a bridge and its abutment, an elevated track or rail located upon the abutment, a flexible guard suspended from the track, and a locking device carried by the guard and adapted to engage the rail, all substantially as shown.

2. In combination with a bridge and its abutment, a track or rail secured in position upon the latter, a flexible gate or guard mounted upon the track and provided with a hook or projection, as *u*, and a hook or projection, as *t*, carried by the bridge, said parts being arranged in such manner that when the guard has reached the limit of its movement its hook or projection will be in such position as to permit the ready disengagement of the projection on the bridge.

3. In combination with a bridge and its abutment, curved as shown, a track or rail curved correspondingly and provided with a straight portion, and a flexible guard mounted thereon and provided with a hook or projection to be engaged by a projection upon the bridge.

4. In combination with a bridge and its abutment, a flexible guard or gate provided at one end with a projection, as *u*, and hooks or projections *s* and *t*, secured to the bridge, one of said projections *t* being adapted to engage the guard's lug *u* when the bridge is being opened, and the other lug *s* serving to return the guard to its position.

5. In combination with the abutment and the track or rail thereon, a flexible guard or gate mounted upon the track, an automatic locking-dog, a bridge provided with an upright, an inclined arm *g* carried by the upright, and projections *s t*, also carried by the upright to engage the guard.



6. In combination with the abutment, the track or rail D thereon, flexible guard or gate E, provided with wheels *h* to run on the track, a guide-roller to steady the lower edge of the guard or gate, and a bridge adapted and arranged to actuate the guard.

7. A flexible guard composed of a series of hinged sections F, comprising upright rod or bar *a*, upper, lower, and intermediate cross-bars *b*, *c*, and *d*, perforated at their ends, as shown, and bolts or pins pivotally connecting the cross-bars of adjacent sections.

8. A flexible guard or gate for bridges and the like, comprising a series of connected sections F, each section being composed of an upright rod *a*, wheels *h* and *i*, to run on the upper and lower edges of the track to which the guard is applied, and a friction wheel or wheels *j*.

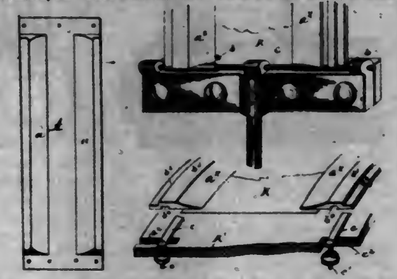
9. A flexible guard for bridges, &c., comprising a series of sections having upright *a* and cross-bars *b c d*, a pin connecting the cross-bars *b* of adjacent sections, a pin connecting the cross-bars *c d* of adjacent sections, and a supporting-wheel at the upper end of one of the sections.

408,065. WIRE-FASTENER. BENJAMIN T. BARRET and RICHARD RUMSICK, Henderson, Ky. Filed Apr. 20, 1889. Serial No. 307,935. (No model.)

Claim.—1. In a wire-fastener for wire fences, &c., the combination of steel nail B, having wire-supporting groove *b*, and U-shaped clamp C, having hooks *c'*, substantially as set forth.

2. In a wire-fastener for wire fences, &c., the combination of post A, steel triangular-shaped nail B, having upper groove *b* and lower series of grooves *b'*, with U-shaped clamp C, having groove *c* and hooks *c'*, all substantially as and for the purpose set forth.

408,066. ROOFING OR SHEATHING. JOHN W. BEAUMONT, Birmingham, Ala. Filed Feb. 16, 1889. Serial No. 300,156. (No model.)

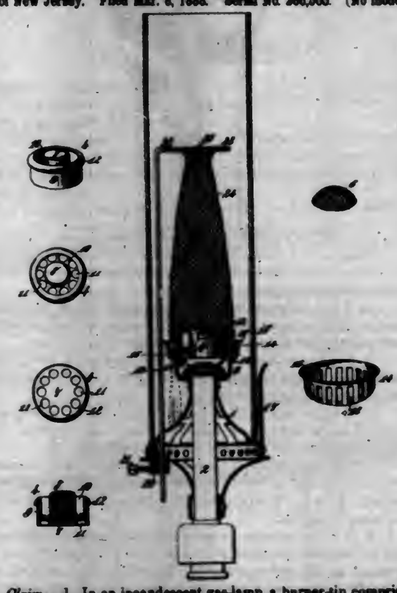


Claim.—1. A roofing or sheathing composed of similar strips laid edge to edge and connected by a tongue and groove intermediate of and at a distance from the two faces of the strip, each strip being provided with a concealed channel cut at the angle between the tongue and the edge from which it projects, substantially as described.

2. A roofing or sheathing composed of similar strips, each having a tongue projecting from one edge with an upward inclination, and a groove formed in the other edge, having a corresponding downward inclination, said tongue and groove being intermediate of and at a distance from the two faces of the strips, a concealed channel or gutter being formed in the strip at the angle between the inclining upper surface of the tongue and the edge from which it projects, substantially as described.

3. The combination, with a strip of roofing or sheathing having a tongue or tenon projecting with an upward inclination from one edge and provided with a channel formed at the angle between the upper surface of the tongue and the edge of the strip, of a similar strip provided with a groove or mortise having a suitable inclination to receive said tenon and provided with a channel formed at the lower angle of the mortise or groove, substantially as described.

408,067. APRON FOR CIGAR-MACHINES. JOHN J. BUCKER, Scranton, Pa. Filed June 24, 1887. Serial No. 242,433. (No model.)



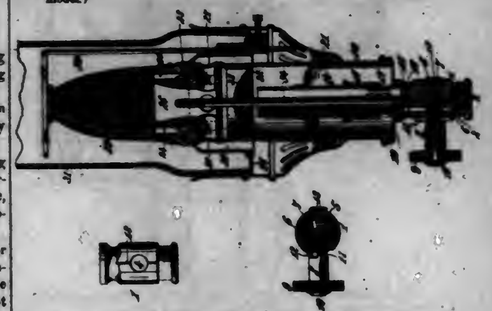
Claim.—1. The apron or belt for cigar-bunching machines, having upon its upper surface one or more removable or separable tapering ribs traversing its length, substantially as set forth.

2. The belt or apron for cigar-bunching machines, having upon its upper surface one or more adjustable tapering ribs, substantially as and for the purpose set forth.

3. The combination, with a belt or apron for a cigar-bunching machine, having upon its upper surface one or more longitudinal tapering flexible ribs, of the loop-forming rollers of the bunching-machine, each roller bearing upon a track or depression in the rib or ribs, substantially as and for the purpose set forth.

4. In a cigar-bunching machine, the combination, with one or more ribs having in its under side a groove or channel, of a cleat entering said groove or channel and adjustable along the table of the bunching-machine by means of nutted screws passed through a slot in the table and engaging the cleat or cleats, and an apron, substantially as specified.

408,068. INCANDESCENT GAS-LAMP. HAROLD J. BELL, Woodbury, N. J., assignor to the Wolsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 6, 1888. Serial No. 266,505. (No model.)



Claim.—1. In an incandescent gas-lamp, a burner-tip comprising a central cone, an outer rim or shell, an intervening annular flame-passage, and an annular series of gas-passages that perforate the base of the burner-tip around the central cone and below the annular flame-passage, said gas-passages being extended partly into the outer rim or shell, whereby the flame is deflected toward the center of the burner-tip, substantially as described.

2. In an incandescent gas-lamp, the combination, with a burner-tube, of a gallery supported on said tube, a cup at the upper end of said tube and gallery, and a burner-tip supported in said cup and provided with an annular flame-passage and with an annular series of gas-passages leading into said flame-passage, substantially as described.

3. In an incandescent gas-lamp, the combination, with a burner-tube and a gallery supported thereon, of a cup at the upper end of said gallery, a wire-gauze cone placed in said cup, and a burner-tip supported in said cup above the inclosed wire-gauze cone and provided with an annular flame-passage and with an annular series of gas-passages leading into said flame-passage, substantially as described.

4. In an incandescent gas-lamp, the combination, with an atmospheric gas-burner tube, of a gas and air expansion chamber at the upper end of said tube, a perforated diaphragm located in said chamber, and a burner-tip supported in said chamber above the perforated diaphragm, substantially as described.

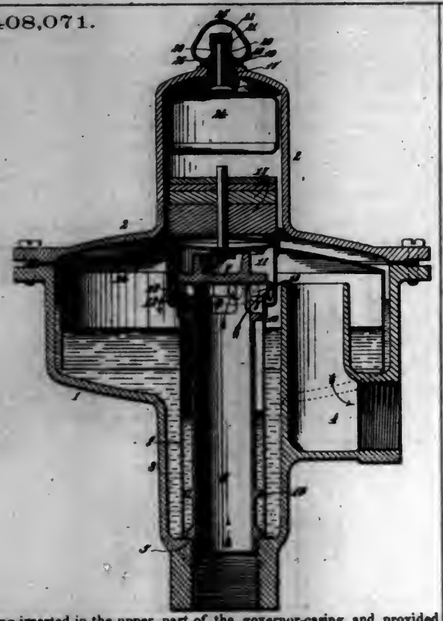
408,069. INCANDESCENT GAS-LAMP. HAROLD J. BELL, Gloucester City, N. J., assignor to the Wolsbach Incandescent Gas Light Company, of New Jersey. Filed Sept. 6, 1888. Serial No. 284,726. (No model.)

Claim.—1. In an incandescent gas-lamp, the combination, with a main gas-passage and an auxiliary or independent gas-passage, of a gas-cock having a turn-plug provided with ports or passages located at an angle with each other, whereby one will be open when the other is closed, and a detachable and adjustable stop-button located at one end of said turn-plug, whereby its rotation can be limited to cut off the gas at a predetermined point, substantially as described.

2. In an incandescent gas-lamp, the combination, with a main gas-passage, an Argand burner, an incandescent device, and a central subsidiary gas-jet, of a gas-cock for controlling the main and subsidiary gas-passages and provided with a turn-plug having an adjustable stop-button, whereby the rotation of the plug in either direction can be limited to cut off the gas at a predetermined point and regulate the lowest point to which the subsidiary gas-jet can be turned after the stop-button has been set, substantially as described.

408,070. SHADE-HOLDER. HAROLD J. BELL, Gloucester City, N. J., assignor to the Wolsbach Incandescent Gas Light Company, of New Jersey. Filed Oct. 2, 1888. Serial No. 286,998. (No model.)

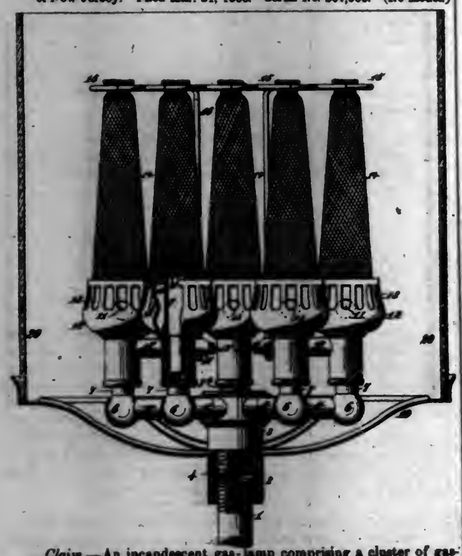
Claim.—1. A reversible shade-holder composed of a continuous piece of zigzagged wire united at its ends and comprising a series of flexible fingers joined by the bends at top and bottom and bowed in radial lines to form a series of shade-supporting ledges, substantially as described.



2. A reversible shade-holder composed of zigzagged wire and comprising a series of flexible duplex and U-shaped fingers bowed between the upper and lower bends of the wire to form a circle of ledges 4, and capable of being turned inside out to project said circle of ledges inward or outward, substantially as described.

408,071. GAS-GOVERNOR. HAROLD J. BELL, Gloucester City, N. J., assignor to the Wolsbach Incandescent Gas Light Company, of New Jersey. Filed Jan. 16, 1889. Serial No. 296,513. (No model.)

Claim.—1. In a gas-governor, the combination, with the governor-casing and a balanced gas-regulating valve inclosed in said casing, of a bushing 18 inserted in an opening in the upper part of the governor-casing, a perforated cap 25, attached to said bushing above the governor-casing, an air-valve 23, having its stem suspended in the bushing, and a float 24, attached to the under side of said valve, substantially as described.

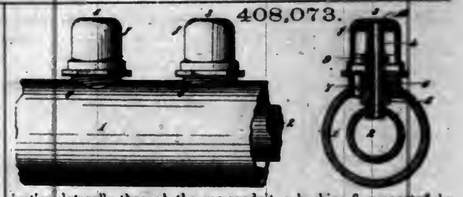


2. In a gas-governor, the combination, with the governor-casing and a balanced gas-regulating valve inclosed in said casing, of a bush-

408,071.

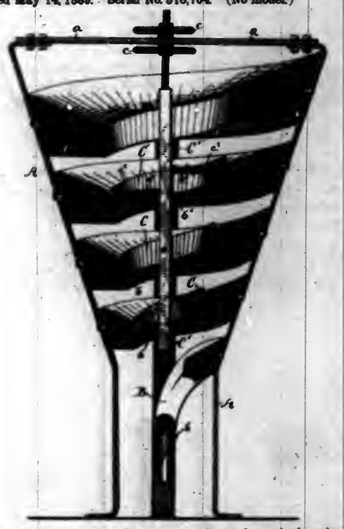
ing inserted in the upper part of the governor-casing and provided with air-openings 19 and 20, an air-valve suspended in said bushing, and a float attached to the under side of said air-valve, substantially as described.

408,072. INCANDESCENT GAS-LAMP. HAROLD J. BELL, Woodbury, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 21, 1888. Serial No. 267,986. (No model.)



Claim.—An incandescent gas-lamp comprising a cluster of gas-burners, one of which is central, while the others are grouped around it, a number of incandescent mantles, each suspended separately above a single gas-burner, and a globe or chimney surrounding the entire cluster of burners and incandescent mantles, substantially as described.

408,073. GAS-HEATING BURNER. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Feb. 3, 1889. Serial No. 299,163. (No model.)



Claim.—1. The combination, with a gas-conduit and an air-conduit, of an air-nozzle 4, communicating with the air-conduit and projecting laterally through the gas-conduit, a bushing 6, supported by the gas-conduit and surrounding the air-nozzle, said bushing being provided with a gas-passage 7 and a burner-tip 8, surrounding the air-nozzle on the outside of said bushing, substantially as described.

2. The combination, with the plates 11, 12, and 13, forming a gas-conduit and an air-conduit, of stays 15 and bolts 16, connecting said plates, and a number of laterally-projecting burners 3, each having a central air-nozzle 4 and a surrounding burner-tip 8, substantially as described.

408,073.

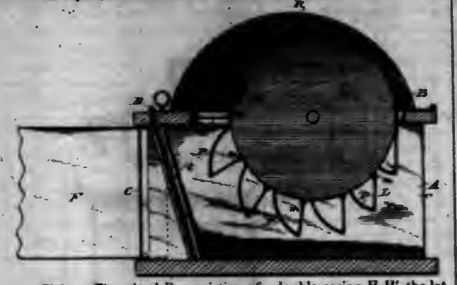
408,074. DUST-COLLECTOR. EUGENE BRETNEY, Indianapolis, Ind. Filed May 14, 1889. Serial No. 310,764. (No model.)

Claim.—1. A dust-collector consisting of a spiral casing having an inlet-opening, a dust-outlet, and an air-outlet through its inner wall, substantially as set forth.

2. A dust-collector consisting of a spiral casing of contracting size, provided with an inlet-opening, a dust-outlet, and an outlet for the discharge of the purified air, substantially as set forth.

3. In a dust-collector, a spiral separating-chamber having an inlet-opening, a dust and air outlet, and a valve for regulating said air-outlet, substantially as set forth.

4. In a dust-collector, a spiral separating-chamber having an inlet-opening and a dust and air outlet, the top of said chamber being a tapered or deflecting wall, substantially as set forth.



5. In a dust-collector, a spiral separating-chamber contracted in size from the inlet to the outlet opening and the tapered deflecting top or wall, and an air-discharge opening formed in the inner wall, substantially as set forth.

6. In a dust-collector, a spiral separating-chamber tapered from top to bottom, a top deflecting or tapered wall and inlet and outlet opening, an air-discharge opening formed in the inner wall, and an adjustable valve for said air-discharge opening, substantially as set forth.

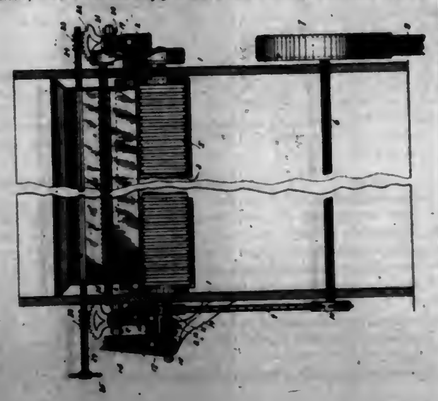
7. A dust-collector consisting of the frame, the tapered spiral separating-chamber, the top wall of which is inclined from its outer to its inner edge, and an opening for the escape of the purified air formed in the inner wall and extending from near its top to near its bottom, substantially as set forth.

8. In a dust-collector, the combination of the frame, the spiral casing having inlet and outlet openings, the opening for the discharge of the purified air, and the valve C, supported on the adjustable rod C' and connected therewith by an adjustable connection, substantially as set forth.

408,075. WATER-MOTOR. HERMIAN BROWN, Brownsville, Kans. Filed Apr. 6, 1889. Serial No. 306,193. (No model.)

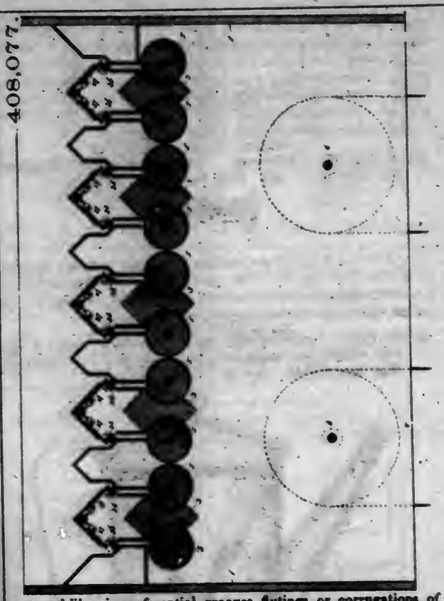
Claim.—The wheel B, consisting of a double casing H H', the latter forming an inner air-tight cylinder, with chambers I at the ends of the wheel formed between the heads of the inner and outer casing and the floats, said outer casing provided with slots o, the freely-moving rods P, extending into said chambers and to which the floats are secured, in combination with a frame to support the same, substantially as described.

408,076. FARE-BOX ATTACHMENT. FREDERICK R. BROWNELL, St. Louis, Mo. Filed Oct. 17, 1888. Serial No. 288,334. (No model.)



Claim.—1. The combination, with a fare-box, of a pin and a cap loosely fitted together, and adapted to separate when the fare-box is inverted, substantially as described.

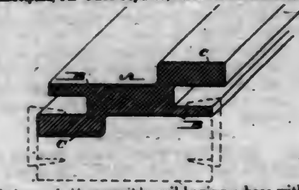
2. The combination of a fare-box, a C-shaped bracket secured to the box, and a cap fitting on the lower end of the bracket and connected to the upper end of the bracket, substantially as and for the purpose set forth.



3. The combination of a fare-box having slides 2, and an attachment located beneath the lower slide, consisting of a pin and a removable cap loosely fitted together, substantially as and for the purpose set forth.

408,077. GRAIN HULLING AND REDUCING MACHINE. GUSTAV ADOLPH BUCHHOLS, Frankfort-on-the-Main, Prussia, Germany; Octavius Knight (administrator of said Gustav Adolph Buchhols, deceased) assignor of one-third to James Underhill Robertson, New York, N. Y. Filed Aug. 2, 1888. Serial No. 281,816. (No model.)

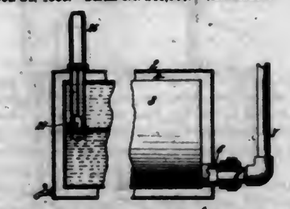
Claim.—1. In a hulling or grain-reducing machine, the combination, with a horizontally-journaled roller having numerous equidistant and like circumferential grooves, flutings, or corrugations, of a similarly-grooved longitudinally-reciprocated concave concentric or nearly concentric with and in near proximity to the descending side of said roller, substantially as and for the purposes set forth.



408,077.

2. In a hulling or grain-reducing machine, the combination of tapered circumferentially-grooved rollers and a longitudinally-reciprocated, correspondingly-grooved, and reversely-tapered concave between and concentric with said rollers, and means for producing such longitudinal reciprocation, as and for the purposes set forth.

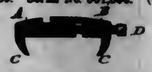
408,078. REVERSIBLE RAILROAD-RAIL. ROBERT R. BURNS, Philadelphia, Pa. Filed Sept. 15, 1888. Serial No. 285,490. (No model.)



Claim.—1. A reversible rail having a base with treads on the upper and lower faces and side flanges, the treads extending laterally farther than the flanges, substantially as described.

2. A reversible rail having a base with treads on the upper and lower faces, the remaining portions of said faces being flat and having flanges extending laterally on the opposite sides at the upper and lower parts, respectively, substantially as described.

3. A reversible rail having a flat base adapted to rest on a suitable support, flanges on said base for securing the rail, and treads on the upper and lower faces of the base arranged diagonally opposite to each other, substantially as described.



408,079. VAPOR-STOVE. JONATHAN S. BUTLER, Springfield, Ill. Filed Oct. 21, 1886. Serial No. 216,916. (No model.)

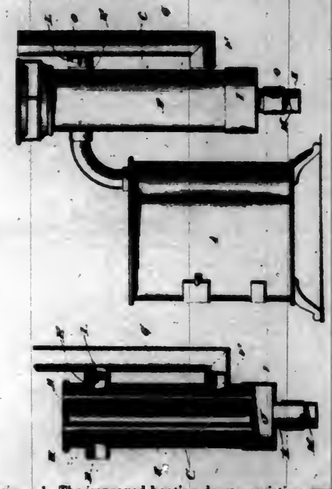
Claim.—A vapor-stove comprising a frame 1, supporting a top plate, an oil-containing tank secured to the lower part of said frame

below said top plate and having a pipe 5 projecting horizontally from one end, vapor-burners communicating with said oil-tank, a rotatable joint 6, fitted in the outer end of the horizontally-projecting pipe 5, a pipe 7, communicating with and supported on said rotatable joint 6, and a water-containing tank 8, mounted on and communicating with the pipe 7 for supplying water to the oil-tank to float the oil therein to the burners, substantially as shown and described.

408,080. HOOF-CLAMP. ALEXANDER H. CARROLL, Philadelphia, Pa. Filed Mar. 1, 1889. Serial No. 301,566. (No model.)

Claim.—A hoof-clamp consisting of sections each having prongs at its outer end, and one of the parts having a threaded socket, and a screw working through an opening in the other portion and in said socket, said parts combined substantially as described.

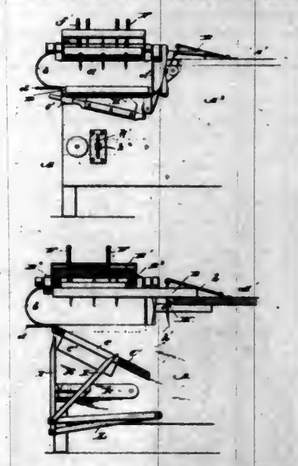
408,081. PERCOLATOR FOR COFFEE-POTS. JAMES M. CHADWICK, Gadsden, Ala., assignor of one-half to Amariah T. Fuller, same place. Filed Sept. 17, 1888. Serial No. 285,635. (No model.)



Claim.—A coffee-pot consisting of a longitudinally-tapered body decreasing in diameter from its upper open end toward the base thereof and having a removable cover *a*, a cone-shaped receptacle C, detachably suspended in the body by the upper edge thereof binding against the wall or body of the pot a short distance below the upper end and cover of said pot, and having an opening *c'* in its apex and a series of openings *d* near the edge of its upper open end, and a fabric sheath or jacket fitted closely around said receptacle over the openings *c' d* therein and lapping the upper edge of the open end of the receptacle, whereby the fabric sheath and receptacle are suspended within the pot below the top thereof solely by frictional contact with the wall of the pot, and a space is provided between said wall and the receptacle to secure a free circulation through the openings *c' d*, substantially as described.

408,082. WASHING-MACHINE. JAMES CHAMBERS, Rochester, Ind. Filed Aug. 9, 1888. Serial No. 282,305. (No model.)

Claim.—The combination of a table, a rigid support erected upon one end of this table, the two rearwardly-extending parallel bars E E, pivoted to the said rigid support, the two operating-levers G G, pivoted to the forward ends of the said bars E, the lower portions of both of these levers being extended below these bars, the depending links I I, pivoted to the bars E E between their pivotal points and their forward ends, the horizontal parallel bars K K, pivotally connecting the lower ends of the levers G G and the links I I, the connecting and bracing rounds F F' and H' J, and rubbers attached to the side bars K K, as and for the purpose described.



408,083. HEATING-DRUM FOR FRUIT-DRIERS. NATHANIEL C. CLEMENT and JAMES I. CLEMENT, West Plains, Mo. Filed June 12, 1888. Serial No. 276,855. (No model.)

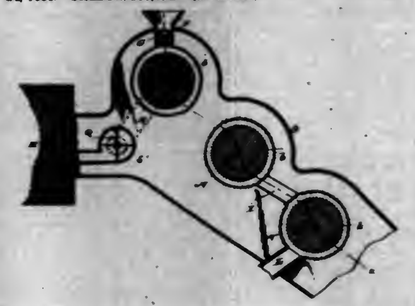
Claim.—1. The improved heating-drum consisting, essentially, of the cylinder having the vertical air-tubes, the inlet-pipe D at the upper end of the cylinder, the escape-pipes E and F at the upper and lower ends of the cylinder, respectively, the pipe E being provided with a damper, and the pipe G, connecting and communicating with the pipes E F, as specified.

2. The combination of the cylinder having the air-flues, the cap secured thereto, the tube depending from the cap, the damper in said tube having a damper-rod provided with a crank-arm on one end, and the link secured to the tube and engaging the said crank-arm, as set forth.

408,084. BAND-CUTTER AND FEEDER. LEVI CLARK, Leona, Kans. Filed Mar. 7, 1889. Serial No. 302,259. (No model.)

Claim.—1. In a band-cutter and feeder for thrashing-machines, the combination, with the endless feeding-belt, of the vertical serrated band-cutting knife arranged transversely relative to said belt and in substantially the same horizontal plane, said knife being attached to a bar, and crank-connections therewith to impart a vertical horizontal reciprocation to said knife and intermittently project the serrated portion above the plane of the endless belt, substantially as set forth.

2. In a band-cutter and feeder for thrashing-machines, the combination, with the endless feeding-belt, of the vertical knife arranged transversely relative to said belt and in substantially the same horizontal plane, connections for imparting to said knife a vertical horizontal reciprocating movement to intermittently project the cutting portion above the plane of the belt, and a frame suspending a toothed feed-roller immediately above said knife, substantially as set forth.



3. In a band-cutter and feeder for thrashing-machines, the combination of the endless belts on either side of the discharge, transverse knives arranged adjacent to the inner ends of the said belts and in substantially the same horizontal plane, connections for vertically and transversely reciprocating said knives, as described, toothed feed-rollers arranged immediately above said knives, and feeding-fingers and their operating devices between said knives, substantially as set forth.

4. In a band-cutter and feeder for thrashing-machines, the combination of the endless belts arranged at either side of the discharge, transverse knives arranged adjacent to the inner ends of said belts and in substantially the same horizontal plane, connections for vertically and horizontally reciprocating said knives, as described, toothed feed-rollers immediately above said knives, reciprocating feed-fingers to move the grain in the direction it is fed by the rollers, and a second set of reciprocating fingers operating at right angles to the fingers first mentioned.

5. In a band-cutter and feeder for thrashing-machines, the inclined slotted discharge-platform, the feeding-bars having their lower ends bifurcated and their upper extremities playing in the slot in the platform, a vertically-adjustable shaft provided with cranks connected to said bars, and a series of horizontal rods pivoted at one end to a fixed portion and having their other ends pivotally connected to the bifurcated ends of the bars, substantially as set forth.

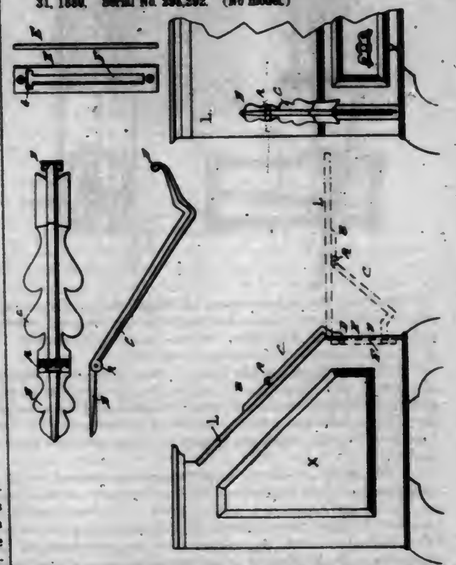
6. In combination with a slotted inclined board C, a series of beveled strips *c'*, bars I, bifurcated at their upper ends to provide fingers which pass through the adjacent slots in the board C, said bars I being centrally connected alternately to opposed bends in a crank-shaft, and bars L, for limiting the movement of the lower ends of the feeding-bars I, substantially as shown, and for the purpose set forth.

408,085. COTTON-SEED CLEANER. ROBERT H. COLLYER, New Orleans, La., assignor to Edward A. Blakely, same place. Filed Sept. 24, 1888. Serial No. 286,154. (No model.)

Claim.—1. In a machine for delinting cotton-seed, the combination, with the main frame, of a plurality of conical gauze chambers arranged one above the other obliquely and having communication with one another, the small end of one being in a vertical transverse plane with the large end of another, brush-cones mounted on horizontal shafts and arranged within the gauze chambers, a lint-chamber communicating with the main frame, and a fan for drawing the cotton from the gauze conical chambers and discharging it into the lint-chamber, substantially as specified.

2. In a machine for delinting cotton-seed, the combination, with the main frame or case having a feed-hopper at its upper end, an inlet-aperture adjacent thereto, and a seed-discharge aperture at its lower end, of a plurality of conical gauze chambers arranged obliquely one above another and communicating with one another by the passages H I, and having the large end of one lying in a vertical transverse plane with the small end of another, brush-cones arranged upon horizontal shafts within the said gauze cones, a lint-chamber communicating with the main frame, and a suction-fan for delivering the lint into the said holder, substantially as specified.

408,086. DRY CLOSET. ANDREW M. COYLE, Washington, D. C. Filed Mar. 13, 1889. Serial No. 303,006. (No model.)



Claim.—1. In a dry closet such as described, the combination of a receptacle to hold the excrement, a draft-pipe connected to the said receptacle and opening into the body of the same and forming at the lower end a foot to receive and hold the lamp for creating the draft, and said lamp provided with a transparent guard to protect the flame and at the same time to allow for examination of the same, the said guard fitting against and forming part of the draft-pipe, substantially as described.

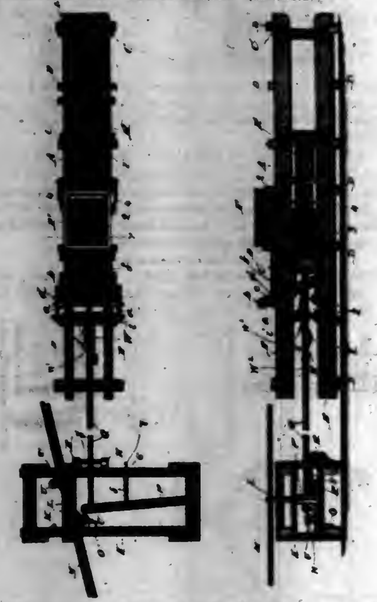
2. In a dry closet such as described, the combination of the receptacle A, the draft-pipe H and H', connecting-wires H^3, the T connection between the draft-pipe and receptacle, and a heater for creating a current of air in the said receptacle and draft-pipe, substantially as described.

3. In a dry closet such as described, the combination of the receptacle A, a draft-pipe, a T connection between the draft-pipe and receptacle, a lamp at the lower end of the draft-pipe, the diaphragm L, set in the draft-pipe below the junction of pipe leading from the receptacle, and a small pipe set in the said diaphragm and extending above the said junction, substantially as described.

408,087. BRACKET FOR DESKS. GEORGE P. DAVIS, Detroit, assignor to the Oriel Cabinet Company, Grand Rapids, Mich. Filed Jan. 31, 1889. Serial No. 298,292. (No model.)

Claim.—In combination with the desk X, having the inclined lid L, the hinge-bracket B C, jointed at A, the part B, fastened to the lid L, the part C, bent around the lower edge of said lid and terminating in a T-shaped end D, and the slotted plate E, substantially as shown and described.

408,088. SPREADER. NELSON R. DAVIS, Confluence, Pa. Filed May 9, 1889. Serial No. 310,184. (No model.)



Claim.—1. The combination, in a whiffletree or spreader, of a round bar A, hooks pivotally attached to the ends thereof, the rear ends of said hooks being bent inwardly and provided with eyes, and the chains D D, connected to the eye of a swiveled hook, substantially as shown, and for the purpose set forth.

2. The combination, in a whiffletree or spreader, of a rounded bar A, provided at its ends with ferrules *a*, hooks having perforations

b, through which pass bolts for securing the hooks to the end of the bar A, the rear ends of said hooks being bent inwardly and provided with eyes *b'*, flexible connections D D, and a hook *c*, connected by a swivel to an eye or link *d*, substantially as shown, and for the purpose set forth.

408,089. BALING-PRESS. WILLIAM M. DENMAN, Lampasas, Tex.
Filed Oct. 10, 1888. Serial No. 287,715. (No model.)

Claim.—1. The combination of the frame, the plunger, the pitman connected to the plunger, mechanism for operating said pitman, the dogs pivoted on the pitman, the door, and devices connected to the door and operated by said dogs, as set forth.

2. The combination of the frame, the hopper mounted thereon, the door for said hopper, the pitman, mechanism for operating the pitman, the levers pivoted on the side of the frame and connected to the door, the cross-bar and links connected to said levers, and the dogs pivoted on the pitman and adapted to engage said cross-bar, as set forth.

3. The combination of the frame, the cross-bars secured thereto having inclined upper surfaces, the pitman, the hopper on the frame, the door for the hopper, the levers pivoted on the frame and connected to the door, the cross-bar J, the links connecting said cross-bar to the levers, and the dogs pivoted to the pitman and adapted to engage the cross-bar J and to be disengaged therefrom by the cross-bars having the inclined upper surfaces, as set forth.

4. The combination of the frame, the hopper, the door sliding in grooves in the frame, the levers pivoted on the sides of the frame, extending above the same, and connected to the door, a cross-bar connecting the upper ends of said levers, the pitman, the dogs pivoted on the pitman, and devices between the dogs and the levers whereby the levers will be operated by the dogs, as set forth.

5. The combination of the frame, the pitman, the hopper, the door, the stops or pins on the pitman, and the weighted dogs pivoted on the pitman and adapted to rest on said stops, and devices between said dogs and the door whereby the door is operated by said dogs, as set forth.

6. The combination of the main frame, the press-box thereon, the supplemental frame arranged adjacent to the front end of the main frame, the plunger working in the press-box, the pitman extending therefrom into the supplemental frame, the lever P, having one end pivoted to the end of the supplemental frame and its other end pivoted to the end of the pitman, the rod pivoted to said lever and extending through the side of the supplemental frame, the spring arranged around said rod between the lever and the side of the supplemental frame, the king-bolt in the supplemental frame, and the arms radiating therefrom and adapted to act on the end of said lever, as set forth.

7. The combination of the supplemental frame, the springs N O secured thereto, the pitman, the lever P, pivoted to the frame and to the pitman, the king-bolt, the arms radiating therefrom, and the rollers at the ends of the said arms, all arranged and operating substantially as set forth.

408,090. PAWL-AND-RATCHET MECHANISM. HENRY H. DILLE, Richmond, Ind. Filed Apr. 24, 1889. Serial No. 308,361. (No model.)

Claim.—1. In a pawl-and-ratchet device, in combination with the two parts movable with reference to each other, the one having a series of ratchet-teeth and the other having a series of cams, a rock-shaft having the two lugs or arms to engage, respectively, the ratchet-teeth and cams, substantially as and for the purpose specified.

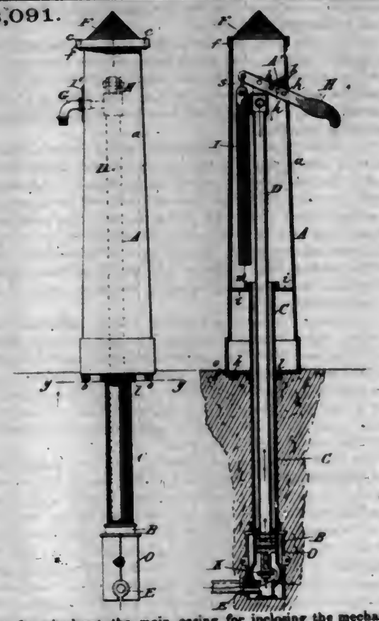
2. In combination with an arbor or shaft and a piece surrounding the same, a longitudinally-arranged rock-shaft carried by one of the parts, provided with a lug on each end, and the ratchet-teeth and cams on the other part to engage the lugs, respectively, substantially as and for the purpose shown.

3. In combination with a shaft or arbor provided with the longitudinal groove, the rock-shaft in such groove, provided with the two lugs or arms, a sleeve or barrel surrounding the arbor and provided with a series of ratchet-teeth to engage one of the rock-shaft lugs, and a series of cams to engage the other lug, substantially as and for the purpose set forth.

4. In combination with the arbor and the longitudinally-arranged rock-shaft carried thereby, provided with oppositely-arranged lugs, and a barrel or sleeve around the arbor, provided at one end with a series of ratchet-teeth to be engaged by one of the lugs on the rock-shaft and at its other end with a series of cams to engage the other rock-shaft lug, substantially as and for the purpose described.

5. In combination with a shaft or arbor having the longitudinal groove, the rock-shaft in such groove, having the two lugs oppositely arranged, so that as the rock-shaft turns to swing one inward toward the arbor the other is swung outward, and a sleeve or barrel around the arbor having the series of ratchet-teeth to be engaged by one of the rock-shaft lugs and a series of cams to engage the other lug, substantially as and for the purpose specified.

6. In combination with the arbor having the longitudinal groove and the rock-shaft in such groove, having the pawl-lug, and a second lug or arm arranged with reference to the other, so that as one swings outward from the arbor the other is carried inward, the barrel or sleeve surrounding the arbor, having the series of inwardly-projecting ratchet-teeth for engaging the pawl-lug and the series of cams for engaging the other lug on the rock-shaft, such cams and ratchet-teeth being arranged with reference to each other so as to alternately engage their respective rock-shaft lugs, substantially as and for the purpose shown.



7. In a pawl-and-ratchet device, in combination with an arbor having the longitudinal groove, the rock-shaft in such groove, provided with the two lugs so arranged thereon that as one moves outward from the arbor the other moves inward, a barrel or sleeve on the arbor, a series of ratchet-teeth thereon adapted to be engaged by one of the rock-shaft lugs when swung outward, and a series of cams also on the barrel adapted to engage and force the other rock-shaft lug inward when the ratchet-teeth are out of engagement with their respective lugs, said arbor being provided with means for limiting the rotation of the rock-shaft when it has been turned to carry the ratchet-tooth-engaging lug outward, substantially as and for the purpose set forth.

8. In combination with the arbor and the longitudinally-arranged rock-shaft carried thereby, having the oppositely-projecting lugs, a barrel or sleeve around the arbor, having the series of inwardly-projecting ratchet-teeth in position to be engaged by one of the shaft-lugs, and a series of cams adapted to engage the other shaft-lug and force it inward when the other lug is out of engagement with the inclined faces of the ratchet-teeth, said arbor being provided with a suitable stop-face or bearing to be engaged by the cam-engaging lug when the latter has been swung inward, substantially as and for the purpose described.

408,091. SELF-CLOSING HYDRANT. CHARLES G. ETTE, St. Louis, Mo. Filed Dec. 14, 1888. Serial No. 293,608. (No model.)

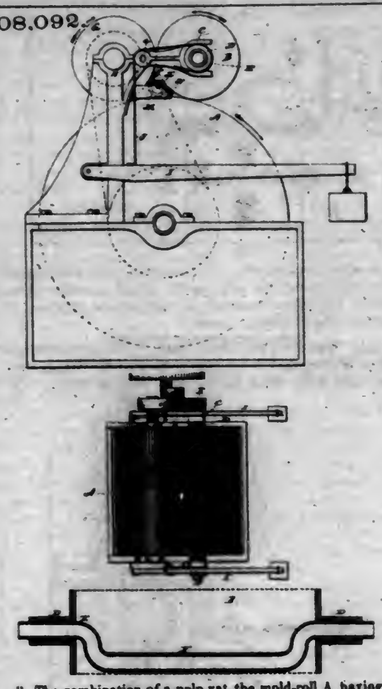
Claim.—1. In a self-closing hydrant, the combination of the main casing having a perforated base, the perforated partition or diaphragm within the casing, and the main hydrant pipe or stem connected to said base and diaphragm, and at its lower end to the valve-body in the base of the hydrant, substantially as described.

408,091.

2. In a hydrant, the main casing for inclosing the mechanical parts, consisting of the two right-angled sections, the cap in the upper end of said casing, a sectional bottom integral with the right-angled sections and centrally perforated, the sectional centrally-perforated diaphragm in the casing, the main hydrant pipe or stem connected to the diaphragm and lower valve-body, and the main water-supply pipe within the hydrant-pipe, but independent thereof, substantially as described.

3. In a self-closing hydrant, the combination of the sectional main casing A, the sectional perforated base therefor, consisting of the parts *k k*, the partition within the casing, consisting of the plates *i i*, the main hydrant-stem C, passing through said base and partition of the main casing, the valve-body connected to the lower end of said stem, the valve within the valve-body, the vertical water-pipe D, the lever H, fulcrumed between lugs A' on the main casing, and the weight I, suspended on the inner end of the lever, substantially as described.

4. The combination, with the main casing A, consisting of the two right-angled sections *a a*, said casing having a base composed of plates *k k*, integral with the right-angled sections, and having also a partition consisting of the plates *i i*, also integral with the right-angled sections, the hydrant pipe or stem C, connected with the main casing, the valve-body B, containing the hydrant-valve, the water-pipe D, having spout or nozzle G, the operating-lever H, and the weight I, connected to said lever, substantially as described.



5. In a self-closing hydrant, the combination of the main casing, its perforated base, the perforated diaphragm within the casing, the main hydrant-pipe connected to said diaphragm and the lower valve-body, and the water-pipe connected to the valve and independent of the main hydrant-pipe, substantially as described.

6. The combination of the sectional casing A, its flanged pyramidal cap, sectional perforated base and sectional perforated partition, the main hydrant-stem C, connected to said base and diaphragm and having jam-nuts *l* and *m* thereon, which bear tightly against the base and diaphragm, and the valve, main water-supply pipe, and lever-handle, all arranged and operating substantially as described.

408,092. MACHINE FOR FORMING BODIES FROM SUCCESSIVE LAYERS OF PULP. HENRY FAIRBANKS and HOWARD PARKER, St. Johnsbury, Vt. Filed Dec. 24, 1888. Serial No. 294,530. (No model.)

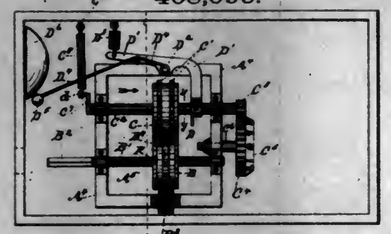
Claim.—1. In a machine for making pulp into sheets or cylinders, the combination of a pulp-vat, a mold-roll arranged with a portion of its surface dipping into the vat of pulp, a couch-roll, the surface of which runs in contact with said mold-roll, the couch-roll presenting a porous surface in contact with the mold-roll, an exhaust applied to the interior of the couch-roll through one or both the gudgeons, and a press-roll, the said press-roll and couch-roll held in yielding contact, whereby the said rolls are permitted to separate, but still held under pressure toward each other, substantially as and for the purpose described.

408,092.

2. The combination of a pulp-vat, the mold-roll A, having a porous surface adapted to dip into said vat, a hollow couch-roll B, presenting a porous surface and so as to run in contact with said mold-roll A, a tubular axle extending through the hollow gudgeons of the couch-roll and bent down within the couch-roll, so as to stand stationary at the lowest point in the couch-roll, the said tubular axle within the couch-roll perforated and provided with a suitable exhaust, whereby an inward current may be produced through the porous surface of the couch-roll, and a press-roll G, arranged to run in substantial contact with the surface of the couch-roll, substantially as described.

3. The combination of the pulp-vat, the mold-roll A, the hollow porous surface couch-roll B, arranged to run in contact with the surface of the mold-roll A, the gudgeons of the said couch-roll hollow and provided with an exhaust from the inside of the roll, the press-roll G, and the pressure-roll N, substantially as and for the purpose described.

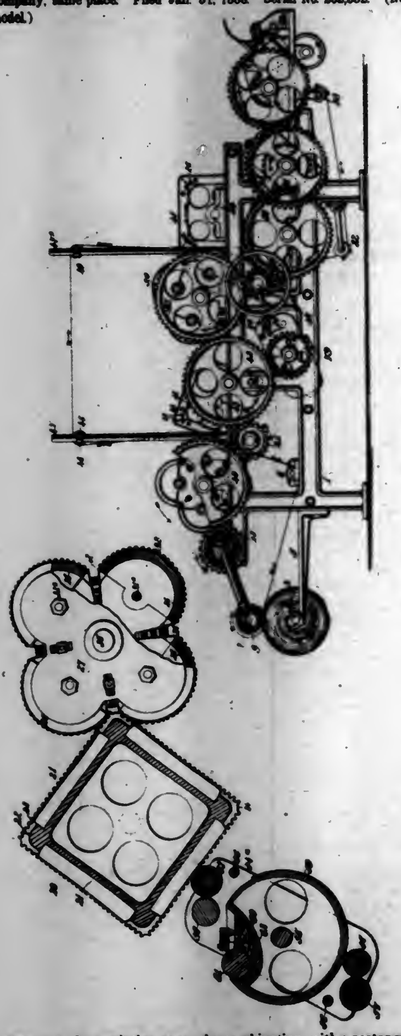
4. In a machine for forming layers of paper-pulp, the combination of a perforated hollow roll adapted to receive a layer of pulp upon its surface, a hollow axle running through one of the gudgeons of the roll, bent down upon the inside of the roll, so as to lie close upon the lowest point of the interior of the roll, the said hollow axle open near the said lower surface of the roll, and in connection with an exhaust, substantially as and for the purpose described.



5. In a machine for forming layers of pulp, the combination of a hollow roll presenting a perforated surface adapted to receive a layer of pulp upon its said surface, a hollow axle extending into said roll and bent down within the roll to substantially the lowest point therein and open at such point into the roll, with means, substantially such as described, to produce exhaust through said hollow axle, and a press-roll presenting a hard surface arranged to work in contact with the said perforated roll and adapted to receive a layer of pulp from the said perforated roll, substantially as described.

408,093. REGISTERING AND CANCELING BALLOT-BOX. LUCIAN M. FOSTER, Troy, N. Y., assignor to Benjamin, Pecie, Topsfield, Mass. Filed Apr. 11, 1889. Serial No. 306,768. (No model.)

Claim.—1. In a ballot-box provided with ballot-canceling attachments, the combination, with a feed-wheel, type-wheel, and type-inker, of a register-roll, parallel toothed rims on such roll, and a peripheral lug on one of such rolls adapted to frictionally engage with the periphery of the other roll, substantially as described.



2. In a ballot-box provided with ballot-registering attachments, the combination, with a feed-roll, of a ballot-actuated registering-roll and spindle, spindle-crank, crank controlling and actuating spring, and a roll-and-spindle-actuated registering-dial, substantially as described.

408,093.

3. In a ballot-box provided with registering attachments, the combination, with the feed-roll and register-roll, of a peripheral lug on the feed-roll, adapted to frictionally engage with the periphery of the register-roll, substantially as described.

408,094. PRINTING-MACHINE. JOSEPH C. FOWLER and EDWARD A. HEWLE, Washington, D. C., assignors to the American Printing Press Company, same place. Filed Jan. 31, 1888. Serial No. 262,552. (No model.)

Claim.—1. In a printing-press, the combination, with a rectangular bed, of a positively-driven inking-frame having continuous movement, and form-rollers mounted upon said inking-frame and having uniform contact successively with the four plane faces of the rectangular bed, substantially as described.

2. In a printing-press, the combination, with a rectangular bed having constant rotation, of an inking-frame carrying form-rollers at both ends and rotating at double speed relatively to the bed, and an inking-table of substantially cylindrical form, with which said rollers have contact during a portion of each revolution of the inking-frame, substantially as described.

3. In a printing-press, the combination, with a rotary rectangular bed, of an inking-frame rotating on a central shaft, inking-rollers journaled in the ends of said frame, an inking-table of substantially cylindrical form rigidly mounted upon said shaft and having an ink pocket or font formed in the upper portion thereof, a font-roller journaled in said font, with its periphery in the cylindrical plane of the ink-table, and means for giving said font-roller an intermittent rotation and for rotating the rectangular bed and inking-frame in the same direction, the latter being driven at double the speed of the former, substantially as described.

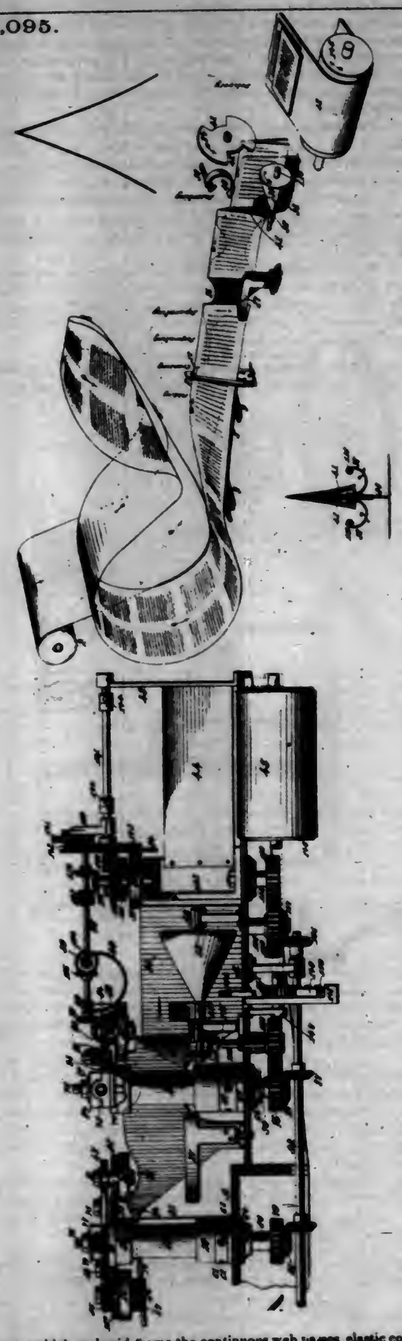
4. In a printing-press, the combination, with the rectangular bed, of an inking-frame centrally journaled and having inking-rollers mounted in the ends thereof, an inking-table having cylindrical form and provided with a pocket or font roller revolving in said font and having a ratchet on the shaft of said roller, an eccentric mounted on the shaft of the inking-frame, and a ring running on said eccentric and having a pawl rigid thereon which engages with the ratchet of the font-roller, substantially as described.

5. In a printing-press, the combination, with a rectangular bed and with a continuously-rotating inking-frame having form-rollers journaled in its ends, of a cylindrical ink-table rigidly mounted on said shaft between the ends of the said frame and having a pocket or font in its upper part, a font-roller journaled to revolve in said pocket and having a ratchet on its shaft, an eccentric on the shaft of the inking-frame, a ring running on said eccentric and having a pawl rigid thereon, with its nose engaging the ratchet of the font-roller, a second pawl pivoted upon said ring, and a spring connecting the same to the pawl on the opposite side of the ratchet, substantially as described.

6. In a printing-press operating upon a continuous web, the combination, with the printing mechanism, of a spool resting upon the surface of the paper in the roll and carried by arms pivotally mounted on a shaft driven by the machine, said shaft having gears by which rotation is given said spool in a direction opposite to the feed of the paper through a shaft journaled in one of the pivoted arms, and having a gear meshing with a gear on the spool, substantially as described.

7. In a printing-press, the combination, with the printing mechanism, of a pair of arms pivotally mounted upon a shaft of said mechanism, a spool journaled in the ends of said arms and having a miter-gear in its shaft, and a counter-shaft carrying a miter meshing with that on the spool-shaft and driven by the shaft on which the arms carrying said spool are mounted, substantially as described.

8. In a printing-press, the combination, with a rectangular bed having continuous revolution, of a frame mounted upon a central axis and carrying inking-rollers upon opposite sides of said axis, and gearing driving said frame in the same general direction of rotation as the bed and at double the speed of the latter, whereby said inking-rolls sweep the flat faces of the square bed with substantially uniform contact, substantially as described.



408,095. FOLDING-MACHINE. JOSEPH C. FOWLER and EDWARD A. HEWLE, Washington, D. C., assignors to the American Printing Press Company, same place. Filed Aug. 3, 1888. Serial No. 281,882. (No model.)

Claim.—1. The combination, with a perfecting-press, of a web-forming shell upon which the perfected web is received and over which it is drawn as it comes from the press, said shell comprising a flat receiving-surface passing gradually into a convex surface and terminating in an angular end to form a central bend in the moving web, and an upright frame supporting the shell and having an angular opening into which the angular end of the shell extends and arranged to provide a space between it and the edge of the angular opening for the passage of the web, substantially as described.

2. The combination, with a perfecting-press, of a web-former consisting of a shell or body having a surface which passes by regular graduations from flat to convex and thence to an angular form, a frame surrounding the angular portion, but leaving space for the passage of the web between the frame and former, and elastic compressors mounted upon said frame directly in front of the angular back of the former, between which the central portion of the web passes as the latter leaves the web-former, substantially as described.

3. The combination, with a perfecting-press, of a web-former having a surface passing from flat to angular by successive graduations, a frame surrounding the angular extremity of said web-former,

408,095.

between which and said frame the continuous web passes, elastic compressors mounted on said frame in line with the angular back of the web-former, a spine or support for the folded web in front of the web-former, and means for drawing the web over the latter and advancing it over said spine, substantially as described.

4. The combination, with a perfecting-press, of a web-former having a surface passing by successive graduations from flat to angular, a frame surrounding and having an inner surface parallel with the angular extremity of the web-former, elastic compressors arranged in front of the angular extremity of the former, a spine or support upon which the folded web is received as it leaves the compressors, continuously-revolving drawing-rolls advancing the folded web upon the spine and having a surface speed greater than the speed of the web, perforators operating upon the web at stated intervals, and separating-rolls traveling at a higher surface speed than the perforators and separating the web along the lines of perforation, said perforators and separators being arranged at intervals along the spine and acting upon the web as it is supported and advanced thereon, substantially as described.

5. The combination, with a perfecting-press, of a web-former having a surface which passes from flat to angular by imperceptible gradations, a frame surrounding the angular portion of said web-former, elastic compressors carried by said frame, and between which the crease or fold in the web is formed, drawing or feeding rolls which advance the web and also perfect the fold therein, a pair of perforators acting on the web at intervals and gripping the same during a partial revolution, a pair of separators running at a surface speed somewhat in excess of the perforators, and a pair of advancing rolls by which the separate sheets are thrown upon an inserter-section of a spine upon which the folded web is supported during its movement, substantially as described.

6. The combination, with a perfecting-press, of a web-former, elastic compressors acting upon the web as it comes from the former, a spine or support upon which the folded web is received as it comes from the compressors, means for successively perforating and separating the web and accelerating the advance of the separated sheets, an inserting-section of the spine upon which the sheets are thrown successively, a stile or gate preventing exit from the inserting-section save at stated intervals, intermittently-operating delivery-rolls which withdraw the signatures from the inserting-section, and a belt-carrier receiving the signatures, substantially as described.

7. The combination, with a perfecting-press, of the web-former, the elastic compressors, the drawing and folding rolls, the perforators, one of which has a section of increased diameter, the separators traveling at a higher surface speed than the perforators and gripping the web during a part of each revolution, a pair of rubber accelerating-rolls having a portion of the peripheral surface removed from each, a spine or support for the folded web, along which the several parts are arranged at intervals, said spine having an inserting-section arranged below the level of the preceding portion, a pair of cone-adjusters revolving one upon each side of said section, and an elastic striker or finger revolving above and in the vertical plane of the inserting-section, substantially as described.

8. The combination, with a perfecting-press, of a web-former, a spine connected to a suitable support adjacent thereto, upon which spine the folded web is carried, and feed-rolls arranged on opposite sides of the spine and engaging the folded edge of the web at a point where the edge of the spine is cut away to permit the rolls to meet, substantially as described.

9. The combination, with a perfecting-press, of a web-former, a spine connected to a suitable support adjacent to said former, and rolls drawing and advancing the folded web thereon during its perforation and separation, said spine being provided with an inserting-section and having spreaders immediately preceding said section to open the folded sheets, substantially as described.

10. The combination, with a perfecting-press, of a web-former, a spine receiving the web therefrom, compressors forming the fold therein as the web comes from the former, perforators, feed-rolls, and separators, the latter traveling at increased speed, acting upon the web successively as it is advanced on the spine, a pair of accelerating-rolls throwing the separate sheets, which are opened by spreaders upon the spine, upon an inserting-section and against a stile having one or more exit-openings, a pair of delivery-rolls, one of which is movable toward and from the other, and means for revolving the stile and throwing the delivery-rolls into engagement as the exit-opening in the stile comes opposite the inserting-section, substantially as described.

11. The combination, with a perfecting-press and with a web-former, of a spine upon which the folded web is received and advanced, drawing and creasing rolls acting upon and perfecting the fold of the web, perforators, one of which is adjustable and has a section of increased diameter extending over an arc on the perforator, rubber feed-rolls advancing the web upon the spine, separators traveling at an increased speed, one of which is adjustable at top and bottom independently, accelerating-rolls having portions of their peripheries removed, a pair of delivery-rolls, one of which is movable toward and from the other, a revolving stile having an exit-opening, a carrier-belt, and means for throwing the delivery-rolls together and giving alternately an advance movement to the delivery-belt, substantially as described.

12. The combination, with the inserting-section of the spine and with the intermittently-operating delivery-rolls, of the deflector-plate

arranged in front of the inserting-section, the carrier-belt moving beneath, and knocker-arms revolving above the deflector-plate, substantially as described.

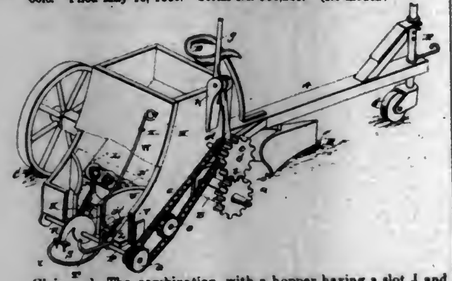
13. The combination, with a perfecting-press and with a spine or similar support, of a web-former, devices for drawing and feeding, perforating, advancing, and separating the folded web while supported on the spine, accelerating-rolls throwing the sheets on an inserting-section of the spine, delivery-rolls acting at intervals on the signature, a stile having one or more openings for the removal of the signature, a carrier-belt having a crank operating the movable delivery-roll, a sleeve on said shaft having an arm advancing the belt-carrier, and a pressgear having cams actuating the shaft and sleeve successively, substantially as described.

14. The stile or gate herein shown and described, the same consisting of a metallic disk having one or more exit-openings formed in the edge, in combination with the inserting-section of the spine, substantially as described.

15. The combination, with a perfecting-press, of a web-former 5, a frame 8, surrounding the angular end thereof, and a spine 14, connected to a bracket carried by said frame, substantially as described.

16. The combination, with a perfecting-press, of a web-former 5, a frame 8, a spine 14, elastic compressor 15, and drawing-rolls 16, advancing the web as it comes from the former upon the spine, substantially as described.

408,096. **CAP FOR FUSES.** WILLIAM H. FRAZER, Mullan, Idaho, assignor of one-half to John Mullan, Washington, D. C. Filed Apr. 1, 1889. Serial No. 305,549. (No model.)



Claim.—1. A flexible fuse-cap made of rubber and provided on its interior surface with raised annular portions, substantially as specified.

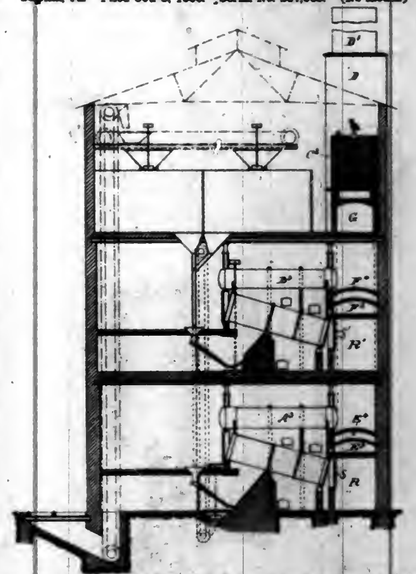
2. A flexible fuse-cap made of rubber and having its outer surface unbroken or straight, and being provided on its interior surface with raised annular portions, substantially as specified.

3. The combination, with a fuse, of a flexible cap fitting over said fuse, the cap being made of rubber and provided on its interior surface with raised annular portions, whereby a dead-air chamber is formed in the interior of the cap between the raised annular portions, substantially as and for the purpose specified.

408,097. **POTATO-PLANTER.** CARL W. PRETER, Walsenburg, Colo. Filed May 10, 1889. Serial No. 310,223. (No model.)

Claim.—1. The combination, with a hopper having a slot J and a discharge-opening I at its rear end, of a rotary shaft mounted in the hopper at the rear end of the same, a picker secured on said shaft and moving through the slot J and discharge-opening I, and mechanism for rotating said shaft, as set forth.

2. The combination of the hopper, the rotary shaft mounted in the hopper, mechanism for rotating said shaft, a picker carried by said shaft and adapted to remove the potatoes from the hopper, a discharging-rod secured on the hopper and adapted to remove the potatoes from the picker, and a crank-arm on the said shaft adapted to actuate the discharging-rod, as set forth.



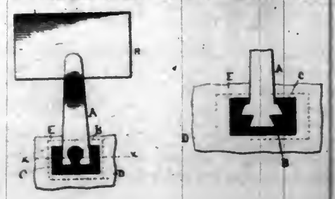
3. The combination, with a hopper, of the rotary shaft mounted in the hopper, mechanism for rotating said shaft, a picker carried by said shaft and adapted to remove the potatoes from the hopper, a spring discharging-rod secured on the side of the hopper and having its lower end bent toward the picker and adapted to remove the potatoes from the same, the said rod being provided with an offset Z, and the crank-arm on the rotary shaft adapted to act on said offset, as set forth.

4. The combination of the hopper having the longitudinal groove K and the transverse slot M at the front end of the said groove, the roller arranged in said transverse slot and having an irregular surface, the rotary shaft mounted in the hopper, the picker carried by said shaft and adapted to enter the groove K and remove the potatoes from the hopper, and mechanism for rotating the said roller and the shaft, as set forth.

5. The combination of the hopper having the slot J, the discharge-opening I, the groove K, registering with said slot and discharge-opening, and the transverse slot M at the front end of said groove, the plate L, covering the groove K, the roller arranged in the slot M and having an irregular surface, the rotary shaft mounted on the hopper and carrying a picker adapted to move through the slot J, groove K, and opening I, and mechanism for rotating the roller and the said shaft, as set forth.

6. The combination, with the hopper having the longitudinal groove K and the transverse slot M at the front end of the said groove, of the roller arranged in said transverse slot and having an irregular surface composed of an alternate series of depressions and bulbous-shaped elevations, as set forth.

408,098. **STEAM-BOILER FURNACE.** JOHN L. GILL, Jr., Philadelphia, Pa. Filed Oct. 3, 1888. Serial No. 287,085. (No model.)



Claim.—1. In steam-boiler furnaces, the combination of the chimney D, having a partition D^a, dividing the same to a point above the highest boiler-setting, with lateral flues leading from each furnace and terminating in a vertical flue in the chimney D, substantially as set forth and shown.

2. In steam-boiler furnaces, the chimney D, in combination with lateral flues E' E^2 and F' and F^2, terminating vertically in the chimney D, with the economizer C, located above the boiler-furnaces and provided with a damper H, arranged to alternately direct the products of combustion through the economizer in one adjustment or to discharge them directly through the chimney, substantially as shown and described.

3. In steam-boiler furnaces, the combination of a series of lateral flues E' E^2 E^3 E^4 and F', F^2, F^3, and F^4 with the passage-ways R and R' under said flues for access to the rear of the boiler tubes and settings, arranged substantially as shown and described.

408,099. **LABEL OR CARD HOLDER.** JOHN J. GOULD, Washington, D. C. Filed Mar. 6, 1886. Serial No. 194,360. (No model.)

Claim.—1. The within-described improved device, consisting in a thin metal strip shaped at one end to form a recess in it or a projection upon it, a card-board of the same thickness as the said metal strip, having a recess or slot in it the counterpart of the said recess or projection in the metal strip, said card-board secured to a base-piece, the said metal strip fitted into the said recess or slot of the card-board, and a covering placed over the card-board and strip and secured to the base-piece, all as specified.

2. The within-described improved card and label holder having a base upon which is cemented a circular disk, in combination with a strip having a circular aperture through it and a covering-piece.

408,100. **MOWER.** ALVARO B. GRAHAM, Chicago, assignor to Lewis C. Tallmadge, Evanston, and Charles J. Haines, trustee, Chicago Ill. Filed Aug. 11, 1887. Serial No. 246,673. (No model.)

Claim.—1. The combination, substantially as set forth, of the shoe having recesses for the spring, the knife, the vertical lugs thereof, the spring connected to both said parts by being seated at its ends in the recesses and passing between the lugs, and the lugs having a greater space between them than is required by the spring, whereby the spring is passive at the middle of each stroke.

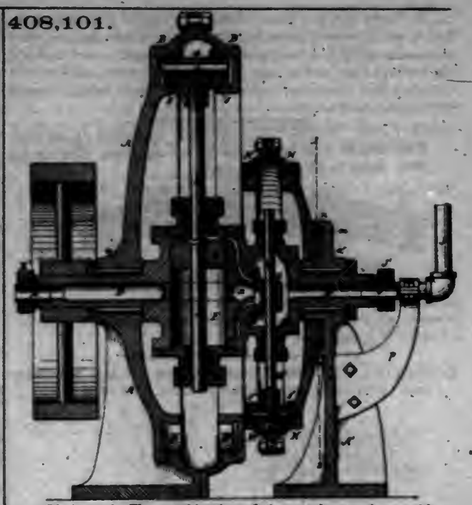
2. The combination, substantially as set forth, of the finger-beam, the knife, the pitman, and the bar-spring having its ends resting in V-shaped notches on the shoe and passing between lugs on the knife.

3. The combination, substantially as set forth, of the spider-frame, the shoe suspended at its heel from the spider-frame independently of the lifting-lever, the swivel-jointed links connecting the shoe and the gearing-carriage, and the lever for rocking the shoe connected to the forward end of the shoe.

4. The combination, substantially as set forth, of the floating finger-beam, the gearing-carriage, the drive-rim at the grass side of the gearing-carriage, and the swivel-jointed links connecting the finger-beam with the gearing-carriage and extending through the drive-rim, and the lever for rocking the beam.

5. The combination, substantially as set forth, of the finger-beam the gearing-carriage, a draft-rod connecting the shoe with the tongue, a swivel-jointed link at the front of the shoe, and a similar link at the heel of the shoe, and the lever for rocking the beam.

6. The combination, substantially as set forth, of the shoe, the gearing-carriage, the links connecting the shoe and the carriage, and the draft-rod jointed to the heel of the shoe and passing above the forward link to limit the upward play of the finger-points, and the lever connected to the forward part of the shoe for raising the same.



7. The combination, substantially as set forth, of the finger-beam, the gearing-carriage, two swivel-jointed links connecting the beam and carriage, and the lever having a single connection with the beam to rock it and to raise it from the ground.

8. The combination, substantially as set forth, of the finger-beam, the lever to rock the same, the chain connecting the lever and the shoe having an elongated link near its attachment to the shoe, and the draft-rod passing through said elongated link and attached at one end to the shoe and at its other end to the tongue.

9. The combination, substantially as set forth, of the finger-beam, the gearing-carriage, the two swivel-jointed links connecting the finger-beam and gearing-carriage, and the pitman located between said two links, whereby the finger-beam is always in line with the pitman, though free to rise or fall at either end and to rock forward or back.

408,101. **ROTARY ENGINE.** WILLIAM M. GIBSON, Berlin, Germany. Filed May 16, 1888. Serial No. 311,067. (No model.)

408,101.

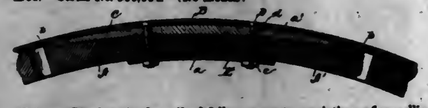
Claim.—1. The combination of the annular track or guide, a cylinder hung eccentrically in respect thereto and having a piston and piston-rod, with rollers engaging said annular track or guide, a slide-valve for controlling the flow of the motive fluid to and from the cylinder, and a supplementary eccentric track or guide for effecting the operation of the slide-valve as the cylinder rotates, substantially as specified.

2. The combination of the cylinder, its opposite hollow trunnions, valve-chest, and slide-valve, the fixed frame of the engine having bearings for said trunnions, the eccentric tracks or guides for controlling the outer ends of the piston-rod and valve-rod, a steam-inlet pipe communicating with the steam-chest of the engine through one hollow trunnion, and an exhaust-pipe communicating with the exhaust-passage of the engine through the other hollow trunnion, substantially as specified.

3. The combination of the cylinder, its valve-chest and slide-valve, the eccentric track or guide controlling the piston-rod of the cylinder, and an eccentric track or guide controlling the valve-rod, said valve-controlling track or guide being movable to effect the shifting of the valve and the reversal of the engine, substantially as specified.

408,102. **TRAY.** ZACHARY T. HALL, Philadelphia, Pa. Filed Feb. 16, 1889. Serial No. 300,164. (No model.)

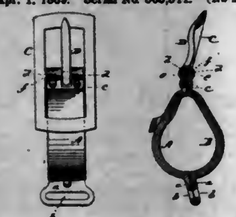
Claim.—1. A tray having a foot connected with an overhanging rim thereof, said foot consisting of a vertical plate and a laterally-projecting base, said parts being combined substantially as described.



2. A tray having a foot consisting of a vertical plate depending from the front of the overhanging rim of the said tray, and provided with a base projecting laterally from the base thereof toward the bottom of the tray, said parts being combined substantially as described.

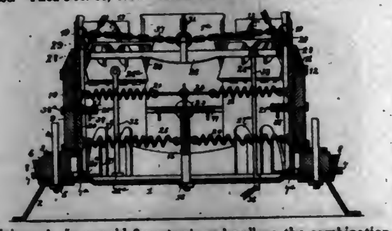
3. A tray having a foot secured to its rim and provided with a laterally-projecting base, a keeper rising from said base, and a holding-spring below said base and with ends secured in said keeper, said parts being combined substantially as and for the purpose set forth.

4. A tray with a foot secured to its rim and having a laterally-projecting base, a keeper rising from said base, and a spring with hooked ends secured in said keeper, said parts being combined substantially as and for the purpose set forth.



5. A tray having a foot consisting of a vertical plate with a slot therein, and a laterally-projecting base with a keeper thereon, and a spring with uprights 3, hooked ends 4, and connecting portions 5, the said portions 5 adapted to enter the slots of the vertical plate and the hooked ends to be secured in said keeper, said parts being combined substantially as described.

408,103. WHEEL-FELLY SUPPORT. LAFAYETTE HARRIS, Pony, Mont., assignor of one-half to Orson W. Jay, same place. Filed Apr. 10, 1889. Serial No. 306,684. (No model.)



Claim.—The herein-described felly-support, consisting of an elliptical-shaped piece of metal flat on its upper surface and semicircular beneath, and provided at each end with a downward-extending toe, substantially as described.

408,104. HARNESS-TUG LOOP. SAMUEL D. HARRIS, Middletown, Conn. Filed Apr. 1, 1889. Serial No. 305,511. (No model.)

Claim.—The combination of a buckle having a central cross-bar made as an integral part thereof, a tongue hinged to the bar and so as to bear upon one end of the buckle-frame, a metal tag-loop composed of two parts A B, each part constructed at its upper end with an upward projection *c*, the said projections each having two upwardly-projecting arms alike on both parts, each of said arms constructed with a horizontal semicircular groove upon the adjacent faces of the two parts and adapted to embrace the cross-bar of the buckle as a hinge and each side the tongue, the said two parts of the loop constructed with a like downward projection *a* on each part, and each of said projections *a* having a like transverse slot through it, which together form the loop for the strap, the said two parts of the loop set and riveted together, substantially as described.

408,105. MOLD FOR CASTING WHEELS. JAMES W. HILL, Peoria, Ill., assignor to the Peoria Pulley and Wheel Company, same place. Filed Feb. 18, 1889. Serial No. 300,362. (No model.)

Claim.—1. In a mold for wheels and pulleys, the combination of the internal parts and the built-up casing composed of upper and adjustable lower and intermediate interchangeable rings, said lower ring having means of vertical adjustment, whereby rims of different widths may be cast, substantially as set forth.

2. In a mold apparatus, the combination, with the bed-plate and internal parts, of the outer interchangeable rings of different widths constituting the casing, interposed block or blocks between the lower ring and the base-plate, and a fastening for securing the lower ring, blocks, and base-plate together, substantially as set forth.

3. In a mold apparatus for wheels and pulleys, the combination, with the bed-plate and internal removable segments, of the casing made up of a series of interchangeable rings of different widths, and interposed interchangeable blocks between the lower ring and the base-plate, whereby rims of different widths may be cast, substantially as set forth.

4. In a mold apparatus, the combination, with the bed-plate and the internal parts, of the casing consisting of upper and lower rings and interchangeable intermediate rings and interchangeable blocks interposed between the lower ring and the base-plate, substantially as and for the purpose set forth.

5. In a mold apparatus, the combination, with the bed-plate and the internal parts, of the outer interchangeable rings constituting the casing, interchangeable interposed blocks between the lower ring and the bed-plate, bolts passing through the bed-plate, blocks, and the lower ring, and nuts screwed onto the lower ends of the bolts, substantially as set forth.

6. In a mold apparatus, the combination of the casing and the internal segments, a series of alternate sections being divided horizontally and provided with grooves to receive the spokes, substantially as set forth.

7. In a mold apparatus, the combination of the casing, the bed-plate, the internal segments, each alternate one being divided horizontally and provided with grooves to receive the spokes, interposed blocks between the casing and the bed-plate, suitable means for securing the blocks to the bed-plate, collars fitting over said blocks and having screw-threaded pins screwing into the lower sections of the divided segments, and wedges driven between the collars and blocks, substantially as and for the purpose set forth.

8. In a mold apparatus, the combination of the casing consisting of upper and lower rings and interchangeable intermediate rings, means for supporting the casing at different heights, and the intermediate segments, every alternate one of which is horizontally divided and provided with grooves to receive the spokes, substantially as and for the purpose set forth.

9. In a mold apparatus, the combination of the casing, the wedge-segments, the alternately-arranged divided segments provided with grooves to receive the spokes, and means for engaging the inclined portions of said wedge-segments and expanding all the segments outwardly, substantially as set forth.

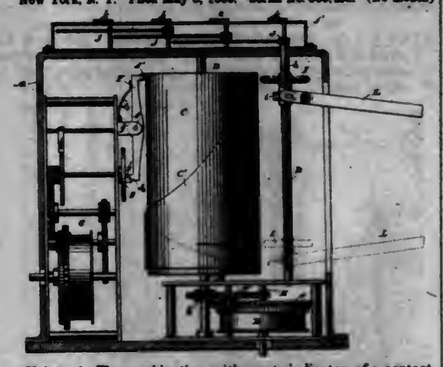
10. In a mold apparatus, the combination of the casing, the wedge-segments, the alternate divided segments provided with grooves to receive the spokes, the upper and lower wedge-rings adapted to engage the inclined portions of the wedge-segments, and devices for forcing said wedge-rings toward each other, substantially as set forth.

11. In a mold apparatus, the combination of the casing, the whole segments, and the alternate divided segments provided with grooves to receive the spokes, a central standard, and springs connecting the lower portions of the divided segments to said standard, substantially as set forth.

12. In a mold apparatus, the combination of the casing, the whole segments, the alternate divided segments provided with grooves to receive the spokes, a central standard having a socket at its upper end, a disk at its top, an upper disk having a post projecting downwardly and fitted loosely in said socket, and springs connecting said standard and upper disk to the divided segments, substantially as set forth.

13. In a mold apparatus, the combination of the casing, the whole segments, the alternate divided segments provided with grooves to receive the spokes, a central standard having a socket or bore extending downwardly and out through its side, a disk at the top of the standard, an upper disk having a post projecting downwardly and fitted loosely in said socket or bore, and devices connecting said standard and upper disk to the divided segments, substantially as set forth.

14. In a mold apparatus, the combination of the casing, the whole segments, the alternate divided segments provided with grooves to receive the spokes, the upper and lower inner rings having means for securing them together and forcing said segments outwardly, projections on the upper ring, and projections on said segments, with which the latter engage, substantially as and for the purpose set forth.



15. In a mold apparatus, the combination of the casing, the inner segments having projections, the lifting-chains, a ring suspended thereby, and projections on said ring engaging the projections on the segments, substantially as set forth.

16. In a mold apparatus, the combination of the casing, the whole segments, the alternate divided segments provided with grooves to receive the spokes, the lower portions of which are fixed, a chain connecting the upper ends of the whole segments and the upper divided segments together, and means for lifting the former and latter, substantially as set forth.

17. In a mold apparatus, the combination of the casing, the inner segments, alternate ones of which have wedge-shaped ends, wedge-rings engaging said ends, hooked rods secured at their upper ends to the upper wedge-ring, the hooked ends engaging the under side of the lower wedge-ring, and means for releasing the hooks of said rods from the lower wedge-ring, substantially as and for the purpose set forth.

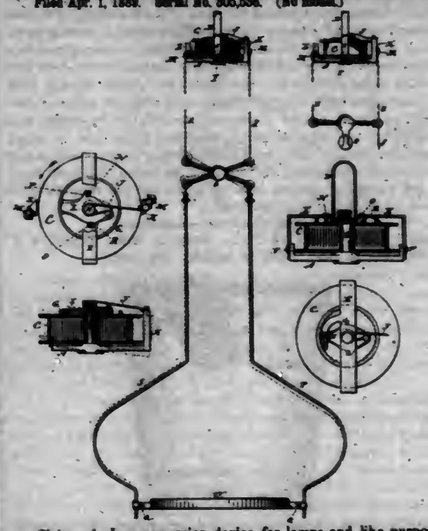
18. In a mold apparatus, the combination of the casing, the inner segments, alternate ones of which have wedge-shaped ends, wedge-rings engaging said ends, hooked rods secured at their upper ends to the upper wedge-ring, the hooked ends engaging the under side of the lower ring, a sliding bar having a projection engaging one of the hooks, and a bell-crank, to one end of which said bar is pivoted, the other end of said bell-crank having engagement with the other hook, substantially as and for the purpose set forth.

408,106. INTEGRATING APPARATUS. HERMAN HOLLERITH, New York, N. Y. Filed May 3, 1889. Serial No. 309,432. (No model.)

Claim.—1. The combination, with a rate-indicator, of a contact-surface shaped to correspond with the curve representing the law of the rate-indicator, mechanism adapted to traverse said contact-surface periodically, mechanism adapted to vary the relative positions of said contact-surface and said traversing mechanism to correspond with the varying rates of flow through the indicator, and a registering device adapted to be actuated while said traversing mechanism is passing across said contact-surface, substantially as and for the purposes set forth.

2. The combination, with a rate-indicator, of a contact-surface shaped to correspond with the curve representing the law of the rate-indicator, a wheel adapted to traverse said contact-surface, mechanism for varying the relative positions of said contact-surface and said wheel to correspond with the rate of flow through the indicator, and registering mechanism adapted to be actuated by the rotation of said wheel, substantially as and for the purposes set forth.

3. The combination, with a rate-indicator, of a revoluble contact-surface shaped to correspond with the curve representing the law of the rate-indicator, a wheel adapted to traverse said contact-surface periodically, mechanism for varying the relative positions of said contact-surface and said wheel to correspond with the rate of flow through the indicator, and registering mechanism adapted to be actuated by the rotation of said wheel, substantially as and for the purposes set forth.



4. The combination, with a rate-indicator, of a revoluble drum having a portion of its surface shaped to correspond with the curve representing the law of the rate-indicator, a wheel adapted to traverse such portion of said surface periodically, an index-arm carrying said wheel and adapted to vary the position thereof relatively to the drum in accordance with the rate of flow through the indicator, and registering mechanism adapted to be actuated by the rotation of said wheel, substantially as and for the purposes set forth.

5. The combination, with a rate-indicator, of a revoluble drum having a raised surface shaped to correspond with the curve representing the law of the rate-indicator, mechanism for revolving said drum at regular intervals, a wheel adapted to engage with and be rotated by said raised or contact surface of the drum as the latter revolves, an arm carrying said wheel and adapted to vary the position thereof relatively to said contact-surface in accordance with the rate of flow through the indicator, and a registering-train adapted to be actuated by the rotation of said wheel, substantially as and for the purposes set forth.

6. The combination, with a rate-indicator, of a revoluble drum having a raised surface shaped to correspond with the curve representing the law of the rate-indicator, mechanism for revolving said drum continuously at a uniform speed, a wheel adapted to engage with and be rotated by said raised or contact surface as the drum revolves, an arm carrying said wheel and adapted to vary the position thereof relatively to said contact-surface in accordance with the rate or flow through the indicator, and a registering-train adapted to be actuated by the rotation of said wheel, substantially as and for the purposes set forth.

7. The combination, with a rate-indicator, of a spring-actuated revoluble drum having a raised or contact-surface shaped to correspond with the curve representing the law of the rate-indicator, a wheel adapted to engage with and be rotated by said raised or contact surface as the drum revolves, an arm carrying said wheel and adapted to vary the position thereof relatively to said contact-surface in accordance with the rate of flow through the indicator, a latch adapted to release said drum and permit it to revolve at regular intervals, a stop to arrest the movement of said drum upon the completion of one revolution, and a registering-train adapted to be actuated by the rotation of said wheel, substantially as and for the purposes set forth.

408,107. SUSPENSION DEVICE FOR LAMPS. WILLIAM C. HOMAN, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed Apr. 1, 1889. Serial No. 305,536. (No model.)

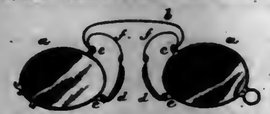
Claim.—1. In a suspension device for lamps and like purposes, the combination of a principal frame, a spring-drum hung upon an axle in said principal frame, an auxiliary frame by which the said device is adapted to be suspended, the said principal frame hung to the auxiliary frame upon an axis at right angles to the axis upon which the drum revolves, and whereby the said drum and its axle are permitted a rocking movement, and an engaging device between said auxiliary frame and the said drum, substantially as described, whereby under such rocking movement of the drum the said engaging device is brought into action with the drum to prevent the reactive force of the spring-drum.

2. In a suspension device for lamps and other articles, the combination of a principal drum, an axle stationary in said frame, a spring-drum arranged to revolve upon said axle, the axle extending through the drum and constructed at its projecting end with an eccentric, an auxiliary frame to which the principal frame is pivoted upon an axis at right angles to the axis upon which the drum revolves, the said auxiliary frame serving as a means for suspending the device, the head of the drum around the eccentric end of the axle constructed with a concentric engaging-surface, a locking-dog between said engaging-surface and said eccentric, the said locking-dog constructed with one or more shoulders, and the auxiliary frame with bearing-points corresponding to said shoulder or shoulders, and with which points said shoulders are adapted to engage under a rocking movement imparted to said drum, with a spring arranged to yieldingly hold the said dog out of engagement with the drum, substantially as described.

3. The combination of the principal frame A, carrying a stationary axle B, the spring-drum C, hung upon said axle, the axle extending through the drum and terminating above in an eccentric H, an auxiliary frame E, hung to said principal frame upon pivots forming an axis upon which the said drum may swing at right angles to the axis upon which the drum revolves, a dog I, hung upon said eccentric H, the end of the drum constructed with a concentric flange G, within which said dog is arranged, the dog constructed with one or more shoulders, and the auxiliary frame with corresponding bearing-points with which said shoulders of the dog are adapted to engage as the drum is rocked, with a spring applied to said dog, the reactive force of which is adapted to hold the said dog yieldingly out of engagement with the drum, but permit its engagement with the drum under a rocking movement of the drum, substantially as described.

4. The combination of a frame provided with an axle, a spring-drum arranged to revolve on said axle, an auxiliary frame by which the said drum may be suspended, the frame of the drum hung to the said auxiliary frame on an axis at right angles to the axis on which the drum revolves, and whereby the drum is permitted a rocking movement at right angles to the axis of its revolution, an engaging device between the said drum and auxiliary frame adapted to interlock with the drum under such rocking movement, and two chains running from the said drum to an evener, and to which evener the thing to be suspended may be hung, substantially as described.

5. The combination of a frame provided with an axle, a spring-drum arranged to revolve on said axle, an auxiliary frame by which the said drum may be suspended, the frame of the drum hung to the said auxiliary frame, and whereby the drum is permitted a rocking movement at right angles to the axis of its revolution, an engaging device between the said drum and auxiliary frame adapted to interlock with the drum under such rocking movement, two chains running from said drum downward, an evener constructed with two points of connection, and to which said chains are attached, and the evener constructed with two other points of connection below said two-chain points of connection, and a harp for suspending a lamp composed of two sides and a fount-ring, the said two sides hinged to the said fount-ring and, extending upward, attached to the said two other points on the evener, substantially as described.

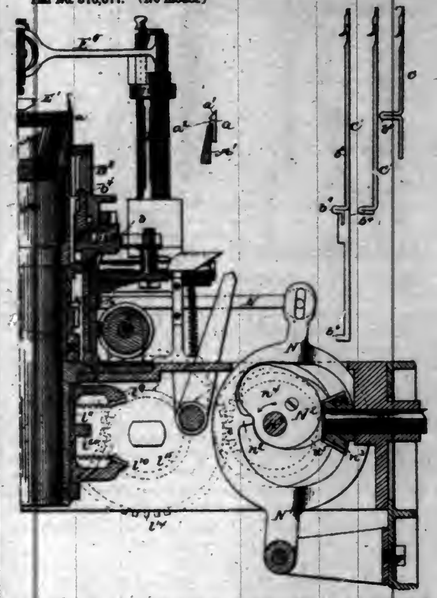


408,108. SHIPPING-PAIL. HERMAN HOWE, Cortland, N. Y. Filed May 26, 1888. Serial No. 312,054. (No model.)

Claim.—1. In a pail for shipping and preserving butter and other dairy products, the combination, with an inner and outer vessel provided with suitable air-passages, of a cover or lid consisting of two sections suitably connected by uprights or pillars, the lower section thereof adapted to fit within the inner vessel and to be supported on a plane below the upper rim or edge thereof, and the upper section adapted to cover the outer vessel and provided with a series of outlet-holes or air-passages, substantially as set forth.

2. The combination of an outer casing having perforations at its bottom, and provided at its upper inner face with a surrounding ridge or supporting-shoulder, an inner containing-vessel provided at its top with a circular flange adapted to bear against and be supported upon the supporting-shoulder of the outer casing, also provided near its top edge with a series of perforations and on its inner face below said perforations with a surrounding flange or ridge, said inner containing-vessel being of such diameter and length as to form a circular air-chamber between the same and the outer casing, and an air-space between the bottom thereof and the base-piece of said outer casing, a double-headed cover or lid made of two sections with an intervening space between said sections, so as to form an upper air-chamber, the upper section thereof provided with a series of exit-openings, and the depending hasps adapted to fit over suitable staples and to be secured thereto by pins or keys, substantially as set forth.

408,109. EYEGLASSES. ROBERT C. KENNEDY, New York, N. Y. Filed Mar. 29, 1889. Serial No. 305,302. (No model.)



Claim.—1. The combination, with the lens-frames and the connecting bow-spring, of nose-pieces pivoted at their lower ends on the lower portions of the lens-frames, and springs independent of the bow-spring connected at their lower ends to the upper ends of the nose-pieces and at their other ends to the upper portions of the lens-frames, substantially as specified.

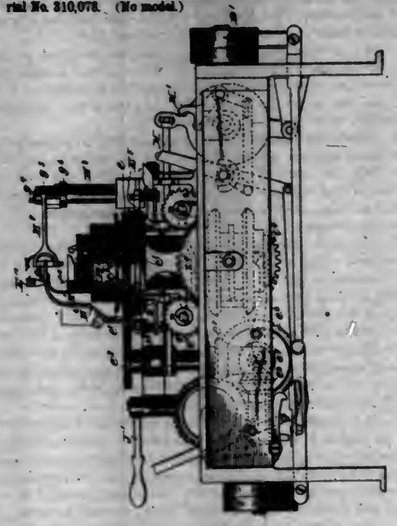
2. The combination, with the lens-frames and the connecting bow-spring, of nose-pieces detachably pivoted at their lower ends to posts on the lower portions of the lens-frames, and springs, independent of the bow-spring, detachably connected at their lower ends to the upper ends of the nose-pieces and at their other ends to posts on the upper portions of the lens-frames, substantially as specified.

3. The combination, with the lens-frames and the bow-spring connecting the same, of nose-pieces pivoted to the lower portions of the lens-frames, and automatically-acting springs curved upward and outward from the upper ends of the nose-pieces to the upper portions of the lens-frames at the points at which the ends of the bow-spring are attached, substantially as described.

408,110. CIRCULAR-KNITTING MACHINE. EDWARD R. KILBOURN, New Brunswick, N. J. Original application filed June 14, 1887, Serial No. 241,243. Divided and this application filed May 9, 1888. Serial No. 310,077. (No model.)

Claim.—1. The combination, substantially as before set forth, of the knitting-cylinder, the cam which operates the gang of fashioning-needles for both circular work and reciprocating work, the cam which operates the other gang of needles for circular work, the gang of fashioning-needles having their nibs arranged to be operated by the said first cam, the other gang of needles having their nibs arranged to be operated only by the said second cam, and the hook-partitions of the nosing by which the work is prevented from rising.

2. The combination, substantially as before set forth, of the needle-cylinder, the cam-cylinder for operating the needles for reciprocating work, the needles, the picker, the carrier, and the hook-partitions of the needle-cylinder, which not only hold down the work during narrowing, but which press the stitches forward out of the way of the needles.



3. The combination, as before set forth, of a needle-cylinder, and cams for both circular and reciprocating work, with a gang of needles all of which are operated for circular work, but a portion of which are thrown out of operation for narrowing during reciprocating work, but which retain their stitches while out of operation, the said needle-cylinder being provided with stationary hook-partitions, which not only hold down the work during narrowing, but press the stitches forward out of the way of the needles.

4. The combination, with a needle-cylinder, of needles a part of which are thrown out of operation for narrowing during reciprocating work, but which retain their stitches while out of operation, and cams for operating the needles for circular and reciprocating work, the said needle-cylinder being provided with stationary hook-partitions between its needle-grooves, said partitions having inclines below the hooks to assist in casting off the stitches, and a part above said inclines and below the hooks for holding the stitches inward out of the way of the needles, substantially as described.

5. The combination, substantially as before set forth, of a needle-cylinder provided at the top with stationary hook-partitions between the needle-grooves, each of said hook-partitions having an outwardly-inclined point at its upper end, the extreme point extending outside of the needles and having all parts of its inner edge below the hook extending as far as or farther inwardly than the outer face of the body of the needle, a series of needles, including narrowing-needles, needle-operating devices, and devices for narrowing and widening.

6. The combination, substantially as before set forth, of two cam-cylinders, one of which only operates during circular work, the gang of fashioning-needles for both circular and reciprocating work having nibs arranged to be operated by the reciprocating cam for reciprocating work, the other gang of needles having nibs arranged to be operated by the first-named cam for circular work, and the hook-partitions, whereby the work is prevented from rising.

408,111. CIRCULAR-KNITTING MACHINE. EDWARD R. KILBOURN, New Brunswick, N. J. Original application filed June 14, 1887, Serial No. 241,243. Divided and this application filed May 9, 1888. Serial No. 310,078. (No model.)

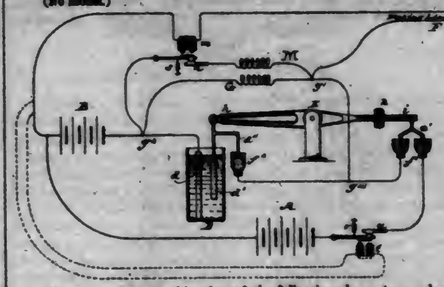
Claim.—1. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders for operating the needles thereof for circular work, the thread-guide for circular work, and a locking device for holding said thread-guide out of its operative position.

2. The combination, substantially as before set forth, of the knitting-cylinder, the two cam-cylinders for operating the needles thereof for circular work, the thread-guide for circular work, and a reciprocating thread-guide, which is reciprocated in combination with one of said cam-cylinders for reciprocating work.

3. The combination, substantially as before set forth, of the reciprocating thread-guide, the stop therefor, and the picker-carrier.

4. The combination, substantially as before set forth, of the needle-cylinder, the needles, the cam by which the needles are operated for reciprocating work, the picker, the picker-carrier, the thread-guide which is operated for reciprocating work, and means for transferring said thread-guide from one side of said cam to the other side thereof, including a stop for said thread-guide moving in a determined relation with the picker-carrier.

5. The combination, substantially as before set forth, of the needle-cylinder, the needles, the cam by which the needles are operated for reciprocating work, the pickers, the picker-carriers, the thread-guide which is operated for reciprocating work, and means for transferring said thread-guide from one side of said cam to the other thereof, including stops mounted on and moving with said picker-carriers.

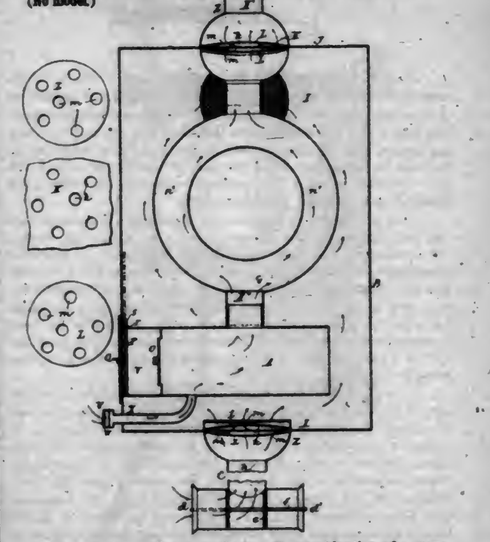


6. The combination, substantially as before set forth, of a knitting-cylinder, the needles, two cam-cylinders, one of which is in operation only during circular work, means for imparting motion to one cam-cylinder for reciprocating work, thread-supplying devices, and means for operating said thread-supplying devices for circular and reciprocating work.

7. The combination, substantially as before set forth, of the knitting-cylinder, the needles, a cam-cylinder which only works during circular work, a reciprocating cam-cylinder, thread-supplying devices for circular work, a separate thread-guide for reciprocating work, and means for operating the latter thread-guide in connection with the reciprocating cam-cylinder.

8. The combination, substantially as before set forth, of a knitting-cylinder and its needles, two cam-cylinders, one of which only works during circular work, and thread-supplying devices, the thread-supplying devices for reciprocating work moving in engagement with the reciprocating cam-cylinder.

9. The combination, substantially as before set forth, of a needle-cylinder and its needles, two cam-cylinders, one of which only works during circular work, and thread-supplying devices, the thread-supplying device for reciprocating work moving in unison with the reciprocating cam through the whole or a part of its movement.

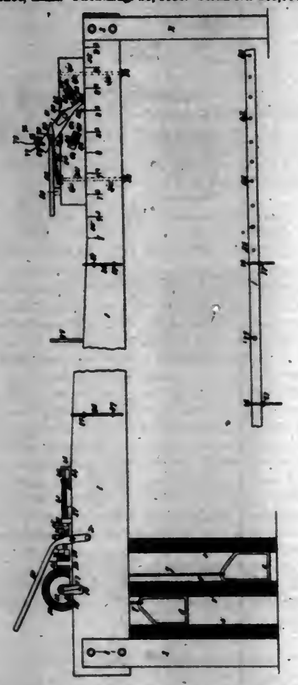


408,112. MEANS FOR MEASURING AND REGULATING THE CHARGE AND DISCHARGE OF SECONDARY BATTERIES. WILLIAM P. KOOKOGEY, Brooklyn, N. Y. Filed July 5, 1888. Serial No. 279,110. (No model.)

Claim.—1. The combination of the following elements: a charging-circuit, a storage-battery, a working-circuit, an electro-depositing cell forming part of both the working-circuit and of the charging-circuit and having one plate movable, and a balance attached at one end to the movable plate and actuating at its other end circuit-connections in the charging-circuit, and a permanent connection between the cell and the working-circuit, substantially as described.

2. The combination of the following elements: a charging-circuit, a storage-battery, a working-circuit, an electro-depositing cell forming part of both the working-circuit and of the charging-circuit and having one plate movable, a balance attached at one end to the movable plate and actuating at its other end circuit-connections in the charging-circuit, and a compensating shunt with a circuit-breaker, such shunt passing around the electro-depositing cell, taking such proportion of the charging-current as will balance the loss by local action in the storage-battery during the discharge, substantially as and for the purpose described.

408,118. RAILROAD-CAR HEATER. FERDINAND KRAFWENKAL and WILLIAM KELLEY, Aurora, Ill. Filed Feb. 1, 1888. Serial No. 262,361. (No model.)



Claim.—1. In a railway-car heater, the combination of a stove-surrounding drum having the openings therein and the two concave or disk-shaped plates L, secured over the same, as set forth, such plates also having openings therein, but lapping or not registering with those in the drum, substantially as and for the purposes set forth.

2. In combination, the perforated drum, concave perforated plates L, applied thereto, as set forth, the wire-netting n, and exterior hemispherical protectors, all substantially as described.

3. The combination of the drum provided with a doorway, guides on its inner surface, and a hole near the doorway, a vertically-sliding door operating in said guides adapted to close the doorway when in its normal position, and having a hole registering with the hole in the drum when in said position, and a swinging door provided with a latch-pin adapted to enter the holes in the drum and sliding door when the doors are in their normal or closed position, substantially as described.

408,114. WIRE-BALE-TIE MACHINE. WILLIAM A. LAIDLAW, Cherokee, Kans. Filed Aug. 23, 1888. Serial No. 283,967. (No model.)

Claim.—1. In a wire-bale tie machine, the combination of the cross-head rest that supports the wire when twisting, the dovetail lug that projects from said cross-head, and the bifurcated clamping-lever provided with a recess between its forks flaring downwardly and having beveled sides, the sides of which clutch the dovetail lug projecting from the cross-head and clamp the same to hold the cross-head with the wire it carries while the strands of the tie-loop are twisting, substantially as and for the purpose set forth.

2. In a wire-bale-tie machine, the combination of the cross-head rest that supports the wire in front of the twister-shaft while twisting, the dovetail lug that projects from said cross-head, the bifurcated clamping-lever provided with a recess 48 between its forks, the sides of which clutch the lug projecting from the cross-head, the shaft that is carried by the cross-head at one end and in bearings in the pedestals 43 at the other end, and the spiral spring mounted on said shaft that allows the cross-head to retreat before the clamping-lever and springs it back again to its work, substantially as and for the purpose set forth.

3. In a wire-bale-tie machine, the combination of the cross-head rest 39, provided with a slotted base, the lug that projects from said cross-head rest, the clamping-lever, the clutch-hold provided in the crotch of said lever to clasp said lug, the spring-mounted shaft integral with the cross-head, having bearings within the pedestals 43, which are secured to the head-block, the twister-frame, the rotary twister-shaft, the former on the end of said shaft, and the tongue that projects forward from the twister-frame on which the slotted base of the cross-head slides, substantially as and for the purpose set forth.

4. In a wire-bale-tie machine, the combination of the head-block and bench-beam of the machine to which said head-block is secured, the bolted connection of the head-block to the beam adjustable to the length of the bale-ties, the combined stretcher and cutter lever, the cutter-edged point of said lever, the pivot on which said lever works, a set-screw for adjusting said lever, and the anvil-bar on which the cutter end of said lever operates, substantially as and for the purpose set forth.

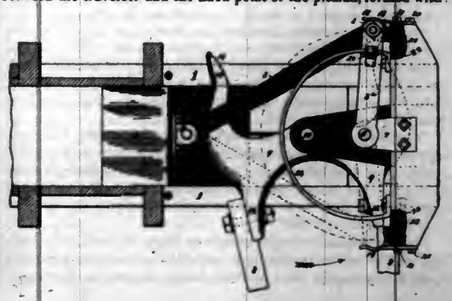
5. In a wire-bale-tie machine, the combination of the head-block, the combined stretcher and cutter lever, the cutter-edged point of said lever, the anvil-bar, the yoke 57, the pivotal connection of said yoke to the head-block, and the pivotal connection of said lever to said yoke, substantially as and for the purpose set forth.

6. In a wire-bale-tie machine, the combination of the adjustable head-block, the yoke pivoted to said head-block, the combined stretcher and cutter lever pivoted to said yoke, the anvil-bar, and the fulcrum set-screw that works in the projecting lug of the yoke, arranged to adjust the presentation of the edged point of said stretcher and cutter-lever, substantially as and for the purpose set forth.

7. In a wire-bale-tie machine, the combination of the pivoted yoke, the combined stretcher and cutter lever pivoted to said yoke, the fulcrum set-screw by means of which said lever is adjusted to its work, and the anvil-bar that rocks on the pivot-bolt of said yoke, substantially as and for the purpose set forth.

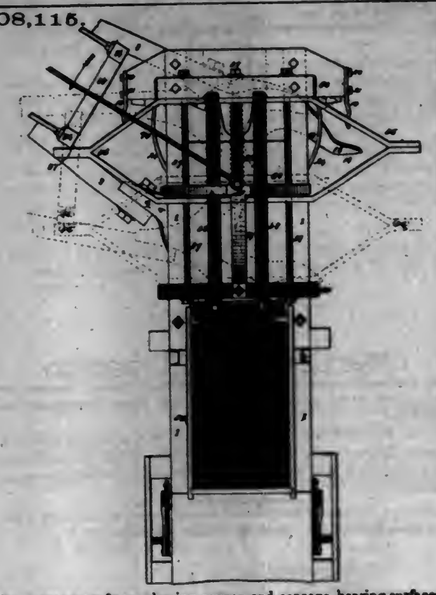
8. In a wire-bale-tie machine, the combination of the pivoted yoke, the combined stretcher and cutter lever pivoted to said yoke, the rocking anvil-bar that is self-adjusting on the pivot-bolt of said yoke, the steel face of said anvil-bar that carries the bale-wire at the point of intended severance, and the pendent arm of said bar, substantially as and for the purpose set forth.

9. In a wire-bale-tie machine, the combination of the pivoted yoke, the combined stretcher and cutter lever pivoted to said yoke, the fulcrum set-screw by means of which said lever is adjusted, the self-adjusting anvil-bar that rocks on the pivot-bolt of said yoke, the pendent arm of the anvil-bar, the adjustable buffer-plates that relatively stay the rock of said arm to present the face of the anvil at the position for the grip on the wire of the edge of the stretcher and cutter lever and at the position for said edge to commence to effect its cut, and the set-screws that fasten said adjustment of the buffer-plates, substantially as and for the purpose set forth.



10. In a wire-bale-tie machine, the combination of the pivoted yoke, the combined stretcher and cutter lever, the fulcrum set-screw by means of which said lever is adjusted, the self-adjusting anvil-bar, the adjustable buffers that limit the movement of said anvil-bar, and the buffer-plates secured on top of the head-block that limit the movement of said yoke, substantially as and for the purpose set forth.

11. In a wire-bale-tie machine, the combination of the adjustable head-block, the yoke pivoted to said head-block, the combined stretcher and cutter lever pivoted to said yoke, the fulcrum set-screw by means of which said lever is adjusted, the self-adjusting anvil-bar, the adjustable buffers that limit the movement of said anvil-bar, the reactionary spring 72, that after the elevation of the pivoted yoke withdraws it to its normal position, and the rest-block 80, on which the said lever reclines when inoperative, substantially as and for the purpose set forth.



12. In a wire-bail-tie machine, the combination of the adjustable head-block, the graduated scale to which said head-block is adjusted, the combined stretcher and cutter lever pivoted to said head-block, the fulcrum set-screw against which said lever is adjusted, the self-adjusting anvil-bar, the vertical stop-rod that prevents the falling of the bale-ties on the wrong side of the machine, the folding depository-hooks that catch and hold the finished bale-ties as they fall from the machine, and the top hooks that lock the depository-hooks, respectively, in their operative and folded positions, substantially as and for the purpose set forth.

408,115. BALING-PRESS. WILLIAM A. LAIDLAW, Cherokee, Kans. Filed Nov. 14, 1888. Serial No. 290,772. (No model.)

Claim.—1. The combination, with a traverser and a jointed pitman connected at its inner end to the traverser and at its outer end to a fixed point, of a sweep having a head connected to a fixed point between the traverser and the fixed point of the pitman, formed with

408,115.

inner prongs or fingers having convex and concave bearing-surfaces, substantially as described.

2. The combination, with a traverser, of the jointed pitman having a friction-roller at the joint, and the sweep having a head connected to a fixed point between the traverser and the outer fixed point of the pitman, formed with inner prongs or fingers adapted to bear on the roller of the pitman, substantially as described.

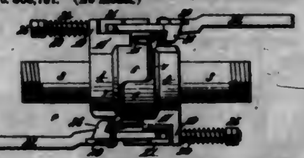
3. The combination, with the frame, the traverser, and the jointed pitman, of the plates 18, bolts 20 and 21, and springs 23, substantially as described.

4. The combination, with a frame and a traverser, of the jointed pitman having bent upper and lower links P, provided with rollers 25, and the upper and lower semicircular tracks 24, supported on the frame, forming guides for the outer part of the pitman and extending between the bent portions of the links and the joint of the pitman, substantially as described.

5. The combination, with a frame and a traverser, of the returning device for the traverser, consisting of the rope 27, passed through the frame, the cross-piece 30, the sleeve 33, the rod 26, sliding in the cross-piece and in the sleeve, having a projection 31, and a spring 32 between the cross-piece and the projection, substantially as described.

6. The combination, with a frame and a traverser, of the returning device for the traverser, consisting of the rope 27, passed through the frame, the pulley 28, the cross-piece 30, the sleeve 33, the rod 26, sliding in the cross-piece and in the sleeve, having a projection 31, and a spring 32 between the cross-piece and the projection, substantially as described.

7. The combination, with a frame having a baling-chamber formed with a yielding delivery end, of the rods 35, cross-heads 36 and 37, blocks 39 and 40 on the cross-heads, screw 38, turning on the lower block and working in the upper block, provided with a ratchet-wheel 41, lever 42, pivoted to the screw, double pawl 43, pivoted to the lever, plate 45, pivoted to the lever, having hand-pieces 47, and the rods 44 on opposite sides of the lever connecting the double dog with the plate, substantially as described.



8. The combination, with a frame having a hopper over the baling-chamber formed with a movable front end, of the sweep having a head, the posts on the sweep, the guide-rods, the frame 56, sliding on the guide-rods, the strips connecting the front end of the hopper with the sliding frame, and means for returning the latter, substantially as described.

9. The combination of a traverser, a sweep having a head for operating the traverser, a hopper having a bottom 52 and a movable end 53, and a frame 56, against which the sweep impinges and which is connected to the movable end of the hopper, substantially as described.

10. The combination of a sweep having a head, a hopper having a bottom 52 and a movable end 53, and a frame 56, against which the sweep impinges and which is connected to the movable end of the hopper, substantially as described.

11. The combination of a traverser, a sweep having a head for operating the traverser, having posts 54, a hopper having a bottom 52 and movable end 53, a frame 56, connected to the movable end 53, guide-rods 59, and spring 62, substantially as described.

408,116. BRAKE-HOSE COUPLING. EDWIN A. LELAND, Brooklyn, N. Y., assignor to Leonard Richardson, same place. Filed Apr. 11, 1889. Serial No. 306,787. (No model.)

Claim.—1. In a brake-hose coupling, the combination, with two separable coupling-sections, of levers pivoted thereon in bearings, which yield against the tension of springs, each lever having a cam engaging a cam projection on the opposite section, a latch on each coupling-section, and a spring-actuated dog pivoted on each locking-lever and having a catch to engage a latch, substantially as described.

2. In a brake-hose coupling, the combination, with two separable coupling-sections, of locking-levers pivoted thereon and having cams engaging with cam projections on the opposite section, and spring-actuated dogs pivoted on the levers and automatically engaging latch-pieces on the coupling to hold the two levers in locking position, substantially as described.

3. In a brake-hose coupling, the combination of the two sections of a coupling, each having at one side a bracket provided with a hole and at the opposite side a cam projection, a headed bolt extending through and lengthwise movable in the hole of each bracket, a spring encircling each bolt between its head and the bracket, a locking-lever pivoted to each bolt at the side of the bracket opposite the spring, a latch on each coupling-section, and a spring-actuated dog pivoted on each lever in advance of the pivot-point of the latter and having a catch to engage a latch, substantially as described.

4. In a brake-hose coupling, the combination, with two separable coupling-sections, each having upon one side a cam projection, and upon the other side a pivoted locking-lever, of dogs pivoted upon said levers and having inwardly-turned catches beveled upon their lower surfaces, and springs housed in the levers and drawing upon rods connected to said levers having cams engaging the cam projections, and the latter being provided with latch-pieces for the catches on the dogs, substantially as described.

408,117. GATE. JOHN R. LITTLE, Princeton, Ind. Filed Mar. 19, 1889. Serial No. 303,836. (No model.)

Claim.—1. The combination of a gate and posts, a reciprocating

bar mounted upon these posts, suitable operating-levers connected to this bar, an arm H, pivoted to one of the posts, and pivotal links connecting this arm to the gate and bar, substantially as described.

2. The combination of a gate and suitable posts, a reciprocating bar and operating-levers, a latch-bar on the gate, an arm H, pivoted to one of the posts and connected to this latch-bar by means of a link, and a pivotal link connecting this arm to the reciprocating bar, substantially as and for the purpose set forth.

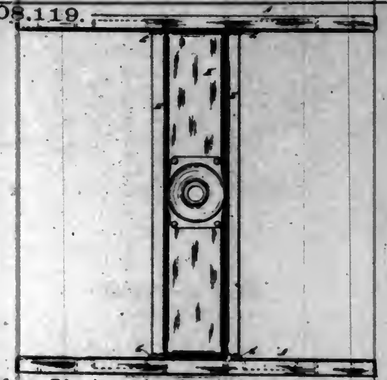
408,118. CHAIR. GEORGE E. LORD, Utica, N. Y. Filed Mar. 6, 1889. Serial No. 302,092. (No model.)

Claim.—1. The combination, with a chair, of a back hinged thereto, a horizontal reciprocating lever pivoted at one end to the chair-back, a plate secured to the frame-work and provided with a perforation, a pin projecting from the plate, and a spring attached at one end to the free end of the horizontal reciprocating lever and at its other end coiled about the pin on the plate, the free end of said spring being inserted in the perforation in said plate, substantially as set forth.

2. The combination, with a chair, of a back hinged thereto, a notched lever pivoted at one end to the back and extending beneath an arm of the chair without contact therewith, a bar secured to the frame, a shell passing through said bar, a spring incased within the shell, a bolt passing through the shell in engagement with the spring and adapted to engage the notches of the lever, and a spring connecting the lever and chair-frame, substantially as set forth.

3. The combination, with a chair, of a back hinged thereto, a lever having notches pivoted to said back, an upright bar secured to the frame, a shell passing through said bar, a spring-sustained bolt passing through said shell and adapted to engage the notches of the lever, a plate secured to said upright bar having a slot to receive the head of the bolt, and a spring secured at one end to the lever and at the other end to the chair-frame, substantially as set forth.

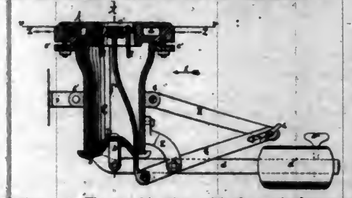
4. The combination, with a chair-frame, of a block mounted to slide in ways beneath the seat, a hanger having laterally-projecting curved arms secured to one end of said block and projecting below the under face thereof, a yoke adapted to slide upon said arms of the hanger and bear against the under face of the sliding block, and a foot-rest pivoted to the free end of the yoke, substantially as set forth.



5. The combination, with a chair-frame, of a sliding block mounted therein, a notched plate secured to said block, a yoke carried by the block and adapted to engage the notched plate, and a foot-rest attached to said yoke, substantially as set forth.

6. The combination, with a chair-frame, of a sliding block mounted therein, a curved notched plate secured to said block, a yoke carried by the block and adapted to engage the notches of the curved plate, and a foot-rest attached to said yoke, substantially as set forth.

7. The combination, with a chair-frame, of a sliding block carried thereby, a notched plate secured to the under side of said block, a yoke carried by the block and adapted to engage the notched plate, guide-pins on said yoke and embracing a portion of the plate, and a foot-rest pivoted to said yoke, substantially as set forth.



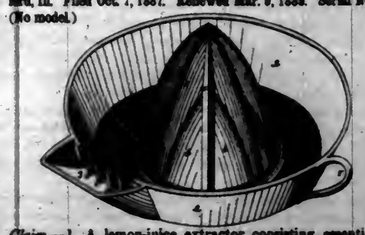
408,119. PRESSED-STEEL TRUCK. EDWARD W. M. HOUSER, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed May 23, 1889. Serial No. 311,877. (No model.)

Claim.—1. The combination of the wheel-pieces A A, formed of pressed steel and flanged at C, with the pressed-steel transom D, having flanges E bearing against the side frames, thereby insuring the parallelism of the side frames without end frames, substantially as described.

2. The combination of the side frames A A, of pressed steel, and having flanges C, with the transom D, of pressed steel, having flanges E, and lugs G G G G, pressed from the flanges E, substantially as described.

408,120. FORGE-TUYERE. JOHN MALQUIST, Salt Lake City, Utah. Filed Mar. 12, 1888. Serial No. 266,902. (No model.)

Claim.—1. The combination, with the conical tuyere-nozzle, of the perforated circular sliding valve and the valve-guides controlling the sliding valve, substantially as described.



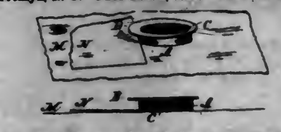
2. The combination, with a conical tuyere-nozzle, of a circular valve having outward tapering aperture and guided to slide centrally within the said nozzle and adapted to close the outer end thereof, for the purpose set forth.

3. The combination, with a conical tuyere-nozzle, of a circular valve having two diametrically-opposite crescent-shaped apertures, and guided to slide centrally within the said nozzle and adapted to close the outer end thereof, for the purpose set forth.

4. The combination, with a tuyere-plate having conical nozzle and a downwardly-projecting hollow body attached to said plate, of a circular valve guided to slide centrally in the said nozzle, a lever G, fulcrumed to the said body and pivoted to the valve-rod, and an arm pivoted to the said body, the free ends of the said arm and lever being adjustably secured together to vary and maintain the elevation of the said valve, substantially as specified.

5. The combination, with a tuyere-plate having conical nozzle and a downwardly-projecting hollow body attached to said plate, of a circular valve guided to slide centrally in the said nozzle, a lever fulcrumed to the said body and pivoted to the valve-rod, and an arm pivoted to the said body, the free ends of the said arm and lever being provided with thumb-screw and slot to adjustably secure them together for varying and maintaining the elevation of the said valve.

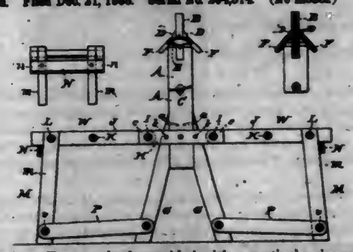
408,121. LEMON-JUICE EXTRACTOR. JOHN P. MANEY, Rockford, Ill. Filed Oct. 7, 1887. Renewed Mar. 9, 1889. Serial No. 302,744. (No model.)



Claim.—1. A lemon-juice extractor consisting, essentially, of a reservoir-base having a strainer located at the side of the reservoir, a tapered extractor uprising from and formed integral with the bottom of the reservoir-base, the exterior surface of the extractor provided with projections, substantially as set forth.

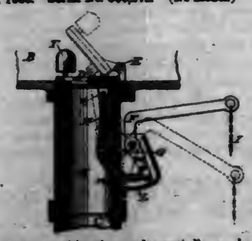
2. A lemon-juice extractor consisting, essentially, of a reservoir-base having a spout, a strainer located at the side of the reservoir, a handle, and a tapered extractor uprising from and formed integral with the bottom of the reservoir-base, the exterior surface of the extractor provided with projections, substantially as set forth.

3. A juice-extractor consisting, essentially, of a ribbed extractor, a reservoir-base forming a support for the extractor, a discharge-spout connected with the side walls of the reservoir, and fingers rising within the discharge-spout to operate as a strainer, substantially as set forth.



408,122. FEED-GAGE FOR PRINTING-PRESSES. EDWARD L. MERRILL, Brooklyn, N. Y. Filed Nov. 2, 1885. Serial No. 181,502. (No model.)

Claim.—1. A metallic gage for printing-presses, provided with a filling or wafer of fibrous or other material having affinity for gum or paste, substantially as herein described.

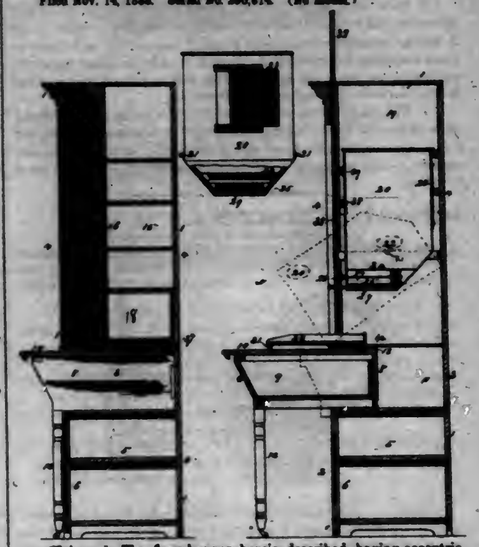


2. A metallic gage A, having ledge B and lugs D, and provided with a filling or wafer of fibrous or other material having affinity for gum or paste, substantially as herein described.

408,123. FOLDING WASH-BENCH. JAMES R. MERRIMAN, La Grange, Ind. Filed Dec. 21, 1888. Serial No. 294,314. (No model.)

Claim.—The standard provided with a vertical wringer-attachment board B, having the cover-joint ribs D, the extended hinge-brackets, and the drip-boards F, pivoted to said brackets, substantially as specified.

408,124. FLUSHING-VALVE. GILBERT MICHAUD, New York, N. Y. Filed Apr. 6, 1889. Serial No. 306,372. (No model.)



Claim.—1. The combination, substantially as described, with a pipe and a valve automatically closing the same transversely to its bore, of a lever pivoted upon the outer periphery of the pipe, an arm actuated thereby and curved to extend through the peripheral wall of the pipe upon an arc having the pivot of the lever as its center, and an intermediate link extending longitudinally within the pipe substantially parallel with its bore.

2. The combination, with a pipe, a valve closing the same, and a lever pivoted laterally upon the outer face of the pipe having an arm extending into the pipe upon a curve, having the pivot as its center, and which is coupled to the valve to move it, of an outer case or safe secured to or formed upon the pipe to inclose the lever and its arm below the pivot, substantially in the manner and for the purpose herein set forth.

3. The combination, with a water-closet bowl or hopper, a service-box connected with a water-main under pressure, and an intermediate connecting-pipe, of a valve closing said pipe and opening toward the tank, a lever pivoted upon the outer periphery of the pipe and having an arm curved to extend and move with a close joint through the peripheral wall of the pipe upon an arc having the pivot of the lever as its center, a link extending longitudinally within the pipe and coupling the arm and valve, and a device for operating the lever from the closet, substantially in the manner and for the purpose herein set forth.

408,125. KITCHEN-CABINET. GEORGE E. MILLER, St. Louis, Mo. Filed Nov. 14, 1888. Serial No. 290,814. (No model.)

Claim.—1. The flour-hopper herein described, having eccentric trunnions, its upper end being closed and having an opening at its back, in combination with a frame having bearings for said trunnions, said frame being open at the front a considerable distance above and below the trunnions to permit said hopper to move a distance of more than a quarter of a circle, whereby one of its edges is adapted to come in contact with said frame and bring the opening to the top, substantially as set forth.

2. In combination with an outwardly-swinging flour-hopper mounted in a suitable frame, a removable cross-bar to keep the hopper in upright position, substantially as set forth.

3. In combination with a flour-hopper supported on trunnions, a flour-drawer beneath having feet at its front end and a sliding table beneath the drawer, upon which the drawer is supported when the table is drawn out, substantially as set forth.

4. The combination, with a flour-hopper, of a coarser and finer sieve secured to the hopper, with a chamber between them, and movable brushes in said chamber and bearing on both of said sieves, substantially as and for the purpose set forth.

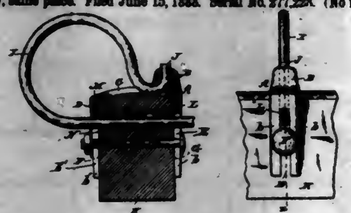
5. The combination, in a flour-hopper, of the described coarser upper sieve and finer lower sieve at the discharge of the receptacle, brushes between the sieves bearing upon the sieves, and slide-valve controlling the discharge of the receptacle, substantially as set forth.

6. The combination, in a kitchen-cabinet, of a sliding table having a projection at the rear and a projection above the table, with which aforesaid projection comes in contact to limit the movement of the table, substantially as set forth.

408,126. CHURN. BUTLER MITCHUM, Hammondsville, Ky. Filed July 5, 1888. Serial No. 278,140. (No model.)

Claim.—1. In a churn, the combination, with the top thereof and a dasher-rod having a flange or extension, of a spiral spring mounted

on said churn-top and having a ring or collar at its upper extremity serving as a rest for said flange, and a sack or cover having angular projections to receive the coils of the spring and having, also, a ring or collar at its top, for the purpose set forth.



2. In a churn, the combination, with the top thereof and a dasher-rod, of a ring or disk D, having depending spring-arms E, and a ring or disk J, likewise having spring-arms J', all substantially as and for the purposes herein set forth.

3. In a churn, the top thereof, a spiral spring mounted on said churn-top, and a dasher-rod, in combination with rings or disks D and J, having depending spring-arms E and J', respectively, and a sack or cover encircling the spiral spring formed to move in unison therewith and having its upper end secured to the dasher-rod and its lower end located between the rings or disks D and J.

4. The combination, with a churn-top, of a spring mounted thereon, a dasher-rod having a flange adapting it to rest on said spring, and a sack or cover encircling said spring and having its upper extremity secured to said spring, whereby the latter and said cover will move in unison.

408,127. WITHDRAWN.

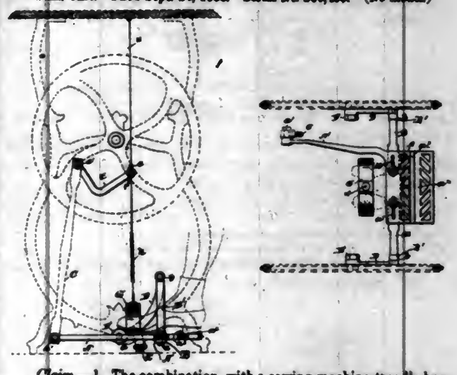
408,128. CLIP OR SADDLE RAKE-TOOTH HOLDER. LEONARD W. O'BRIAN, Bellevue, Ohio, assignor to the Fremont Cultivator Company, same place. Filed June 15, 1888. Serial No. 277,228. (No model.)

Claim.—1. A tooth-fastening of the character described, consisting of a clip provided with a socket and a slot at the top, and having fingers which extend below the plane of the top of the clip, forming U-shaped openings, in combination with a rake-head having a transverse perforation and a rake-tooth extending through said perforation in the rake-head and through the U-shaped openings in the clip, all constructed and combined to operate substantially as and for the purposes specified.

2. A tooth-fastening of the character described, consisting of a clip provided with a socket and a slot at the top, and having fingers which extend below the plane of the top of the clip, forming inverted-U-shaped openings open at the bottom, in combination with a rake-head having a transverse perforation small at the front and larger at the rear, and a rake-tooth extending through said perforation in the rake-head and the U-shaped slots and fitting within the socket at the top of the clip, all constructed and combined to operate substantially described.

3. A tooth-fastening of the character described, consisting of a clip provided with a socket and a slot at the top, and having fingers which extend below the plane of the top of the clip, forming inverted-U-shaped openings, in combination with the rake-head having a transverse perforation small at the front and larger at the rear, and a rake-tooth extending through said perforation in the rake-head and fitting within the socket at the top of the clip and extending through the U-shaped openings in the clip and abutting against a portion of the rake-head above the small end of the perforation in the front of the rake-head, substantially as and for the purposes specified.

408,129. WASTE-BASKET. JOHN H. OSBORN, Auburn, N. Y. Filed Jan. 26, 1889. Serial No. 297,631. (No model.)



Claim.—1. In combination with a writing-desk, an angular waste-basket hinged to the outside corner and arranged to swing from an exposed position in front of the desk to a position beyond the end of the same.

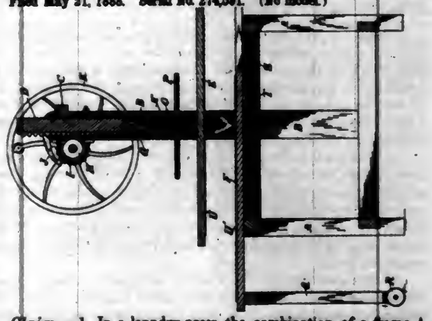
2. The desk having hinges on its outer corner, in combination with the basket or receptacle mounted on said hinges to swing wholly outside of the desk from a position beyond the end to a position at the front, said hinges adapted, as described and shown, to permit the disconnection of the receptacle.

408,130. NON-MAGNETIC ALLOY. HENRICH OTTENBAHN and CHARLES LACROIX, Geneva, Switzerland, assignors to the Usine Genevoise de Dégrossissage d'Or, same place. Filed May 13, 1889. Serial No. 310,634. (No specimens.)

Claim.—A non-magnetic alloy composed of nickel, chromium, platinum, copper, zinc, lead, and tin, in the proportions and substantially as described.

408,131. SEWING-MACHINE TREADLE. WILLIAM F. OTIS, Norwalk, Ohio. Filed Sept. 27, 1888. Serial No. 286,496. (No model.)

Claim.—1. The combination, with a sewing-machine treadle having a longitudinal rib or flange thereon, of upwardly-projecting arms adjustably attached to the treadle and located in front of said rib, and pivoted to the machine-supports, and a pitman connecting the front end of the treadle with the crank of the machine, substantially as set forth.



2. The combination, with a sewing-machine treadle having upwardly-projecting arms pivotally mounted, substantially as indicated, of a swinging stirrup for supporting the forward part of the foot of the operator, substantially as set forth.

3. The combination, with a sewing-machine treadle having a seat for engaging the heels of the operator, of a stirrup for supporting the forward parts of the feet, such stirrup being suspended from above, so as to swing with the movement of the treadle, substantially as set forth.

4. The combination, with a treadle having arms pivoted substantially as indicated, of brackets connected by bolts with the legs of the machine, such brackets pivotally supporting the said arms and treadle, lateral arms connected with such brackets, and adjusting-screws connected with such lateral arms, said adjusting-screws engaging the floor, substantially as set forth.

5. The combination, with a treadle substantially as indicated, of a pitman for connecting the treadle with the crank of the sewing-machine and a link mounted on the crank and adjustably secured thereto, such link having a wrist for connecting with the pitman, substantially as set forth.

408,132. LAUNDRY-PRESS. ADRIAN OTTE, Grand Rapids, Mich. Filed May 21, 1888. Serial No. 274,591. (No model.)

Claim.—1. In a laundry-press, the combination of a frame A with a horizontally-movable board F, having the leg Q, provided with a roll R, and the vertically-movable board E, provided with means for raising, lowering, and pressing upon the same, substantially as described.

2. In a laundry-press, the combination of a frame A, provided with strips S, with a horizontally-movable board F, having hooks T, engaging with said strips, and a vertically-movable board E, provided with means for raising, lowering, and pressing upon the same, substantially as described.

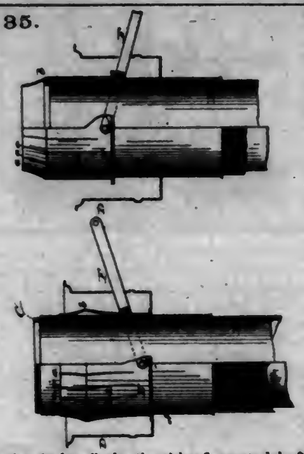
3. In a laundry-press, the combination of a frame A, having strips S, with a board F, having hooks T and leg Q, and a vertically-movable board provided with means for raising, lowering, and pressing upon the same, substantially as described.

4. In a laundry-press, the combination of a frame A with a horizontally-movable board or top F, the post B, shaft L, having a hand-wheel K, ratchet I, pawl J, and pinion H, the post D, having the rack G and latch M, and the board E, attached by the screw O, substantially as described.

408,133. MOWING-MACHINE. GARDNER B. PARKER, Worcester, Mass., assignor to the Richardson Manufacturing Company, same place. Filed June 11, 1888. Serial No. 276,712. (No model.)

Claim.—In a mowing-machine, the combination, with a stand supported on the frame of the machine, having a stop-notch 6 and a holding-notch 6' in its upwardly-projecting edge and a smooth rim between the notches, and a stud 12, on which is supported a spiral spring 13, bearing at one end against the lifting-lever pivoted concentrically with the stud and bearing at the other end on said stand, of the lifting-lever carrying a sliding dog to engage said notches, a chain-cam secured to said lever, and a chain 8, secured to said cam and to the hinged bar 9, and said bar hinged at its lower end to the inside shoe, the finger-bar 19, secured at its inner end to the shoe, and said shoe having an inwardly-projecting part carrying a stud, and a spiral spring 18, supported on said stud and interposed between the lower end of the hinged bar 9 and the projecting part of the shoe, for the purpose stated, substantially as set forth.

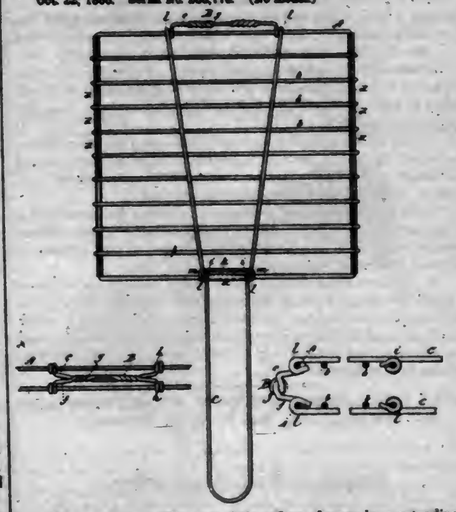
408,134. SCHOOL-FURNITURE. JOHN PEARD, Brooklyn, N. Y. Filed Apr. 19, 1889. Serial No. 307,641. (No model.)



Claim.—1. A school-desk comprising the following elements: the end legs A, the back B, the back board H, the brackets I, secured to the outside of the back board and carrying the seat-arms G, and the separate brackets K, secured to the inside of the back board and to the inside of the desk-back, substantially as described.

2. A school-desk comprising the following elements: the end legs A, the back B, the book-rack J, having the rigid back board H, the brackets I, secured to the outside of the back board and carrying the seat-arms G, the separate brackets K, arranged on the inside of the back board and rising along the desk-back, and the bolts M, passing through the seat-carrying brackets, the back board, and the back-sustaining brackets, substantially as described.

408,135. CENTRAL-DRAFT LAMP. EUGENE H. PECK, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed Feb. 4, 1889. Serial No. 298,609. (No model.)

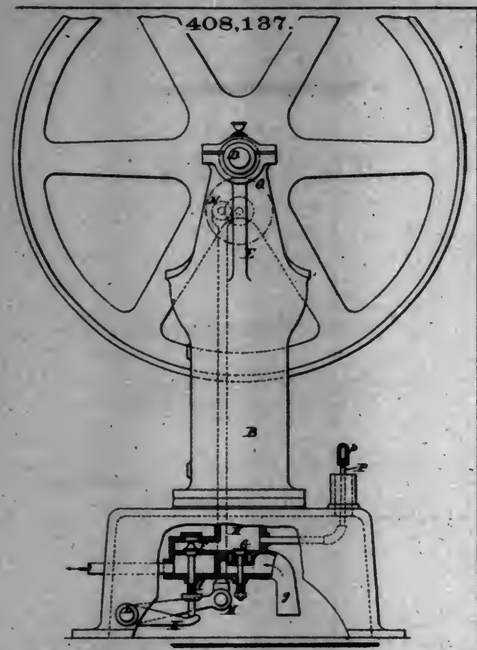


Claim.—1. In a central-draft lamp, a sleeve arranged upon the tube which surrounds the wick and so as to slide vertically thereon, the upper end of the said sleeve forming a series of vertical springs around the tube, their upper ends bent inward, so that when the sleeve is raised the upper ends of the springs will close inward around and above the upper end of the wick, and on the descent of the sleeve the said springs will spread and pass onto the outside of the tube, substantially as described.

408,135.

2. The herein-described extinguisher for central-draft lamps, consisting of a sleeve E arranged upon the outside of the tube and so as to move vertically thereon, the upper end of the said sleeve slit to form a series of vertical springs integral with the sleeve, the upper ends of the springs bent inward, so as to close over the wick when the sleeve is raised, and a lever hung to the sleeve and extending through the burner, substantially as described.

408,136. GRIDIRON. WILLIAM C. PERKINS, New Haven, Conn., assignor to the New Haven Wire Goods Company, same place. Filed Oct. 22, 1888. Serial No. 288,773. (No model.)



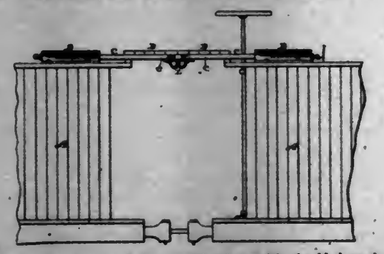
Claim.—A wire gridiron consisting of two frames, bars extending across each frame and secured to opposite sides, a hinge B, connecting the two frames and consisting of two wires twisted about each other, the ends of the wires bent around the adjacent sides of the respective frames, substantially as described.

408,137. GAS-MOTOR ENGINE. JOHN J. PURNELL, Lambeth, County of Surrey, England. Filed May 15, 1889. Serial No. 310,860. (No model.) Patented in England July 12, 1888, No. 10,105.

Claim.—A gas-motor engine having a vertical cylinder made with brackets projecting up therefrom to carry the crank-shaft, and having in a hollow base under the cylinder a valve-box containing a self-acting air and gas supply valve and an exhaust-valve closed by a spring and opened at every alternate revolution of the crank-shaft by a lever worked by a crank eccentric or cam caused to revolve by gear at half the speed of the shaft, having also in communication with the cylinder-bottom an igniting-pipe heated by a burner, this pipe being adjustable in length, all substantially as described.

408,137.

408,138. METHOD OF GELATINIZING ELECTROLYTES FOR GALVANIC BATTERIES. PAUL SCHOOP, Zürich, Switzerland. Filed Mar. 30, 1889. Serial No. 305,443. (No model.)

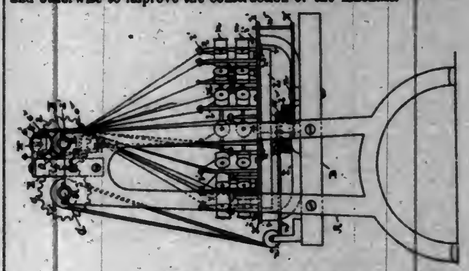


Claim.—1. The herein-described method of converting the electrolyte of a galvanic battery or pile into a gelatinous mass by the addition to said electrolyte of a sufficient quantity of water-glass, substantially as specified.

2. The herein-described method of converting the electrolyte of a galvanic battery or pile into a gelatinous mass by adding to said electrolyte a sufficient quantity of water-glass and a mineral acid, (such as sulphuric acid,) substantially as specified.

3. The herein-described method of converting the electrolyte of a galvanic battery or pile into a gelatinous mass by the addition thereto of a sufficient quantity of water-glass and the sulphate of alumina, substantially as specified.

4. The herein-described method of preparing the electrolyte of a galvanic battery or pile by converting said electrolyte into a gelatinous mass by the addition thereto of sufficient quantities of water-glass and a mineral acid (such as sulphuric acid) and covering or coating said mass with a bland soft material, such as wax or paraffine, substantially as specified.



408,139. CAR-ROOF ATTACHMENT. WILLIAM P. SETTLES, La Due, Mo. Filed Jan. 14, 1889. Serial No. 296,328. (No model.)

Claim.—In a car-roof, the combination, with the U-shaped supporting-rods, the castings secured to the roof of the car, into which the ends of the said supporting-rods move back and forth, springs within the said castings which engage the ends of the rods and force them outward, and a flooring secured to the outer end of the support, of a bracket secured to the under side of the said support at its outer extremity, having a vertical bearing-surface for engaging a similar bracket upon the roof of the adjacent car, for the purpose shown and described.

408,140. DOUBLING-MACHINE. JOSEPH H. SEARS, Lenox, assignor to himself, and the Housatonic Silk Company, Florence, Mass. Filed Aug. 27, 1888. Serial No. 283,969. (No model.)

Brief.—The objects of the invention are to provide a doubling-machine in which the strain upon the filaments will be uniform and which will enable any desired number of supply-bobbins to be used, and otherwise to improve the construction of the machine.

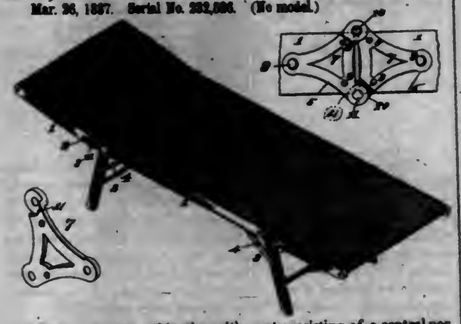
Claim.—1. In a doubling-machine, the combination of the following instrumentalities, viz: a spindle adapted for carrying a receiving-bobbin, a revoluble frame carrying a rack, which rack supports a series of supply-bobbins, means, substantially as described, for revolving said spindle and frame, a series of vertical rods mounted upon said frame adjacent to said supply-bobbins, an annulet loosely mounted upon each of said rods, which annulets serve as guides for the filaments from said supply-bobbins as they pass to the receiving-bobbin, and which are retained at or near the upper ends of the rods by said filaments, a shipping-ring located adjacent to and circumscribed about said frame, said shipping-ring being supported in such manner as to be capable of a limited revolving movement, and having a series of lugs projecting into the path of movement of said annulets when the latter are at the bottom of their supporting-rods, a lever governing the application of power to said frame, whereby the latter is revolved, and intermediate connections, substantially as described, between said shipping-ring and said lever for disconnecting the power by the movement of said ring, whereby the descent of one of said annulets to the bottom of its rod will effect the stoppage of the movement of the frame, substantially as set forth.

2. In a doubling-machine, a spindle adapted for carrying a receiving-bobbin, a revoluble frame supporting a series of supply-bobbins, means, substantially as described, for revolving said spindle and frame, releasing devices, substantially as described, for disconnecting the power from said spindle and also from said frame, a series of annulets held in an elevated position upon said frame by the filaments passing from said supply-bobbins to said receiving-bobbin, a shipping-ring, suitable intermediate connections between said ring and both of said power-releasing devices, whereby the latter are operated by the former, and a series of contact devices projecting from said ring over said frame to a point beneath the plane of revolution of said annulets, whereby, upon the release of either of said annulets by its filament, it will descend to a position to engage one of said contact devices and impart movement to said shipping-ring, combined and operating substantially in the manner described.

3. In a doubling-machine, a frame supporting at its upper end the revolving receiving-bobbin H and having a bed, as B, located beneath said bobbin, shipping-ring K, supported upon said bed in such manner as to have a limited revolving movement, and having the inwardly-projecting lugs k^3, circular frame L, having a revolving movement upon said bed within said shipping-ring, the upper surface of said frame being located in a plane slightly below that of the lower surface of said lugs k^3, rods l, mounted upon said frame and supporting loosely thereon annulets l', bobbin-rack M, secured upon said frame and having pegs m projecting radially therefrom, gear l^3, secured to said frame, lever N, pivotally mounted upon said bed, said lever carrying at one end pinion n' and pulley n^3, intermediate connections between said lever and said shipping-ring, and a belt connecting said pulley n^3 with a suitable source of power, combined and operating substantially as described.

4. In a doubling-machine, a frame supporting at its upper end revolving shaft D, carrying wheel d', spindle G, carrying receiving-bobbin H and having drum g, resting by gravity upon the periphery of said wheel d', lever O, pivoted to said frame and having arm o' adapted to be moved against said drum g to elevate the latter, rock-shaft P, having an arm engaging said lever, revolving bobbin-rack M, mounted upon said frame near the lower end of the latter, means for imparting motion to said rack, lever N, governing the means by which motion is transmitted to said bobbin-rack, shipping-ring K, intermediate connections between said ring and said lever N, and also between said ring and said rock-shaft P, and intermediate connections, substantially as described, between said bobbin-rack and said shipping-ring, whereby movement will be imparted to the latter from the former upon the breaking of a filament in its passage from one of the bobbins carried by said rack to the receiving-bobbin H, combined and operating substantially as set forth.

5. In a doubling-machine, support I, having arms i, terminating in horizontal faces, in combination with shipping-ring K, adjustably secured upon said arms by screws i', passing through slots k in said ring, said ring having the inclines k^2 upon its lower side adjacent to said arms, arranged and operating substantially as and for the purpose set forth.



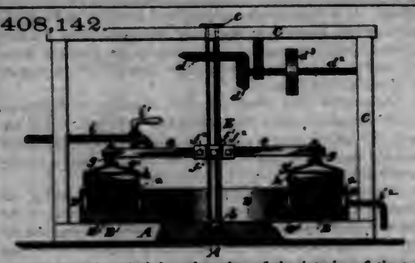
6. In a doubling-machine, support I, having arms i, shipping-ring K, adjustably mounted upon said arms, frame L, having a central hub revolubly supported upon said support I, said frame having the series of rods l, provided with annulets l', means for revolving said frame, bobbin-rack M, secured to said frame and having pegs m radially projecting therefrom, and lugs k^3, projecting from said shipping-ring into the path of movement of said annulets l' at the bottom of said rods l, combined and operating substantially as and for the purpose set forth.

7. In a doubling-machine, the combination, with the spindle adapted for carrying the receiving-bobbin H, frame L, carrying bobbin-rack M, and shipping-ring K, said frame also carrying gear l^3, of shaft C, carrying band-pulley c', lever N, carrying at one end pinion n' and pulley n^3 and having at its opposite end pin n^5, engaging a portion of said shipping-ring, and belt n^4, connecting said pulley c' with pulley n^3, substantially as described.

8. In a doubling-machine, the combination, with revolving frame L, of bobbin-rack M, mounted thereon, said rack consisting of standards m', secured to said frame, a plurality of rings having radially-projecting pegs m, supported upon said standards, and sleeves m^2, located upon said standards between said rings, substantially as set forth.

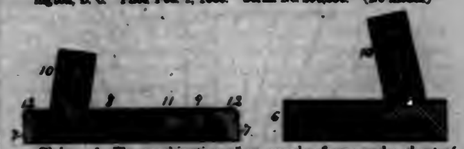
9. In a doubling-machine, a frame composed of end pieces A A, supporting between them bed B and united at their upper ends by cross-piece E, shafts C D, carrying intermeshing gears c d, mounted in bearings at the upper end of said frame, spindle G, hung in brackets projecting from said cross-piece E and having drum g resting by gravity upon a wheel d' on said shaft D, frame L, mounted upon said bed B and carrying bobbin-rack M, pinion n', engaging a gear l^3 on said frame, pulley n^3, connected with said pinion, and a belt connecting said pulley n^3 with a pulley c' on said shaft C, substantially as described.

408,141. FOLDING COT. JOHN G. SMITH, St. Louis, Mo. Filed Mar. 26, 1887. Serial No. 232,226. (No model.)



Claim.—1. In combination with a cot consisting of a central portion and end wings, the hinges fixed to the sides and connecting the end wings to the central portion, so that they may be folded thereon, said hinges consisting of two parts, each connected at the top of the cot at 10 and having abutting ends at the bottom of the cot, whereby the ends are adapted to fold over on top of the cot, substantially as set forth.

2. In combination with a cot consisting of a central portion and end wings having spaces between the contiguous ends, the hinges connecting the end wings to the central portion, so that they may be folded thereon, said hinges consisting of two triangular pieces having openings at 10 and 11 to receive pivot-pins, depending on which side of the cot the hinges are placed, said pieces being pivoted together at the top of the cot and having abutting lower ends, substantially as set forth.

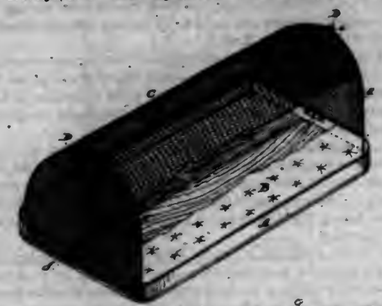


408,142. MILL FOR TREATING FIBER-YIELDING MATERIALS. JAMES D. STANLEY, Rustover, S. C. Filed Jan. 5, 1889. Serial No. 295,809. (No model.)

Claim.—An annular trough and a series of corrugated segments forming an annulus resting on the bottom of said trough, said segments being of a width less than that of the interior of the trough, for the purpose specified, combined with a series of corrugated rollers engaging the corrugated segments, a rotating shaft and arms projecting therefrom for moving the said rollers, a pipe for conveying water to the trough, and an outlet-pipe leading from the bottom of the trough to carry off water and dross, substantially as set forth.

408,142.

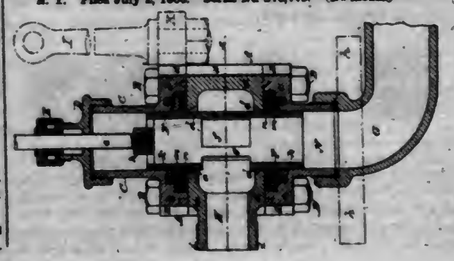
408,143. INK-GRINDING SLAB. WILLIAM X. STEVENS, Washington, D. C. Filed Feb. 1, 1889. Serial No. 298,330. (No model.)



Claim.—1. The combination of an annular frame and a sheet of flexible material secured thereon, and shaped as a grinding-dish therein and having the impervious character described.

2. The combination of an annular frame and a sheet of flexible material thereon formed into two dishes, one of which is a grinding-surface and the other an ink-well, substantially as shown and described.

3. The combination of an annular frame and a sheet of flexible material thereon formed into two dishes, and a channel connecting them, substantially as shown and described.

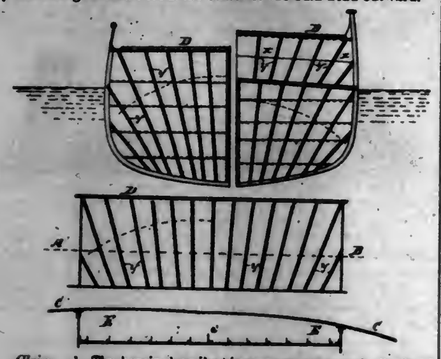


4. An ink-grinding slab of flexible impervious material shaped in dish form, substantially as shown and described.

408,144. PORTABLE FOLDING BED. WILLIAM W. ST. JOHN, Brooklyn, N. Y. Filed July 2, 1888. Serial No. 278,772. (No model.)

Claim.—A folding bed consisting of the bottom formed of two sections hinged together, in combination with the folding screen consisting of the wires c and d, hinged to the folding frame and divided at their centers, where they are connected by a hinge, and the rod D, all arranged as shown and specified.

408,145. THROTTLE-VALVE. WILLIAM W. ST. JOHN, Brooklyn, N. Y. Filed July 2, 1888. Serial No. 278,773. (No model.)



Claim.—1. A throttle-valve consisting of a central part and two end parts secured together, as shown, in combination with a hollow piston-valve having openings for the passage of the fluid and its periphery packed by suitable packing-rings, arranged in the manner herein shown and set forth.

2. The throttle-valve herein described, consisting of the central part *a*, the end parts *b* and *c*, secured together by bolts B, in combination with the hollow piston-valve F, provided with openings *f*, and the packing-rings *m* and *n*, arranged in the manner shown, and for the purpose set forth.

3. The combination of the parts *a b c*, forming the shell A, the part *b* having a stuffing-box E, and the part *c* having the neck N, for attachment with the piston-valve F, having openings through its periphery, which moves through packing-rings *m n*, placed in recesses in the shell, as herein shown and set forth.

408,146. BULK-HEAD. WALFRID T. SYLVÉN, Washington, D. C. Filed Oct. 9, 1888. Serial No. 287,700. (No model.)

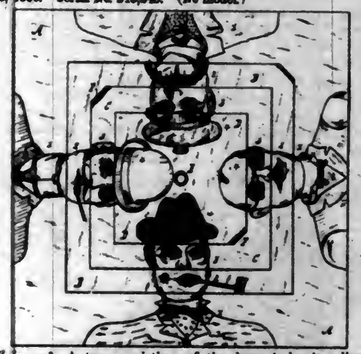
Brief.—A ship's bulk-head has stiffening-ribs placed closer together at the bottom than at the top and the ribs spaced at gradually-increasing intervals from the center of the bulk-head outward.

Claim.—1. The herein-described improvement in vertically-fitted bulk-heads, consisting of stiffening-ribs placed diagonally across the bulk-head and secured thereto and diverging from a central line, substantially as and for the purposes specified, whereby the varying degrees of statical pressure are resisted by correspondingly varied or graduated stiffeners, as set forth.

2. In a bulk-head, diagonal stiffening-ribs converging toward the bottom, placed closer together at the center line of the ship and the bulk-head than at the sides of the ship, the lower elongation of said stiffeners to intersect with said center line or its downward elongation, substantially as described.

3. In a bulk-head, diagonal stiffening-ribs fastened to the bulk-head, placed in a vertical plane closer at the bottom than at the top of the bulk-head, in order to conform with the different statical pressures acting on the bulk-head when laid open to the sea, the stiffeners as a whole having the appearance of a modified vertical fan, substantially as described.

4. In a bulk-head, a water-tight partition having stiffening-ribs arranged in pairs and extended obliquely from points on a vertical line drawn in the middle of the bulk-head or partition or on the downward elongation of said middle line, the stiffening ribs or stays as a whole having a resemblance of a vertical fan with its lower part cut off, the stiffeners fastened to the bulk-head or partition, and the distance between the stiffeners increasing upward and the same distance also increasing toward the sides of the vessel, substantially as and for the purpose set forth.



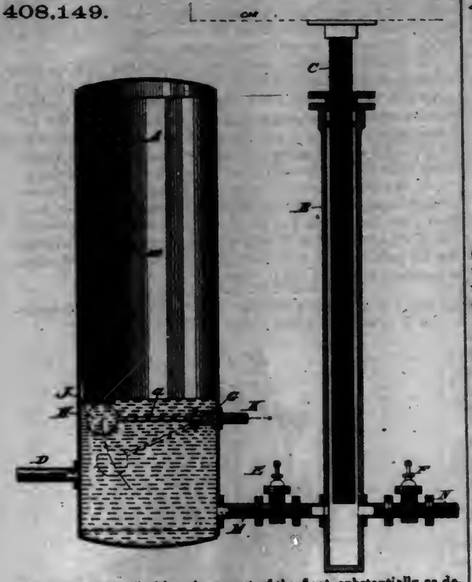
408,147. LOCK. THOMAS TAYLOR, South Norwalk, Conn., assignor to the Norwalk Lock Company, same place. Filed Mar. 25, 1889. Serial No. 304,637. (No model.)

Claim.—1. In a tubular lock, the combination of the tube D, constructed with a cylindrical longitudinal recess, a cylinder E, arranged longitudinally therein, having a key-hole opening at its outer end and its inner end adapted to engage the lock-bolt mechanism, the cylinder constructed with one or more transverse recesses cutting across the key-hole, a tumbler hung in each of said transverse recesses, and so as to swing in a plane across the plane of the key-hole, each tumbler constructed with an opening corresponding to the key-hole and through which the key may pass, the tumblers each provided with a spring to yieldingly hold it in its normal position, each tumbler constructed with a gate upon its periphery, radial pins arranged in openings through the cylinder onto the periphery of the tumblers, springs between the pins and the tumblers, the tendency of which is to force the pins outward, the tube constructed with seats corresponding to the outer end of said pins, the said pins and seats of cam shape, and a key adapted to be inserted longitudinally into the key-hole, its edge irregular and adapted to swing the tumblers to bring their respective gates into line with their respective pins, substantially as described.

2. In a tubular lock, the combination of the tube D, constructed with a longitudinal cylindrical recess, a cylinder E, arranged in the recess of said tube, extending through the tube, constructed with a longitudinal key-hole, the cylinder constructed with two or more transverse recesses cutting across the key-hole, tumblers arranged in said recesses and hung upon a pivot, so as to swing therein across the plane of the key-hole, the tumblers each constructed with an opening in line with the key-hole, but of a length greater than the width of the key, a spring for each tumbler, and a bearing for the said spring, with a bearing upon the opposite side against which the tumblers may rest and there yieldingly held by said springs, the periphery of the tumblers, each constructed with a gate *a*, pins I, corresponding to the said tumblers and arranged in openings through the cylinder onto the tumblers, each pin provided with a spring the tendency of which is to force the pin outward, the cylinder constructed with seats K, adapted to receive the said pins when in normal position, and a key having its edges constructed of irregular shape and adapted to work against the end of the tumbler-openings toward the said springs, substantially as described.

408,148. TOY. GEORGE B. THROOP, New York, N. Y. Filed Sept. 10, 1888. Serial No. 213,945. (No model.)

Claim.—1. A toy consisting of the base A, having distributed thereon at various points fragmentary portions or sections of pictorial representations, and a series of revoluble plates B C D, supported by said base and decreasing in size, as shown, each of said plates having arranged thereon other fragmentary portions of the pictorial representations in such manner as to form with the fragmentary representations on the base and other plates of the series a complete and variable picture at every point occupied by the sectional or fragmentary representations, substantially as shown and described.



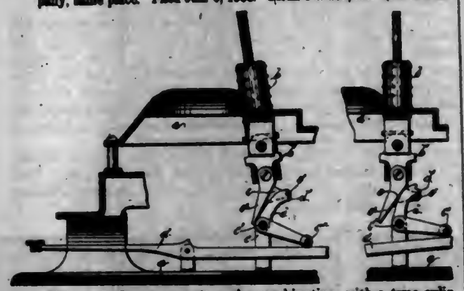
2. The combination of a stationary base A, having fragments of pictorial representations distributed thereon, and a series of flat revoluble plates B C D, provided with finger-pieces F, said plates having distributed thereon other fragments of pictorial representations arranged to form a number of complete and variable pictures when the several plates are turned to bring the fragments on the base and plates in line, substantially as described.

3. The combination, with a stationary base A, having distributed thereon near its edges sections of pictorial representations, of a series of revoluble plates B C D, nested one within the other, the faces of the plates and base being flush or on the same plane, and said plates having sections of the representations arranged thereon to form a number of complete pictures with the portions on the base, substantially as described.

408,149. HYDRAULIC ELEVATOR. WILLIAM F. TOOTHAKER, San Francisco, Cal. Filed Mar. 23, 1888. Serial No. 304,492. (No model.)

Claim.—1. In safety appliance for hydraulic elevators, the combination, with the pneumatic hydraulic accumulator, of a safety-valve, the air-exit pipe, the float for operating the valve connected thereto,

408,149.



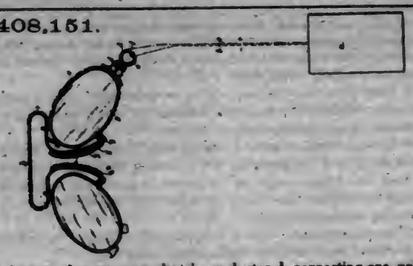
and the stop for limiting the ascent of the float, substantially as described.

2. In a hydraulic elevator, the combination, with the pneumatic hydraulic accumulator, the hydraulic cylinder, the ram within the latter, and the inlet and outlet valves for the hydraulic cylinder, of the safety appliance consisting of an air-escape valve within the accumulator and a float connected thereto by a lever, and the stop for limiting the ascent of the float, substantially as described.

3. The combination of the accumulator A, having air-escape valve G and air-outlet K, and the float H, connected to valve G by lever *a*, substantially as described.

4. The combination, with accumulator A, of the safety-valve G, air-outlet K, water-supply D, float H, connected to valve G by lever *a*, and the stop J, all substantially as described.

408,150. CAM-MOTION FOR TYPE-WRITING MACHINES. FREEMAN L. TWEED, Groton, N. Y., assignor to the Crandall Type-Writer Company, same place. Filed Jan. 9, 1888. Serial No. 260,157. (No model.)



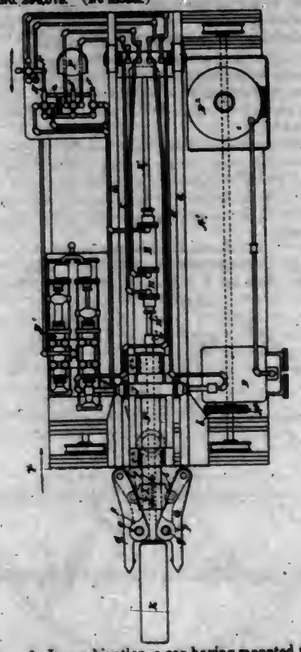
Claim.—1. In a type-writer, the combination, with a type-cylinder and a pivoted yoke for carrying said cylinder, provided with a stop-pin and an inclined bearing-face, of a cam-arm having its face formed with a gradually-increasing curve, and its end adapted to lie between the stop-pin and inclined bearing-face at the end of the stroke to prevent recoil, substantially as and for the purpose set forth.

2. In a type-writer, the combination, with the main frame *a*, key-lever *d'*, type-cylinder *b*, and its pivoted carrier *b'*, provided with the arm *c*, having the bearing-face *c²* and pin *c'*, of the rock-shaft *d'*, its yoke *d²*, and the notched cam-faced arm *d*, all constructed and arranged to operate substantially as and for the purpose set forth.

408,151. ELECTRIC EYEGLASSES. HERMANN WILCKE, Berlin, Germany. Filed Apr. 26, 1889. Serial No. 308,508. (No model.)

Claim.—1. The combination, with an eyeglass-frame comprising a bow-spring A, of the opposite nose-plates A' A², insulated from each other by an insulating-plate *g* between one nose-plate and the frame,

408,151.



a battery element *a*, an electric conductor *b*, connecting one pole of the battery with one nose-plate, and an electric conductor *c*, connecting the other pole of the battery with the opposite nose-plate, substantially as described.

2. The combination, with an eyeglass-frame comprising the bow-spring A, of two opposite nose-plates carried by said spring and insulated from each other, an electric conductor *c*, passing along the upper side of the frame and along the bow-spring to one nose-plate, and an electric conductor *b*, passing along the lower side of the frame direct to the opposite nose-plate, substantially as described.

3. In eyeglasses, the combination, with a sectional frame, of insulating-plates *f f'*, the bow-spring A, in metallic connection with one of the frame-sections, the nose-plate A', insulated from the bow-spring, the nose-plate A², in metallic connection with the bow-spring, and the electric conductors *b c*, substantially as described.

408,152. APPARATUS FOR CHARGING AND DRAWING FURNACES. SAMUEL T. WELLMAN, Cleveland, Ohio. Filed Dec. 26, 1888. Serial No. 294,578. (No model.)

Claim.—1. In combination, a car having mounted thereon apparatus for charging and drawing furnaces, a steam-pump for operating the different motors of such apparatus, and a steam-generator for supplying motive power to such pump, substantially as and for the purpose set forth.

2. In combination, a traction-car having mounted thereon an engine for propelling the car, steam-generator, and apparatus for charging and drawing furnaces, substantially as set forth.

3. In combination, a traction-car having mounted thereon engine for propelling the car, steam-pump, steam-generator, and mechanism for charging and drawing furnaces, the different devices being operatively connected, substantially as set forth.

4. In combination, a traction-car having mounted thereon engine for propelling the car, steam-pump, steam-generator, and apparatus

for charging and drawing furnaces, these devices being operatively connected, and the levers for operating the different motors being assembled within reach of the operator when occupying his seat on the car, substantially as set forth.

5. Reversible tongs, the same being mounted on a rotating shaft or trunnion, whereby the tongs are reversed by turning such shaft or trunnion on its axis, substantially as set forth.

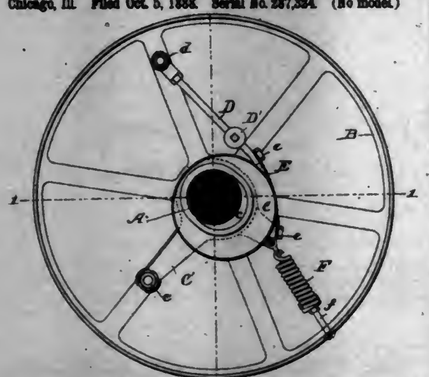
6. The combination, with reversible tongs mounted on a hollow rotating shaft, of a reciprocating rod operating in the bore of such shaft, such rod being connected by means of sleeve and links with the tongs for opening and closing the latter with reverse movements of such rod, substantially as set forth.

7. The combination, with a reciprocating frame, of reversible tongs mounted on such frame, substantially as set forth.

8. The combination, with reciprocating tilting frame, of reversible tongs mounted on such frame, substantially as set forth.

9. The combination, with reciprocating frame, tongs, and water-motors mounted on such frame for operating the tongs, of jointed so-called walking-pipes connected with such motors, the arrangement being substantially as indicated, whereby the jointed pipes may accommodate themselves to the movements of such motors by distending and collapsing the legs of such jointed pipes, substantially as set forth.

10. The combination of reversible tongs mounted on a hollow rotating shaft with hydraulic ram set in line with such shaft and connecting mechanism, substantially as indicated, whereby the tongs are opened and closed by reverse action of such ram, substantially as set forth.



11. The combination of reversible tongs mounted on a rotating shaft or trunnion with motor operatively connected with such shaft for rotating the latter, substantially as set forth.

12. The combination, with reversible tongs mounted on a rotating shaft, such shaft bearing a spur gear or pinion, of water-motor operatively connected with a rack, the latter engaging such gear or pinion for rotating the shaft, substantially as set forth.

13. The combination, with rotating shaft having mounted thereon tongs and toothed wheel, substantially as indicated, of water-cylinder bearing a rack for engaging such toothed wheel, such cylinder being mounted and adapted to reciprocate on a stationary piston-rod, substantially as set forth.

14. In combination, a rotating shaft bearing tongs and toothed wheel, reciprocating water-cylinder bearing a rack for engaging such toothed wheel, a hollow piston-rod for supporting such cylinder, a piston mounted on such hollow rod and operating inside the cylinder, and the ports in the rod located on either side of the piston, substantially as set forth.

408,153. STEAM-ENGINE GOVERNOR. EDWIN F. WILLIAMS, Chicago, Ill. Filed Oct. 5, 1888. Serial No. 287,324. (No model.)

Claim.—1. In a steam-engine governor, the combination, with the shaft and wheel fixed thereon, of a shifting eccentric on the shaft, a weighted governor-arm secured to the wheel, and a strap-spring connecting the governor-arm to the eccentric, substantially as and for the purposes specified.

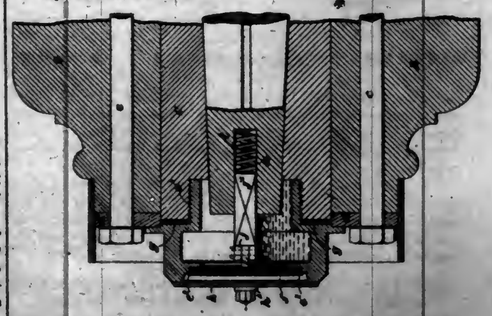
2. In a steam-engine governor, the combination, with the shaft and wheel, of the slotted eccentric and its supporting-arm pivoted to said wheel, the weighted governor-arm pivoted to the wheel, and a strap-spring connecting the governor-arm and eccentric, said governor-arm furnishing the centrifugal force and said spring furnishing the centripetal force, substantially as and for the purposes specified.

3. In a steam-engine governor, the combination, with the shaft and wheel, of the slotted eccentric and its supporting-arm, the governor-arm connected to said eccentric by a centripetally-acting flat spring, and a spiral spring of adjustable tension connecting the eccentric and wheel and supplementing the centripetal action of the flat spring, substantially as and for the purposes specified.

4. In a steam-engine governor, the combination, with the shaft A and wheel B fixed thereon, of the eccentric C, slotted at c and provided with hub C^2, having arm C', pivoted to the wheel at c', and arm c^3, the weighted governor-arm D, the spring E, connecting said governor-arm and the arm c^3, and the coiled spring F, connected to the arm c^3 at one end and adjustably connected to the wheel by a bolt f at the other end, substantially as and for the purposes specified.

5. In a steam-engine governor, the combination, with the main eccentric fixed on the shaft, of the cut-off eccentric capable of movement across the shaft and having its center of motion at a point outside of the axis of the shaft, said cut-off eccentric being so arranged that the path of motion of its center is substantially radial to the shaft, substantially as and for the purposes specified.

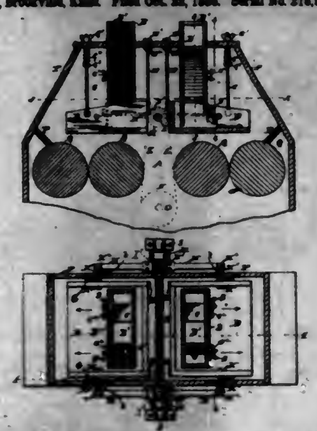
408,154. STEAM-ENGINE. SILAS S. WILLIAMS, East Randolph, N. Y. Filed Dec. 22, 1888. Serial No. 294,371. (No model.)



Claim.—1. In a steam-engine, the combination of the base, the cylinders mounted thereon, having a flange on their lower ends, the standards below the base, bolts extending through the standards and engaging the flanges on the cylinder, a crank-shaft mounted in the standards, a cross-head, and a connecting-rod connecting the cross-head and crank-shaft, substantially as described.

2. In a steam-engine, the combination of the base, the cylinders mounted thereon, the guides secured to the cylinders, the cross-head mounted on the guides, and the piston-rods secured to the cross-head, substantially as described.

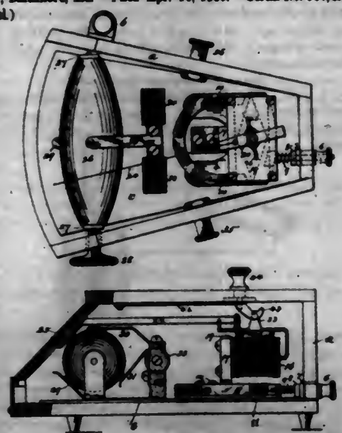
3. In a steam-engine, the combination of the base, the cylinders mounted thereon, the guides secured to the cylinders, the yoke connecting the guides, the cross-head mounted on the guides, the piston-rods secured to the cross-head, the standards below the base-plate, and bolts extending through the standards and engaging the cylinder, the crank-shaft journaled in the standards, and the connecting-rod connecting the cross-head and crank-shaft, substantially as described.



408,155. CARRIAGE-AXLE LUBRICATOR. JOHN A. WILSON, Dundee, Scotland, assignor to Dan Rylands, Barnsley, England. Filed Dec. 27, 1888. Serial No. 294,835. (No model.) Patented in England Sept. 14, 1888, No. 13,279.

Claim.—1. The combination, with an axle box or bearing, of the cap, cap, or cover formed wholly or partially of glass or other suitable transparent material and provided with a movable external protecting guard or shield on the outside of the cap, substantially as and for the purposes set forth.

2. The combination, with the cap, cap, or cover formed wholly or partially of glass or other suitable transparent material, of means for automatically cleaning the said glass or other material, substantially as and for the purpose set forth.



408,156. FEED-REGULATOR FOR ROLLER-MILLS. JOSEPH W. WILSON, Brookville, Kans. Filed Oct. 22, 1888. Serial No. 288,961. (No model.)

Claim.—1. The combination, with a pair of vibratory shoes D D, of a shaft I, and eccentric I', near each extremity of said shaft, and a pair of flexible rods, each having at an intermediate point a yoke embracing one of said eccentrics and each rod connected at its ends to the respective shoes.

2. A feeding device for roller-mills, consisting of the supply-box B, having feed-opening B', the deflectors C, having pivots C', by which they are journaled within the supply-box, the thumb-nuts C^2, by which the deflectors are adjusted to the desired inclination, the valve R, having serrations or teeth R' and mounted on the front side of the supply-box and forming the lower edge of the side, thumb-nuts S, by which the valve is adjusted in keeping with the position of the deflectors, the shoe D, the spring-rod E, and nuts E', supporting one end of the shoe, and the rods G, having collars G^2, the springs G^3, and thumb-nuts G', supporting the other end of the shoe, substantially as described.

408,157. ELECTRIC MEASURING-INSTRUMENT. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the John A. Barrett Battery Company, Baltimore, Md. Filed Apr. 16, 1889. Serial No. 307,451. (No model.)

Claim.—1. An electric measuring-instrument provided with an index or pointer and its deflecting-coil, two or more scales adapted for use separately therewith, and a cover or shield arranged to permit the exposition of only one scale at a time.

2. An electric measuring-instrument provided with an index or pointer and its deflecting-coil, two or more scales adapted for use separately therewith, a cover or shield arranged to permit the exposition of only one scale at a time, and means for simultaneously exposing one scale and controlling the current through said deflecting-coil.

3. In an electric measuring-instrument, the combination, with a needle and its deflecting-coil, of two or more scales and corresponding shunts, and means for mechanically bringing one of the scales into view and connecting the appropriate shunt into the circuit.

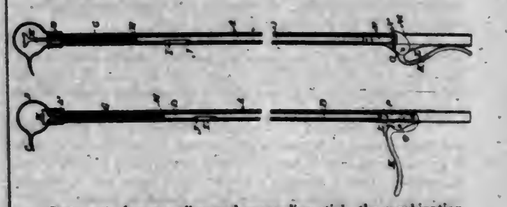
4. In an electric measuring-instrument, the combination, with an index or pointer and its deflecting-coil, of two or more scales and corresponding shunts, and means for mechanically bringing one of the scales into view and connecting the corresponding shunt across the terminals of the deflecting-coil.

5. In a galvanometer having a deflecting-coil and one or more shunts therefor, the combination therewith of two or more scales, respectively corresponding to the deflections of said coil direct and shunted, and means for exposing only one of said scales at a time.

6. In a galvanometer having an inclosing-case provided with an opening or window, and having a deflecting-coil and an index therefor projecting in proximity to said window, the combination therewith of a scale-carrier adapted to manual rotation, so as to present different sides to the window, and having two or more scales on its surface.

7. In a galvanometer having an index or pointer, a deflecting-coil therefor and a shunt or shunts thereto, and a rotary scale-carrier adapted for manual rotation and having separate scales for the deflecting-coil and each shunt, in combination with circuit-closing devices connected to said coil and shunts and controlled by said rotating scale-carrier.

8. In a galvanometer, the rotating scale-carrier having two or more different scales located inside the case opposite a window or opening therein, and having two or more contacts, in combination with two or more switch-springs in the path of said contacts and forming the terminals of the shunts of the instrument, substantially as described.

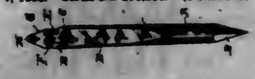


9. In a galvanometer, a stationary deflecting-coil and deflecting-needle, in combination with a directing-magnet pivoted below the coil on the same vertical axis as the needle.

10. In a galvanometer, a stationary deflecting-coil and deflecting-needle, in combination with a directing-magnet provided with an independently-adjustable armature.

11. In a galvanometer, the combination of the stationary deflecting-coil 15, the cover-plate 19, applied to the upper surface of said coil and provided on top with the needle-bearing 18, with the two needles suspended on said bearing, one outside said coil and the other inside, and connected by the extension 22, the relation being such that the needles can be removed from the coil only by removing with them the cover-plate 19, as described.

12. In a galvanometer, the combination, with the magnetic needle having the wings 23, of the spring-blade 42, having the hooks 43 extending under the needle-wing 23 and adapted by upward pressure on the same to lift the needle from its bearing, said plate 42 being fixed at one end to the cover and at the other bearing in an adjusting-screw projecting through the cover.

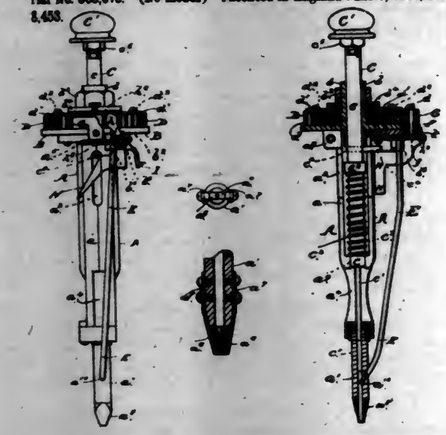


408,158. COUPLING AND UNCOUPLING STICK. FLETCHER W. BEALL, Birmingham, Ala. Filed June 20, 1889. Serial No. 314,942. (No model.)

Claim.—1. In a coupling and uncoupling stick, the combination of a tube A, provided with a ring at one end, a longitudinally-moving rod provided with a grip within said tube, a slide P, a pin O, a trigger K, loosely pivoted to the slide, and a spring G, substantially as set forth.

2. In a coupling and uncoupling stick, the combination, with the tube A, ring B, and projection C, of the rod D, trigger K, having the slot N therein, slide P, and pin O, substantially as set forth.

408,159. WIRE SHOE-NAIL. ADELBERT BRIGGS, Taunton, Mass. Filed Nov. 7, 1888. Serial No. 290,216. (No model.)

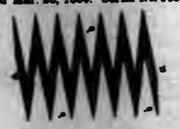


408,159.

Claim.—As an improved article of manufacture, the wire shoe-nail described, having an elongated body, laterally-projecting shoulders, cruciform neck, and wedge-pointed head, substantially as set forth.

408,160. TACKING-TOOL FOR BOOTS OR SHOES. THOMAS BRINING, Leeds, County of York, England. Filed Mar. 18, 1889. Serial No. 303,675. (No model.) Patented in England June 9, 1888, No. 8,453.

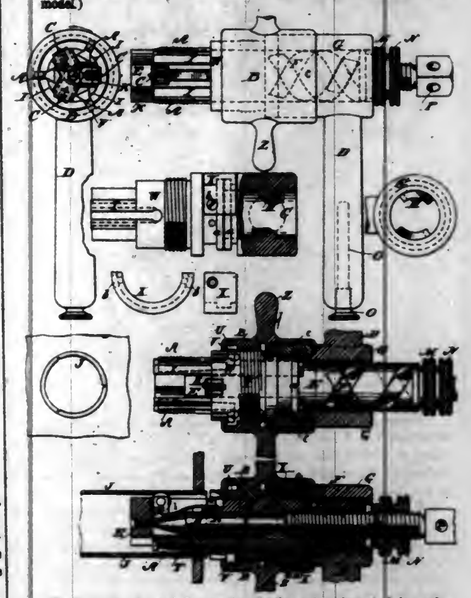
Claim.—1. In a boot and shoe tacking tool, the combination, with a divided and slotted case A; formed in two portions a a', spring dies a^4, table B, boss b, and reciprocating plunger C, of a ratchet-wheel D, mounted upon said table and provided with holes d for the reception of the fastening-nails, and mechanism for actuating the same, substantially as herein described.



2. In a boot and shoe tacking tool, the combination of a divided and slotted case A, formed in two portions a a', spring-dies a^4, table B, provided with hole b^3, and reciprocating plunger C, with ratchet-wheel D, mounted to revolve freely upon said table and provided with holes d for the reception of the fastening-nails, cover d', mechanism, substantially as described, for actuating said ratchet-wheel, and tube E, through which the fastening-nails pass one at a time to the driving-tool, substantially as herein set forth.

3. In a boot and shoe tacking tool, the combination, with a divided and slotted case A, formed in two portions a a', armed with spring-dies a^4, and with a vertically-reciprocating plunger formed in two diameters, the larger and upper of which is armed with a handle C, boss c^3, and spring c^2, of a table B, provided with hole b^3, boss b, tube E, ratchet-wheel D, having holes d and cover d', and mechanism, substantially as described, for actuating and regulating the tension of said ratchet-wheel, all substantially as set forth.

4. In a boot and shoe tacking tool, the combination of table B, provided with holes b^3, reciprocating spindle C, ratchet-wheel D, having holes d and b^3, tube E, pin c^4, cam-lever H, pivot b^4, adjusting-screw h', spring h^2, lever F, and pawl G, all operating substantially as described.



5. The combination, in a boot and shoe tacking tool, of a divided and slotted casing A, formed in two portions a a', spring-dies a^4, table B, provided with hole b^3, boss b, wheel D, having holes d, cover d', nut b^3, washer b^4, tube E, entering a hole a^{10} in the lower part of the casing, reciprocating spindle C, formed in two diameters, handle C', nut c^5, spring c^2, bearing a^4, boss c^3, pin c^4, cam-lever H, pivoted to said table at b^4, adjusting-screw h', lever F, working in slot a^9, spring-pawl G, and spring h^2, all operating together substantially as herein set forth and illustrated.

408,161. BELT-FASTENER. WILLIAM H. BRISTOL, Hoboken, N. J., assignor to himself, and Benjamin H. Bristol and Franklin R. Bristol, Naugatuck, Conn. Filed Mar. 28, 1888. Serial No. 305,079. (No model.)

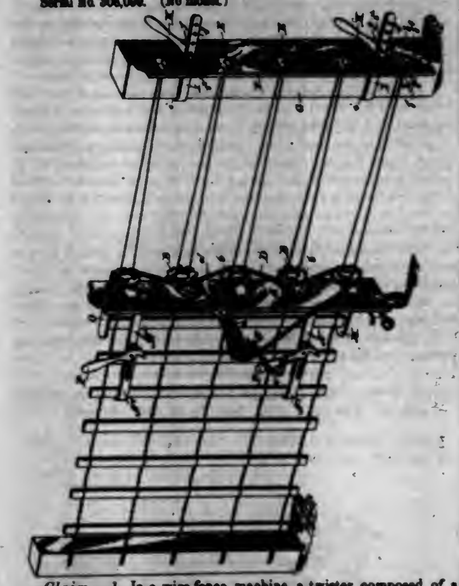
Claim.—As an improved article of manufacture, an elastic belt-fastener formed of metal into a continuous zigzag or sinuous body having spurs alternating on opposite sides of a longitudinal center line, said spurs being bent so as to extend at right angles or in parallel planes all in the same direction, as set forth.

408,162. TOOL FOR CUTTING OUT BOILER-TUBES. SAMUEL R. CONDON, Brooklyn, N. Y., assignor to himself, M. Hickborough, and N. W. Pratt, same place. Filed May 23, 1888. Serial No. 275,369. (No model.)

Claim.—1. A tool for cutting boiler-tubes inserted in and secured to the tube to be cut, having an internal tool-stock capable of reciprocation, and provided with cutters operating longitudinally against the interior surface of said tube.

2. A tool for cutting boiler-tubes, consisting of a body bearing expansive grippers to seize upon the interior of a tube, and a stock capable of reciprocation bearing expanding cutters that operate in a direction parallel with the length of the tube.

3. In a tool for cutting boiler-tubes, the combination of a sleeve connected to the interior of a tube, a cutter-stock capable of reciprocation within said sleeve, and a lever-collar rotating upon said sleeve and engaging with said stock by means of spiral teeth and grooves, as described.



408,163. GRAIN-BINDING HARVESTER. ORVILLE COOLEY and EDWARD PRIDMORE, Batavia, N. Y., assignors to the Johnston Harvester Company, same place. Filed Jan. 5, 1888. Serial No. 259,918. (No model.)

Claim.—1. The combination, with the single right-angled finger-bar having the guard-fingers bolted to the under side of the horizontal flange at the bottom of the vertical flange of the bar, of the metallic supplementary angle-bar made from a single piece of metal, the front vertical face of which is secured to the rear face of the vertical flange of the finger-bar, and therefrom extending downward sufficiently far to permit the attachment of the front side of the platform, which rests upon and is secured to the rearwardly-extending bend, forming a part of the said supplementary bar, in the manner substantially as described, and for the purpose hereinbefore set forth.

2. The combination, with the elevating-apron roller and binder-deck, of the slotted adjustable cleat-bar for regulating the opening between the elevating-apron roller and the upper edge of the binding-deck, for the purpose described, and substantially as hereinbefore set forth.

408,164. WIRE-FENCE MACHINE. JOHN DRIEKER, Cockpert, Pa., assignor of one-half to L. D. Musman, same place. Filed Apr. 22, 1889. Serial No. 308,009. (No model.)

Claim.—1. In a wire-fence machine, a twister composed of a holder b^3, a part b', fitting into the same and having pinions in its flanged end and tenons at the other, and a cylinder b^3, slotted at b^4 and fitting over the tenoned end of part b' and having holes for the wires to pass through, substantially as described.

2. In a wire-fence machine, and combined with the twister-frame and twisting mechanism, the supporting-arm M and weighted lever m^2, substantially as described.

3. In a wire-fence machine, the combination of the arm M and lever m^2, to which said arm is attached, with the twister-frame A and twisting mechanism secured thereto, and the arm O at the top of the post, substantially as and for the purposes set forth.

4. In combination with the board carrying the tension devices, a hooked arm passing through said board and a cam-lever operating on said arm and against the board, whereby the board can be readily clamped to the fence-post.

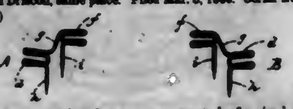
5. The tension device consisting of the plate L, having wire-holes, the angular part l', and a flanged cover l^3, having wire-holes therein, and the screw and nut by which the tension can be adjusted at will, substantially as described.

6. The spacing device consisting of the pieces N and N', bent and hooked at their ends, as described, and the moving and locking cam-lever P, in combination with the twister-frame, as and for the purposes described.

7. In a fence-machine, the slotted pieces N and N', bent, respectively, at n^2 and n^4 and hooked at n^5, combined with the bolt and nut, and the cam-lever P, operating on the shoulder n^4, substantially as set forth.

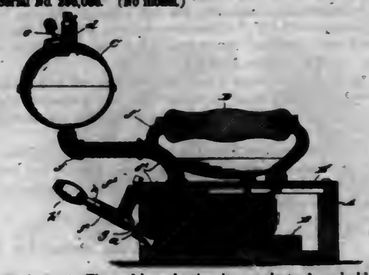
408,165. SUPPORT FOR SPINNING-SPINDLES. GEORGE O. DRAPER, Hopedale, Mass. Filed June 5, 1889. Serial No. 313,179. (No model.)

Claim.—The combination, with a sleeve-whirl spindle, a step-block a to constitute a lateral bearing for the lower end of the spindle and having a tubular extension a' rigidly connected thereto, and a supporting-case in which the said step-block is mounted loosely, of a bolster-tube placed loosely in the tubular portion of the step-block, substantially as described.



408,166. SUPPORT FOR SPINNING-SPINDLES. WILLIAM F. DRAPER, Hopedale, Mass. Filed May 17, 1889. Serial No. 311,176. (No model.)

Claim.—1. The combination, with a supporting-case or holder, a spindle, a step-bearing loose in the said supporting-case, and a spring to support it, of a bolster-bearing and a spring acting upon it, to operate substantially as described.

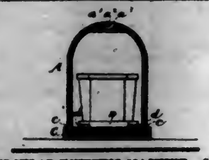


2. A supporting-case or holder, a step-bearing mounted therein loosely, and a spring to sustain the step-bearing, combined with a bolster-bearing mounted loosely therein and a spring surrounding the said bolster-bearing and forcing it normally against the upper end of the step-bearing, to operate substantially as described.

408,167. SHOE-STRING FASTENER. JEREMIAH DRISCOLL, Taunton, Mass., assignor to himself and Richard Caffrey, M. F. Fitz Gibbons, and William Driscoll, same place. Filed Mar. 5, 1889. Serial No. 301,836. (No model.)

Claim.—A shoe-string fastener constructed of a single piece of wire bent to form vertical U-shaped loops d f, opening in diametrically-opposite directions, said loops being connected at their inner ends by a middle piece g and respectively provided with a downwardly-projecting attaching-prong h i, substantially as described.

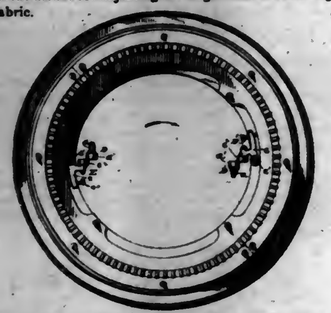
408,168. SAD-IRON. JOHN H. DUNROW, Cleveland, Ohio, assignor to Wm. A. Smith and Robt. S. West, same place. Filed Jan. 11, 1889. Serial No. 296,093. (No model.)



Claim.—1. The sad-iron having its supply tank or holder connected thereto by a pipe passing through the top of the iron, and having an arm within the iron extending out beyond one end or edge of the iron and outward and downward, and uniting at its lower end with an upward and outward inclined arm having a plug-valve closing a jet-opening in its lower end, and the burner having an upward and outward inclined tube, the upper end of which stands opposite and slightly away from the jet-opening of said latter pipe-arm, substantially as set forth.

2. The sad-iron having its supply tank or holder connected thereto by a pipe passing through the top of the iron, and having an arm within the iron extending out beyond one end or edge of the iron and outward and downward, and uniting with an upward and outward inclined arm having a plug-valve closing a jet-opening in the lower end of the latter pipe-arm, and the burner having an upward and outward inclined tube, the upper end of which stands opposite and slightly away from the jet-opening of said latter pipe-arm, the said tank having a valved air-tube in its upper end, substantially as specified.

408,169. COFFIN. JAMES H. DUNN, Dubois, Pa. Filed Dec. 5, 1888. Serial No. 292,750. (No model.)



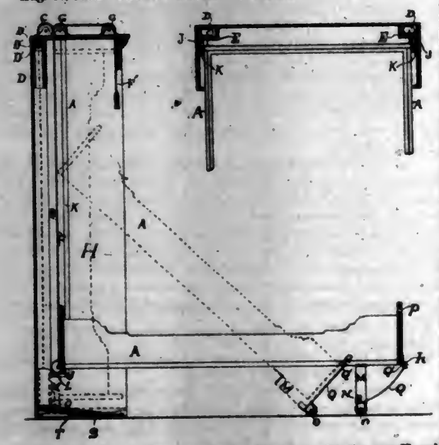
Claim.—The described burial-casket, consisting of the hollow cover A, having cord-holes at the top, and the base-plate C, having cross-ribs, and rabbeted at d, the said plate being also provided with the cement-groove e, as set forth.

408,169.

408,170. CIRCULAR-KNITTING MACHINE. CHRISTIAN FREDERICK, Wilmington, Del. Filed Apr. 13, 1889. Serial No. 307,108. (No model.)

Brief.—The objects of the invention are to lessen the friction of the dial-driving dogs upon the fabric which descends between them and to provide means for adjusting the dogs without removing or cutting the fabric.

Claim.—1. In a knitting-machine and in combination with the cylinder and dial-plate, the arm attached to the dial and provided with the roller, the arm attached to the cylinder and provided with a roller, and means, substantially as described, for adjusting the last-named arm in a horizontal direction.

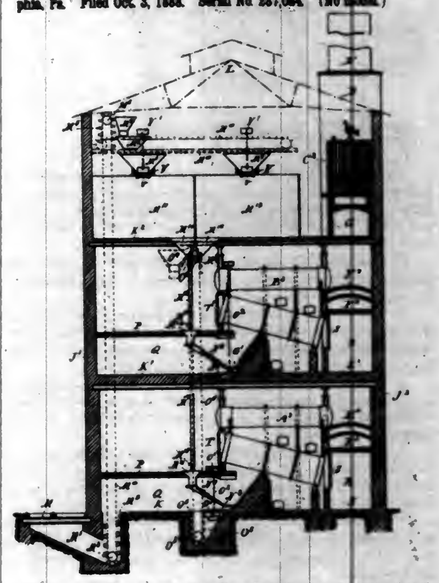


2. In a knitting-machine and in combination with the dial and cylinder, the arm attached to the dial and provided with the roller, the arm pivoted to the cylinder and provided with a roller, and a screw or like device for adjusting said pivoted arm.

3. In combination with the dial and cylinder, the arm slotted and connected to the dial as described, that it may be radially adjusted, the roller attached to said arm, the second arm pivoted to the cylinder, its roller, and its adjusting-screw.

4. In combination with a dial and cylinder, the two co-operating-rollers, supporting-arms by which they are connected, respectively, to the dial and cylinder, and the balls applied, substantially as described, to sustain said rollers.

5. In a knitting-machine and in combination with a cylinder and dial, the overlapping rollers connected to the cylinder and dial, respectively, and the balls applied to support said rollers on the rear sides behind the points at which they overlap.



408,171. FOLDING BED. CLARK L. GILL, Madison, Wis. Filed Aug. 17, 1888. Serial No. 283,035. (No model.)

Claim.—1. In a folding bed, the combination, with the case H and bed-frame A, the foot-board of said bed-frame being provided with the opening P near the upper edge thereof, of the catch R on the lower edge of said foot-board, foot-legs M, hinged to the bed-frame so as to fold flush with the foot thereof, bar N, connecting said foot-legs, and the flexible catch-brace Q, attached to the middle of said bar N and passing through said catch R and having the direct offset Q′, whereby said foot-legs may be retained in a folded position by the lower side of said offset clasping over the edge of the foot-board within the opening P and in an unfolded position by the upper side of said offset engaging with said catch R, substantially as set forth.

2. In a folding bed, the combination, with the case H and bed-frame A, of the rollers J on the front end of said bed-frame, connecting same with said case, pulleys C and G in the top of the case, cords B, attached to the head of said bed-frame and passing over said pulleys C, boxes E in the corners of the case, variable weights D D′, attached to said cords B and moving in said boxes E, whereby the head of the bed-frame is drawn upward into the case, foot-legs M, hinged to the bed-frame, as described, and provided with the connecting-bar N, catch-brace Q, and rollers O, foot-shelves S, pivots T, connecting said foot-shelves to the sides of the case near the bottom thereof, said pivots being placed near enough to the inner ends of said foot-shelves to cause their outer ends to drop to the floor, thereby forming an incline for the rollers O to mount when the foot-legs are folded and when the bed-frame is being drawn into the case, and the cord F F′, attached to the middle of the head-board of the bed-frame and passing over the pulley G, substantially as set forth.

408,172. STEAM-BOILER HOUSE. JOHN L. GILL, Jr., Philadelphia, Pa. Filed Oct. 3, 1888. Serial No. 287,084. (No model.)

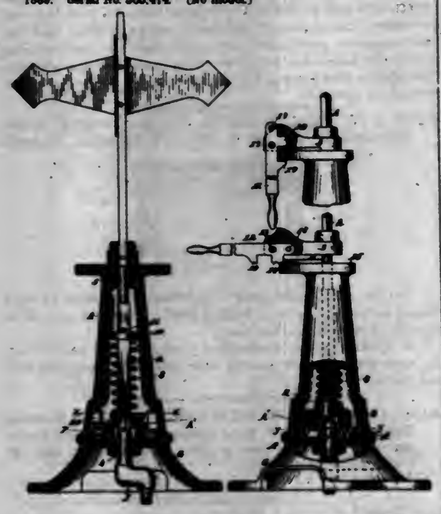
Claim.—1. The described boiler-plant having superposed fuel-storage bins and elevators, and horizontal conveyers arranged to raise and distribute fuel to said bins, combined with hoppers located at a lower level and pipes provided with adjustable gates for distributing fuel by gravitation and regulating the supply thereof from said storage bins and hoppers into the several furnaces, substantially as set forth and shown.

2. The described boiler-plant having fuel-storage bins provided with hoppers and pipes having adjustable gates therein for distributing fuel to the several furnace-hoppers inclosed within a building having floors affording access to the furnace-hoppers located intermediately between the boiler-supporting floors and covering air-conduits to the ash-pits, substantially as set forth.

3. In a boiler-plant, the combination of the furnaces, provided with feeding-hoppers, with the described fuel elevating and distributing apparatus and storage-bins located above the furnace-levels, with tubes leading to the several furnace-hoppers, and ash-conveyers arranged to continuously remove ashes from the several furnaces, substantially as set forth and described.

4. The combination of self feeding and stoking furnaces arranged in series horizontally, with conveyers to continuously remove the ashes from the ash-pits of the several furnaces, floors located intermediately between the supporting-floors and ceilings of the boiler-rooms, arranged to afford access to the fuel-feeding hoppers of the furnaces and to form conduits for air to the ash-pits excluding ash-dust from the furnace and boiler rooms, substantially as set forth.

5. In a boiler-plant, the combination of the described fuel elevating and distributing apparatus with one or more series of boilers arranged in a line and provided with a horizontally-operating ash-conveying mechanism, which continuously removes the ashes from the entire line of furnaces at the same level, and an ash elevating and discharging apparatus arranged substantially as and for the purpose set forth.

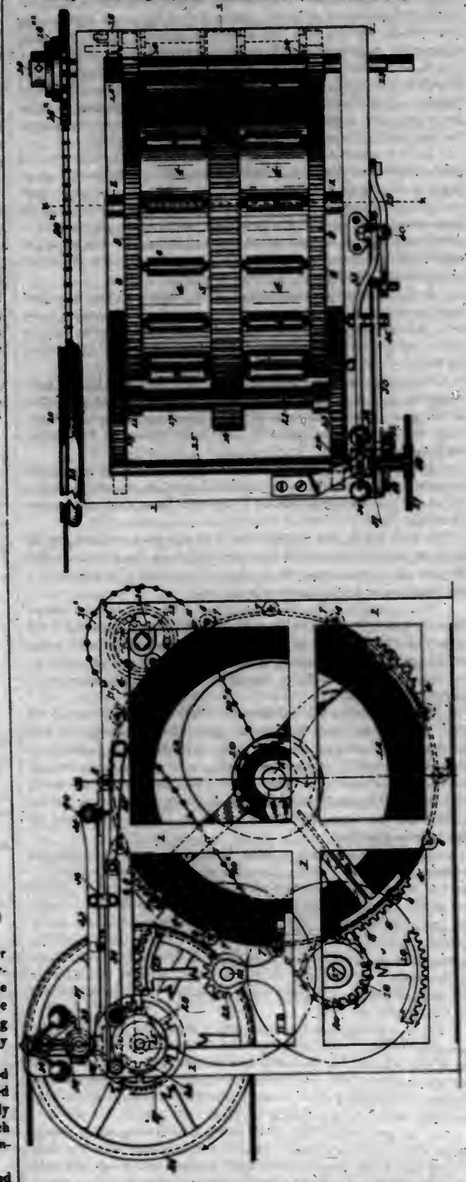


6. The combination, in the boiler-plant, of several boilers arranged in parallel positions, with a single horizontally-operating ash-conveyer for continuously removing the ashes from the ash-pits of the entire series, with an elevator for removing the ashes from the conveyer to an ash-storing bin, substantially as set forth and shown.

408,173. NAIL FOR BOOTS OR SHOES. CHARLES W. GLIDDEN, Lynn, Mass. Filed Aug. 20, 1888. Serial No. 283,194. (No model.)

Claim.—The herein-described cut nail, it comprehending a metal body of uniform thickness from end to end, including the flat head and point, the said body being tapered outwardly at one end, as at 7, along one edge thereof, to form a head, and being tapered inwardly, as at 8, near its opposite end along one edge to form a point, all substantially as described.

408,174. SWITCH-STAND. NATHANIEL O. GOLDSMITH, Cincinnati, Ohio, assignor to the Weir Frog Company, same place. Filed Mar. 30, 1889. Serial No. 305,414. (No model.)



Claim.—1. The combination of a sectional switch-stand the lower part of which is provided with a stationary toothed clutch 7, the vertically-movable crank-shaft 2, the toothed clutch 9, adapted to slide vertically upon the crank-shaft, a spring 8, movable bodily with the crank-shaft and compressed by the upward movement of the sliding clutch, and a lever 12, connected with the crank-shaft, substantially as described.

2. The combination of a switch-stand having a stationary toothed clutch, the vertically-movable crank-shaft, the toothed clutch arranged to slide vertically on the crank-shaft, and a spring movable bodily with the crank-shaft and located thereupon above the sliding clutch to press the latter in engagement with the stationary clutch, substantially as described.

3. The combination of a switch-stand having a stationary toothed clutch, the vertically-movable crank-shaft, the toothed clutch arranged to slide vertically on the crank-shaft, a spring located on and movable bodily with the crank-shaft and acting to press the sliding clutch in engagement with the stationary clutch, and a vertically-swinging lever which in its vertical movement acts on the switch-stand to raise the crank-shaft and spring, substantially as described.

4. In combination with the switch-stand, the clutch 7, attached to the stand, the clutch 9, attached to the crank-shaft, the compressing-springs 8, the crank 3, the lock-lever 12, and the stops 20 and 21, substantially as herein specified.

408,175. SPRING-MOTOR. WILLIAM J. GORDON, EDMUND D. GILBERT, and DANIEL M. PRAUTZ, Philadelphia, Pa., assignors to the Philadelphia Locomotive Vehicle and Stationary Motor Company, of New Jersey. Filed Aug. 30, 1888. Serial No. 284,132. (No model.)

Claim.—1. In a motor, the combination of a frame, a shaft rigidly mounted thereon, a casing or drum on said shaft, wheels mounted on said shaft and having their hubs recessed or socketed to receive the hub of the casing or drum, and springs having one end connected to the hubs of the wheels and their other ends connected to the casing, whereby motion is imparted by the springs to the casing, in the manner and for the purpose described.

2. In a motor, the combination of the casing or drum having friction-rollers journaled in the periphery thereof, the wheels having their hubs recessed to receive the hub of the casing, and the springs on each side of the casing having one end attached to the hubs of the wheels, and the other end connected to the casing, substantially as and for the purpose set forth.

3. In a motor, the combination of a shaft, a casing or drum mounted on said shaft, wheels mounted on said shaft and having gear-teeth, springs connected to the wheels and casing, and a shaft having gear-wheels meshing with the gear-teeth on the wheels for winding the springs, substantially in the manner and for the purpose described.

4. In a motor, the combination of the casing having gear-teeth, wheels having gear-teeth, springs connected with the wheels and casing, a shaft having gear-wheels meshing with the gear-teeth on the wheels, and a gear-wheel meshing with the teeth on the casing, substantially in the manner and for the purpose described.

5. In a motor, the combination of the winding-shaft having the gear-wheels and sprocket-wheels thereon, the wheels having gear-teeth meshing with said gear-wheels, the casing having gear-teeth, the springs connected with the wheels and casing, the shaft having the gear-wheel meshing with the gear-teeth on the casing, the sprocket-wheel on said shaft, and the sprocket-chain passing over said sprocket-wheel and sprocket-wheel of the winding-shaft to revolve said shaft, substantially as and for the purpose described.

6. In a motor, the combination of the casing having the gear-teeth on the outer surface thereof, the gear-wheel 18, meshing therewith, and the gears 19, 22, 23, 24, and 27, for operating the driving-pulley and governor, substantially in the manner and for the purpose set forth.

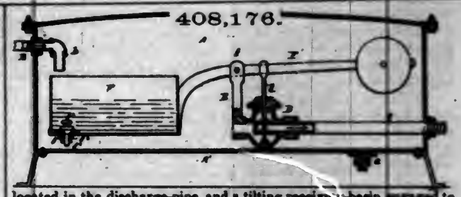
7. In a motor, the combination of the gear-wheel 23, the gear-wheel 24, meshing therewith, the shaft 25, carrying said gear-wheel 24, the gear-wheel 27, the gear-wheel 29, meshing therewith for operating the governor, the roller 28, and the friction-roller 31, substantially as described.

8. In a motor, the combination of the lever 29, the lever 30, connected therewith and carrying a friction-roller 31, the friction-roller 28, and the screw 40, operating in the manner and for the purpose described.

9. In a motor, the combination, with the governor-shaft, of the lever 33, lever 30, connected therewith and carrying a friction-roller 31, and the friction-roller 28 on shaft 25, operating substantially in the manner and for the purpose described.

10. In a motor, the casing or wheel 4, having slots 7 in its periphery, rollers journaled in the walls of said slots and extending transversely of the diameter of the casing or wheel, and a coil-spring within said casing and bearing against the said rollers, said parts being combined substantially as described, whereby the binding of the spring is prevented.

11. In a motor, the combination, with the casing having the gear-teeth, of the shaft having the gear-wheel meshing with said gear-teeth, the sprocket-wheel on said shaft, the winding-shaft having a sprocket-wheel and a chain passing over said sprocket-wheels, whereby the rotation of the gear-wheel which meshes with the casing turns the winding-shaft, and a friction-clutch on said shaft to prevent a retarding movement of the winding-shaft, in the manner and for the purpose described.



12. In a spring-motor, a shaft having a drum loosely mounted thereon, the said drum being provided with teeth on its periphery, a toothed wheel loosely mounted on said shaft, a spring secured at one end to the hub of the wheel and at the other end to the inner face of the casing of the drum, and mechanism consisting of rotary shafts, meshing gear-wheels, and sprocket-wheels with chain-connections, substantially as described, connected to said drum and wheel, whereby the rotation of the drum in one direction revolves the wheel in the same direction, said parts being combined substantially as and for the purpose set forth.

13. In a spring-motor, a shaft with a drum and a wheel loosely mounted thereon, a coil-spring connected at one end to the inner casing of the drum and at the other end with the hub of the wheel, and gearing connected with said drum and wheel, whereby different rates of speed are communicated to said drum and wheel, respectively, substantially as and for the purpose set forth.

14. An automatic differential spring-motor having an operating-spring with drum and wheel, respectively connected with the ends thereof, and freely mounted on a shaft, gearing connected with said drum and wheel and adapted by the unwinding of the spring to rotate the said wheel in the same direction, but at a less rate of speed than the drum, said parts being combined substantially as described.

408,176. STEAM-TRAP. GUSTAV J. GRABBERT, Detroit, Mich. Filed Nov. 20, 1888. Serial No. 291,395. (No model.)

Claim.—1. In a steam-trap, the combination, with the condensing-chamber provided with an inlet and a discharge pipe, of a valve

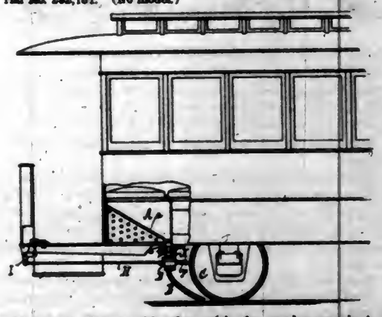
located in the discharge-pipe, and a tilting receiving-basin engaged to operate said valve, substantially as described.

2. In a steam-trap, the combination, with the condensing-chamber provided with an inlet and a discharge pipe, of a valve controlling communication through the discharge-pipe and provided with a valve-stem, and a tilting receiving-basin provided with a weighted arm engaged with said valve-stem, said basin provided with an outlet and controlling valve, substantially as set forth.

3. In a steam-trap, the combination, with a condensing-chamber provided with an inlet and a discharge pipe, of a valve D, to control communication through the discharge-pipe, a tilting receiving-basin engaged to operate said valve, a live-steam pipe communicating with the discharge-pipe through said valve, and a check-valve G, located in the discharge-pipe, substantially as set forth.

4. In a steam-trap, the combination, with the condensing-chamber provided with an inlet and a discharge pipe, of a valve D, to control communication through the discharge-pipe, a tilting receiving-basin engaged to operate said valve, check-valves G and H, located in the discharge and inlet pipes, respectively, and a live-steam pipe communicating with the discharge-pipe through the valve D, substantially as set forth.

5. In a steam-trap, the combination, with the condensing-chamber provided with an inlet and a discharge pipe, of a valve D, to control communication through the discharge-pipe, a tilting receiving-basin engaged to operate said valve, a live-steam pipe communicating with the discharge-pipe through the valve D, said discharge-pipe provided with an inlet-opening, a conical point, and a check-valve G, substantially as described.



408,177. SEALING-DISK FOR JARS, &c. DANIEL W. JOHNSON, Philadelphia, Pa. Filed Feb. 16, 1889. Serial No. 300,095. (No model.)

Claim.—1. A sealing-gasket for jars or other vessels, having a base of water-proof material backed with and secured to a felted material, substantially as described.

2. A sealing-gasket consisting of a body of felted material having water-proof material secured to its opposite faces, substantially as described.

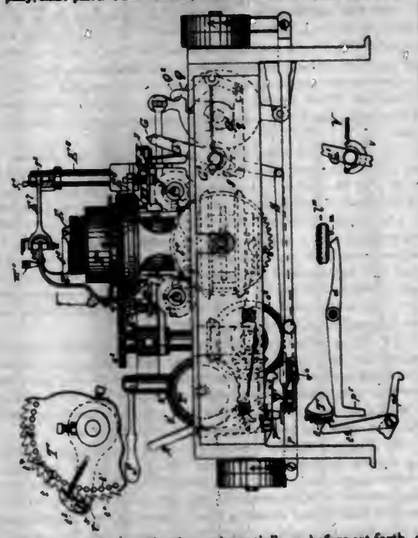
408,178. SAND-BOX FOR RAILWAY-CARS. HENRY W. JORDAN, Hoboken, and GEORGE W. MILLS, Elizabeth, N. J., and LOUIS JORDAN, New York, N. Y. Filed June 12, 1886. Renewed Nov. 28, 1888. Serial No. 292,131. (No model.)

Claim.—1. The combination, with the sand-reservoir A and its discharge-tube B B', of the valve E, the port or opening e therein, the yoke or staple shaped stirrer J, carried by the valve, and mechanism, as described, for operating the valve, substantially as set forth.

2. The combination, with the platform *j*, push-rod *i*, bell-crank lever I, link H, valve E, and spring F, of a locking device consisting

of the hook-shaped block *l*, centered on the bolt *m*, substantially as and for the purpose hereinbefore shown and described.

3. The combination of a sand-hopper having a tubular opening in its bottom leading down to a valve, and a slide-valve provided with a rod or stirrer which extends upward in said tubular opening, substantially as described.



4. In a sanding apparatus for street-cars, the combination, with a headed push-pin for operating the valve, of a detent pivoted to the platform of the car and adapted to be moved under the head of the pin to prevent its operation, substantially as described.

408,179. GARTER. JACOB KATZENBERG, New York, N. Y. Filed Jan. 8, 1889. Serial No. 296,764. (No model.)

Claim.—As an improved article of manufacture, a garter composed of an elastic tape A, having its ends united by a metal clasp B, applied to the tape a short distance from its extremities, the ends being left free to form the bow-pieces *a a*, which cover the clasp at the front, substantially as described.

408,180. CIRCULAR-KNITTING MACHINE. EDWARD R. KILBOURN, New Brunswick, N. J., assignor to the Kilbourn Knitting Machine Company, same place. Filed June 14, 1887. Serial No. 241,243. (No model.)

Claim.—1. The combination, substantially as before set forth, of the stationary knitting-cylinder, the sliding nosing for said cylinder and the screw-ring which holds said nosing.

2. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders fitted to turn simultaneously around it, and the disconnectible drivers by which one cam-cylinder is driven from the other for continuous circular work, but which automatically permit one cam-cylinder to be reciprocated independently of the other for reciprocating work.

3. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders fitted to turn around it, and disconnectible drivers connecting the two cam-cylinders, whereby, when power is applied to move one of said cylinders continuously in the same direction, the two cylinders are caused to revolve simultaneously for circular work, and whereby one of them is permitted to remain at rest while said other cam-cylinder is reciprocated a complete revolution for reciprocating work.

4. The combination, substantially as before set forth, of the knitting-cylinder, the two cam-cylinders for operating the needles of the knitting-cylinder for knitting circular work, and the locking device for locking one of said cam-cylinders and rendering it temporarily inoperative while the other cam-cylinder is being caused to reciprocate.

5. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders for operating the needles thereof for circular work, the locking device for locking one cam-cylinder and rendering it inoperative during reciprocating work, and the lever-handle by means of which said locking device is controlled.

6. The combination, with a knitting-cylinder, of two cam-cylinders operating in connection therewith, two driving-shafts, gearing intermediate one of said shafts, and the cam-cylinders for imparting a circular movement to the latter, reciprocating gearing operated from the other driving-shaft, and means for throwing said reciprocating gearing into operative connection, whereby one of the cam-cylinders may be reciprocated.

7. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders for operating the needles thereof, a driving-shaft, and gearing for operating the cam-cylinders from said shaft for circular work, said gearing having drivers with provision for lost motion or play to permit reciprocating movement to be given to one of the cam-cylinders without reciprocating the driving-shaft.

8. The combination, substantially as before set forth, of the driving-shaft for circular work, the driven wheel caused to revolve thereby, the disconnectible drivers, the notched hub with which one of said drivers is connected, and the pin in said driven wheel.

9. The combination, substantially as before set forth, of the knitting-cylinder, the two cam-cylinders for operating the needles thereof for circular work, the driving-shaft for circular work, the supplementary driving-shaft for reciprocating work, the gearing which is used for both circular work and reciprocating work, and the clutch and reciprocating mechanism through the intervention of which said gearing is connected with and disconnected from said supplementary driving-shaft.

10. The combination, substantially as before set forth, of two driving-shafts which are operated successively, the two belt-shippers for the same, and a single shipping-lever and means for putting the same into operative connection with either of said shippers when desired.

11. The combination, substantially as before set forth, of two driving-shafts, two belt-shippers for the same, a single shipping-lever, and a shifting device by which but one of the two belt-shippers at a time is subjected to the control of the shipping-lever.

12. The combination, substantially as before set forth, of the knitting-cylinder, the cam-cylinder for operating a part of the needles thereof for reciprocating work, operating devices whereby said cylinder is reciprocated, and the stop-lever and cam-tooth for stopping the reciprocating movement of said cam-cylinder at a particular part of its movement.

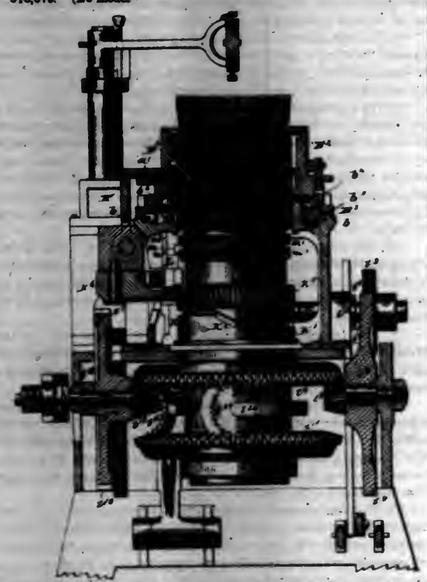
13. The combination, substantially as before set forth, of a knitting-cylinder, two cam-cylinders for operating the needles of the same, operating devices whereby one of said cylinders may be reciprocated, and whereby, when desired, the two cylinders may be caused to rotate together continuously in one direction, a stop-lever and cam-tooth for stopping the reciprocating movement of one of said cam-cylinders at a particular part of its movement, devices for locking one of said cylinders in a stationary position during the reciprocating movement of the other, and the lever which controls the locking and unlocking of the said cam-cylinder.

14. The combination, as before set forth, of the knitting-cylinder, a circular series of needles divided into two gangs, two cam-cylinders for operating the needles for circular work, one of said cam-cylinders operating one of said gangs of needles for reciprocating work, and the counting device which indicates the number of circular rows of stitches which have been knitted.

15. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders by which the needles thereof are operated for circular work, the counting devices which indicate the number of circular rows of stitches which have been knitted, the driving-shaft for circular work, the belt-shipper appertaining to said driving-shaft, and the belt-shipper latch of the driving-shaft for circular work.

16. The combination, substantially as before set forth, of the picker and its carrier, a revolving shaft, and intermediate mechanism, including the change-wheels and segments, through the intervention of which the carrier is caused to move in reverse directions, the latch of the belt-shipper appertaining to said shaft, and a stop through the intervention of which the said latch is disengaged.

17. The combination, substantially as before set forth, of the picker and its carrier, a driving-shaft, gearing intermediate said shaft and said carrier, including the change-wheels and segments among its members, a belt-shipper for said shaft and its connected latch, and a stop moving with the change-wheels and adapted to release said latch.



18. The combination, substantially as before set forth, of a needle-cylinder with two cam-cylinders, devices whereby said cam-cylinders are given a common operative rotation for knitting circular work, and devices whereby one of said cam-cylinders is given a reciprocat-

ing movement independently of the other for operating the needles during the widening and narrowing of the work.

19. The combination, substantially as before set forth, of a knitting-cylinder having needles divided into two gangs, independently-movable cam-rings for operating each gang of needles, the operative portion of each cam being on one side of its cam-ring, whereby an independent movement of one of said cams in relation to the other will throw all of the needles into an elevated position.

20. The combination, substantially as before set forth, of the lower knitting-cylinder with the upper knitting-cylinder, constructed of larger internal diameter than the lower cylinder.

408,181. CIRCULAR-KNITTING MACHINE. EDWARD R. KILBOURN, New Brunswick, N. J. Original application filed June 14, 1887, Serial No. 241,343. Divided and this application filed May 9, 1889. Serial No. 310,079. (No model.)

Claim.—1. The combination, substantially as before set forth, of the picker-carrier, with the frame of the machine by means of grooves which are concentric with the needle-cylinder and which hold and guide the upper and lower edges of said picker-carrier.

2. The combination, substantially as before set forth, of the picker, the needle-holder, and the carrier, by means of which the first two are held and moved.

3. The combination of a driving-shaft and a picker-carrier with intermediate gearing, through the intervention of which the picker-carrier is operated from the driving-shaft, the members of the said gearing being inseparable during operation.

4. The combination, substantially as before set forth, of the knitting-cylinder, a cam-cylinder for operating the needles for reciprocating work, the picker for acting on the needles which are to be put out of operation with said cam-cylinder, the carrier for said picker, and the needle-holder by which the needles are held positively out of their operating positions.

5. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders for operating the needles of the same for circular work, the picker for acting on the needles which are to be put out of or into operation with one of said cam-cylinders for reciprocating work, and the movable carrier for said picker.

6. The combination, substantially as before set forth, of the circular series of needles, the picker, a cam operated independently of the needle-cams for moving the picker positively in both directions, the carrier, and the worm-segment and screw whereby said carrier is moved partially around the circular series of needles positively without the possibility of overmovement by momentum.

7. The combination, substantially as before set forth, of the knitting-cylinder, the two cam-cylinders for operating the needles thereof for circular work, the picker, and the carrier, which operates in combination with one of said cam-cylinders for reciprocating work.

8. The combination, substantially as before set forth, of a circular series of needles, the cam-cylinder for operating the same for reciprocating work, the picker, the carrier, the worm-segment and screw, and the cams by which the said screw is moved endwise while being caused to turn.

9. The combination, substantially as before set forth, of the knitting-cylinder, two cam-cylinders for operating the needles thereof for circular work, the picker, the carrier, the worm-segment and screw, and the cams by which said screw is caused to move endwise.

10. The combination, substantially as before set forth, of the circular series of needles, the cam-cylinder for operating the same for reciprocating work, the picker, the carrier, the change-wheels and segments, whereby the number of times the carrier is to be moved in opposite directions is determined, devices intermediate said change-wheels, and the carrier for moving the latter, and the driving-gearing engaging with said change-wheels and segments.

11. The combination, substantially as before set forth, of the change-wheels and the curved segments set behind the teeth of the said change-wheels.

12. The picker, substantially as described, having a lug for engaging the nibs of the fashioning-needles from the under side, and a lug for engaging such nibs on their upper side, said lugs being located upon the picker in different vertical planes, substantially as described.

13. The combination, herein described, of a knitting-cylinder having a gang of needles for reciprocating work, a cam for operating said needles, a picker having two lugs in different horizontal and vertical planes, and a single cam-grade for actuating said picker.

14. The combination, substantially as before set forth, with the frame of the machine and a knitting-cylinder, said frame being provided with annular grooves outside of said cylinder, of picker-carriers of segmental form mounted in said grooves.

15. The combination, substantially as before set forth, of the knitting-cylinder having a gang of needles for reciprocating work provided with nibs for engaging the operating-cam, a portion of which are provided with supplemental nibs, a cam for operating said needles for circular and reciprocating work, pickers for engaging the supplemental nibs of said needles, and mechanism operated independently of the needle-cam for operating said pickers positively in both directions.

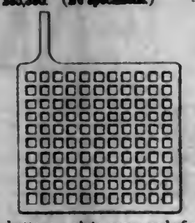
16. The combination, with a knitting-cylinder and needles, of two pickers, two picker-carriers, and the worm-segments and screws for moving the carriers, the movable parts of said pickers intersecting the planes of said segments and screws, substantially as described.

17. The combination, substantially as before set forth, of a knitting-cylinder and a circular series of needles, including a gang for reciprocating work, a portion of said reciprocating needles being provided with supplemental nibs, cams for operating said needles for circular or reciprocating work, pickers for engaging the supplemental nibs of the needles, and a cam for operating said pickers having motion independent of the needle-operating cams.

18. The combination, substantially as before set forth, of a knitting-cylinder having a gang of needles for reciprocating work, a portion of said needles being provided with supplemental nibs, a cam for operating said needles for circular and reciprocating work, pickers for acting on the supplemental nibs, and an independently-operated cam for moving said pickers positively in both directions.

19. The combination, substantially as before set forth, of a knitting-cylinder having needles divided into gangs, one of said gangs being for reciprocating work, and a portion of said reciprocating gang being provided with supplemental nibs, pickers for engaging the supplemental nibs of said needles, a cam for operating the reciprocating gang for both reciprocating and circular work, a cam for operating the other gang for circular work, and a cam for operating said pickers positively in both directions.

20. The combination, substantially as before set forth, of a knitting-cylinder having a gang of needles for reciprocating work, a cam for operating said needles, two pickers, and a separate cam-grade for operating each of said pickers having motion independent of the needle-operating cam.

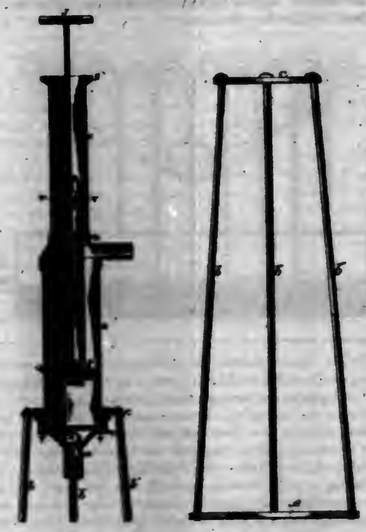


21. The combination, substantially as before set forth, of a knitting-cylinder having a gang of needles for reciprocating work, a cam for operating said needles, two pickers, and a cam-ring having motion independent of the needle-operating cam and having a separate cam-grade for operating each of said pickers.

22. The combination, substantially as before set forth, of a knitting-cylinder having a gang of needles for reciprocating work, a cam for operating said needles, two pickers, and a grooved cam having a separate grade for operating each of said pickers.

23. The combination, substantially as before set forth, of a knitting-cylinder having a gang of needles for reciprocating work, a cam for operating said needles, two pickers having each two lugs in different vertical and horizontal planes, two picker-carriers having alternate movements from needle to needle, and a cam for operating said pickers.

24. The combination, substantially as before set forth, of a needle-cylinder with needles, all of which are in operation during circular work and a part of which constitute a gang for reciprocating work, a thread-guide for reciprocating work, narrowing and widening devices, including both means for throwing a portion of the reciprocating gang of needles out of operative position, and a stop for said thread-guide, and screws for moving said narrowing and widening devices in proper relation to the needles during the narrowing and widening.

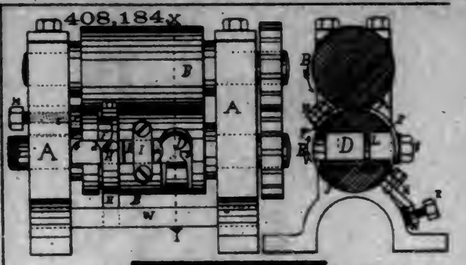


408,182. ALLOY FOR SECONDARY-BATTERY PLATES. EDWARD R. KNOWLES, Brooklyn, N. Y., assignor, by mesne assignments, to the Mutual Electric Manufacturing Company, of New York. Filed Sept. 29, 1888. Serial No. 285,980. (No specimens.)

Claim.—1. In a battery, a plate composed of an alloy of lead, tin, and antimony, substantially as set forth.

2. A plate for electric batteries, composed of an alloy of about eighty-two parts lead, sixteen parts tin, and two parts antimony.

408,183. HAND FORCE-PUMP. PETER KOONS, Avon, Ohio. Filed Jan. 10, 1889. Serial No. 296,080. (No model.)



Claim.—In a pump, the combination, with the piston and a cylinder therefor, of a collar placed around its lower end having a flange at its upper edge, and an external screw-thread below said flange, a cap which closes the lower ends of the collar and cylinder, provided with a flange at its upper edge, an internal screw-thread engaging the thread upon the collar, an inwardly-extending horizontal rest for the lower end of the cylinder, and a valve-seat, whereby a support is clamped between the flanges upon the cap and collar and the pump-cylinder within both, substantially as shown and described.

408,184. MACHINE FOR MAKING PLUMBERS' HOOKS. HENRY LILLEY, Philadelphia, Pa., assignor to Lilley & Hillsley, same place. Filed May 6, 1889. Serial No. 309,793. (No model.)

Claim.—1. In a machine for rolling pipe-hooks, a pair of rolls mounted in a pair of housings, the lower roll constructed with a transverse opening D, in which is fixed a die J below the transverse center of the roll, as shown, and for the purpose specified.

2. The combination of die J, sliding bar K, band-cam H, fixed cam P, rolls B, and housings A, all substantially as shown and described.

408,185. SUPPORT FOR SPINNING-SPINDLES. THOMAS H. LOGAN, Lowell, Mass. Filed Jan. 22, 1889. Serial No. 297,143. (No model.)

Claim.—1. The yielding or elastic bolster, the tube in which it is held, and a holder to support the said tube loosely, combined with a sleeve-whirl spindle, the exterior of the said tube coming next the interior of the said sleeve-whirl, substantially as described.

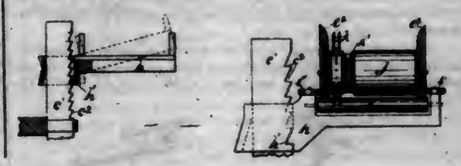
2. The spindle, the elastic bolster, and the tube interposed between the said bolster and whirl, and a holder to receive the said tube, the said holder having a detachable cap, which engages the lower end of the tube to keep it down in the holder, substantially as described.

3. The spindle, the elastic bolster, the tube in which it is held, the holder in which the said tube is mounted loosely, and the spring to support the weight of the said tube and permit it to yield vertically, substantially as described.

4. The described bolster and step, consisting of a short tube e', closed at its bottom to hold oil, and a tubular or sleeve-like bolster open at both ends and having a series of independently-yielding flexible arms, a rigid portion of the said bolster coming in contact with the interior of the said tube, while the said flexible arms bear directly against the spindle at opposite sides and yield independently to the requirements of the foot of the spindle as the latter moves, due to an unbalanced load.

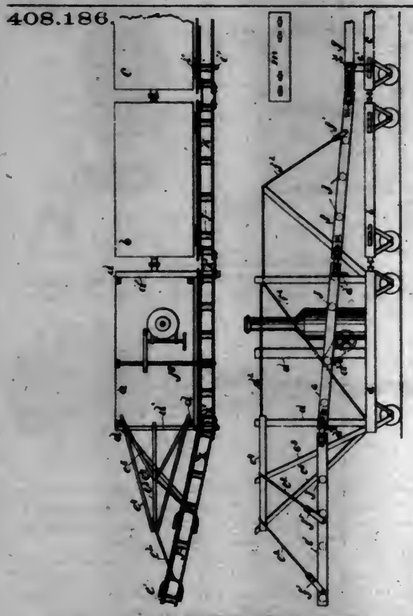
5. The described bolster and step, consisting of a tube e' and the bolster secured in the upper end of the step-tube and having flexible arms f^2 extended within the said tube, combined with a spindle and a holder for the said tube, and with a pin or projection to prevent the rotation of the tube with the spindle, substantially as described.

408,186. RAILWAY-TRACK LAYER. DAILY S. MOORE, Chicago, Ill., assignor of two-thirds to Abner Price and Alexander Price, same place. Filed Sept. 11, 1888. Serial No. 285,110. (No model.)



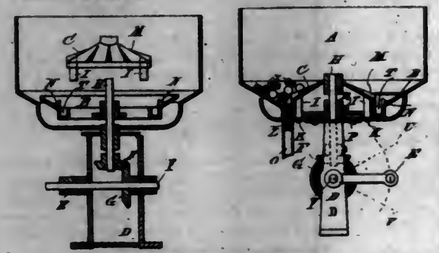
Claim.—1. In a railway-track layer, in combination with the carriers g, the brackets h and stakes i', provided with notches i^2, substantially as specified.

2. In a railway-track layer, the combination of the notched stake i' with a bracket provided with lip h', substantially as specified.



3. In a railway-track layer, in combination with the carrier g, the adjustable carriers f i', fixed carrier c, and car a, substantially as specified.

4. In a railway-track layer, in combination with the car a, provided with posts d and fixed carrier c outside of said posts, the adjustable carrier i', attached to the front of said fixed carrier, whereof the front is over the center line of the car, posts i^2, braces i^3, and ropes i^4, substantially as specified.



5. In a railway-track layer, in combination with the car a, provided with posts d and fixed carrier c outside of said posts, the adjustable carrier i', provided with brace i^3, posts i^2, and braces i^3, substantially as specified.

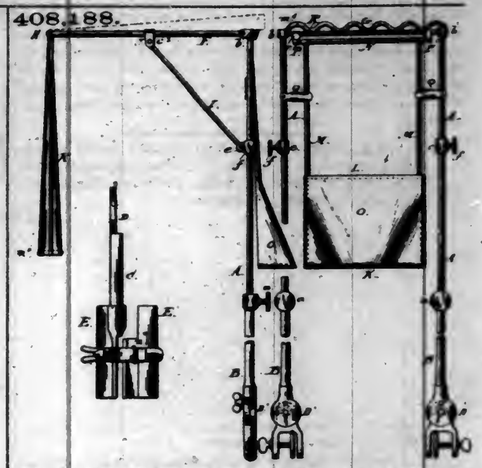
408,186.

408,187. FEEDER FOR BRAID-ROLLS AND SMALL SPOOLS. JOHN H. MORRISON, Pawtucket, R. I. Filed May 15, 1888. Serial No. 274,007. (No model.)

Claim.—1. In combination, hopper A, having opening L, agitator B, having concentric channel T and lugs N, the conical cap C, having lugs M, and projections I I, all substantially as described.

2. The combination, in a braid-roll and small-spool feeder, of a stand D, bearing a hopper A, having an opening L, the agitator B, having a concentric channel T, and means for imparting a vibratory movement to said agitator, substantially as described, for the purpose specified.

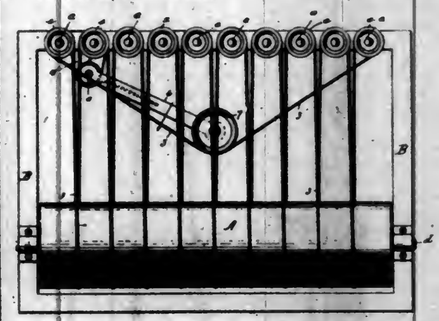
3. In a braid-roll and small-spool feeder, in combination, the hopper A, bearing on the inside a conical cap C, provided with means for fastening rigidly to bottom of said hopper, or to shaft H, substantially as described, the vertical shaft H, bearing agitator B and gear F, the stand D, bearing shaft Y, gear G, arm E, and operating mechanism, whereby blanks poured promiscuously into the hopper are delivered one by one through the exit, all substantially as described.



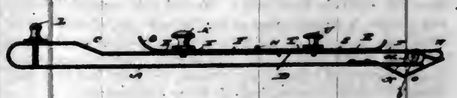
408,188. FAN FOR ROCKING FURNITURE. ARTHUR W. MCCOMAS and HENRY A. FITZHUGH, Austin, Tex. Filed Nov. 4, 1887. Serial No. 254,270. (No model.)

Claim.—1. The combination, with the fan-supporting frame having a bar G, with one fixed loop and a corresponding loop secured by a thumb-screw, of the back fan and its frame journaled in said loop, as set forth.

2. The combination, with the fan-supporting frame, substantially as described, the fan O, adjustably journaled to the bar G, and the holding-forks Q, pivoted to uprights A, of the fan R, pivoted to the

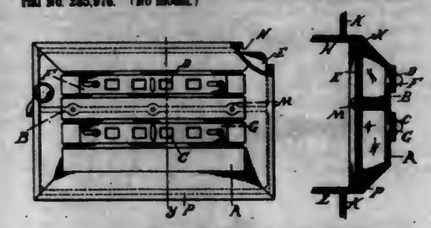


408,188.



ends of the horizontal arms of the frame, all arranged to form a set of fans for front and rear service, as set forth.

408,189. TENSION-REGULATING DEVICE FOR SPINDLE-DRIVING BANDS. ARTHUR MCDONALD, Scotland, Conn. Filed Mar. 26, 1889. Serial No. 304,666. (No model.)



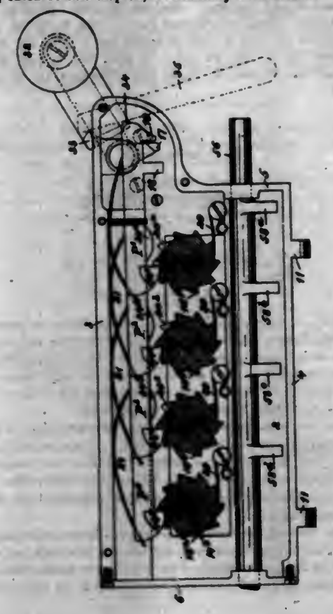
Claim.—In combination, the driving-drum and the spindles of a spinning and twisting machine, an endless driving-band engaging said drum and spindles and having a long horizontal loop thereof extending between the ends of the machine under that portion of the band extending between the drum and the spindles, a vertical post supported in bearings in said machine and free to rotate reciprocally therein, an arm attached to and extending at right angles from said post, having a pulley thereon engaging with said band, and a spiral spring surrounding said post and acting to swing said post and arm and force said pulley against the band, substantially as set forth.

408,190. TUCKING-GUIDE FOR SEWING-MACHINES. HENRY L. SICK, New Orleans, La. Filed Sept. 3, 1888. Serial No. 284,414. (No model.)

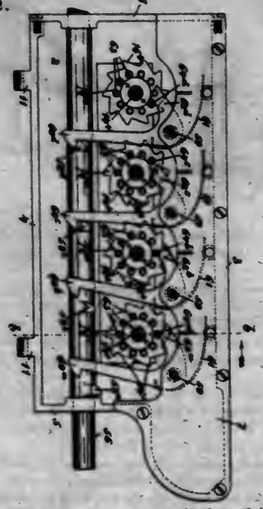
Claim.—In a tucking-guide for sewing-machines, the combination, with the base-plate having an overhanging portion C, of a set-screw for regulating the distance between the free end of the same and the frame, the gage-arm having the slot F and a flange at its forward end, a guide-lug entering the slot, and the set-nut passing into a threaded aperture in the branch C of the tucking-guide frame and through the guide-lug and the shoulder bearing on the gage-arm to hold the latter in position, the arm P, hinged to one end of the guide-frame and having a projecting tongue W, the spring secured to the guide-frame and bearing against said tongue to depress the inner end of the arm P, and the pressure-plate adjustably secured to said arm by means of a set-nut, substantially as specified.

408,191. DOOR FOR STOVE-OVENS. JESSE ORR, Reading, Pa., assignor to Orr, Painter & Co., same place. Filed Sept. 21, 1888. Serial No. 285,976. (No model.)

Claim.—An oven-door constructed with upper and lower chambers separated by a horizontal solid partition, substantially as described, the lower chamber having air-inlet openings C in its outer wall immediately below said partition, and the upper chamber having similar outlet-openings D, the inner wall of said chambers being formed by a solid vertical deflector-plate E, arranged to leave top and bottom openings N and P to said upper and lower chambers, respectively, substantially as set forth.



408,192. STOP-MOTION REGISTER FOR GRAIN-SCALES. FRANCIS H. RICHARDS, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. Filed Oct. 15, 1888. Serial No. 288,152. (No model.)



Claim.—1. In a register mechanism, the combination of a series of toothed wheels carrying register-dials and a corresponding series of reciprocatable pawls lying contiguous to said wheels for actuating said wheels, respectively, said wheels each having a space therein under each pawl except its own, all substantially as described.

2. In a register mechanism, the combination of the toothed wheels N and of a corresponding series of pawls P, for actuating said wheels, respectively, and a reciprocating arm for actuating said pawls, said wheels each having a space underneath each pawl except its own, all substantially as described.

3. In a register mechanism, the combination of the wheels N' and N², driving-arm 17, pawl P', connected with said arm for actuating wheel N', and pawl P², adapted to be engaged with said arm for actuating wheel N², said wheel N' having a space at one point in its circumference under said pawl P², whereby the latter is let into engagement with said driving-arm once during each revolution of wheel N', substantially as described.

4. In a register mechanism, the combination of the vertically-reciprocating beam 40, driving-arm 35, connected thereto, and lever 31, having catch 33 and stop 34, substantially as described.

5. The combination, with register mechanism, of the driving-arm 17, lever 31, operating said arm and provided with catch 33 and stop 34, and having a weight for performing the work of moving forward the dials, and the arm 35, engaging with and lifting said lever by said catch, and then detaching therefrom by said stop, substantially as described.

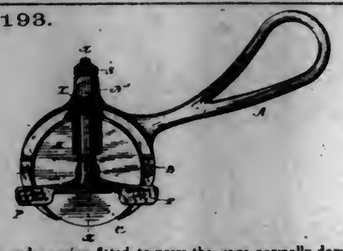
6. In a stop-motion register, the combination of the intermittingly-revolving stop-cylinder, stop-pins set in said cylinders, a corresponding series of hooks operated by said pins, respectively, and a stop-shaft having stop-arms engaging with said hooks, all substantially as described.

7. In a stop-motion register, dials carrying stop-pins, hooks actuated from said pins, and a series of stop-arms engaging with said hooks, said arms projecting from one movable part and being set at a gradually-increasing height, all being organized and coacting substantially as described.

8. In a stop-motion and register for grain-scales, the combination of the supply-chute, the stop-valve, hooks operatively connected to lock said valve open, and register-dials carrying stop-pins located therein to detach said hooks at a predetermined time, all substantially as described.

9. In a stop-motion and register for grain-scales, the combination of the supply-chute, the stop-valve, a lever actuating said valve to open the same, cam-arm 55, hooks locking said cam-arm in position to hold the valve open, and register-dials carrying stop-pins set to detach said hooks at a predetermined time, all substantially as described.

10. In a stop-motion register, the register-dials figured and intermittingly revolved, substantially as described, and having circumferentially thereof stop-pin holes corresponding to the figures thereon, in combination with stop-pins insertible in said holes and valve-locking hooks constructed to be detached by cam-arms operated by said pins, all substantially as described.



11. In a register mechanism, the combination of the dial D, perforated as set forth, cylinder N, carrying said dial and correspondingly bored, a stop-pin insertible in the holes of said dial and cylinder, and the hook having a cam-arm normally standing in the path of said pin between said dial and cylinder, all substantially as described.

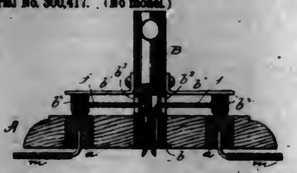
12. In a stop-motion register, the combination of cylinders N, carried by toothed wheels and carrying stop-pins, substantially as described, the rock-shaft having stop arms 58, and hooks 60, pivotally supported on the frame and having cam-arms 62, all organized and coacting substantially as described.

408,193. TOOL FOR CUTTING PAPER, TRIMMING SHADES, &c. CHARLES T. RINGLEY, Springfield, Ohio, assignor of one-half to Mark A. Smith, same place. Filed Sept. 6, 1888. Serial No. 284,714. (No model.)

Claim.—1. In a paper-cutting tool, the combination, with a head having a receding face at one side thereof to receive the blade, whereby surfaces are left at each side of the blade to act against the guide-strip, and a fixed arbor mounted in the head and projecting into the said recess, of a disk-blade mounted upon said arbor and within the said recess, a gage extending across the head and having a vertical shank, a channel in the head in which said shank is slidingly

408,193.

mounted, and a spring fitted to press the gage normally downward, and a device to prevent the spring from forcing the shank out of the channel.

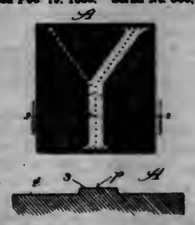


2. In a paper-cutting tool, the combination, with a head having a shouldered channel in it, of a gage having a shouldered shank slidingly mounted in said channel, screw-threaded at its upper end and provided with a nut, and a spiral spring inclosed in the channel and around the shank and pressing at its ends against said shoulders respectively.

3. In a paper-cutting tool, the combination, with a head and a blade mounted therein, of a gage which extends across the said blade and is mounted in said head and provided with dependent lips, and a flange extending laterally beyond the said lips.

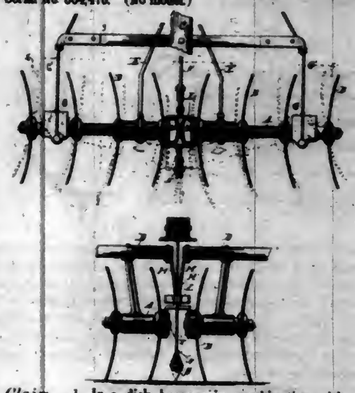
4. In a paper-cutting tool, the combination, with a head, of a disk-blade having a central bore constructed with a seat, and an arbor fitted to said bore and secured to the tool-head and extending beyond the outside thereof, and a jam-nut screwed on the said projecting end of the arbor.

5. In a paper-cutting tool, the combination, with a head having a screw-threaded arbor-hole, a recess round said hole, and a washer fitted to said recess and extending beyond the adjacent surface of the head, of a disk-blade having a central bore and fitted upon said washer, and an arbor fitted to said bore in the blade and secured in the head and provided with a jam-nut.



408,194. ELECTRIC SWITCH. HARRY T. RIGGS, Farmington, Me., assignor of one-half to Alvin S. Riggs, same place. Filed Feb. 19, 1889. Serial No. 300,417. (No model.)

Claim.—1. In an electric switch, a center rotating post having attached thereto by means of lateral arms two contact pieces or lugs, the said post being hollow and the two terminals of the circuit entering the structure of the switch through the hollow post and extending through lateral openings in said post to the contact pieces or lugs mentioned, all in combination with a base-piece, which supports the said post, and also two terminals of a circuit corresponding to the terminals fixed to the post, substantially as described.



2. In an electric switch, a rotating hollow post having attached thereto two spring-arms bearing at their outer ends metallic circuit-terminals, the spring-arms being insulated from the terminals, and the circuit-wires leading in through the hollow post and connecting, respectively, with the insulated terminals.

408,195. TYPE. AMOS D. ROOD, Chicago, Ill., assignor, by direct and mesne assignments, to Netta G. Rood and Thomas B. Bryan, both of same place. Filed Feb. 19, 1889. Serial No. 300,422. (No model.)

Claim.—A type provided with puncturing-points extending beyond the face of its character and producing, when the type is used for printing, an outline of the character by perforations in addition to the ink-impression thereof, substantially as described.

408,196. DISK HARROW. CHARLES S. RUSH, Dixon, Ill., assignor to the Grand Detour Plow Company, same place. Filed Mar. 23, 1888. Serial No. 304,476. (No model.)

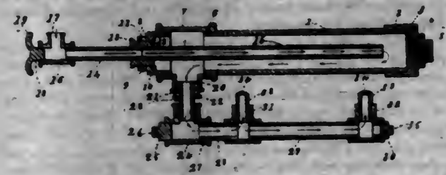
Claim.—1. In a disk harrow, in combination with the gang-planks D D and disk-gangs A A, the bumpers H H, attached at their upper ends to said gang-planks and collared at their lower ends on the inner ends, respectively, of said disk-gangs, and provided intermediately with the opposing faces H', substantially as shown, and for the purpose described.

2. In a disk harrow, the combination of the gang-planks D D, disk-gangs A A, the bumpers H H, attached at their upper ends to said gang-planks and collared at their lower ends on the inner ends, respectively, of said disk-gangs, and provided intermediately with the opposing faces H', and the link L, adapted to loosely inclose said bumpers and limit the separation of said gangs, substantially as shown, and for the purpose described.

3. In combination with the gangs of a disk harrow, the bumpers H H, formed, respectively, upon the inner ends thereof, the shovel M, the pivotally-seated arm N, the rod K, provided with the link L, encircling said bumpers, and the actuating and adjusting lever F, substantially as shown, and for the purpose described.

4. In combination with the gangs of a disk harrow, the bumpers H H, attached, respectively, to the inner ends of said gangs, the rod K, provided with the link L, encircling said bumpers, and the actuating and adjusting lever F, substantially as shown, and for the purpose described.

408,197. REGENERATIVE LAMP. JOHANN F. E. W. SCHMIDT, Dresden, Saxony, Germany. Filed Jan. 21, 1888. Serial No. 297,031. (No model.) Patented in England Dec. 11, 1888, No. 18,066; in Switzerland Dec. 15, 1888, No. 184; in France Dec. 17, 1888, No. 194,818; in Belgium Dec. 17, 1888, No. 84,316; in Spain Dec. 21, 1888, No. 9,000; in Italy Dec. 31, 1888, No. 24,500, and in Denmark Apr. 25, 1889, No. 1,266.



Claim.—1. The combination of a lamp-frame, a transparent burner-globe having imperforate bottom and side walls and suspended from the lamp-frame, a pendent burner in the burner-globe, and a translucent shade-globe, also suspended from the lamp-frame and inclosing within it the burner-globe for enlarging the circle of downwardly-radiating light, substantially as described.

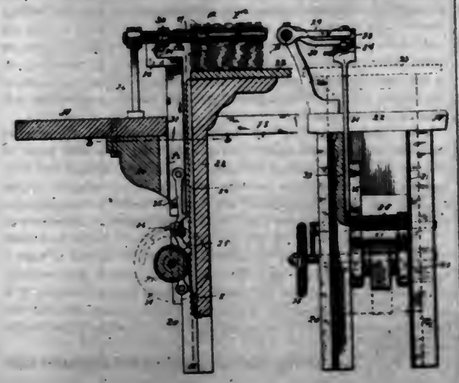
2. The combination of a lamp-frame, a pendent burner, a burner-globe suspended from the lamp-frame, and a translucent shade-globe suspended from the lamp-frame, inclosing within it the burner-globe and having its curved walls eccentric to the curved walls of the burner-globe for enlarging the circle of downwardly-radiating light, substantially as described.

3. The combination, with a lamp-frame, a burner-globe suspended therefrom and having imperforate bottom and side walls, and a pendent burner in the burner-globe, of the translucent shade-globe, inclosing the burner-globe and detachably connected at its open top with the lamp-frame for enlarging the circle of downwardly-radiating light, substantially as described.

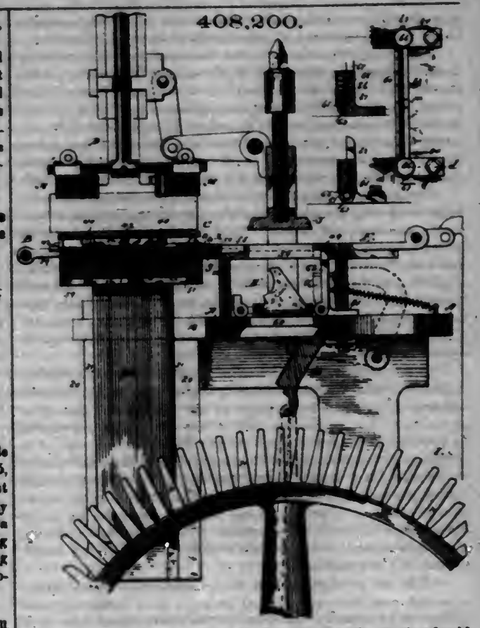
4. The combination of a lamp-frame, a burner-globe suspended therefrom and having imperforate bottom and side walls, a pendent burner in the burner-globe, and a translucent shade-globe suspended from the lamp-frame, inclosing the burner-globe and provided at its bottom with an unobstructed air-inlet orifice for the constant admission of ascending currents of cool air, which rise between the globes and discharge at the open top of the shade-globe, substantially as described.

408,198. HYDROCARBON-OIL VAPORIZER AND BURNER. JACOB S. SIMON, Buffalo, N. Y., assignor of one-half to Cheeseman Dodge, same place. Filed Sept. 1, 1888. Serial No. 284,273. (No model.)

Claim.—In a hydrocarbon-oil vaporizer and burner, a removable retort portion 1, having an inlet-tube consisting of the tubes 14 and 15, secured by a reducer to the retort, the portion 15 forming a straight tube projecting and opening into and extending lengthwise of the body of the retort without coming in contact with the sides of the same, in combination with a burner-tube extending parallel with it, consisting of the pipes 28 and 29, connected together by T portions carrying gas-burners and by a T and connecting parts to the T portion 7, substantially as described.



408,199. STREET-LAMP SIGN. JOHN STEWART, Chicago, Ill. Filed Apr. 18, 1889. Serial No. 307,773. (No model.)



Claim.—A street-lamp sign composed of the wires *a a*, connected together by stripe *b*, in combination with the pieces *c c*, secured one to each wire *a*, and provided with projections *d*, and the glass pieces *e*, fitted therein, substantially as specified.

408,200. ENVELOPE-MACHINE. ALVIN D. TYRRELL, South Hadley Falls, assignor of one-half to H. L. Newell, Springfield, Mass. Filed Feb. 17, 1888. Serial No. 264,441. (No model.)

Claim.—1. In an envelope-machine, the combination, with suitable fixed guiding-ways thereof, of a movable upright 22, carrying the blank-supporting table and having a ratchet-bar 24, a slide-bar

provided with a spring-pawl adapted to engage the teeth of said ratchet-bar, a rock-shaft, and a connection, substantially as described, between the same and said pawl-carrying slide-bar, whereby the latter is reciprocated on a rocking of said rock-shaft, and a detent 25, for the purpose set forth.

2. In an envelope-machine, the combination, with a fixed standard 20, having suitable guiding-ways therein provided with the cam-shaft 36, and having the roller 37, of a movable upright 22, carrying the blank-supporting table, and having a ratchet-bar 24, the detent 25, and a flexible connection, substantially as described, by its one end secured to said upright and by its other to said roller, a slide-bar 31 provided with the spring-pawl 35, adapted to engage the teeth of said ratchet-bar, the rock-shaft B, and a connection between same and said slide-bar, for the purpose set forth.

3. In an envelope-machine, the combination, with the upright D having the lugs 41 41, and a movable envelope-blank-supporting table, of a pair of clamp-frames C C, pivoted to said lugs 41, the rock-shaft B, having radial arms, as 29 39, and the links 43, connecting said radial-arms and said clamp-frames, substantially as and for the purpose described.

4. In an envelope-machine, the combination, with the envelope-blank carrier F, having the cross-bar 59 and its stationary support and guideway 49, provided with the forwardly-extending headed studs *g*, of the frame K, comprising the arms 52, with apertured lugs 51, the fingers 56, and the rearwardly-disposed joining-web 58, and the springs surrounding said stud *g* between said lugs and the front of the carrier-support, acting to project said frame K to its forward extent, substantially as and for the purpose described.

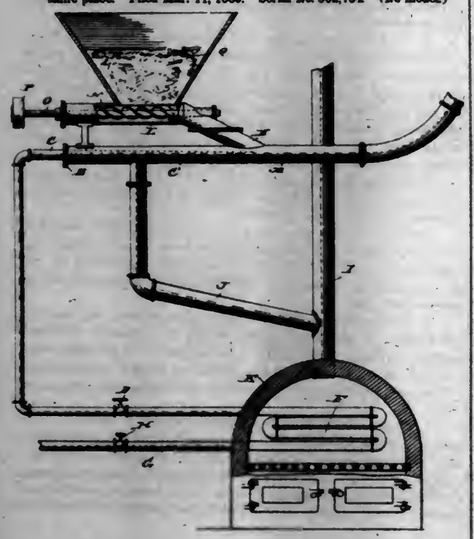
5. In an envelope-machine, a flap-folder wing supported in the bed on spring journal-bearings, whereby it is capable of a yielding pressure, for the purpose described.

6. In an envelope-machine, the combination, with a flap-folder having the trunnions or pintles 63, of the boxes or end bearings comprising the bearing-blocks 64, having vertically-extended slots 65, with upper chambered extensions or boxes 66, and the springs 68, for the purpose described.

7. In an envelope-machine, the combination, with the vibrating folder-wing, of the tubular spindle having the extended peripheral surface *j*, arranged with its axis in the pivotal line of the folder-wing, and said folder-wing and tubular spindle operated to simultaneously roll in opposite directions, substantially as and for the purpose set forth.

8. In an envelope-machine, a flap-folder wing *f*, pivoted on a longitudinal journal-rod *h*, and having a recessed shank *k*, a tubular spindle *i*, surrounding said journal-pin, having a longitudinal peripheral extension *j* and a radial lever *n*, in combination with a pivotally-hung and suitably-actuated angular lever *m*, and connecting-rod *l* between one end of said angular lever and an outer portion of said pivoted

wing *f*, and a connecting-rod *p* between said radial arm *n* and the arm of said angular lever, all substantially as shown and described.



9. In an envelope-machine, the combination, with a stationary frame 91, comprising side boards 92, having suitable opposing guiding slots or ways 93, and the cross-rod 101, of the carrier-frame Q, comprising the side walls 98, having the opposing angular slots 100, and the studs 94, extending laterally therefrom through said slots 93, said carrier-frame being provided with suitable envelope clasping and releasing devices, substantially as described, and the reciprocating connecting-rods 95, connected to said studs, for the purpose set forth.

10. In an envelope-machine, the combination, with the stationary frame comprising the side boards 92, having the opposite slots or ways 93, the abutments 108 108 and 115 115, the cross-rod 101, and the cam-edged spring-catches 110, of the carrier-frame Q, comprising the side walls 98, having the opposing angular slots 100, the cross-bracing strips 99, and the studs 94, extending laterally from said side walls through said slots 93, said carrier-frame having at its forward portions spring-fingers 104, with notched hubs having radial arms 106, provided with studs 107, and the reciprocatory connecting-rods 95, substantially as and for the purpose described.

11. In an envelope-machine, the combination, with a suitably-supported rotatable ratchet-wheel having a fixed number of teeth adapted to be rotated to the extent of one tooth at each delivery of an envelope from the machine, said ratchet-wheel being provided at its one side with a disk secured thereto, having at one edge of its periphery an extended or cam face, and having on the other edge of its periphery, at a certain distance around said periphery, another extended or cam face, of a laterally-movable delivery box 90, the Y-lever pivoted in a suitable stationary bracket and having its branch legs arranged to extend into the plane of rotation of said cam-faces, and a connecting-rod between said Y-lever and said delivery-board, substantially as described.

12. In an envelope-machine, the combination, with a suitably-supported rotatable ratchet-wheel having a fixed number of teeth adapted to be rotated to the extent of one tooth at each delivery of an envelope from the machine, said ratchet-wheel being provided at its one side with a disk secured thereto having at one edge of its periphery an extended or cam face, and having on the other edge of its periphery, at a desired distance around said periphery from said cam-face, another extended or cam face, of a laterally-movable envelope delivery-box, a rock-shaft 121, supported in suitable fixed bearings having radial lugs which extend across the path of travel of the envelopes when the same are discharged from the machine, and having the offset arc-shaped guard-arm 124, adjusted normally to lie opposite the peripheral line of said ratchet-wheel, the Y-lever pivoted in a suitable stationary bracket and having its branched legs arranged to extend into the plane of rotation of said cam-faces, and a connecting-rod between said Y-lever and said movable delivery-board, substantially as and for the purpose described.

408,201. REFUSE-EJECTOR. JOHN S. WALLACE, Nelsonville, Ohio, assignor to himself, William B. Brooks, Jr., and Frank A. Prendergast, same place. Filed Mar. 11, 1889. Serial No. 302,734. (No model.)

Claim.—1. In a refuse-ejector, the combination, with a discharge-pipe closed at one end, of a steam-pipe carrying superheated steam and opening into the said discharge-pipe, a refuse feed-pipe held at an angle and discharging into the said discharge-pipe at the nozzle end of the said steam-pipe, and a gas-pipe also opening into the said discharge-pipe between its closed end and the said inner end of the said refuse feed-pipe, substantially as shown and described.

2. In a refuse-ejector, the combination, with a discharge-pipe closed at one end, of a steam-pipe carrying superheated steam and opening into the said discharge-pipe, a refuse feed-pipe held at an angle and discharging into the said discharge-pipe at the nozzle end of the said steam-pipe, a gas-pipe also opening into the said discharge-pipe between its closed end and the said inner end *b*[7] of the said refuse feed-pipe, and a furnace discharging into the said gas-pipe and serving to superheat the steam passing through the said steam-pipe, substantially as shown and described.

3. In a refuse-ejector, the combination, with a discharge-pipe closed at one end, of a steam-pipe carrying superheated steam and opening into the said discharge-pipe, a refuse feed-pipe held at an angle and discharging into the said discharge-pipe at the nozzle end of the said steam-pipe, a gas-pipe also opening into the said discharge-pipe between its closed end and the said inner end of the said refuse feed-pipe, and a feed-screw held in the said feed-pipe to discharge the refuse from the said feed-pipe to the nozzle end of the said steam-pipe, substantially as shown and described.

4. In a refuse-ejector, the combination, with a discharge-pipe closed at one end, of a steam-pipe carrying superheated steam and opening into the said discharge-pipe, a refuse feed-pipe held at an angle and discharging into the said discharge-pipe at the nozzle end of the said steam-pipe, a gas-pipe also opening into the said discharge-pipe between its closed end and the said inner end of the said refuse feed-pipe, a feed-screw held in the said feed-pipe to discharge the refuse from the said feed-pipe to the nozzle end of the said steam-pipe, and a hopper containing the refuse and opening on the said feed-screw, substantially as shown and described.

5. In a refuse-ejector, the combination, with a discharge-pipe closed at one end, of a steam-pipe provided with a nozzle extending into the closed end of the said discharge-pipe, a coil of pipe connected with the said steam-pipe and also connected with the boiler, a furnace containing the said coil of pipe and serving to superheat the steam in the said coil of pipe, a feed-pipe discharging into the said discharge-pipe at the end of the nozzle of the said steam-pipe, a chimney extending from the said furnace, and a branch pipe leading from the said chimney into the said discharge-pipe between its closed end and the end of the nozzle, substantially as shown and described.

6. In a refuse-ejector, the combination, with a discharge-pipe closed at one end, of a steam-pipe provided with a nozzle extending into the closed end of the said discharge-pipe, a coil of pipe connected with the said steam-pipe and also connected with the boiler, a furnace containing the said coil of pipe and serving to superheat the steam in the said coil of pipe, a feed-pipe discharging into the said discharge-pipe at the end of the nozzle of the said steam-pipe, a chimney extending from the said furnace, a branch pipe leading from the said chimney into the said discharge-pipe between the closed end and the end of the nozzle, and a feed-screw connected with a hopper and discharging into the said feed-pipe, substantially as shown and described.

408,202. MAILING-MACHINE. ERASTUS WOODWARD, Somerville, Mass., assignor to the Waters Wrapping and Mailing Machine Company, Portland, Me. Filed Apr. 21, 1888. Serial No. 271,447. (No model.)

Claim.—1. The paper-receiving box, the independent freely-rotating rolls forming the bottom thereof and on which rests the pile of papers, and means to rotate the said rolls in a direction to feed the papers from the said box, combined with the nippers to engage the undermost paper of the pile and draw it from the said box, the paper being pulled out by the nippers causing the rotation of the feed-rolls in the same direction and at a speed determined by the movement of the nippers, and with the first folding-blade and its co-operating roll, substantially as described.

2. A paper-receiving feed-box having in its bottom two or more independently-movable loose rolls to support the lowermost paper of the pile of papers, a pair of rolls located outside of the said feed-box, and the first folding-blade, combined with the nippers adapted to pass between the said folding-blade and the rolls under it to engage the paper and pull it from the said feed-box, substantially as described.

3. The paper-receiving box having a series of independent feeding-rolls, upon which rests the undermost paper of the pile of papers to be folded, a ratchet-wheel for each roll, a pawl for each ratchet, and means to actuate the said pawls to rotate the said feeding-rolls positively and independently in but one direction, combined with the first folding-blade and its co-operating rolls, to operate substantially as described.

4. The paper-receiving box having a series of independent feeding-rolls, upon which rests the undermost paper of the pile of papers to be folded, a ratchet-wheel for each roll, a pawl for each ratchet, means to actuate the said pawls to rotate the said feeding-rolls positively and independently in but one direction, and a presser to impinge the lowermost paper of the pile against that feeding-roll of the paper-receiving box nearest the first folding-blade, combined with the first folding-blade and the nippers to carry the paper from the said receiving-box to the said blade, substantially as described.

5. The bed-plate, the track, the nipper-carriage mounted on the said track at the rear of the first feed-rolls in the direction of the feed of the paper, the link g^{17}, the arm g^{16}, to which it is connected to move the said slide on the said track, the box to receive the paper to be folded, the first feeding-rolls, the first folding-blade, the rock-shaft g', mounted in the said carriage, the movable nipper member g^6, attached to an arm at one end of the said rock-shaft, and the elbow-lever g^8, attached to the opposite end of the said rock-shaft, and having projection g^9 extended over the said carriage, combined with an independent link jointed to the said elbow-lever, and with means, substantially as described, to actuate the said link to positively move the jaw g^6 toward and from the jaw g^5, as and for the purpose set forth.

6. The paper-receiving box, independent loose rolls in the bottom of the box to support the papers, the pressure-finger f^{10}, the first folding-blade, its co-operating rolls, the nippers having stationary and movable members, a carriage supporting the said nippers, and a track upon which the said carriage is adapted to slide, combined with means to move the carriage on the track and means to rock the movable member of the nippers on the carriage, substantially as described.

7. In a mailing-machine, the rolls 101 and 102 and folding-blades and the bed-plate 94, provided at one edge with a track, a nipper-carriage thereon, the rocking or movable member g^6 thereof, and the connecting-link and lever to reciprocate the said carriage, combined with a link and lever and friction device and means to move the said lever to rock the movable member of the nippers upon the carriage, substantially as described.

8. The rolls 105 and 106, for feeding the paper forward, and the jaws to grasp the folded leading end of the paper as it leaves the said rolls, combined with the second folding-blade and rolls, the jaws carrying the paper forward to be folded squarely across the same, substantially as described.

9. The folding-blade A^{17} and its co-operating rolls, combined with the spring-jaws to grasp the folded end of the paper and carry it positively and squarely under the said folding-blade, and with stops to arrest the folded end of the paper held by the said jaws, substantially as described.

10. The feeding-rolls b^2 b^4 and the cross-bar b^5, having fingers b^5, combined with the bed B^3, having the fingers $a^{\times}$, the knife-carrying yoke in the said bed, and with means to adjust the said bed toward and from the said feeding-rolls, substantially as described.

11. The feeding-rolls b^2 b^4, the cross-bar b^5, having the fingers b^5, and the adjustable bed B^3, having rearwardly-extended fingers $a^{\times}$, combined with the cross-plates b^{12} and a^2, and with their attached fingers located above the fingers b^5 and $a^{\times}$, to operate substantially as described.

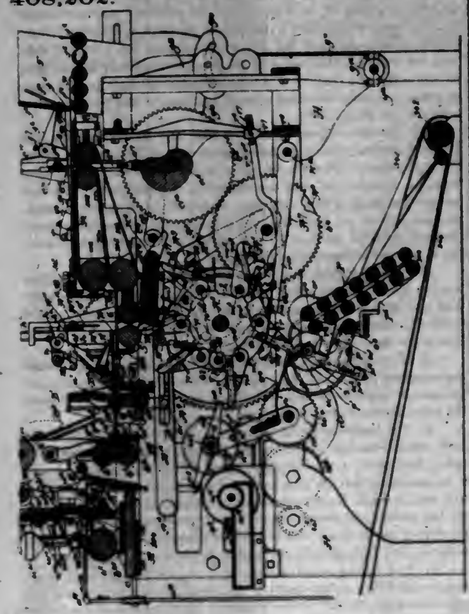
12. The second folding-blade, its co-operating rolls, and the jaws to grasp the folded paper and draw it underneath the said folding-blade, combined with the elevated supporting-plate 79, located near the said rolls, and with feeding-rolls to feed the wrapper-web underneath the said supporting-plate and across the path of movement of the said folding-blade, substantially as described.

13. The bed B^3, the knife-carrying yoke therein, its attached knife for severing the wrapper-web, and the cutter member $B^{\times}$, combined with the adjusting-rod, its pinions, and the rack-bars to adjust the said bed horizontally upon the frame of the machine, and with the slotted levers A^{16} and the blocks *a*, and with means to move the said levers to reciprocate the knife-carrying yoke, substantially as described.

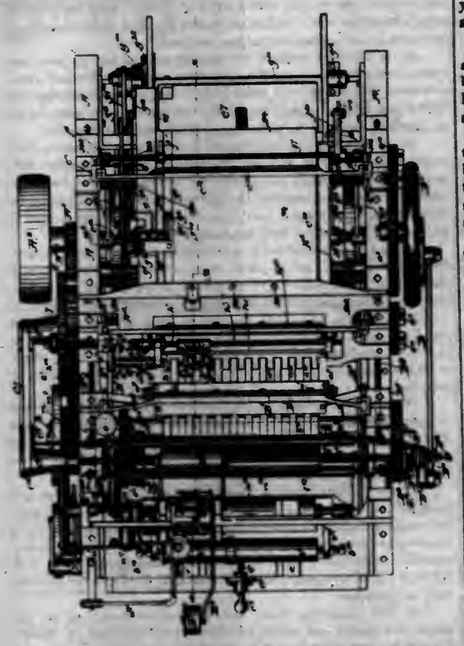
14. The second folding-blade and its co-operating rolls, combined with the transferring mechanism located below the said rolls and adapted to receive the folded paper within them, and with the jaws to which the said transferring mechanism delivers the folded paper, substantially as described.

15. In a paper-folding mechanism, the folding-blade and rolls, combined with the transferring device, including the shaft H^3, the arm H^5, its attached spring-jaw 78, arm H^4, means to move the said arm, and the shield 77, loose on the said shaft, substantially as described.

16. The cylinder composed of a shaft, the heads m^3, and bars m^5 combined with the jaws composed, essentially, of the pivoted arms m^4, the rocker-plates m^2, pivoted thereon, and the pads m^7, substantially as described.



17. The shaft A^5, its heads, the shafts m^3, arms m^4, plates m^2, pivoted thereon, and arms 67 and 71, connected by a spring, and a cam to move the arms 71, combined with the pads m^7, substantially as described.



18. The shaft A^5, its heads, the rods m^5, and plates m^2, slotted at 75, combined with the stops 74, made movable in the said slots, substantially as described.

19. The shaft A^5, its heads, the rods m^5, and plates m^2, slotted at 75, combined with the stops 74, made movable in the said slots, and with the pads m^7, substantially as described.

20. The shaft A^5, its heads, the rods m^5, and plates m^2, slotted at 75, combined with the stops 74, made movable in the said slots, and

408,202.

the pads m^7, and with cams P, to simultaneously adjust the bars 65, carrying the said stops, substantially as described.

21. The shaft A^5, heads m^3, rods m^4, plates m^6, having slots 73, and pad m^7, combined with the bunter r, substantially as described.

22. The shaft A^5, heads m^3, rods m^4, plates m^6, having slots 73, and pads m^7, combined with the bunter r and with the lip-lappers, to operate substantially as described.

23. The roll carrying the wrapper-web and means to rotate it to deliver the wrapper-web at a speed faster than it is required by the feed-rolls, thus accumulating slack in the web, combined with the feed-rolls, the web-cutting mechanism, means, substantially as described, to adjust the same toward and from the said feed-rolls, and folding blade and rolls, between which the wrapper-web is fed before being cut off, substantially as described.

24. The roll carrying the wrapper-web, means to rotate it to form slack in the said web, and the feed-rolls b^2 and b^3, combined with the intermediate guide-roll b^4, means to feed the addressing-strip, sever therefrom a single address, and stick it to the wrapper-web, and with means to adjust the said roll b^4 to insure the application of the address to the face of the wrapper, substantially as described.

25. The support 204 for the addressing-strip and the shaft w^{12}, provided with the arm w^{14}, combined with the feeding-finger frictionally connected thereto, and having a feed-point to engage a hole or depression in the addressing-strip, substantially as described.

26. The support 204, its rod 217, the upright w^9, in which it is free to slide, and the spring 218, combined with the clamping-plate 213, the rod 216, the carriage w^8, its rod 210, and friction device attached to the said rod 210 and engaging the rod 216, to operate substantially as described.

27. The vertically-movable supporting-plate 204 and the carriage w^5 and its attached knife, combined with means, substantially as described, to reciprocate the said carriage and knife, substantially as described.

28. The spring-supported supporting-plate 204, its attached blade, the carriage w^5, and attached knife or cutter w^6, combined with means to raise and lower the said carriage and supporting-plate, and with wetting mechanism to travel under and wet the gummed end of the addressing-strip when the same is elevated, substantially as described.

29. The supporting-plate 204, located above the wrapper-web and supporting the under side of the addressing-strip provided with addresses and with a series of holes or recesses, one for each address, a feeding-finger to enter each hole or depression in succession, the arm w^{14}, to which it is jointed frictionally, the rock-shaft w^{13}, and means to actuate the said rock-shaft to cause the feeding-finger to positively feed the said addressing-strip the distance of one address and leave one address projecting beyond the knife at the delivery end of the said supporting-plate, and a stop to limit the upward movement of the feeding-finger, combined with a knife n^9 and means to actuate it to cut off the said addressing-strip substantially in line with the hole or depression engaged by the feeding-finger, thus insuring correct placing and cutting of the addressing-strip, substantially as set forth.

30. The adjustable roll b^3, over which is extended the wrapper-web, the rest 220 for the wrapper-web, the supporting-plate 204, to support the addressing-strip, its connected knife, the slide or carriage w^5, and its attached knife or cutter, combined with means for reciprocating the slide or carriage w^5, and with it the said supporting-plate, and with a feeding-finger to engage holes or recesses in the addressing-strip and feed it positively just the distance for one address at each stroke, substantially as described.

31. The roll for supporting the addressing-strip and the feeding-finger for engaging holes or recesses in the said strip to feed it intermittingly, combined with drawing-off mechanism, substantially as described, to make slack in the addressing-web in advance of the requirements of the feeding-finger, substantially as described.

32. The supporting-plate 204, to support the gummed addressing-strip, the bar w^{17}, means to reciprocate it, the box attached to the said bar, and the roll in the said box, combined with a water-supply and with an overflow-pipe, to operate substantially as described.

33. The addressing-strip-supporting plate having a ledge at one side, under which passes the edge of the addressing-strip, combined with the feeding-finger having a point, a stop to limit the upward movement of the feeding-finger, and with means to operate the said finger, the said ledge supporting the said finger to insure the movement of the point of the finger in a horizontal line, substantially as described.

34. The jaws to hold the wrapper and paper, the swing-frame n^3, its rotating shaft n^7, having pasting-bars, and the paste-roll, combined with the shaft n' and gears n^3 n^5 n^6, the cam n^{19}, gear n^{20}, and sector n^{21}, to operate substantially as described.

35. The shaft n^7 and the attached pasting-bars, combined with the yoke n^3, the gears n^5 n^4 n^2, and shaft n', the said yoke resting on the said shaft loosely, and with means to rotate the gear n^2, substantially as described.

36. The jaws to carry the wrapper and paper, the paste-box mounted in guides on the frame-work, the paste-roll shaft in the said box, the yoke n^3, the shaft n', to support the yoke, the shaft n^7, its attached pasting-bars, and the link n^{13}, to connect the paste-roll shaft with the shaft n^7, combined with the gears, substantially as described, to rotate the said shaft n^7 at a variable speed, the said gearing being operative to rotate the shaft n^7 in all positions of the said paste-box, substantially as described.

37. The feed-roll shaft b^2, the ratchet D^{20} fast thereon, the stud D^7, pawl thereon, the loose slotted plate or hub D^4, having a pinion D^6, and a stud to act upon one end of the said pawl and disengage it from the teeth of the said ratchet-wheel, combined with a rack to reciprocate the said gear and plate or hub D^4 to effect the intermitting rotation of the feed-roll in one direction and remove the point of the pawl from the teeth of the said ratchet in the backward stroke of the said pawl, substantially as described.

38. The plate 204 and the spring-clamp 203, combined with a wetting device having a roll and a box in which the roll is partially held, and with means, substantially as described, to operate the said wetting device and cause it to travel but once across the wetting-strip before the same is severed, substantially as described.

39. The combination, with the clamping-jaws to hold the folded and wrapped papers and the bunter, of a series of rolls and supports therefor to conduct the said folded and wrapped papers away from the jaws, substantially as described.

40. The paper-receiving box, a series of rolls therein provided with ratchet-toothed wheels, a bar 102, provided with a series of spring-held pawls, arms 116, upon which the said bar is pivoted, and a reciprocating slide-bar 115, combined with the nippers and with the first folding-blade, loosely connected to the said arms 116, to provide for lost motion and enable the pawls to be disengaged from the ratchets during one stroke of the bar 115, combined with the nippers and with the first folding-blade, to operate substantially as described.

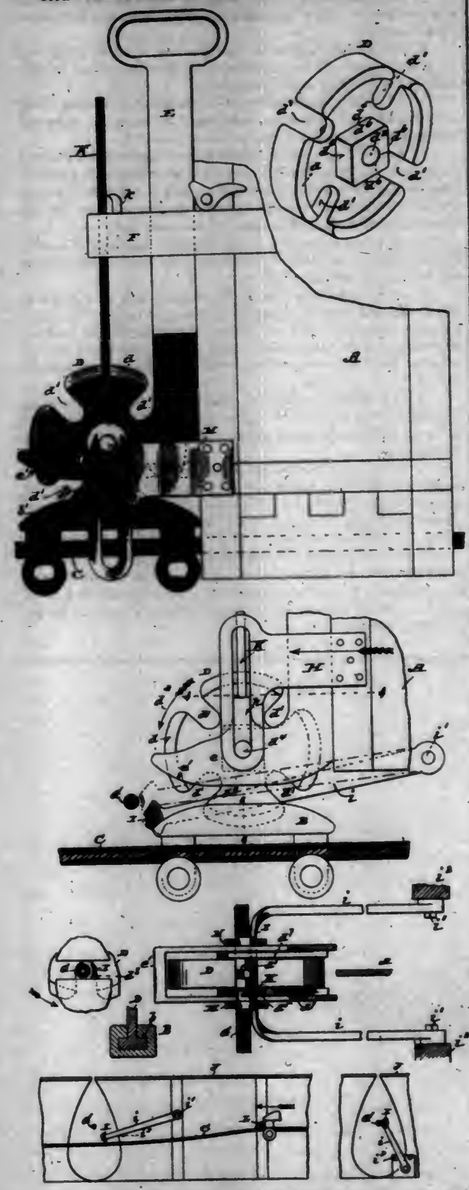
41. In a folding-machine, the rolls r' r^2 and their supports, combined with means, substantially as described, to open or separate the said rolls intermittingly for the reception between them of the folded and wrapped papers, and with a series of rolls to carry the wrapped papers from the rolls r' r^2 first to receive between them the papers, substantially as and for the purpose set forth.

42. In a folding-machine, the rotating cylinder having jaws, and means, substantially as described, to open and close the said jaws, combined with a bunter to enter slots in the jaws and dislodge the folded and wrapped papers therefrom in succession, the same bunter co-operating with all the sets of jaws, substantially as described.

43. In a folding-machine, the roll to support the addressing-web, means to feed the said web, the blade to support the wrapper-web, and means, substantially as described, to feed the wrapper-web, combined with the frame carrying the said roll b^2, and with adjusting devices for the said frame to enable the addressing-slip to be applied to any part of the wrapper-web, substantially as described.

44. In a folding-machine, a rotating cylinder containing jaws composed of pads, as m^7, and of plates, as m^6, arms m^4, on which the said plates are pivoted, shafts carrying the said arms, and springs to normally press the plates toward the said pads, substantially as described.

45. In a folding-machine, the rods m^2, arms m^4, a paste-roll, and plates m^5, pivoted thereon, to support the end of the wrapper-web to be pasted, combined with a vibrating frame and its attached paster to transfer paste from the paste-roll to the wrapper, substantially as described.



46. In a folding-machine, jaws to hold the assembled paper and wrapper, and pasting mechanism, substantially as described, to paste the wrapper, combined with the lip-lapper to meet and lay the lip of the wrapper over upon the pasted part thereof, substantially as described.

47. In a folding-machine, jaws to hold the assembled paper and wrapper, and pasting mechanism, substantially as described, to paste the wrapper, combined with the lip-lapper to meet and lay the lip of the wrapper over upon the pasted part thereof, and with means, substantially as described, to move the lip-lapper bodily and cause it to follow the jaws for a slight distance and meet the rolls r' r^2, substantially as described.

48. The rotating cylinder and its attached jaws, and the lip-lapper, the bunter, and means, substantially as described, to operate the said lapper and the bunter, combined with the rolls between which the folded and wrapped paper is delivered, substantially as described.

49. The feed-box and its series of independent rolls, on which rests the pile of papers, and means, substantially as described, to rotate the said rolls to project the end of the paper next to be fed out of the box, combined with nippers to engage the paper so projected forward and draw it from the said feed-box, the said rolls during such operation being turned only by the moving paper, and only so long as the said paper is in contact with the roll, and then coming to rest, and with the first folding-blade and parts co-operating therewith to fold the paper, to operate substantially as described.

408,208. CABLE-GRIP DEVICE. JOHN T. HODGINS, St. Louis, Mo., assignor, by direct and mesne assignments, of five-sixths to Samuel G. Hodgins and William Stromberg, both of same place. Filed July 30, 1888. Serial No. 281,496. (No model.)

Claim.—1. The combination of the adjustable guard and the holder B and part D, substantially as described.

2. The combination of the holder B, the part D, and the handle E, having the curve e', substantially as described.

3. The combination of the grip, the handle, the guides, the part D, and the holder, substantially as described.

4. The combination of the grip, the two cables, the holder B, the circular part D, as described, the handle E, and the guard, substantially as described.

5. The combination of the indicator K, the part D, and the holder B, substantially as and for the purpose set forth.

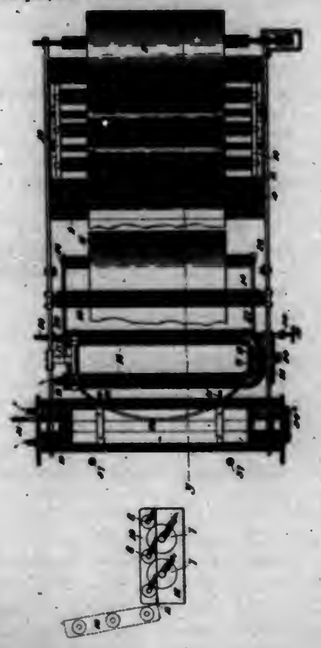
6. The fixed rope F, extending across the conduit, as and for the purpose described.

7. The combination of the conduit, the cables C G, the rope F, the guard I, the grip A, the holder B, and the part D, substantially as described.

REISSUES.

11,016. COMPOUND ORCIN DYE. RUPERT GRENVILLE-WILLIAMS, Albany, N. Y., assignor to the Albany Coal Tar Dye and Chemical Company, same place. Filed July 3, 1889. Serial No. 316,494. Original No. 404,231, dated May 28, 1889.

Claim.—The process of producing new coloring-matters, which consists in combining one molecule of tetrazo-diphenyl or tetrazo-ditolyl or their sulpho-acids with first one molecule of naphthylamine or one of the present known sulpho-acids of naphthylamine, and then combining this intermediate product with one molecule of orcin or sulpho-acids of the same, substantially as set forth.



11,017. MACHINE FOR THE MANUFACTURE OF ROOFING. JOHN A. MCGRAW, HENRY L. MCGRAW, GEORGE W. MCGRAW, Jr., and CHARLES B. MCGRAW, Allegheny, Pa., assignees of GEORGE W. MCGRAW, deceased. Filed June 5, 1889. Serial No. 312,239. Original No. 366,857, dated July 19, 1887.

Claim.—1. In a roofing-machine, the combination of the tank 4, parallel rollers 7, arranged therein and immersed in the liquid thereof, and the rollers 8, arranged above the rollers 7, one of said rollers 8 being between the rollers 7 and the others at the outer sides thereof, substantially as and for the purposes described.

2. In a roofing-machine, the combination of the tank 4, rollers 7, arranged therein and immersed in the liquid of the tank, rollers 8, arranged above the rollers 7, and a hinged frame 10, within which the rollers 8 are mounted, substantially as and for the purposes described.

3. An improvement in the art of making roofing-paper, which consists in passing a web of paper in contact with a spreading-roller of less width than the paper, whereby the paper is coated with adhesive material and the margins are not coated, and then compressing said paper in contact with a second web of paper, whereby the adhesive material is caused to spread out to the edges of the two webs, substantially as and for the purposes described.

4. In a paper-roofing machine, the compression device consisting in a longitudinally-pivoted frame having side bars 16, substantially as and for the purposes described.

11,017.

5. In a paper-roofing machine, the compression device consisting in a longitudinally-pivoted frame having hollow side bars 16, provided with steam-connections, substantially as and for the purposes described.

6. In a paper-roofing machine, the compression device consisting in a longitudinally-pivoted frame having side bars 16, in combination with a lever fixed to the axis of the frame and a rack, substantially as and for the purposes described.

7. The combination of the horizontal compression-cylinders 19 and a weight 20, resting thereupon, substantially as and for the purposes described.

8. In a roofing-machine, the sand-pipes 37, whose discharge ends are arranged over the roofing-sheet at the margins thereof, substantially as and for the purposes described.

9. In a roofing-machine, a paper-roll mounted in a tilting frame, in combination with adjusting mechanism for shifting the frame endwise, substantially as and for the purposes described.

10. In a roofing-machine, a primary receiving-table 46, situate at the delivery end of the machine, and a second table situate below the table 46, said table 46 having a bottom which is removable from under the roofing-sheets, whereby the latter are dropped upon the table below, substantially as and for the purposes described.

11. In a roofing-machine, a receiving-table consisting of portible pivoted slats 47, and bars 61, connecting said slats, substantially as and for the purposes described.

12. In a roofing-machine, the combination of a table situate at the delivery end thereof, gripping-tongs arranged to grasp the paper, a traveler supporting the tongs, a drum connected with the tongs for drawing it over the table, and a second drum 56, connected with the tongs for retracting them, substantially as and for the purposes described.

13. In a roofing-machine, the combination, with the web-coating mechanism, of a compression device consisting of bars 16, over and under which the web passes, substantially as and for the purposes described.

14. In a roofing-machine, the combination, with the web-coating mechanism, of a compression device consisting of bars 16, over and under which the web passes, said bars being hollow and provided with connections for the circulation of a heating medium, substantially as and for the purposes described.

15. In a roofing-machine, the combination, with the web-coating mechanism, of a compression device situate in the path of the web and constructed to exert a rubbing and compressing action thereon and to smooth or iron the layers thereof, substantially as and for the purposes described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

BECHMAN *v.* JOHNSON.

Decided July 24, 1889.

APPEAL ON MOTION TO DISSOLVE AN INTERFERENCE BETWEEN AN APPLICATION AND A PATENT ISSUED INADVERTENTLY DURING THE PENDENCY OF THAT APPLICATION.

1. When an interference is declared between an application and a patent issued inadvertently during the pendency of that application, and the applicant files a motion to dissolve the interference and to stay proceedings without having made any proof of service of notice of said motion upon the opposite party, said motion will not be entertained. (Rule 158.)
2. The case is the same as if the interference had been declared between two pending applications, and the interference is rightly declared when declared under Rule 94, paragraph 1, without the affidavit called for by Rule 94, paragraph 2.
3. While a motion to dissolve the interference and suspend proceedings will be refused if made without notice to the opposite party, *Quære*, whether in a case like the present a petition, without notice to the opposite party, to *vacate* the order establishing the interference might not be sustained.

AMENDMENT PENDING THE INTERFERENCE.

4. Pending the interference in such case an amendment which does not come within the terms of Rules 106, 107, 109 will not be received or considered. (Rule 130.)

FAILURE TO DECLARE INTERFERENCE.

5. The fact that in such case the Office failed to declare an interference prior to the issue of the patent does not establish the fact that there is no conflict between the application and the patent.

APPEAL on motion.

INKING DEVICES FOR PRINTING-MACHINES.

Patent granted Henry F. Bechman July 20, 1886, No. 345,760. Application of Henry Johnson filed November 6, 1885, No. 182,058.

Mr. John G. Elliott for Bechman.
Mr. James A. Skilton for Johnson.

MITCHELL, *Commissioner:*

An interference was declared in this case between certain claims of the Bechman patent and certain claims of Johnson's application. Pending the interference Johnson filed a proposed amendment to his application. Thereafter Johnson filed a motion to dissolve the interference and a further motion to suspend the interference proceedings pending the determination of the motion to dissolve. The Examiner of Interferences dismissed the motions for the reason that no proof of service thereof upon said Bechman had been made. From this action of the Examiner of Interferences Johnson appeals to the Commissioner. Applicant insists that no conflicting claims are in issue, and that therefore the interference has been improperly declared; that the question whether there is a conflict between his case and that of Bechman is *res adjudicata*, the Patent Office having already decided that no interference in fact exists by failing to declare an interference prior to the issue of Bechman's patent; that no affidavit was filed, as required by Rule 94, paragraph 2, and that consequently the interference was improperly declared; that therefore this is not a contested case and ought to be considered *ex parte*, and that the rules relating to the giving of notice in contested cases should not apply.

It appears that applicant Johnson was first in the Office, and that while the applications of both parties were pending Bechman's application went to patent without an interference having been declared. Either the Bechman patent must have been issued inadvertently without a declaration of interference, or the examiner, after its issue, must have changed his mind and decided that the cases did in fact conflict. It is perhaps a hardship upon applicant in this case; but there is nothing improper in the action of the examiner in declaring this interference, if an interference in fact exists, for it is the duty of the Office to see that two patents do not issue for the same invention. (Rev. Stats., sec. 4904.)

In the case of *Brookfield et al.* v. *Brooke* (4 O. G., 81) it was held that when two conflicting applications are pending in the Office at the same time and a patent is issued upon one of them by mistake, without declaring an interference between them, the rights of the parties will be determined upon the same ground as if both were applicants. The one who has obtained a patent will derive no advantage from it in the controversy, neither will the other be prejudiced by it. The case of *Goodman* v. *Scribner* (C. D., 1872, 254) is to the same effect. (See, also, *ex parte Frick*, C. D., 1872, 124.) In such a case the second clause of Rule 94 does not apply, the patent there referred to being one which was granted before the pending application was filed. (*Ex parte Marston*, 21 O. G., 633.) The same principle was recognized in *ex parte Green and Ryer*, (MS. Dec., vol. 39, 137,) in which it was held that when during the pendency of an application a patent inadvertently issued to another and later applicant an interference should be declared between the application and the patent without requiring the affidavit called for by Rule 75, and that the oath to the application was sufficient. Therefore it must be held in the present case that the oath in Johnson's application is sufficient without the affidavit called for by the second clause of Rule 94; that the question whether or not there is a conflict between the two

inventions is not *res adjudicata*, and that the present case is the same as if the interference had been declared between two pending applications.

If, in the opinion of the Primary Examiner, there really exists a conflict between two pending applications, or between an application and an unexpired patent, the application for which was pending at the same time with the other application, there is nothing left for him to do but to declare an interference under Rule 94, section 1, and an interference having been declared the case becomes a contested one under the provisions of Rule 101 and subject to all the rules governing interference cases. (See *Gray* v. *Bell*, 15 O. G., 385 and 776; *ex parte Shinn*, 16 O. G., 458.)

Inasmuch as no proof of service of notice of the motions of applicant upon the opposing party has been made, as called for by Rule 153, the action of the Examiner of Interferences is sustained in refusing to entertain the said motions.

Rule 130 provides that amendments to the specification shall not be received during the pendency of an interference, except as provided for in Rules 106, 107, and 109, and, as the proposed amendment is not such a one as is contemplated by any of the rules last mentioned, the examiner was right in refusing to receive or consider such amendment. (See *ex parte Shinn*, 16 O. G., 458.)

The decision of the Examiner of Interferences is therefore affirmed. The conclusion thus announced is the inevitable result of the application of the rules relating to the dissolution of interferences, and it is demanded by the necessity of so administering the law of the Office that practitioners may be intelligently guided as to the proper course to be pursued. At the same time it is difficult to see why in a case like the one under consideration the applicant is not entitled to "the opinion of the Commissioner" (Rev. Stats., sec. 4904) upon the question whether an interference in fact exists before the interference is irrevocably declared. It may be therefore that a petition, without notice to the opposite party, to vacate the order establishing the interference would be permitted to prevail. Such a petition could only lie in the exceptional case of an interference between an application and a patent granted during the pendency of such application. When such a petition shall be brought in this case or in any similar one, it will receive the attention to which it will be entitled. Proceedings will be stayed for twenty days in this case to enable such a petition to be brought, if the attorney for Johnson shall so elect.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

ROOT v. THIRD AVENUE RAILROAD COMPANY.

Decided July 9, 1889.

1. EPPELSHEIMER—CLAMP APPARATUS FOR CONNECTING STREET-CARS, &c.

Letters Patent No. 160,757, granted March 16, 1875, to William Eppelsheimer, for an improvement in clamp apparatus for connecting street-cars, &c., *Held* to be infringed by the defendant's device.

2. SAME—INFRINGEMENT.

The only difference between the two gripping devices is that the pulleys in the defendant's device are connected with the movable jaw, while in the device of the patent they are connected with the fixed jaw; and in the patented devices the movement of the lower jaw to release the cable is a vertical movement both as respects the fixed jaw and the pulleys, while in the defendant's apparatus the movement of the lower jaw is a vertical movement as respects the fixed jaw, but not as respects the pulleys. These are merely formal differences. They do not involve any inventive thought and are immaterial as respects the function and mode of operation of the parts of the combination.

Mr. George Harding and *Mr. George J. Harding* for the complainant.

Messrs. Frost & Coe and *Mr. Harry E. Knight* for the defendant.

WALLACE, *J.*:

The patent in controversy in this suit is No. 160,757, granted to William Eppelsheimer March 16, 1875, for improvement in clamp apparatus for connecting street-cars, &c., with endless traveling devices. The complainant alleges that the defendant has infringed the second claim of this patent. The claim is as follows:

2. In combination with the lower jaw *l*, the transverse bar *o*, with its vertical rope-supporting pulleys *p*, substantially as described.

This claim is for a combination in a gripping device for connecting a street-car or other vehicle with an endless moving rope or cable for propelling the vehicle along the track, which consists of two elements, (1) a movable jaw, and (2) a transverse bar carrying pulleys.

The specification describes and the drawings show a gripping device provided with two jaws, one fixed and one movable, the lower one of which is caused by suitable mechanism operated from the car to advance toward the other and grip a cable moving upon pulleys between them and to recede and release the cable. The transverse bar *o*, described and illustrated, has vertical rope-supporting pulleys, one at each end, so located and arranged that the movable jaw can be raised and lowered between them and carry the cable resting on the pulleys into contact with the fixed jaw when it is raised and release it when the jaw is lowered, so that the cable will rest upon the pulleys. The bar is a longitudinal frame to which the pulleys are journaled and held in a fixed relation to the movable jaw. This bar may be connected with the movable jaw so as to be partially rotated by the movement of the jaw as it advances to or recedes from the upper jaw; but this feature may be dispensed with, and it may be secured immovably to the fixed jaw. The lower movable jaw and the transverse bar with the pulleys, constructed and arranged substantially as thus described, are the elements of the claim. The function of the devices in this combination is to enable the pulleys to support and carry the cable when the jaw is lowered and hold the cable in such a relation to the two jaws that the lower jaw when raised again will restore its contact with the upper or fixed jaw. The combination is confined to parts which coact when the movable jaw is lowered.

The patentee was not the first to employ a jaw and pulleys as parts of a gripping device for propelling the vehicle by an endless cable, constructed and arranged so that the pulleys support and carry the cable when the jaw is opened and hold the cable in such relation to the jaw that it is removed from the pulleys to the jaw by the closing of the jaw. A combination of these parts having these functions is described and shown in the patent to Andrew S. Hallidie, No. 129,130, granted July 16, 1872. The gripping-jaws of this patent are moved toward or from each other by means of a wedge actuated by a hand-wheel. The pulleys are oblique, two at each end of the jaws, operate in pairs, and are carried by a transverse bar. When it is desired to stop the vehicle, the wedge is lowered sufficiently to free the jaws from the rope without dropping it from the pulleys. The rope will then be carried by the pulleys at its ordinary speed, ready to be gripped when the wedge is lifted by turning the hand-wheel and the jaws are forced together.

The Hallidie patent is the nearest anticipation of the invention claimed, which is shown in the prior state of the art as exhibited in the record. Except as showing devices which perform in combination the function of the combination of the claim it is of no value. The other patents in the record, which have been adduced by the defendant for the purpose of negativing novelty, do not merit attention. It is apparent from the Hallidie patent alone that the claim in controversy does not extend to every combination of pulleys and releasing-jaw which will perform the functions mentioned. Consequently the claim is limited by the construction impressed upon it by the prior state of the art, as well as by its reference to the specification, to a combination in which the jaw and transverse bar are substantially such as are described, and in which the pulleys and jaw coact by the same mode of operation to discharge the function assigned to them.

The real question in the case is whether the gripping devices of the defendant which discharge the same functions are substantially those of the patent. The gripping device of the defendant has no transverse bar as a distinct and independent element of the combination, but the lower jaw itself supports the pulleys. The lower jaw is the movable jaw, and when raised or lowered carries the pulleys with itself toward or from the fixed jaw. The pulleys are one at each end of the jaw, and have their upper faces on a plane above the jaw. When the two jaws are in contact, the fixed jaw rests upon the lower jaw between the two pulleys, and the seat of the fixed jaw is below the plane of the upper faces of the pulleys. When the movable jaw is lowered, the cable is released from the grip of the fixed jaw and rests wholly upon the pulleys, and when the jaw is raised again the cable resting on the pulleys is held by the grip of the two jaws. Plainly, the lower jaw does the work of the transverse bar and also of the lower jaw of the complainant's patent. The doubt is whether it should be considered as embodying both a jaw and a transverse bar, or should be deemed a single device which dispenses with one element of the combination claimed. If the claim had been one for the lower jaw and the pulleys, substantially as described, it would have appropriately specified the combination described in the patent, and would have covered in terms the combination of the defendant. The transverse bar of the patent is nothing but a pulley-carrier. The movable jaw of the defendant's apparatus is a pulley-carrier besides being a jaw. It supports the pulleys in the requisite location as respects the fixed jaw, which is the only office of the transverse bar of the patent. If the transverse bar of the patent had been called a pulley-carrier in the claim, the movable jaw of the defendant's apparatus would answer the descriptive term. The lower jaw of the defendant's combination does the work of transferring the cable from the gripping-jaws to the pulleys, and enables the pulleys to support and carry the cable when the jaw is lowered and hold it in such a relation to the two jaws that the lower jaw when raised again will restore the contact of the cable with the upper or fixed jaw precisely as does the lower jaw of the combination of the patent. The only difference between the two gripping devices is that the pulleys in the defendant's device are connected with the movable jaw, while in the device of the patent they are connected with the fixed jaw; and in the patented devices the movement of the lower jaw to release the cable is a vertical movement both as respects the fixed jaw and the pulleys, while in the defendant's apparatus the movement of the lower jaw is a vertical movement as respects the fixed jaw but not as respects the pulleys. These are merely formal differences. They do not involve any inventive thought and are immaterial as respects the function and mode of operation of the parts of the combination.

The usual decree for an injunction and accounting is ordered for the complainant.

U. S. Circuit Court—Eastern District of New York.

UNDERWOOD *et al. v.* GERBER *et al.*

Decided March 6, 1889.

SUITS FOR INFRINGEMENT—AMENDED BILL.

In a suit to restrain the infringement of a patent complainant was defeated because he sued on one only of two patents relating to the same invention. (48 O. G., 116.) The evidence introduced would be necessary under a bill based on the omitted patent. *Held* that he should be permitted to amend by bringing in the other patent, and alleging its infringement, and that the case should be opened for taking additional testimony, but that relief should be granted only on condition that complainant give an undertaking to pay the expense of such additional testimony, including witness fees, mileage, master's or examiner's fees, and printing.

MOTION for leave to amend and take further proofs.

STATEMENT OF THE CASE.

The complainants in this case were defeated at final hearing because they declared only on one of the patents granted for their invention. (48 O. G., 116.) Thereupon complainants moved for leave to amend the bill by declaring also upon the other patent, and charging infringement thereof, and to reopen the case for the purpose of letting in such further evidence as may be necessary.

Mr. James A. Hudson, for the complainants, cited *Neale* v. *Neales*, (9 Wall., 9;) *Tremaine* v. *Hitchcock*, (23 Wall., 518;) *Hamilton* v. *Gold Co.*; *U. S.* v. *Parrott*, (McAll., 447;) *Hardin* v. *Boyd*, (113 U. S., 761; 5 Sup. Ct. Rep., 771.)

Messrs. Briesen, Steele & Knauth, for the defendants, cited, (in addition,) *Shields* v. *Barrow*, (17 How., 144;) *Battle* v. *Insurance Co.*, (10 Blatchf., 426;) *Snead*

v. *McCoull*, (12 How., 453;) *Clifford* v. *Coleman*, (13 Blatchf., 210.)

LACOMBE, *J.*:

The amendment asked for does not involve an entire change of the character of the action. It is still a suit for the infringement of the same invention as that touching which the evidence already taken was introduced. So much of that evidence as was properly taken under the original bill would be necessary under the bill if amended as complainants pray. It would certainly be very unreasonable to require the parties at great additional expense to take it over again, after both patents are declared upon. No good reason is shown why the court, if it has the power, should not also allow the record to be supplemented by such additional testimony as may be rendered necessary in consequence of the amendment. An early disposition of the case upon its merits at the least possible expense, and, so far as appears, without doing injustice to either party, would be thus secured. The authorities cited by counsel show that the granting of the relief now asked for is a matter of discretion and within the power of this court at this stage of the case. The complainants may amend their bill by the insertion of apt words, so that the same shall declare on the omitted patent, (No. 348,072,) and also charge infringement of the invention therein set forth. Upon service of the amended bill defendants may amend their answer as they may be advised, or may plead or demur to the amended bill. Upon the raising of an issue as to the omitted patent the case is reopened, and additional testimony pertinent to that issue may be taken before a master or examiner. This relief is granted only upon the complainants undertaking to pay the expenses of taking all such additional testimony, (whether introduced by complainants or defendants.) Such expense to include witness fees, mileages, master's or examiner's fees, and printing.

U. S. Circuit Court—Western District of Pennsylvania.

THE PENNSYLVANIA DIAMOND DRILL COMPANY *v.* SIMPSON *et al.*

Decided June 13, 1889.

PRACTICE IN THE COURTS.

Upon a motion for an attachment against the defendants for contempt in violating an injunction granted at final hearing, *Held* that as the present alleged infringing device differs from that adjudged to be an infringement, and also from the patented device, the question presented ought not to be determined upon such a motion as this, but only by an original suit.

SUR motion for an attachment against the defendants for contempt in violating the injunction granted at final hearing.

Mr. G. G. Frelinghuysen for the motion.

Mr. E. T. Rice opposed.

ACHESON, *J.*:

The claim of the patent sued on (the Frisbee patent) is in these words:

The combination, operating substantially as described, of an annular core-lifter, and a tube or ring constructed with a tapering recess in its inner surface.

The described operation is this:

In operation, as the bit excavates the rock and the core enters D (*i. e.*, the core-lifter) the latter first becomes stationary on the core, and is then forced over it by the shoulder of the recess C, the tube B revolving around D till the required depth is reached. When the drill-rod is withdrawn, D is forced toward the small end of the recess, clamping the core more firmly as the tube B recedes until it detaches the core from the solid rock.

The court has heretofore adjudged that the defendants infringed this patent by the use of the Case core-lifter, in which the court found a combination substantially the same as Frisbee's, operating substantially in the manner described in his patent.

Upon reference to the opinion of the court (29 Fed. Rep., 288) it will appear that this decision was put not simply upon the ground that the two devices when in position to act as core-lifters operated in the same way, but in part upon the additional facts that during the operation of boring each device clasped or hugged the core, and was forced over it by the shoulder of the recess; that in each the tubular rod revolved freely round the core-lifter until the desired depth was reached, and that each was wedged tightly in the tapering recess by the upward pull of the drill-rod. But the core-lifter now employed by the defendants, and the use of which the plaintiff insists is a violation of the injunction, is a device described in and covered by Letters Patent subsequently granted to Albert Ball, being No. 366,913, dated July 19, 1887, upon application filed November 13, 1886.

In mode of operation this latter device differs from the Frisbee core-lifter and also from the Case device in two particulars: First, during the work of boring the Ball device does not embrace or come in contact with the core, but by an outward spring-pressure clings to the tube or core-barrel and partakes of its rotary motion; secondly, the Ball core-lifter is not forced toward the small end of the recess by the withdrawal of the drill-rod, but is driven into the conical chamber, and thus made to grasp the core by hydraulic devices brought into action by the operator in charge of the boring-machine. Now, I am not prepared to declare that these differences are colorable or immaterial. They are not obviously so. The decision of the question of infringement here for the first time raised demands an inquiry into the state of the art prior to Frisbee's invention, and involves, too, the construction of the claim of his patent as limited by the phraseology "operating substantially as described." In cases of this kind a motion for an attachment is not granted unless the violation of the injunction is plain and free from doubt. (*Bate Refrig. Co.* v. *Eastman*, 11 Fed. Rep., 902; *Smith* v. *Halkyard*, 19 Id., 602.) Upon the whole I am of opinion that the question whether Ball's patented device infringes the Frisbee patent ought not to be determined upon such a motion as this, but only by an original suit. (*Temple Pump Co.* v. *Goss Pump, &c., Co.*, 31 Fed. Rep., 292.)

And now, June 13, 1889, the motion for an attachment for contempt is denied, without prejudice to any suit the plaintiff may bring to test the question of infringement involved in this motion.

THE OFFICIAL GAZETTE OF THE United States Patent Office.

[BY AUTHORITY OF CONGRESS.]

VOL. 48—No. 6. TUESDAY, AUGUST 6, 1889. PRICE—$5 per year.

PATENTS GRANTED	819
REISSUES	821
DECISIONS OF THE COMMISSIONER— Beach *v.* Fowler	821
DECISIONS OF THE U. S. COURTS— Adee *v.* Peck Brothers & Co	823
The United States of America *v.* The American Bell Telephone Company and Alexander Graham Bell	824

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter, one volume, 935 pages, bound in cloth $10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 120 pages—

Bound half-turkey	2 50
Bound in cloth	1 85
Paper covers	1 00

DESIGNS.

19,247 to 19,250, inclusive.—DISH-COVER.—*Thomas B. Atterbury*, Pittsburg, Pa. Applications filed July 2, 1889. Serial Nos. 316,338 to 316,341, inclusive. Term of patents 7 years.

19,251 and 19,252.—WALL-PAPER.—*Charles Booze*, Buffalo, N. Y., assignor to *M. H. Birge & Sons*, same place. Applications filed July 2, 1889. Serial Nos. 316,342 and 316,343. Term of patents 7 years.

19,253.—FIRE-PLACE GRATE.—*Edward L. Calely*, Philadelphia, Pa., assignor to *Gilbert Combs*, *John Bawden*, and *John H. Bawden*, Freehold, N. J. Application filed January 9, 1889. Serial No. 295,884. Term of patent 7 years.

19,254.—STREET-CAR DASH.—*John W. Fowler*, Brooklyn, N. Y. Application filed January 17, 1889. Serial No. 296,654. Term of patent 14 years.

19,255.—MARINER'S CLOCK-DIAL.—*Silas H. Harding, Jr.*, New Castle, N. H. Application filed May 18, 1889. Serial No. 311,341. Term of patent 7 years.

19,256.—TEA-POT.—*John E. Jeffords*, Philadelphia, Pa. Application filed July 12, 1889. Serial No. 317,333. Term of patent 7 years.

19,257.—FONT OF PRINTING-TYPE.—*George Frederick Jordan*, Philadelphia, Pa., assignor to *The MacKellar, Smiths & Jordan Company*, same place. Application filed May 6, 1889. Serial No. 309,822. Term of patent 14 years.

19,258.—FENCE-GATE.—*Roger B. McMullen*, Chicago, Ill. Application filed May 21, 1889. Serial No. 311,596. Term of patent 7 years.

19,259.—ROTARY-FAN APPLIANCE.—*Charles E. Waldeck*, Paterson, N. J. Application filed May 21, 1889. Serial Nos. 311,622. Term of patent 14 years.

19,260.—DRUGGIST'S SIGN.—*William G. Walter*, Pittsburg, Pa. Application filed March 26, 1889. Serial No. 304,893. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,895.—CANNED VEGETABLES, FRUITS, FISH, OYSTERS, AND MEATS. *James H. Brookmire & Co.*, St. Louis, Mo. Application filed June 26, 1889. Used since April 1, 1889.

"A representation of the White House with the words 'THE WHITE HOUSE.'"

16,896.—DRY HOP YEAST.—*Chicago Yeast Company*, Chicago, Ill. Application filed May 13, 1889. Used since May 15, 1889.

"A colored circle from the sides of which extend two American flags and around the rim of which the words 'NICKEL YEAST' appear, inclosing the picture of a nickel having 'V CENTS' on it."

16,897.—PREPARATION FOR THE COMPLEXION.—*Hattie R. Eaton*, Springville, N. Y. Application filed June 28, 1889. Used since June 25, 1880.

"The words 'OCEAN SPRAY.'"

16,898.—STEAM-VALVES AND WATER-VALVES.—*Fairbanks & Co.*, New York, N. Y. Application filed June 17, 1889. Used since December 10, 1888.

"The letters 'X L' surrounded by or inclosed in a circle."

16,899.—STEAM-VALVES AND WATER-VALVES.—*Fairbanks & Co.*, New York, N. Y. Application filed June 17, 1889. Used since December 10, 1888.

"The letters and character 'F. & Co.' inclosed in or surrounded by a triangle."

16,900.—SHOE-BUTTONS.—*Felix Fournier & Knopf*, New York, N. Y. Application filed November 2, 1888. Used since May 1, 1886.

"The letters 'F. F. K.'"

16,901.—REMEDIAL AND COSMETIC CREAM.—*Nancy Kate Gentry*, Denver, Colo. Application filed July 1, 1889. Used since January 1, 1888.

"The word 'KA-TI-LA.'"

16,902.—CREAMERY BUTTER.—*The Grocers Supply and Storage Company*, Pittsburg, Pa. Application filed April 12, 1889. Used since May 15, 1889.

"A domestic dairy scene having in the foreground several cows and a calf, a woman sitting on a stool milking a cow, and a small boy with a cup in his hand at her side, and in the background mountains, fields, and a farm-house."

16,903.—MEN'S SHOES.—*John Meier*, St. Louis, Mo. Application filed April 8, 1889. Used since April, 1886.

"The representation of a man's shoe on a railroad-truck."

16,904.—PAPER CLOTHING.—*Richard C. Mudge* and *Edgar M. Wasson*, Detroit, Mich. Application filed April 5, 1889. Used since October 9, 1888.

"A disk having lines radiating therefrom and the word 'WARMTH.'"

16,905.—SHOES FOR MEN, WOMEN, AND CHILDREN.—*Peters & Miller Shoe Company*, St. Louis, Mo. Application filed June 24, 1880. Used since January 1, 1889.

"The words 'DIAMOND LINE' and the representation of a diamond-shaped figure."

16,906.—MEDICINAL PLASTERS.—*Potter Drug and Chemical Co.*, Boston, Mass. Application filed October 6, 1888. Used since January, 1887.

"The representation of one or more diamond-shaped spots."

16,907.—BOOTS AND SHOES.—*Bemis & Fletcher*, Worcester, Mass. Application filed June 15, 1889. Used since May 1, 1889.

"The representation of a boot or shoe with its sole turned toward the beholder and split open from the toe to the heel."

16,908.—FINGER-RINGS.—*Sinnock & Sherrill*, New York, N. Y. Application filed June 4, 1889. Used since January 1, 1889.

"The representation of a crucible—such as issued for the melting of gold in the manufacture of jewelry."

16,909.—CLOTHES-WRINGERS.—*Colby Wringer Company*, Montpelier and Berlin, Vt., Chicago, Ill., and Boston, Mass. Application filed June 13, 1889. Used since December, 1860.

"The word 'COLBY.'"

LABELS.

5,891.—Title: "GREFF'S RUATAN CHEWING GUM."—*Henry Greff*, New Orleans, La. Application filed April 2, 1889.

5,902.—Title: "DUNDEE CREAMERY BUTTER."—*The Grocers Supply and Storage Company*, Pittsburg, Pa. Application filed April 12, 1889. (Trade-Mark Registered.)

5,903.—Title: "GOLDEN SEAL CATARRH CURE."—*Mary Miller and Elizabeth Gundacker*, Deer Lodge, Mont. Ter. Application filed July 9, 1889.

5,904.—"GLASGO LACE THREAD CO."—*Glasgo Yarn Mills Company*' Glasgo, Conn. Application filed July 15, 1889.

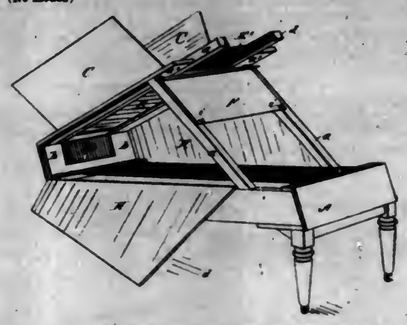
DISCLAIMERS.

10,088, (Reissue.)—*Mark L. Deering*, Cleveland, Ohio, assignor to *The Union Paper Bag Machine Company*, Philadelphia, Pa. IMPROVEMENT IN MANUFACTURE OF PAPER BAGS. Original Patent No. 227,350, dated May 11, 1880. Reissue dated April 11, 1882. Disclaimer filed July 29, 1889, by the assignee.

Enters his disclaimer to claim 2, which is in the following words, to wit:

"2. A bag consisting of a bellows-sided tube having a satchel-bottom and inward triangular folds, which form part of its two sides when distended."

293,740.—*Isaac Smith Hyatt*, Morristown, N. J. IMPROVEMENT IN METHODS OF PURIFYING WATER. Patent dated February 19, 1884. Disclaimer filed July 27, 1889, by the present assignee, *The Hyatt Pure Water Company*, Newark, N. J.



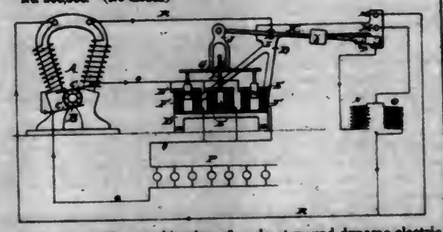
Enters its disclaimer to the paragraph in the specification which is in the following words, to wit:

"I do not confine myself to the employment of persulphate or perchloride of iron or permanganate of potassa, but make use of any other suitable agent which is capable of coagulating the impurities of the liquid and preventing their passage through the filter-bed. Neither do I limit myself to any particular proportions or quantities of the coagulating agent, as they may be varied according to circumstances and the character of the liquid to be treated. Nor do I confine myself to any particular liquid, although I contemplate chiefly the purification of water in large quantities."

PATENTS

GRANTED AUGUST 6, 1889.

408,204. SUN AND VAPOR BATH. EDWIN D. RABBITT, New York, N. Y. Filed Sept. 6, 1888. Renewed Jan. 12, 1889. Serial No. 296,210 (No model.)



Claim.—1. A sun bath or box having an opening in the same admitting light, in combination with external reflectors for increasing or intensifying the amount thereof passing through said opening, as set forth.

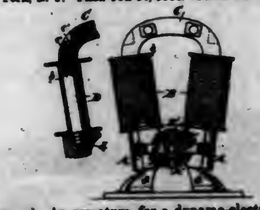
2. A sun-bath box or case inclined upon the front and having two doors, a glass extending from top to bottom of the slope, the adjustably-arranged glasses thereon, a reflector on each side of the glass and inclined toward the edges of said glass, and a grooved frame projecting upward carrying a blue pane, all substantially as shown and described.

3. The combination, with a bath-box, of a wire mattress, having adjustably suspended therefrom a heating-plate apertured to receive a steaming-pan, operating substantially in the manner and for the purpose herein set forth.

4. The combination, with a bath-box, of a detachable inclined wire couch extending out therefrom, substantially in the manner and for the purpose herein set forth.

408,205. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. HERMANN B. DOBBINS, New York, N. Y. Filed Oct. 17, 1888. Serial No. 288,366. (No model.)

Claim.—1. The combination of a shunt-wound dynamo-electric machine, a line-circuit leading therefrom, translating devices in said line-circuit, a circuit in series with the shunt-coils of the dynamo, one or more resistances, a switch having an adjusting-weight to insert or remove said resistances in the shunt-circuit of the dynamo, and an automatic electro-magnetic regulator, consisting of two or more helices in parallel circuit having movable and separate cores connected to the switch for actuating said switch upon varying the line resistance arranged in circuit with the line.



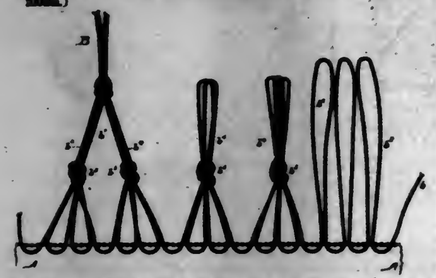
2. The combination of a shunt-wound dynamo-electric machine, a line-circuit leading therefrom, translating devices in said line-circuit, a circuit in series with the shunt-coils of the dynamo, one or more resistances, a switch to insert or remove said resistances in the shunt-circuit of the dynamo, and an automatic electro-magnetic regulator, consisting of two separate helices, and separate relatively-adjustable cores therefor connected with the switch for actuating said switch upon varying the line-resistance arranged in series with the line.

3. The combination of a shunt-wound dynamo-electric machine, a line-circuit leading therefrom, translating devices in said line-circuit, a circuit in series with the shunt-coils of the dynamo, one or more resistances, a switch to insert or remove said resistances in the shunt-circuit of the dynamo, and an automatic electro-magnetic regulator, consisting of two or more helices having two or more cores connected to the same support and in which one of said cores is arranged lower down into its helix than the others.

4. A regulator for a shunt-wound dynamo-electric machine and line-circuit with a varying resistance, consisting of three helices in circuit with the line, three cores therefor, one of which enters its helix to a greater extent than the others, and a switch actuated by said three cores to insert or remove a resistance into or out of the shunt-circuit of the dynamo-electric machine.

5. A regulator for a shunt-wound dynamo-electric machine and line-circuit with a varying resistance, consisting of three low-resistance helices in parallel circuit with the line, three cores therefor, one of which enters its helix to a greater extent than the others, and a switch actuated by said three cores to insert or remove a resistance into or out of the shunt-circuit of the dynamo-electric machine.

408,206. DYNAMO-ELECTRIC MACHINE. HERMANN B. DOBBINS, New York, N. Y. Filed Oct. 17, 1888. Serial No. 288,369. (No model.)

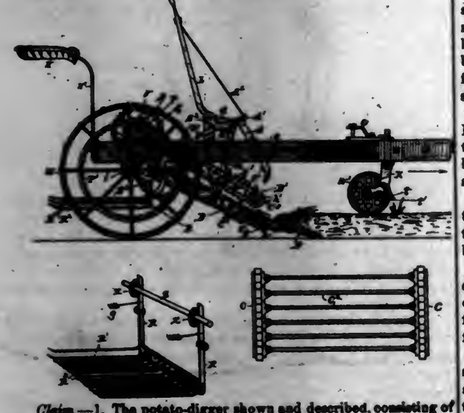


Claim.—1. An armature for a dynamo-electric machine or motor, consisting of a suitable magnetic core wound with four complete coils of wire, in which all active parts of the same coil are located upon the core to one side of a plane passed through its axis, a commutator made in four sections, and connections for coupling the coils in series and uniting their terminals in pairs to separate sections of the commutator.

2. An armature for a dynamo-electric machine or motor, consisting of a suitable magnetic core wound with four complete coils of wire, in which all active parts of the same coil are located upon the core to one side of a plane passed through its axis, and in which a terminal from each coil is connected to a terminal of other coils separated from the coils of the first-mentioned terminals by intermediate coils, a commutator and connections between the coil, terminal connections, and sections of the coil.

3. An armature having its coils wound substantially as set out, and consisting of a core with four coils d d^2 d^3 d^4, arranged in pairs side by side, in which one terminal of coil d is connected with one terminal of coil d^2 perpendicular thereto and with one commutator-section, the other terminal of coil d^2 connected with one terminal of coil d^3, parallel with coil d and with the next section of the commutator, the remaining terminal of coil d^3 connected with one terminal of coil d^4, parallel with coil d^2, and to the next section of the commutator, and, finally, the remaining terminal of the coil d^4 connected with the remaining terminal of coil d and the last section of the commutator.

408,207. METHOD OF MAKING HAMMOCKS. JAMES BRAITHAW, North Weymouth, Mass. Filed Aug. 26, 1888. Serial No. 283,782. (No model.)



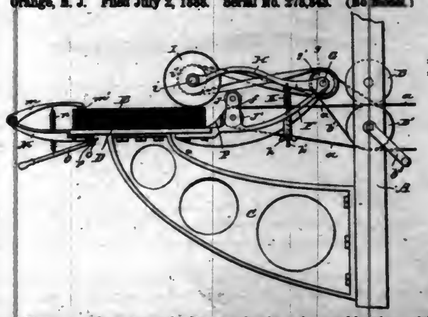
Claim.—1. The herein-described method of connecting suspension-cords to woven hammocks, said method consisting, first, in passing a single cord beneath the extended warp-threads of the hammock fabric, then in pulling up loops of said cord between certain of said warp-threads, then in weaving a short section of fabric beyond said cords, and finally in folding over said short section and sewing it to the hammock fabric, substantially as set forth.

2. The method of connecting suspension-cords to woven hammocks, consisting in first passing a single cord beneath the extended warp-threads of the hammock, next in pulling up loops of said cord between certain of said warp-threads, then in tying together sets of said loops; fourth, in weaving a short section of fabric beyond said loops; fifth, in folding over said short section and sewing it to the hammock-body, and finally in securing the suspension-cords to said loops and to the suspension-eyes, substantially as set forth.

3. The method of forming hammocks, consisting in weaving the desired length of hammock-body, then passing a single cord beneath the warp-threads and pulling up loops of said cord between said warp-threads, next in weaving a short section of hammock fabric, then inserting another series of loops and weaving a second length of hammock fabric, inserting another series of loops, and so on until a desired number of hammocks has been woven, separating the same by cutting through said short sections, and finally folding over and sewing said short sections to the hammocks, substantially as described.

408,208. POTATO-DIGGER. FRANK M. DUBBEE, Joliet, Ill. Filed Mar. 26, 1889. Serial No. 304,586. (No model.)

Claim.—1. The potato-digger shown and described, consisting of the combination, with the main frame and its traveling wheels and the caster-wheel, of the lower endless carrier having its cross-bars arranged to be lower at their central part than at their ends, and having the plow secured to the forward part of its frame, the upper carrier arranged to be parallel with the lower carrier and having its forward end free to be elevated and lowered by material passing between the carriers, and having its cross-bars terminate in teeth or arms for engaging such material, and the shaker arranged at the rear of said carriers and to receive material therefrom, all arranged to operate substantially as and for the purpose set forth.



2. In the potato-digger shown and described, the lower endless carrier having its cross-bars arranged to be higher at each end than at their parts between their ends, in combination with the upper endless carrier having its cross-bars arranged wider apart than those of the lower carrier and extending at each end to form teeth or arms for engaging material between the carriers, the plow for delivering material to and between the carriers, and the means shown for driving and adjusting said carriers, substantially as and for the purpose set forth.

3. In the potato-digger shown and described, the combination, with the main frame, of the two endless carriers arranged to be parallel with each other and vertically adjustable at their forward ends, the lower carrier having a plow secured to its forward end and having its cross-bars formed to be lower at their central parts than at their ends, and the upper carrier having its cross-bars project to form teeth or arms to carry material along between the carriers to the rear of the machine, substantially as and for the purpose set forth.

4. In the potato-digger shown and described, and in combination with the endless carriers, the shaker consisting of the frame R and double row of teeth R' R², the shaft S, cams Z Z, and coil-springs *g g*, substantially as and for the purpose set forth.

5. In the potato-digger shown and described, in combination with the lower endless carrier having a plow secured to its forward end, the upper endless carrier, the rock-shaft S', having the arms *a a* and *a²*, ratchet-pawl *d*, and hand-lever L, and the links *m m*, for connecting said arms *a a* and lower carrier and for supporting the forward end of the upper carrier, substantially as and for the purpose set forth.

408,209. PAPER-FEEDING MACHINE. ROBERT DURRET, East Orange, N. J. Filed July 2, 1888. Serial No. 278,843. (No model.)

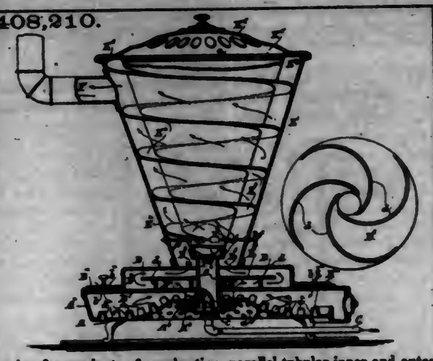
Claim.—1. In a paper-feeding mechanism, the combination, with a table or support for the paper, of a rotating frictional paper-feeding roll to engage the forward ends of the sheets of paper, pivoted arms by which the said roll is carried, a spring-pressed frictional holdback-bar arranged to bear on the rear ends of the sheets of paper, and feeding-rolls to which the paper is presented by the said frictional roll, substantially as set forth.

2. In a paper-feeding mechanism, the combination, with the rolls B and B' and the pulley *b*, of the shaft G, having the pulleys *g* and *g'*, the feeding-roll I, its shaft *i*, the pulley *i'*, the belt *b'*, and the cross-belt *b²*, connecting said pulleys, the paper table or support, and the spring-pressed frictional holdback-bar, substantially as set forth.

3. In a paper-feeding mechanism, the combination, with the frictional feeding-roll I, the arms H, by which said roll is carried, and the brackets F, of the adjustable springs K, connecting said arms and brackets, substantially as set forth.

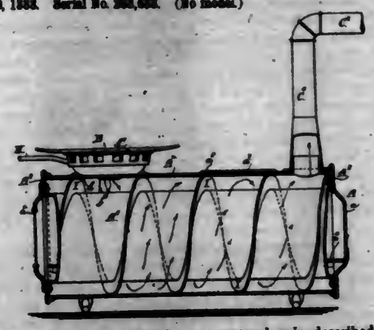
4. In a paper-feeding mechanism, the combination, with a paper-supporting table and a rotating frictional roll I, having a sand or emery feeding-surface, of a spring-pressed holdback-bar having a frictional surface of rubber, substantially as and for the purpose set forth.

5. In a paper-feeding mechanism, the combination, with the paper-supporting table and the frictional feeding-roll I, of the connected arms *m*, the frictional holdback-bar *m'*, attached thereto, the bar N, the spring *n*, the hand-lever O, the rod *o*, and the thumb-nut *p*, substantially as set forth.



6. In a paper-feeding mechanism, the combination, with a table or support for the paper, of a rotating frictional paper-feeding roll to engage the forward ends of the sheets of paper, pivoted arms by which the said roll is carried, a spring-pressed frictional holdback-bar arranged to bear on the rear ends of the sheets of paper, a carrying-belt to receive the paper, feeding-rolls between which the said belt passes, and an upwardly-inclined guide, as P, interposed between the pile of paper and the said feeding-rolls, substantially as set forth.

408,210. OIL-STOVE. ALBERT H. CALKINS, Chicago, Ill. Filed Feb. 10, 1888. Serial No. 263,632. (No model.)



Claim.—1. An oil stove or heater embracing an oil-burner having a combustion-chamber, air-inlet openings thereto, and an exit-opening for products of combustion, parallel tubular inner and outer walls, a spiral partition between the same forming a spiral frame-passage communicating at one end with the said exit-opening of the combustion-chamber, and a smoke-pipe connected with the opposite end of said flame-passage, substantially as described.

2. An oil stove or heater comprising a combustion-chamber having a bottom plate provided with a central upwardly-projecting tubular part A⁴, a drum comprising an exterior wall E, and an inner tubular wall E', parallel with said outer wall and resting upon the tubular projection A⁴, substantially as described.

408,210.

408,211. OIL-STOVE. ALBERT H. CALKINS, Chicago, Ill. Filed Feb. 10, 1888. Serial No. 263,633. (No model.)

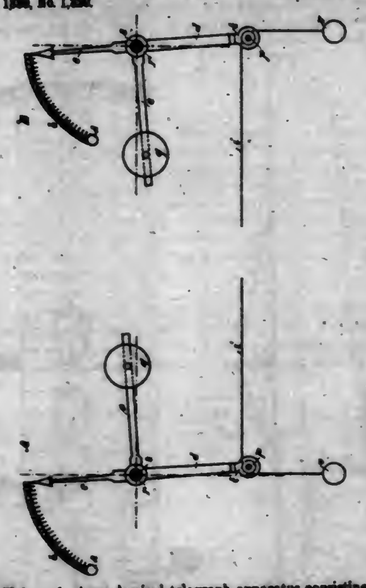
Claim.—1. The novel heating apparatus herein described, consisting of a drum comprising inner and outer tubular walls and provided with a partition between said walls, forming a tortuous smoke-passage, and with a smoke-flue communicating with one end of said passage, and an opening in the said drum communicating with the other end of said passage, and a separate burner having an exit-opening in its bottom for flames and products of combustion and adapted to fit into said opening, substantially as described.

2. The novel heating apparatus herein described, consisting of a drum comprising inner and outer tubular walls and provided with a partition between said walls, forming a tortuous smoke-passage, and with a smoke-flue communicating with one end of said passage and an opening in its top communicating with the opposite end of said passage, a separate burner having an exit-opening in its bottom for flames and products of combustion and adapted to fit into said opening, the space inclosed by the inner tubular walls being provided with a horizontal flooring, thereby forming an oven, substantially as described.

408,212. LABEL-HOLDER FOR BOTTLES. JOHN H. CARNEGHAM, Rennselaer, Iowa. Filed Mar. 26, 1889. Serial No. 304,704. (No model.)

Claim.—In combination with a bottle, a label-holder having the back A coated with adhesive cement B, the lower rim C, projecting hooks D D, and the spring-clasp F, substantially as described.

408,213. BRICK-MOLD. EDWARD R. CARTER, Huntsville, Ala. Filed Apr. 19, 1888. Serial No. 271,127. (No model.)



Claim.—1. A convertible brick-mold, comprising an ordinary mold having conical blocks removably secured to its bottom, as set forth.

2. The combination of the mold having slots in its bottom, and the conical blocks having T-shaped studs on their bottoms, adapted to be inserted through said slots and engage the edges of the same, as set forth.

3. The combination of the mold, the conical blocks removably secured therein, and the cleats secured to the bottom of the mold, as set forth.

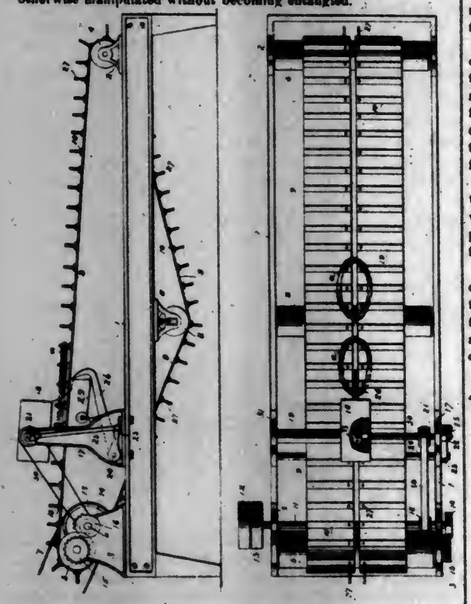
4. The combination of the mold having slots in its bottom, the cleats secured to the under side of the bottom near the ends of the same, and the frusto-conical blocks having studs in their bases adapted to pass through the slots in the bottom of the mold and engage the edges of the said slots, substantially as described.

408,214. MECHANICAL TELEGRAPHIC APPARATUS. ADRIAN CASARA, Madrid, Spain. Filed Feb. 16, 1889. Serial No. 300,068. (No model.) Patented in Spain Dec. 1, 1888, No. 8,966, and in England Feb. 1, 1889, No. 1,880.

Claim.—1. A mechanical telegraph apparatus consisting of two instruments each having an indicating-dial and a pivoted pointer provided with a counter-weight, and a wire connecting said instruments for transmitting motion from one to the other, provided with weights at each end for maintaining the proper tension of the wire under varying conditions of temperature, substantially as described.

2. A mechanical telegraphic apparatus consisting of two instruments A and B, each having a dial *b*, a pivoted pointer *c*, arms *c d*, counter-weights *g*, mounted on arms *c*, and pulleys *p* on arms *d*, and the wire *i*, passing over pulleys *p* and having weights *u* connected to the ends, substantially as and for the purpose specified.

408,215. BOTTLE-TRAP. ROBERT CLARKE, Gravesend, N. Y. Filed Oct. 12, 1888. Serial No. 287,808. (No model.)

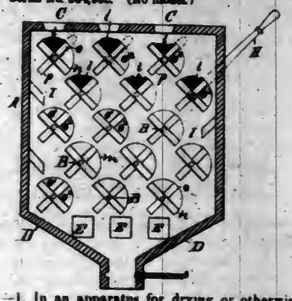


408,215.

Claim.—The within-described improved trap, provided with a body contracted at the upper end, and the lower end of which is equal to or greater in diameter than the remaining portion, with a bottom consisting of a ring secured to the lower end of the body, and a cap connected detachably to the ring, and with an outlet-pipe and an inlet-pipe increasing in diameter toward the lower end, substantially as set forth.

408,216. **MACHINE FOR TYING SKEINS OF YARN, &c.** ROBERT H. COMEY, Camden, N. J. Filed Dec. 31, 1888. Serial No. 295,102. (No model.)

Brief.—The object of the invention is to provide an improved machine for tying skeins of yarn, &c., so that they may be dyed and otherwise manipulated without becoming entangled.



Claim.—1. The combination, with the needle, the knotter, and their actuating devices, of a movable carrier constructed to support a series of open loops of material, and extending between the knotter and the needle and past the same, whereby it serves to support the material during the knot-tying operation, substantially as set forth.

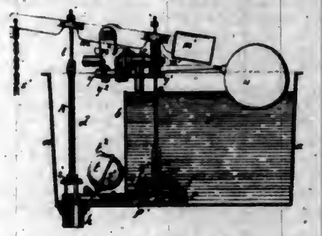
2. The combination, with the needle, the knotter, and their actuating devices, of a movable carrier formed of two parts, separated for the passage of the needle and constructed to support a series of open loops of material, and extending between the needle and knotter and past the same, substantially as set forth.

3. The combination, with the needle, the knotter, and their actuating devices, of an endless carrier extending between and past the needle and the knotter, and constructed to support open loops of material, and a driver for the carrier having a step-by-step motion arranged to move the carrier in one direction, substantially as set forth.

4. The combination, with the needle and the knotter, of the carrier extending between the knotter and the needle and past the same, and constructed to support a series of open loops of material, the intermittent driver for the carrier, and the continuous driver for the needle and knotter, substantially as set forth.

408,217. **APPARATUS FOR DRYING OR OTHERWISE TREATING MATERIALS.** EDWARD M. COOK, New York, N. Y. Filed Sept. 10, 1888. Serial No. 284,962. (No model.)

Claim.—1. In an apparatus for drying or otherwise treating material, a series of receptacles provided each with a series of open troughs arranged longitudinally around a common axis and adapted for receiving and discharging the contents of the troughs intermittently by a partial rotation, substantially as herein set forth.



2. In an apparatus for drying or otherwise treating material, a series of receptacles having each a partition forming longitudinal chambers or troughs at its adjacent sides, and cranks attached to the receptacles and united in one system to actuate the same intermittently, as and for the purpose set forth.

3. In an apparatus for drying or otherwise treating material, the combination, with a suitable casing, of several series or tiers of receptacles consisting each in a number of open troughs or chambers arranged around a common axis, all the receptacles being separated from one another to permit the passage of treating-currents, and cranks connected with the several receptacles and united in one system for simultaneously tilting the receptacles to discharge the contents from one tier into another, as and for the purpose set forth.

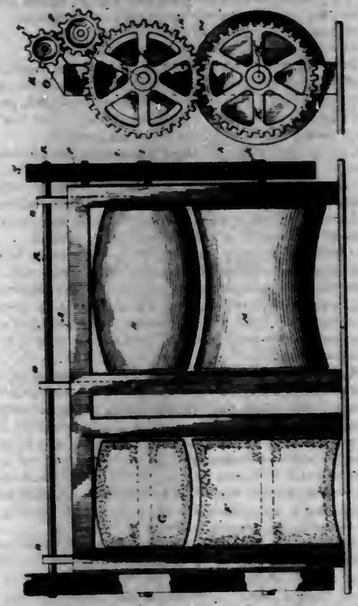
4. In an apparatus for drying or otherwise treating materials, the combination, with several series of oscillating receptacles having vertical partitions extended upward from their bottoms, of deflectors projected from the bottom of the receptacles and operating substantially as shown and described.

5. In an apparatus for drying or otherwise treating material, the combination, with several series or tiers of receptacles having partitions forming chambers at their adjacent sides, of cranks attached to the respective receptacles and a frame applied to all the crank-pins and connected with a lever-arm to actuate the frame for simultaneously oscillating all the receptacles, substantially as herein set forth.

408,218. **WATER-CLOSET TANK.** HUGH H. CRAIGIE, Stamford, Conn. Filed Nov. 17, 1887. Serial No. 255,451. (No model.)

Claim.—1. In a water-closet tank, the combination, with a service box or chamber, of a flushing-pipe leading therefrom having a main and a minor orifice communicating with the service-box, with a manually-controlled valve governing the main orifice, and an auxiliary valve controlling the minor orifice governed by a perforated submergible air-chamber, substantially as herein shown and described.

2. In a water-closet tank, the combination, with a reservoir-chamber and a service-chamber, a valve controlling the passage of the water from one to the other, a flushing-outlet extending from the service-chamber to connect to the closet, and a main flushing-valve controlling said outlet, of an auxiliary flushing-outlet, a valve controlling the same, and a hollow submergible air chamber or float connected to said valve and having a leak-hole to permit the escape of air therefrom, substantially as and for the purpose set forth.



3. In a water-closet tank, the combination, with a flushing or service chamber, of the flushing-outlet *h*, having the main valve *i*, with the auxiliary outlet *r*, valve *s*, and perforated float *t*, substantially as and for the purpose set forth.

4. In a water-closet tank, the combination, with the chambers *c d*, having a communicating passage at the base, of a valve *g*, controlling said passage, a flushing-outlet *h* from chamber *d*, and valve *i* controlling the same, operative connections between said valves arranged to close one when the other is opened, auxiliary outlet *r*, valve *s*, and perforated float *t*, substantially as and for the purpose set forth.

5. In a water-closet tank, the combination, with a reservoir-chamber and a flushing-chamber, a valve for controlling the passage of water from one to the other, a flushing-outlet from the service-chamber and a main flushing-valve controlling said outlet, of an auxiliary valve for producing a forewash, consisting of an outlet leading from the flushing-chamber to the flushing-pipe, with a hinged flap *s* covering said outlet, and a perforated air chamber or float *t* directly attached to said flap, substantially as herein shown and described.

6. In a water-closet tank, the flushing-outlet *h*, having its top adapted as a seat for the main flushing-valve, with the lateral auxiliary outlet *r*, an auxiliary valve controlling said outlet, and a perforated air-chamber connected to said auxiliary valve, substantially as set forth.

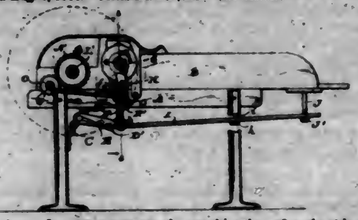
408,219. **ROLL.** CORNELIUS J. CURTIN, High Falls, N. Y. Filed Jan. 30, 1888. Serial No. 262,157. (No model.)

Claim.—1. The rolls having the concave peripheral surfaces, in combination with the proximate rolls having the convex peripheral surfaces, for the purpose set forth, substantially as described.

2. The pairs of rolls geared together and adapted to rotate in unison, and the driving-shaft R, geared to said rolls, all in combination, substantially as described.

3. The combination of the frame or housing, the two pairs of rolls mounted in opposite ends thereof, each pair of rolls having meshed gear-wheels of the same diameter, and the driving-shaft journaled on the housing or frame and having the gears or pinions engaging the roll-gears, substantially as described.

4. The combination of the two pairs of rolls having the gear-wheels engaging each other, the idle gear-wheels engaging the roll-gears, and the driving-shaft having the gears engaging said idle-gears, substantially as described.

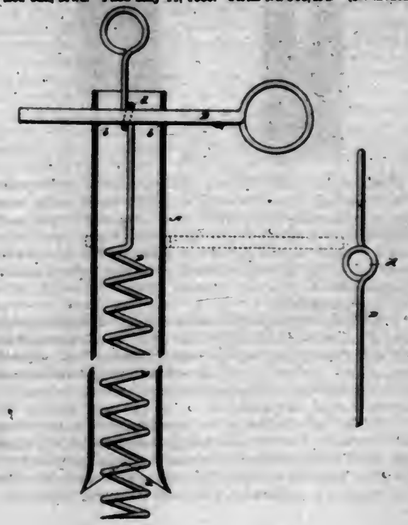


408,220. **FUEL-CARTRIDGE.** WILLIAM DALY, New York, N. Y. Filed June 8, 1888. Serial No. 276,488. (No model.)

Claim.—As an improved article of manufacture, a fuel-cartridge consisting of a metal casing 10, having an annular inwardly-projecting portion 20 in its bottom forming a drip-chamber, a central opening 11, formed in the portion 20, said casing formed with a horizontal annular inwardly-projecting bead 12 near the bottom, an asbestos filling provided with a central bore, the lower edge of said filling supported upon the bead 12, whereby a chamber 14 is formed between it and the bottom, and a detachable cover 16, provided with a central opening 17, aligning the bore in the filling, all arranged substantially as shown and described.

408,220.

408,221. **STRAW-CUTTER.** WILLIAM E. DAVIS, Racine, Wis., assignor to the S. Freeman & Sons Manufacturing Company, same place. Filed Aug. 6, 1888. Serial No. 282,031. (No model.)



Claim.—In a straw-cutter, the combination of a shackle journaled in the machine-frame, vertical arms pivotally connected to the shackle and slotted to have loose play on the journals of the lower feed-roller, the upper feed-roller journaled to the arms, a spring-board fulcrumed on a cross-brace of the machine, a rod arranged to hold the spring-board in contact with said cross-brace, a stem depending from the feed-box to pass through the rear end of the spring-board, and a set-nut arranged on the stem to impinge against said spring-board, substantially as set forth.

408,222. **COMPOSITION OF MATTER.** MARK L. DERRICK, Cleveland, Ohio. Filed June 21, 1888. Serial No. 277,230. (No specimens.)

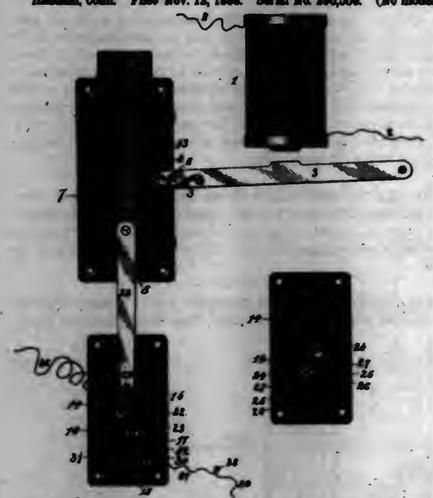
Claim.—A new composition of matter, consisting of fibrous material, blood, water-proof gum, and creosote, substantially as set forth.

408,223. **DEVICE FOR SAMPLING HAY.** THOMAS R. DRAPER, Red Oak, Iowa. Filed May 11, 1888. Serial No. 310,431. (No model.)

Claim.—1. A hay sampling and ventilating device comprising a tube having one end provided with a cutting-edge and an auger adapted to enter said tube, substantially as specified.

2. The combination, with a tube having one end provided with a cutting-edge, of an auger adapted to enter said tube and suitable means for fixing the auger to the tube, substantially as specified.

3. The combination, with a tube having one end provided with a cutting-edge and its opposite end provided with diametrically-arranged apertures, of an auger adapted to enter said tube and having an *eye* or aperture adapted to coincide with those of the tube, and a key or pin adapted to enter the respective apertures, so as to fix the auger with respect to the tube, substantially as specified.



4. The combination, with a tube having one end provided with a cutting-edge and its opposite end provided with registering apertures, of an auger adapted to enter said tube and having an eye or aperture to coincide with those in the tube, and a round or pin passing through the respective apertures and extended from the tube to form handles, substantially as specified.

5. The combination, with the tube having one end provided with a cutting-edge and its opposite end provided with a removable handle or arm, of an auger adapted to enter said tube and be fixed by said handle, substantially as specified.

6. A hay-sampling device comprising a tube having one end provided with a cutting-edge, an auger arranged in said tube, and a round or rod having an eye at one end and adapted to serve the functions of removably fixing the auger in the tube, of serving as a handle, and of staying the tube while the auger and core are being withdrawn, substantially as specified.

7. A hay-sampling device comprising a tube having one end provided with a cutting-edge, an auger arranged in said tube, and a handle for removably fixing the auger in the tube, so as to have the entering point of the auger project slightly beyond the cutting-edge of the tube, substantially as specified.

408,224. ELECTRIC SIGNALING APPARATUS. WILLARD EDDY, Haddam, Conn. Filed Nov. 12, 1888. Serial No. 290,558. (No model.)

Claim.—1. In a differentiating switch, a switch-pin and mechanism for imparting to said switch-pin variable reciprocating movements, in combination with a system of three channels or mechanically-defined courses determining the lateral movements of said pin, and having a common terminal pocket and gates of intercommunication between one of said channels and each of the other of said channels at unequal distances from said common pocket, substantially as and for the purpose specified.

2. In a differentiating switch, a switch-pin and mechanism for imparting a variable reciprocating motion to said switch-pin, in combination with a switch-plate having for the guidance of said switch-pin a main channel, and two lateral channels branching from said main channel and returning to different portions of the same, substantially as and for the purpose specified.

3. A switch-pin, mechanism for imparting reciprocating motion to said switch-pin, a switch-plate having three channels of unequal length, which are provided with a common terminal pocket and with two movable gates between one of said channels and each of the other of said channels, in combination with alarm mechanism which is connected with the shortest of said channels, substantially as and for the purpose specified.

4. A switch-pin and mechanism which imparts to said switch-pin reciprocating movements of greater or less amplitude, as desired, in combination with a switch-plate having three intercommunicating channels of unequal lengths, said channels being provided with a common terminal pocket and with gates located at unequal distances from said common pocket and determining the course of said pin in and among said channels, according to the amplitude of said reciprocating movements, substantially as and for the purpose specified.

5. A switch-plate which has a system of intercommunicating channels, consisting of a main channel and two lateral channels, all said channels having a common terminal pocket, and said lateral channels having gates or apertures of intercommunication with said main channel at points unequally distant from said common pocket, in combination with an electric motor, and intermediate mechanism, whereby motion may be communicated from said motor to said switch-pin, substantially as and for the purpose specified.

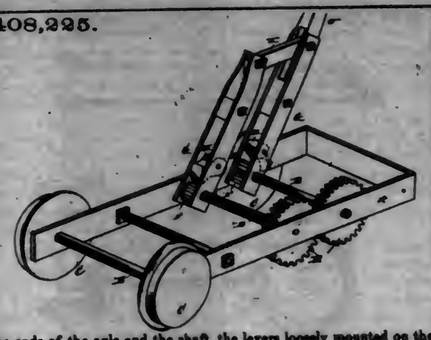
6. A reciprocating switch-pin, an electric motor, and a connection between said motor and said pin, in combination with a system of guides and gates limiting the reciprocating movements of said pin to three intercommunicating courses of unequal lengths, and an alarm which is connected with the shortest of said courses, substantially as and for the purpose specified.

7. A system of guides, a switch-pin which is movable therein through three separate courses of unequal lengths, and an electric motor actuating said pin, in combination with an alarm which is excited when said pin reaches a certain position in the shortest of said courses, substantially as and for the purpose specified.

8. An electric motor, a sliding bar which is actuated thereby, and a switch-plate which has three intercommunicating channels of unequal lengths, in combination with a switch-pin which is movable in said channels, and a connecting-link between said sliding bar and said switch-pin, substantially as and for the purpose specified.

9. A switch-plate which has three intercommunicating channels of unequal lengths, a switch-pin which is adapted to circulate in said channels, an electric motor, and intermediate mechanism whereby motion may be communicated from said motor to said switch-pin, in combination with an alarm which is connected with the shortest of said channels, substantially as and for the purpose specified.

10. A switch-plate which has three intercommunicating channels of unequal lengths, a switch-pin fitted to slide in and among said channels, an electric motor, an intermediate mechanism which actuates said switch-pin, in combination with an alarm, and mechanism whereby said alarm is brought into action whenever said switch-pin reaches a predetermined point in the shortest of said channels, substantially as and for the purpose specified.



11. A switch-pin which has a system of intercommunicating channels of unequal lengths provided with gates, a switch-pin which is fitted to slide in and among said channels, an electric motor, intermediate mechanism whereby said motor may impart to said switch-pin reciprocating movements of variable amplitude, as desired, and an alarm, in combination with mechanism for working said alarm, and mechanism whereby said switch-pin is brought into connection with said alarm-working mechanism whenever said switch-pin reaches a predetermined position in said system of intercommunicating channels, substantially as and for the purpose specified.

12. A switch-plate which has a system of three intercommunicating channels—namely, a central or main channel and two lateral channels of unequal lengths—a switch-pin which is movable in said channels, an electric motor, intermediate mechanism whereby said motor can move said switch-pin, an alarm, and mechanism whereby said alarm is brought into action whenever said switch-pin reaches a predetermined point in the shortest of said lateral channels, all located at one of several stations on a single line, in combination with a similar equipment of like elements similarly connected to said line and located at each other of said stations, substantially as and for the purpose specified.

13. A system of channels which have local apertures of intercommunication, a switch-pin which is movable in said system, an alarm which is brought into action when said switch-pin reaches a predetermined point in said system, and an electric motor which may actuate said switch-pin, all located at one of several stations on a single-line wire, in combination with a system of channels which have differently-located apertures of intercommunication, a switch-pin, an alarm, and an electric motor, all located at another of said stations, said motors being connected in series with each other and with a central office which is provided with a generator and circuit-closer, substantially as and for the purpose specified.

408,225. HAND-CAR. WILLIAM H. BRIMA, Farmington, Ark. Filed May 11, 1889. Serial No. 310,416. (No model.)

Claim.—The combination, with the axle and the transverse shaft, of the intermeshing gear-wheels secured thereon, the spur-pinions at the ends of the axle and the shaft, the levers loosely mounted on the axle and the shaft and having their lower ends bifurcated, the connecting-rod between the upper ends of the levers, and the reversible pawls pivoted within the bifurcations at the lower ends of said levers and engaging the spur-pinions, as specified.

408,226. HORSESHOE-BLANK-CUTTING MACHINE. ERWIN PIEPER, Troy, N. Y. Filed Nov. 24, 1888. Serial No. 291,787. (No model.)

Claim.—1. In a horseshoe-blank-cutting machine, the combination of a set of coacting creasing-rolls and a single rotatable saw arranged at right angles to the axes of the rolls, and at one side thereof, to sever a bar of metal longitudinally as it emerges from said rolls, as set forth.

2. In a horseshoe-blank-cutting machine, the combination of a set of coacting creasing-rolls, one having a V-shaped periphery and a single vertical rotatable saw arranged in rear of said rolls at right angles to the axes of the rolls in the path of the bar of metal as it emerges from the latter to sever or divide said bar longitudinally in the middle of the crease formed by the rolls, substantially as described.

3. In a horseshoe-blank-cutting machine, the combination of a set of coacting creasing-rolls, one having a V-shaped periphery, and a single vertical rotatable saw arranged at one side of said rolls at right angles to the axes thereof and in the vertical plane of the apex of the periphery of the V-shaped roll, substantially as and for the purpose described.

4. In a horseshoe-blank-cutting machine, the combination of a set of creasing-rolls, a single rotatable saw arranged at one side of said rolls and at right angles to the axes thereof, and a fixed guide intermediate of the rolls and saw, with one end terminating in close proximity to the pass of the rolls, and having a longitudinal passage therein through which the bar of metal passes as it emerges from the rolls, substantially as and for the purpose described.

5. In a horseshoe-blank-cutting machine, the combination of a set of creasing-rolls, a horizontal fixed guide located at one side of said rolls and having a longitudinal passage extending therethrough and a vertical slot, and a rotatable vertical saw operating in the slot of said guide, substantially as and for the purpose described.

6. In a horseshoe-blank-cutting machine, the combination of a longitudinal receptacle or box having a movable bottom, a fixed support arranged below said receptacle to receive the bar of metal therefrom, a crescent rotatable saw arranged to cut said bar of metal transversely as it rests on said support, and mechanism for reciprocating said bottom of the receptacle laterally, substantially as and for the purpose described.

7. In a horseshoe-blank-cutting machine, the combination of a horizontal receptacle or box having a movable bottom, a series of fixed horizontal supports arranged transversely across the receptacle beneath the same to receive the bar of metal therefrom when the bottom is withdrawn from the receptacle, a series of rotatable crescent-saws arranged in relation to said supports to cut the bar of metal transversely as it rests on the supports, and mechanism for reciprocating said bottom of the receptacle laterally, substantially as and for the purpose described.

8. In a horseshoe-blank-cutting machine, the combination of a longitudinal box or receptacle having an open lower side, a laterally-reciprocating bottom arranged to move beneath said receptacle to alternately open and close the latter throughout its entire length, a series of horizontal supports below said movable bottom, a series of crescent-saws located in relation to said supports to cut the bar of metal transversely when it rests on said supports, and mechanism for reciprocating said bottom of the receptacle laterally, substantially as and for the purpose described.

9. In a horseshoe-blank-cutting machine, the combination of a longitudinal receptacle or box having an open lower side, a laterally-reciprocating bottom arranged to close and open the lower side of the receptacle, a series of horizontal fixed supports below the receptacle, a series of rotatable crescent-saws arranged in line with the supports, and means, movable with said reciprocating bottom, for forcing the bar of metal laterally on the supports toward the saws, substantially as and for the purpose described.

10. In a horseshoe-blank-cutting machine, the combination of a longitudinal receptacle or box, a series of fixed horizontal supports arranged transversely below said receptacle, a laterally-reciprocating bottom arranged to close and open the receptacle and having the depending flanges or ribs, which ride on said supports, and a series of rotatable crescent-saws arranged in line with the supports, substantially as and for the purpose described.

11. In a horseshoe-blank-cutting machine, the combination of a longitudinal receptacle or box, a laterally-reciprocating bottom arranged close to the bottom of the receptacle to alternately open and close the same, a series of horizontal supports located transversely below the receptacle and adjustably fixed at one end to a rigid supporting-bar, and a series of rotatable crescent-saws adjustably fixed to a common shaft or arbor to be movable lengthwise thereon, substantially as and for the purpose described.

12. In a horseshoe-blank-cutting machine, the combination of a longitudinal receptacle or box, a laterally-reciprocating bottom having a depending flange, a series of transverse supports fixed at one end and having a longitudinal open slot in its other end, and a series of rotatable crescent-saws arranged to enter the slots in the free ends of said supports, substantially as and for the purpose described.

13. In a horseshoe-blank-cutting machine, the combination of a longitudinal receptacle or box, a laterally-reciprocating bottom arranged close to the lower side thereof, a series of horizontal fixed supports, a longitudinal saw-arbor carrying a series of rotatable crescent-saws, an eccentric-shaft connected by pitmen with said reciprocating bottom, and a counter-shaft geared to the saw-arbor and eccentric-shaft, substantially as and for the purpose described.

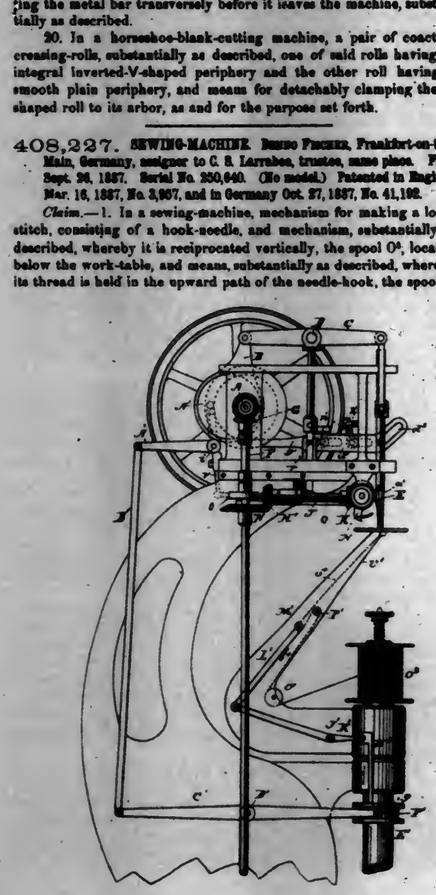
14. In a horseshoe-blank-cutting machine, the combination of a suspended longitudinal receptacle or box, a laterally-movable bottom, a series of horizontal supports arranged transversely below said receptacle, a longitudinal saw-arbor carrying a series of rotatable crescent-saws, an eccentric-shaft having its eccentric-straps connected by intermediate pitmen with the reciprocating bottom, a sectional counter-shaft geared to the saw-arbor and eccentric-shaft, and a clutch controlled by a treadle for coupling said sectional counter-shaft, substantially as and for the purpose described.

15. In a horseshoe-blank-cutting machine, the combination of a set of coacting creasing-rolls, a longitudinal receptacle or box arranged in line with said rolls to receive the bar of metal therefrom, a rotatable rip-saw intermediate of said receptacle and the creasing-rolls for dividing said bar of metal longitudinally, and a series of rotatable crescent-saws for cutting the bar of metal transversely into

suitable lengths before said bar is discharged from the machine, substantially as described, for the purpose set forth.

16. In a horseshoe-blank-cutting machine, the combination of a set of coacting creasing-rolls, a longitudinal receptacle arranged at one side thereof to receive the bar of metal after it passes through the rolls, a rip-saw intermediate of said receptacle and the rolls, and a guide between the saw and receptacle for directing the bar of metal into the receptacle after it is split or divided longitudinally by the rip-saw, substantially as and for the purpose described.

17. In a horseshoe-blank-cutting machine, the combination of a set of creasing-rolls for forming a longitudinal crease or groove in a bar of metal, a vertical rotatable rip-saw for dividing said metal bar longitudinally along the middle of the crease therein, and a series of rotatable crescut-saws rotating in a plane at right angles to the rip-saw for cutting said metal bar transversely into suitable lengths, substantially as and for the purpose described.

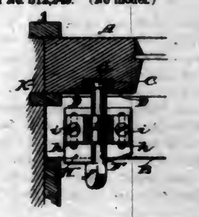


18. In a horseshoe-blank-cutting machine, the combination of a set of coacting creasing-rolls, an open receptacle or box arranged in line with said rolls for receiving the metal bar as it emerges therefrom, a vertical rip-saw between the rolls and receptacle, an open-ended conical guide fixed to the receiving end of said receptacle and terminating close to the saw, and a series of rotatable crescut-saws for cutting the metal bar transversely after it leaves the receptacle, substantially as and for the purpose described.

19. In a horseshoe-blank-cutting machine, the combination of a set of coacting creasing-rolls, a horizontal fixed guide arranged close up to said rolls and having a longitudinal passage and a vertical slot, a vertical rip-saw operating in said slot of the guide, a longitudinal receptacle or box in rear of and in line with said guide, an open-ended conical guide intermediate of the rip-saw and receptacle to receive the metal bar from the horizontal guide and direct the same into the receptacle, and a series of rotatable crescut-saws for cutting the metal bar transversely before it leaves the machine, substantially as described.

20. In a horseshoe-blank-cutting machine, a pair of coacting creasing-rolls, substantially as described, one of said rolls having an integral inverted-V-shaped periphery and the other roll having a smooth plain periphery, and means for detachably clamping the V-shaped roll to its arbor, as and for the purpose set forth.

408,227. SEWING-MACHINE. Bruno Fischer, Frankfort-on-the-Main, Germany, assignor to C. S. Larrabee, trustee, same place. Filed Sept. 26, 1887. Serial No. 250,040. (No model.) Patented in England Mar. 16, 1887, No. 3,967, and in Germany Oct. 27, 1887, No. 41,192.



Claim.—1. In a sewing-machine, mechanism for making a lock-stitch, consisting of a hook-needle, and mechanism, substantially as described, whereby it is reciprocated vertically, the spool O^2, located below the work-table, and means, substantially as described, whereby its thread is held in the upward path of the needle-hook, the spool Z, located between the jaws *l m*, in close proximity to the path of the needle above the work-table, the bolt *y*, one end of which bears against the spool Z, and means, substantially as described, whereby said bolt is reciprocated intermittently, and the loop-carrier N, located upon the squared shaft L and capable of a sliding movement thereon, mechanism, substantially as described, for rotating the shaft, the lever Q, pivotally connected to the loop-carrier N, and mechanism, substantially as described, whereby said lever is oscillated, all as set forth.

2. In a sewing-machine, mechanism for making and tightening a lock-stitch, consisting of a hook-needle, and mechanism, substantially as described, whereby it is reciprocated vertically, the spool O^2, located below the work-table, and means, substantially as described, whereby its thread is held in the upward path of the needle-hook, a take-up mechanism, whereby said thread is tightened after the stitch is made, said mechanism consisting of the rollers O P, connecting-rod L', roller M, the lever K', sleeve F, mounted on shaft E, and mechanism, substantially as described, whereby said sleeve is reciprocated, in combination with the spool Z, located between the jaws *l m*, in close proximity to the path of the needle above the work-table, the bolt *y*, one end of which bears against the spool Z, and means, substantially as described, whereby said bolt is reciprocated intermittently, a loop-carrier N, and mechanism, substantially as described, whereby said loop-carrier is rotated across the line of said thread, and mechanism whereby it is reciprocated during its rotation toward and from the spool Z, all substantially as and for the purposes set forth.

3. In a sewing-machine, mechanism for making a lock-stitch, consisting of a hook-needle, and mechanism, substantially as described, whereby it is reciprocated vertically, the spool O^2, located below the work-table, and means, substantially as described, whereby its thread is held in the upward path of the needle-hook, the spool Z, the loop-carrier N, located upon the squared shaft L and capable of a sliding movement thereon, mechanism, substantially as described, for rotating the shaft, the lever Q, pivotally connected to the loop-carrier N, and mechanism, substantially as described, whereby said lever is oscillated, said spool Z being located between the jaws *l m* and in combination with the clamping-bolt *y*, with its spring, the bracket X, attached to the frame of the machine, the beveled piece O^3, located upon the farther end of the bolt *y*, the bell-crank V, provided with the beveled end located in contact with the beveled piece O^3, and means, substantially as described, whereby the beveled end of said bell-crank is reciprocated, as and for the purposes set forth.

408,228. FASTENER FOR THE MEETING-RAILS OF SASHES. Grant Fitch and Robert W. Williams, Milwaukee, Wis. Filed May 27, 1889. Serial No. 312,249. (No model.)

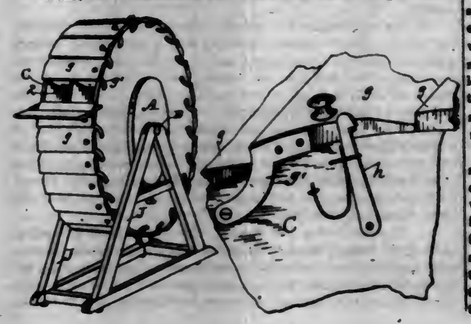
Claim.—1. In a sash fastener and tightener, the combination of the sash A, having a longitudinal groove C, with the facing-plate D, provided with a longitudinal slot having an enlargement *d* and a covering-plate E, and a sash B, having a shank or pin F, provided with a disk or projection G, fitting within the groove C, substantially as described.

2. In a sash fastener and tightener, the combination, with the sash A, having a longitudinal groove C, of a slotted facing-plate D, and the sash B, having a shank or pin F, provided with a disk or projection G, fitting within the groove C, and having a thumb-piece *f*, a plate H, having at its forward end a cam-shaped edge, and a saddle I, substantially as described.

3. In a sash fastener and tightener, the combination, with the sash A, having a longitudinal groove C, of a slotted facing-plate D, the sash B, having a shank or pin F, provided with a disk or projection G, fitting within the groove C, and having a thumb-piece *f*, a plate H, having at its forward end a cam-shaped edge, said plate being provided with slots *h*, and a saddle I, provided with lateral lugs and screws *i*, substantially as set forth.

4. In a sash fastener and tightener, the combination of the sash A, having a longitudinal groove C, with the facing-plate D, provided with a longitudinal slot having an enlargement *d* and covering-plate E, a sash B, having a shank or pin F, provided with a disk or projection G, fitting within the groove C, and having a thumb-piece *f*, a plate H, provided at its forward end with a cam-shaped edge and having slots *h*, and a saddle I, provided with lateral lugs and screws *i*, substantially as described.

408,229. STEAM-MOTOR. Thomas J. Framer, Lyons, Iowa. Filed Sept. 27, 1888. Serial No. 286,616. (No model.)



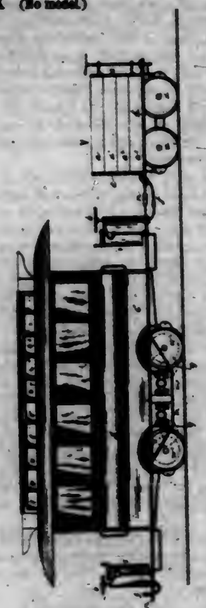
Claim.—1. The combination of the front frame C, provided with the circular rear plate D and plate H, the carrying-wheels G, axle G', rear frame A, provided with ways J, carrying-wheels E', axle F, reach D', and pivot E, substantially as shown, and for the purpose described.

2. The combination of the front frame C, suitably supported upon carrying-wheels G and provided with the rear transverse circular rack H, the rear frame A, suitably supported upon the carrying-wheels E' and provided with the pinion I, means for rotating said pinion, reach D', and pivot E, substantially as shown, and for the purpose described.

3. The combination of the front frame C, suitably supported upon carrying-wheels G and provided with the rear circular rack H, and adapted to carry the boiler L, cylinders L' and their adjunctive parts, the rear frame A, suitably supported upon carrying-wheels E', pinion I, adapted to engage and move the rack H, means for rotating said pinion, transverse rack T', pinion W, and means for locking and means for actuating said last-named pinion, reach D', and pivot E, substantially as shown, and for the purpose described.

4. The combination of frame C, axle G', wheels G, provided with internal gear P, braces O O, seated on said frame, driving-shaft N', journaled on said braces and provided with elbow-crank N, pinions R, seated on shaft N' and adapted to engage gear P at or near the top of wheels G, respectively, inclined cylinders L', and pistons M, pivotally attached to said elbow-crank, substantially as shown, and for the purpose described.

408,230. ROTATING PIGEON-HOLE CASE. George A. Goodenow, Cedar, Iowa. Filed Nov. 5, 1888. Serial No. 289,965. (No model.)



Claim.—1. In combination with a cylindrical and vertically-rotative pigeon-hole case having radial partitions and pockets, hinged doors or pocket-covers that are thicker at their hinged edges than at the free front edges, and thereby adapted to be utilized as shelves when open.

2. The hinge-irons *g'*, in combination with the doors *g* and the sides C of a vertically-rotating case having radial partitions and pockets, for the purposes stated.

3. A vertically-rotating case having an annular shoulder on its side in concentric position with its axis, in combination with a stand having an adjustable brake device adapted to engage the said shoulder, in the manner set forth, for the purposes stated.

4. A cylindrical vertically-revolving case having radial pockets and covers hinged to its sides to close the pockets and to project radially when the pockets are open to serve as shelves, in combination with a portable stand, and mechanism for holding the case stationary at any point desired.

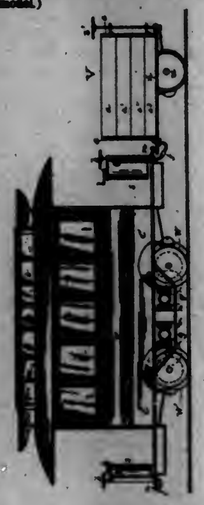
408,231. MEANS FOR PROPELLING VEHICLES BY SECONDARY BATTERIES. William W. Gibbon, Haverford College, assignor to the Electro Dynamic Company, Philadelphia, Pa. Filed Apr. 5, 1889. Serial No. 306,114. (No model.)

Claim.—1. The combination of a wheeled vehicle having seats for passengers, one or more electric motors located on said vehicle and mechanically connected with a wheel or axle thereof, a second wheeled vehicle mechanically connected with the first vehicle, a series of secondary batteries or accumulators located thereon, an electric circuit uniting the motors on one vehicle with the batteries on the other, and a switch or circuit-changer for varying the connection of the batteries with respect to said circuit, substantially as described.

2. The combination of a wheeled vehicle having seats for passengers, means for propelling said vehicle, consisting of one or more electric motors located thereon and mechanically connected with a wheel or axle thereof, a second wheeled vehicle mechanically connected with the first and moved thereby, a series of cells of battery located upon the second vehicle, an electric circuit uniting the batteries on one vehicle with the motors on the other, and suitable switches for varying the connection between said circuit and the motor and batteries, substantially as described.

3. The combination of a wheeled vehicle having seats for passengers, means for propelling said vehicle, consisting of one or more electric motors located thereon and mechanically connected with a wheel or axle thereof, a second wheeled vehicle connected with the first and moved thereby, superposed rows of cells of secondary battery located upon said second vehicle inside the plane of the wheels, an electrical circuit uniting the batteries on one vehicle with the motors on the second, and one or more switches for varying the connection between the said circuit and the batteries and motors, substantially as described.

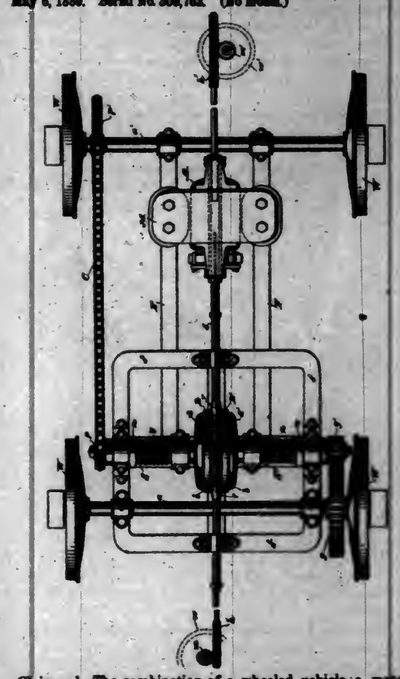
4. The combination of a vehicle having four or more wheels, suitable bearings or axles therefor, means for propelling said vehicle, consisting of two electric motors located thereon and mechanically connected to the wheels or axles, respectively, seats for passengers upon said vehicles, a second wheeled vehicle mechanically connected with the first vehicle and moved thereby, a series of cells of secondary battery located thereon, an electric circuit uniting the motors on one vehicle with the batteries on the other, and a switch or circuit-changer for varying the connection between said circuit and the motors and batteries, substantially as described.



5. The combination of a vehicle having four or more wheels, suitable bearings or axles therefor, means for propelling said vehicle, consisting of two electric motors located thereon and mechanically connected to the wheels or axles, respectively, seats for passengers upon said vehicle, a second wheeled vehicle mechanically connected with the first vehicle and moved thereby, a series of cells of secondary battery located upon said vehicle in superposed rows, an electrical circuit uniting the motors on one vehicle with the batteries on the other, and a switch or circuit-changer for varying the connection between said circuit and the motors and batteries, substantially as described.

6. The combination of a wheeled vehicle having seats for passengers and entrances thereto from opposite ends, one or more series-wound electric motors located on said vehicle and mechanically connected with a wheel or axle thereof, a second wheeled vehicle mechanically connected with the first vehicle and moved thereby and therewith, a series of cells of secondary battery located thereon, an electric circuit uniting the motors on one vehicle with the batteries on the other, and a switch or circuit-changer for varying the connection of the circuit, batteries, and motors with respect to each other, substantially as described.

7. The combination of a wheeled vehicle, one or more series-wound electric motors located on said vehicle and mechanically connected with a wheel or axle thereof, a second wheeled vehicle mechanically connected with the first vehicle and moved thereby and therewith, a series of cells of secondary battery located on said second vehicle, an electrical circuit uniting the motors on one vehicle with the batteries on the other through the medium of a flexible electrical connection between the two said vehicles, and suitable switching apparatus for varying the connection of said circuit with respect to the batteries and motors, substantially as described.



8. The combination of a wheeled vehicle having seats for passengers and entrances at opposite ends, one or more electric motors located thereon and mechanically connected with a wheel or axle thereof, a second wheeled vehicle mechanically connected with the first vehicle and moved thereby and therewith, a series of cells of secondary battery located thereon, an electric circuit uniting the motors on one vehicle with the batteries on the other, and suitable switching apparatus for varying the number of cells in circuit for connecting said cells in parallel and for reversing the polarity of the motor, field, and armature coils with respect to each other, substantially as described.

408,282. MEANS FOR PROPELLING VEHICLES BY SECONDARY BATTERIES. WILLIAM W. GIBSON, Haverford College, assignor to the Electro Dynamic Company, Philadelphia, Pa. Filed Apr. 12, 1889. Serial No. 306,922. (No model.)

Claim.—The combination of a wheeled vehicle having seats for passengers, one or more electric motors located on said vehicle and mechanically connected with a wheel or axle thereof, a second vehicle having two wheels mechanically connected to and partially supported by the first vehicle, a series of cells of secondary batteries or accumulators located thereon, an electric circuit uniting the motors on one vehicle with the batteries on the other, and suitable switching apparatus for varying the connection of the batteries with respect to said circuit, substantially as described.

408,283. VEHICLE-MOTOR. WILLIAM W. GIBSON, Haverford College, assignor to the Electro Dynamic Company, Philadelphia, Pa. Filed May 6, 1889. Serial No. 309,762. (No model.)

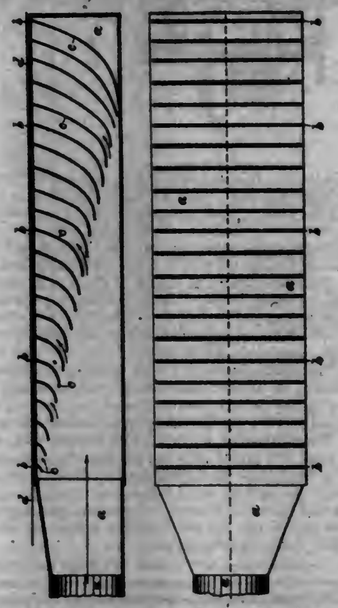
Claim.—1. The combination of a wheeled vehicle, a motor for propelling said vehicle located thereon, and means for applying the movement of said motor to the running-gear of said vehicle, consisting of two parallel friction-disks mechanically connected with said running-gear, one or more friction-rollers operating upon the faces of said disks and connected with the moving parts of the motor, and means for varying the radial point of contact between said roller and disks, substantially as described.

2. The combination of a wheeled vehicle, a motor for propelling said vehicle located thereon, and means for connecting said motor to the running-gear of said vehicle, consisting of two parallel friction-disks mechanically connected to said running-gear, two friction-rollers mechanically connected with the moving part of said motor, and means for bringing either roller into contact with said friction-disks to produce movement in either direction, substantially as described.

3. The combination of a wheeled vehicle, a motor for propelling said vehicle located thereon, operating with a substantially uniform speed and direction of movement, and means for communicating the movement of said motor to the running-gear of said vehicle to produce a variation in speed of movement in either of two directions, said means consisting of two parallel friction-disks mechanically connected to the running-gear of the vehicle, two friction-rollers fixed to a shaft located between said friction-disks and adjustably connected with the moving part of said motor, and means for bringing either of said friction-rollers into contact with the opposing faces of said friction-disks at varying but equidistant radial points on both said disks, substantially as described.

4. The combination of a wheeled vehicle, a motor for propelling said vehicle located thereon, operating with a substantially uniform speed and direction of movement, and means for communicating the movement of said motor to the running-gear of said vehicle to produce a variation in speed of movement in either of two directions, said means consisting of two parallel friction-disks mechanically connected to the running-gear of the vehicle, a spring for each disk acting to force said disks toward each other, a supplemental disk and ball bearings between each spring and friction-disk, two friction-rollers fixed to a shaft located between said friction-disks and adjustably connected with a moving part of said motor, and gear-teeth and gear-wheels at each end of said shaft for imparting a longitudinal movement to said shaft, substantially as described.

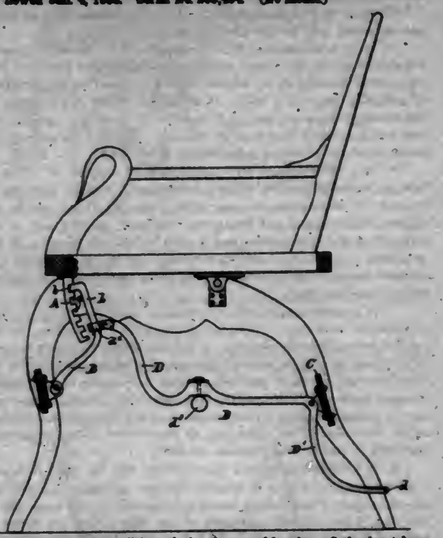
5. The combination of a wheeled vehicle, a motor for propelling said vehicle located thereon, and means for connecting said motor to the running-gear of said vehicle, consisting of one or more friction-disks mechanically connected to said running-gear, two friction wheels or rollers mechanically connected with the moving part of said motor, and means for bringing either roller into contact with said friction-disk to produce movement in either direction, substantially as described.



408,284. HARROW. JAMES T. HAMILTON, Council Bluffs, Iowa. Filed Nov. 20, 1888. Serial No. 292,247. (No model.)

Claim.—1. A tooth-bar for harrows, consisting of a tubular bar that has a longitudinal opening extending from one end to the other and coinciding perforations or notches at intervals adapted to admit teeth to be clamped fast therein by clamping the bar.

2. In a harrow, the combination of a clip B and a tooth with a tubular tooth-bar A, having an opening extending its entire length and coinciding perforations or notches, substantially as shown and described, for the purposes stated.



408,285. DEVICE FOR DRYING WARPS, PIECE GOODS, &c. FRANK HASKELL, Westbrook, Me. Filed Apr. 27, 1887. Serial No. 236,209. (No model.)

Claim.—1. A chamber or pipe closed at one end and open at the other, having in one of its sides narrow transverse openings, from the edges of which openings, nearer the closed end of the chamber, extend downward within the chamber curved pieces or wings, which gradually increase in length as they approach said closed end, substantially as described.

2. The rectangular box *a*, adapted to be connected at one end with a hot-blast pipe and closed at the other end, and having in one of its broader sides transverse openings *b* at suitable intervals from end to end, and within the chamber the curved pieces *c*, placed, respectively, at the rear of said openings *b*, and increasing in length from front to rear, substantially as set forth.

408,286. BARBER'S CHAIR. FREDERICK HEER, Cincinnati, Ohio, assignor to A. Gumbiteh & Co., same place. Filed Mar. 13, 1887. Renewed Jan. 4, 1889. Serial No. 295,654. (No model.)

Claim.—1. In a tilting chair, the combination of the boot lever D', journaled at the back of the chair and provided with foot-piece *d*, and loop d^3, pawl B, journaled at the front of the chair and extending through the said loop and provided with tooth *b*, and ratchet A, attached to the movable part of the chair and provided with notches *a*, substantially as and for the purposes specified.

2. In a tilting chair, the combination of the rack-bar attached to the chair, the pawl pivoted to the frame and engaging with the rack-bar and having an approximately vertical portion, and a lever having an approximately horizontal weighted portion having a sliding connection with the vertical portion of the pawl, whereby the pawl is normally locked by the lever, but may be withdrawn from the rack by moving the lever, substantially as set forth.

408,287. ROLLER-BEARING. RUDOLF W. HERZ, San Francisco, Cal. Filed Dec. 12, 1888. Serial No. 294,044. (No model.)

Claim.—1. In a roller-bearing, the combination, with a series of bearing-rollers, a series of separating-rollers bearing only on the bearing-rollers, and a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, of a smaller ring bearing at its periphery on the latter journals, substantially as set forth.

2. In a roller-bearing, the combination, with the series of bearing-rollers B, having journals B^3, the series of rollers C, bearing only on the rollers B and having journals C^3, and the ring H, bearing at its periphery on the journals C^3 and at its inner side on the journals B^3, of the ring J, bearing at its periphery on the journals B^3, substantially as shown and described, and for the purposes set forth.

3. In a roller-bearing, the combination, with a series of bearing-rollers, a series of separating-rollers bearing only on the bearing-rollers, a ring bearing at its inner side on journals of the separating-rollers, and a ring bearing at its periphery on said journals and at its inner side on journals of the bearing-rollers, of a smaller ring bearing at its periphery on the latter journals, substantially as set forth.

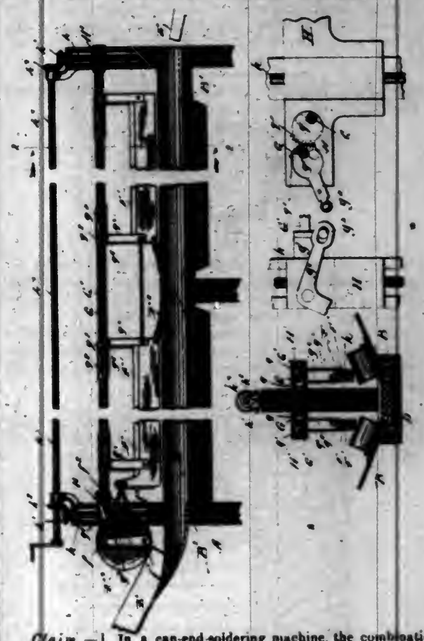
4. In a roller-bearing, the combination, with the series of rollers B, bearing on and projecting beyond the sleeves A' and D' and having journals B^3, the series of rollers C, bearing only on the rollers B at their projections and having journals C^3, the ring I, bearing at its inner side on the journals C^3, and the ring H, bearing at its periphery on the journals C^3 and at its inner side on the journals B^3, of the ring J, bearing at its periphery on the journals B^3, substantially as shown and described, and for the purposes set forth.

5. In a roller-bearing, the combination of a series of bearing-rollers bearing on the central journal and the bearing-casing and having journals bearing on the inner side of a ring and on the periphery of a smaller ring, and a series of separating-rollers bearing only on the bearing-rollers and having journals bearing on the periphery of said first-mentioned ring and on the inner side of a larger ring, all constructed and arranged substantially as set forth.

6. In a roller-bearing, the combination of a series of rollers B, bearing on and projecting beyond the sleeves A' and D', and having journals B^3, bearing on the inner side of the ring H and on the periphery of the ring J, and the series of rollers C, bearing only on the rollers B at their projections, and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, all constructed and arranged substantially as shown and described, and for the purposes set forth.

7. In a roller-bearing, the combination, with three coaxial rings of different diameters, of a series of bearing-rollers bearing on the central journal and the bearing-casing and having journals bearing on the inner side of the intermediate ring and on the periphery of the inner ring, and a series of separating-rollers keeping the bearing-rollers separate from each other and bearing only on the bearing-rollers and having journals bearing on the periphery of the intermediate ring and on the inner side of the outer ring, all constructed and arranged substantially as and for the purposes set forth.

8. In a roller-bearing, the combination, with the rings H, I, and J, of the series of rollers B, bearing on and projecting beyond the sleeves A' and D' and having journals B^3, bearing on the inner side of the ring H and on the periphery of the ring J, and the series of rollers C, bearing only on the rollers B at their projections, and keeping the rollers B separate from each other, and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, all constructed and arranged substantially as shown and described, and for the purposes set forth.



9. In a roller-bearing, the combination, between the shaft and casing, of sleeves upon the shaft and sleeves within the casing, three coaxial rings of different diameters, a series of bearing-rollers bearing on and projecting beyond said sleeve and having journals bearing on the inner side of the intermediate ring and on the periphery of the inner ring, and a series of separating-rollers bearing only on the bearing-rollers at their projections, each separating-roller on and between two bearing-rollers to keep the latter rollers separate from each other, and having journals bearing on the periphery of the intermediate ring and on the inner side of the outer ring, keeping the separating-rollers from contact with the casing, all constructed, arranged, and operating substantially as and for the purposes set forth.

10. In a roller-bearing, the combination, between the shaft A and the casing D, of the sleeves A' and D', located between the same planes, the rings H, I, and J, the series of rollers B, bearing on and projecting beyond the sleeves and having journals B^3, bearing on the inner side of the ring H and on the periphery of the ring J, and the series of rollers C, bearing only on the rollers B at their projections, each roller C on and between two rollers B to keep the latter rollers separate from each other, and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, keeping the rollers C from contact with the casing, all constructed, arranged, and operating substantially as shown and described, and for the purposes set forth.

11. A roller-bearing comprising the central journal, the bearing-casing, three coaxial rings of different diameters, a series of bearing-rollers bearing only portions of their lengths on the central journal and the bearing-casing and having journals bearing on the inner side of the intermediate ring and on the periphery of the inner ring, a series of separating-rollers keeping the bearing-rollers separate from each other and bearing only on the portions of the bearing-rollers not bearing on the central journal and the bearing-casing, and having journals bearing on the periphery of the intermediate ring and on the inner side of the outer ring, keeping the separating-rollers from contact with the casing, all constructed, arranged, combined, and adapted to operate substantially as and for the purposes set forth.

12. A roller-bearing comprising the shaft A, the casing D, the sleeves A' and D', located between the same planes, the series of rollers B, bearing on and projecting beyond the sleeves and having journals B^3, bearing on the inner side of the ring H and on the periphery of the ring J, the rollers C, keeping the rollers B separate from each other and bearing only on the rollers B at their projections beyond the sleeves, each roller C on and between two rollers B and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, the said ring H interposed between and bearing on the journals C^3 at its periphery and on the journals B^3 at its inner side, the said ring I bearing at its inner side on the journals C^3 and keeping the rollers C from contact with the casing, and the said ring J bearing at its periphery on the journals B^3, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

408,238. SOLDERING-MACHINE. John G. Hodgson, Maywood, Ill., assignor to Edwin Norton, same place, and Oliver W. Norton, Chicago, Ill. Filed Oct. 15, 1888. Serial No. 288,061. (No model.)

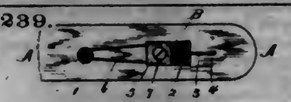
Claim.—1. In a can-end soldering machine, the combination, with a solder bath and a track for supporting the cans as they roll through the same, of a pair of alternately rising and falling reciprocating devices for rolling the cans along said track, said can-rolling devices operating alternately upon the cans, so that the cans are rolled continuously through the bath of solder, substantially as specified.

2. The combination, with a track, of a pair of alternately reciprocating can-rolling devices, means for reciprocating said devices, and means for moving said devices out of contact with the cans as they make their backward movement, whereby the cans are rolled continuously, substantially as specified.

3. The combination, with a track having a raised portion, of a reciprocating can-holding device having a flexible portion to permit the cans to pass over the raised portion of the track, and means for raising and lowering said can-rolling device, substantially as specified.

4. The combination, with a flux bath, a solder bath, and a can-rolling track, of a pair of rising and falling bodily-reciprocating can-rolling devices, means for reciprocating said devices, and means for alternately moving them out of contact with the cans as each makes its backward movement, said can-rolling devices operating alternately upon the cans, so that the cans are rolled continuously through said solder bath, substantially as specified.

5. The combination, with a track, of a rising and falling bodily-reciprocating flexible can-rolling device, substantially as specified.

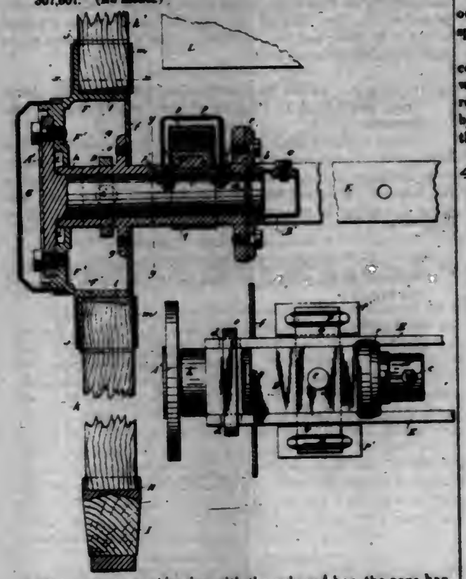


6. The combination of a solder bath, a track, and a pair of alternately rising and falling reciprocating flexible can-rolling devices, substantially as specified.

7. The combination, with a solder bath, of a track, a rising and falling reciprocating can-rolling device, means for reciprocating said can-rolling device in a rectilinear path in contact with the cans, and means for raising and lowering it, whereby said can-rolling device is given a four-motion movement, substantially as specified.

408,239. TRACE-HOLDER. George L. Hydorn, Lacona, N. Y. Filed June 6, 1889. Serial No. 313,377. (No model.)

Claim.—1. A trace-holder consisting of a wire coiled, then bent



408,239.

to form an arch, and then bent to form a handle, and means for securing the same to the whiffletree, substantially as described.

2. A trace-holder consisting of a handle, an arch adjacent to the handle, a spring adjacent to the arch, and rearward arms, all constructed from a single piece of wire, and means for securing the arms to the whiffletree.

408,240. VEHICLE WHEEL AND AXLE. George Johnson, Battersea, County of Surrey, England. Filed Apr. 17, 1889. Serial No. 307,007. (No model.)

Claim.—1. In combination with the axle and box, the nave having the vertical flange F secured to the axle, and a horizontal flange extending inwardly toward the vehicle, said horizontal portion having bearings or sockets for the spokes.

2. In combination, the box, the axle having the head A', and the nave having the flange F secured thereto.

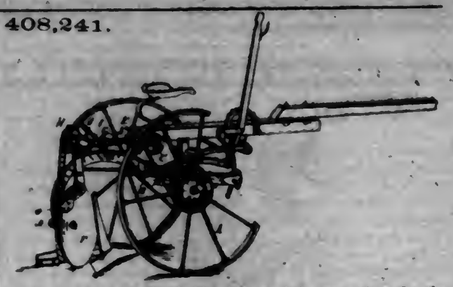
3. In combination, the box, the axle having the head A' and the nave, the nave having the vertical flange F secured thereto, the said parts being arranged and constructed with the oil-chamber at the outer end of the box, substantially as described.

4. In combination, the box, the axle, and the nave secured thereto, said axle having an oil-chamber at its front and rear end, substantially as described.

5. In combination, the axle, the nave secured thereto, the box for the axle, and an oil-chamber B', secured to the rear end of the box and over the end of the axle, substantially as described.

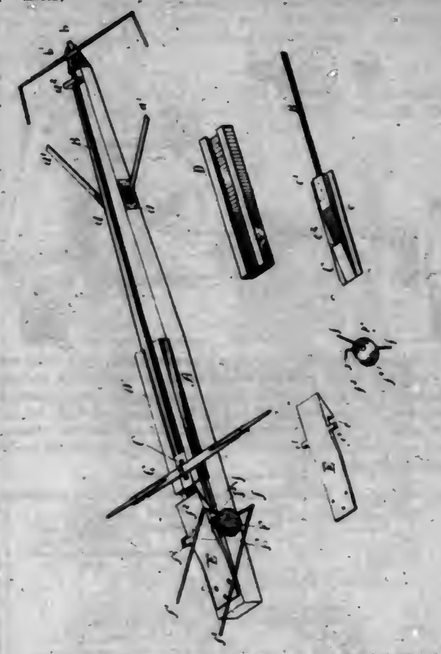
6. In vehicle-wheels, the combination, with spokes and suitable wedges, of half-sockets in which said spokes are held and ferrules or collars by which they are secured, substantially as described.

7. In the mounting of vehicle-wheels, the combination, with the nave and axle-box, of an axle-tree composed of two parallel bars adapted to hold said axle-box, substantially as set forth.



408,241. PLOW. John P. Kirk, Austin, Tex. Filed Nov. 10, 1888. Serial No. 290,456. (No model.)

Claim.—1. The combination, with a plow-carriage having a sprocket-wheel attached to the driving-wheel, and a rotary mold-board provided with a sprocket-hub having bearings in the plow-beam, of a shaft journaled upon the carriage-frame and provided with toggle

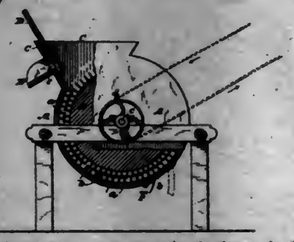


408,241.

or universal joints, and suitable chain or belt connections for the sprocket-wheels, as and for the purpose set forth.

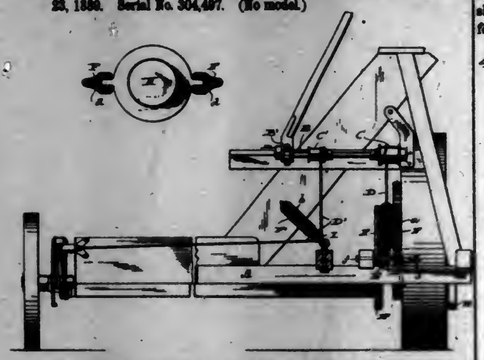
2. A jointed shaft journaled upon a beam of a plow-carriage, composed of parts I G F C, the said parts I and C being provided with sprocket-wheels, the part F being in the form of a socket to receive the shaft G, and the said parts I G and F C being connected by knuckles and pins to form universal joints, substantially as and for the purpose set forth.

408,242. SAFETY POLE OR SHAFTS FOR VEHICLES. John P. Kleis, Texarkana, Ark. Filed May 18, 1889. Serial No. 311,325. (No model.)



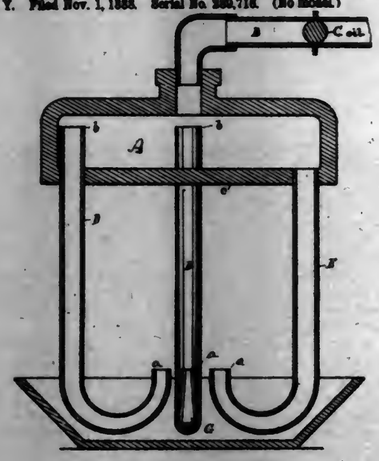
Claim.—1. The combination of the pole A, provided with the hitch-rein holders *a*, hitch-reins *a'*, perforated elevation or staple a^3, and the guide D, rod B, passing through perforated elevation a^3 and having on its front end the cap *b*, fitting over the front end of said pole, its rear end screwed into or otherwise secured to the lock-plate C, lock-plate C, having the base *c*, elevation *c'*, and lock-notch c^2, spring-plate E, having the catch projection *e* and lugs *e'*, wheels F, having their peripheries partly concentric and partly eccentric and provided with the upper and lower arms *f*, and lock-hooks f^3, said wheels being pivoted immediately under said lugs, said arms being provided with straps *f'*, substantially as shown and described.

2. The combination of the pole or shafts A, provided with hitch-rein holders *a*, hitch-reins *a'*, and guides D, rods B, having on their front ends the caps *b*, fitting over the front ends of said pole or shafts A, their rear ends attached to the lock-plate C, lock-plate C, having the base *c*, elevations *c'*, and lock-notches c^2, spring-plates E, having the catch projection *e* and lugs *e'*, wheels F, having their peripheries partly concentric and partly eccentric and provided with the upper and lower arms *f*, and lock-hooks f^3, said wheels being pivoted im-



mediately under said lugs, and said arms being provided with straps *f*, substantially as shown and described.

408,243. MACHINE FOR SEPARATING SEED FROM PULP. LAFAYETTE LARD, Adrian, Mich. Filed Feb. 20, 1889. Serial No. 300,573. (No model.)



Claim.—A water-tight concave casing having projecting teeth and a rotating cylinder within said casing having projecting teeth, in combination with a hopper on the upper front part of said casing, said hopper having a port in its front side, and a sliding valve or gate closing said port, substantially as set forth.

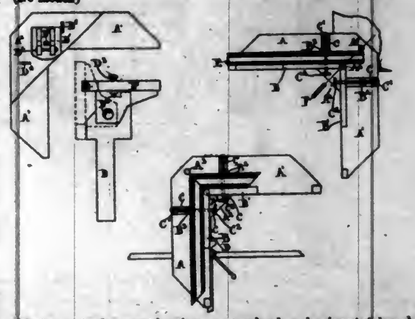
408,244. HARVESTER. JOHN W. LATHER, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Mar. 23, 1889. Serial No. 304,497. (No model.)

Claim.—The combination, in a harvester, of the main wheel and its axle and sheave, a keeper hinged to the harvester-frame, a spring confined in the keeper, and a follower confining the spring therein, a sheave carried by the follower, and a lifting-shaft and cable, the latter extending from the lifting-shaft under the sheave of the follower and connected at its lower end to the periphery of the sheave on the main-wheel axle.

408,245. PETROLEUM-BURNER. FRANCIS G. LILLY, Jamestown, N. Y. Filed Nov. 1, 1888. Serial No. 289,716. (No model.)

Claim.—In a petroleum-burner, a vaporizing-retort provided with outlet burner-tubes having their outlet-openings from the retort situated above the bottom of the retort, and one outlet burner-tube having its outlet-opening from the retort flush with or below the bottom of the retort, substantially as set forth

408,246. CARTRIDGE-SHELL. WILLIAM R. LIDDELL, Arcata, Cal. Filed Dec. 27, 1888. Serial No. 294,792. (No model.)

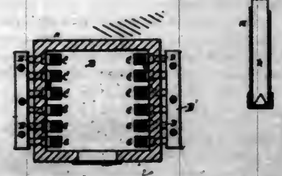


Claim.—As a new article of manufacture, a cartridge-shell made wholly of metal, the base thereof having a recess in its outer face and a projection on its inner face, and a block located within the shell and provided on its rear face with a recess adapted to receive the projection on the inner face of the base, and provided with a conical cavity in its front face, the said block being rigidly secured to the shell, substantially as set forth.

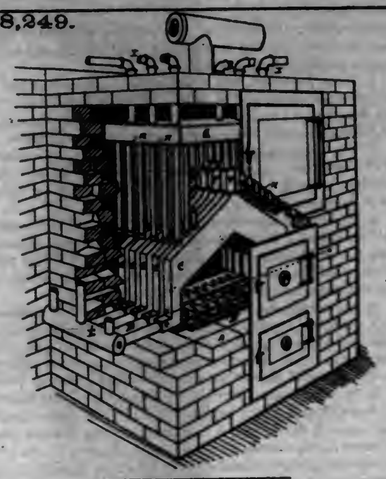
408,247. ART OF MANUFACTURING BINDER-TWINE. JAMES LYALL, New York, N. Y. Filed Aug. 30, 1888. Serial No. 284,166. (No specimens.)

Claim.—The method herein specified of manufacturing jute binder-twine, consisting in giving to the roving or thread a preliminary twist, flattening the same longitudinally and rolling up and twisting the flattened thread and winding it on spools or bobbins, and then sizing and drying the same to form binder-twine, substantially as set forth.

408,248. COMBINED MITER-BOX AND PICTURE-FRAME CLAMP. HORACE C. MARSH, Rockford, Ill. Filed Oct. 27, 1888. Serial No. 289,327. (No model.)



Claim.—1. In combination, a standard, a horizontal bracket jointed to the upper end thereof, as shown, and capable of being turned perpendicularly downward, a turn-table pivotally mounted upon said bracket, and a miter-box secured to said turn-table, substantially as described, and for the purpose specified.



2. The herein-described combination miter-box and picture-frame vise, consisting essentially of a standard, a horizontal bracket jointed to the upper end thereof and capable of being turned perpendicularly downward, a turn-table pivotally mounted upon said bracket, as shown, and a miter-box rigidly secured to said turn-table and provided with saw-guide pins and vises, substantially as described, and for the purpose set forth.

408,249. WATER-HEATER. THOMAS G. G. MOJAT, Detroit, Mich. Filed Mar. 15, 1889. Serial No. 303,391. (No model.)

Claim.—A hot-water heater consisting of a series of cross-sections C, extending over the fuel-bed, having inflow and return pipes communicating therewith, a water-chamber G, located over said sections, pipes F, leading from the middle of said sections to said chamber, and drop-tubes leading downward from said chamber, substantially as set forth.

408,249.

408,250. VULCANITE PAVEMENT. WILLIAM C. MURDOCK, Washington, D. C., assignor to the National Vulcanite Company, New York, N. Y. Original application filed May 16, 1888. Serial No. 274,093. Divided and this application filed Nov. 5, 1888. Serial No. 290,083. (No specimens.)

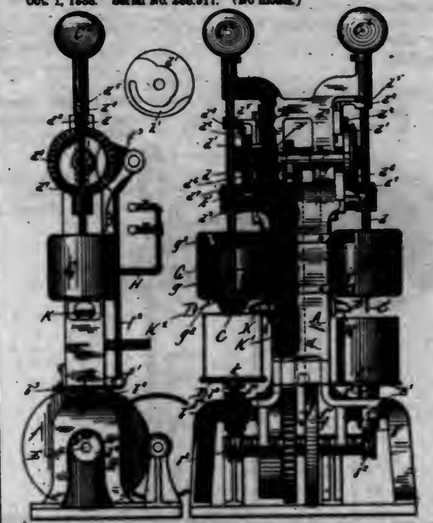
Claim.—The hereinbefore-described improvement in the art of forming and laying vulcanite pavements, which consists in first preparing a base or substratum of broken stone, filling the interstices with coal-tar distillate, and rolling; secondly, preparing a binder course of smaller stone heated and thoroughly mixed with asphaltic cement prepared by subjecting asphalt and coal-tar distillate to a temperature of about 450° Fahrenheit and not exceeding 500° Fahrenheit, laying said binder course evenly upon the base, and rolling, and, finally, applying and rolling a top coating or surface prepared by mixing comminuted mineral substances, of which one ingredient is sulphur, with asphalt and coal-tar previously subjected to a temperature of about 450° Fahrenheit, but less than 500° Fahrenheit, and protecting the top surface by applying thereto dry hydraulic cement and powdered sulphate of calcium, substantially as set forth.

408,251. EXERCISING-MACHINE. JOHN P. NEMOCA, Marion, Ind. Filed Apr. 27, 1889. Serial No. 308,807. (No model.)

Claim.—1. An exercising-machine for receiving blows, comprising a base, a blow-receiving rock-arm mounted on a rock-shaft journaled on the base, a rearwardly-extending rock-arm, a movable pointer mounted over a dial, and devices connecting the arm and pointer and adapted to rotate the latter by the oscillation of the former, substantially as specified.

2. An exercising-machine for receiving blows, comprising a base, a depressible rock-arm, a dial-case mounted above the rock-arm and carrying a movable pointer, a sector mounted in the case and adapted to mesh with a toothed wheel mounted on the dial-shaft, and a rod connecting the sector and the rock-shaft, substantially as specified.

3. In an exercising-machine, the combination, with a base provided at its forward end with a rock-shaft carrying an upwardly-projecting blow-receiving rock-arm and a rearward rock-arm, of a dial-case mounted above the rock-arm and provided with a pointer-shaft carrying a gear, a sector mounted at one side of the gear and meshing therewith, and a loosely-pivoted connecting-rod connecting the inner end of the sector with a pin projecting from the rock-arm, substantially as specified.



4. In an exercising-machine, the combination, with blow receiving and transmitting mechanism, of blow-registering mechanism connected therewith and independent means for returning each to its normal position irrespective of the movement of the other, substantially as specified.

5. In an exercising-machine, a base provided at its forward end with a rock-shaft having upwardly-projecting and rearwardly-projecting rock-arms suitably braced, and a spring for returning the rear rock-arm to position, in combination with a dial-case mounted above the rearwardly-projecting rock-arm and provided with a pointer-shaft having a gear, a sector mounted to the side of the gear and meshing therewith, a spring for returning the sector to its normal position, a ratchet-plate mounted on the sector, and a pawl for engaging the teeth of the ratchet, substantially as specified.

6. The base-sills 2, 3, and 4, arranged as described, in combination with the standards 7, mounted upon the sill 3, and provided with bearings 8, carrying a rock-shaft 9, and the rock-arms 10 and 14, the former provided with the blow-receiving device 11, having opposite guide-arms 12 and buffer 13, and the spring 29, mounted on the sill 2 and under the rear end of the rock-arm 14, substantially as specified.

7. The combination, with the base having the rock-shaft 9 and arms 10 and 14, the former provided with the blow-receiving device and the latter having the spring 29, of the supports 5, having the cross-bar 6 and buffer, and the standard 16, having the casing 17, provided with the dial 18, transverse dial-shaft 19, carrying the dial 20 and gear 21, and the sector-shaft 23, mounted in bearings 22, carrying the sector 24, meshing with the gear and having the return-spring 28 and ratchet-plate 25, and the spring-pressed pawls 26, substantially as specified.

408,252. CAN-CAP-SOLDERING MACHINE. EDWIN NORTON, Maywood, assignor to himself, and Oliver W. Norton, Chicago, Ill. Filed Oct. 1, 1888. Serial No. 286,917. (No model.)

Claim.—1. The combination, with a pair of alternately vertically-movable can-holders, of a pair of alternately vertically-movable soldering-irons, substantially as specified.

2. The combination, with a pair of alternately vertically-movable can-holders, of a pair of alternately vertically-movable soldering-irons and a pair of cap-holder rods extending through said soldering-tools, substantially as specified.

3. The combination, with a pair of rotatable soldering-tools, of a pair of alternately vertically-reciprocating can-holders, substantially as specified.

4. The combination, with a pair of can-holders, of a pair of alternately vertically-reciprocating soldering-tools, substantially as specified.

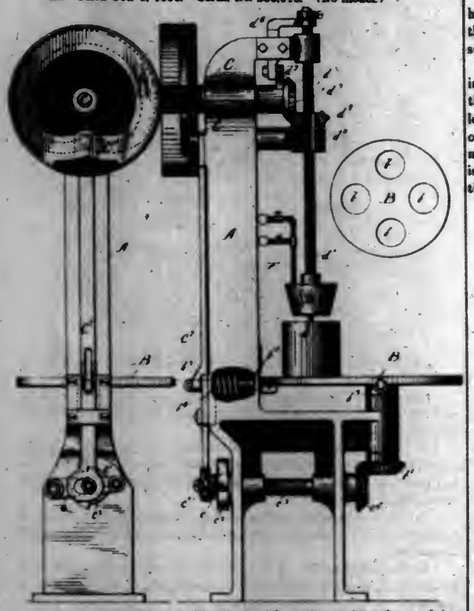
5. The combination, with a pair of can-holders, of a pair of alternately vertically-reciprocating soldering-tools and a pair of cap-holder rods extending down through the soldering-tools, substantially as specified.

6. The combination, with a pair of can-holders, of a pair of alternately vertically-reciprocating soldering-tools, a pair of cap-holder rods extending down through the soldering-tools, a pair of cooling-nozzles, and a pair of alternately-operated valves for opening and closing said cooling-nozzles, substantially as specified.

7. The combination, with a stationary heating-chamber and a stationary cooling device on the frame of the machine, of a reciprocating can-holder, a hollow reciprocating revolving soldering-tool adapted to move in and out of said heating-chamber and revolve within it, and a cap-holder rod extending through said heating-chamber and hollow soldering-tool, substantially as specified.

8. The combination of a stationary heating-chamber with a hollow reciprocating revolving soldering-tool adapted to move in and out of said heating-chamber and revolve within it, a reciprocating can-holder, and a cap-holder rod extending through said heating-chamber and said hollow soldering-tool, the movement of the can-holder serving to clamp the can-cap in place, substantially as specified.

9. The combination, with a pair of can-holders, of a pair of heating-chambers and a pair of rotatable alternately-reciprocating soldering-tools, substantially as specified.



10. The combination, with a pair of can-holders, of a pair of air-blowing cooling-nozzles and a pair of alternately-operated valves for opening and closing said nozzles, substantially as specified.

11. The combination, with a can-holder, of a cooling nozzle or pipe, a valve for opening and closing the same at intervals, a revolving reciprocating soldering-tool, means for automatically reciprocating and revolving said tool, and means for automatically operating said valve at intervals when the reciprocating soldering-tool is withdrawn from contact with the can, substantially as specified.

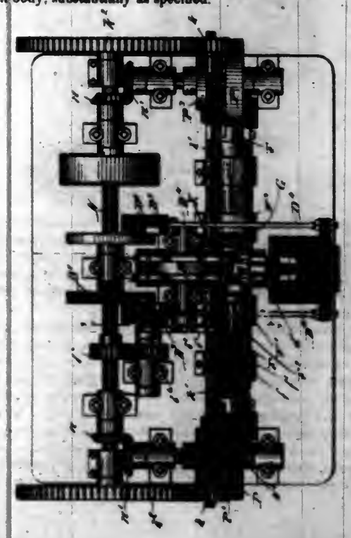
12. The combination, with a reciprocating can-holder, of a revolving reciprocating soldering-tool, a cooling-pipe, a valve for opening and closing said pipe, means for automatically reciprocating said can-holder, means for automatically revolving and reciprocating said soldering-tool, and means for automatically operating said valve at intervals when the soldering-tool is withdrawn from contact with the can, substantially as specified.

13. The combination, with a pair of soldering-tools, of a pair of alternately vertically-reciprocating can-holders, substantially as specified.

408,253. MACHINE FOR SOLDERING VENT-HOLES. EDWIN NORTON, Maywood, assignor to himself, and Oliver W. Norton, Chicago, Ill. Filed Oct. 1, 1888. Serial No. 286,918. (No model.)

Claim.—1. The combination, with an intermittently-revolving turret furnished with can-holders, of mechanism for intermittently revolving said turret, a revolving vertically-reciprocating soldering-tool provided with an annular cavity in its upper end to receive and confine the flame, the walls of said cavity being imperforate, so that the flame will not be projected through the soldering-tool, mechanism for reciprocating and revolving said tool, and a burner F, for projecting the flame into said annular cavity and heating said tool as it revolves, substantially as specified.

2. The combination, with a can-holder, of a soldering-tool having a revolvable sliding shaft d', gears d^3 d^4, shaft C, and cam d^5, said shaft d' having an arm or projection engaging said cam for revolving and reciprocating said soldering-tool, substantially as specified.



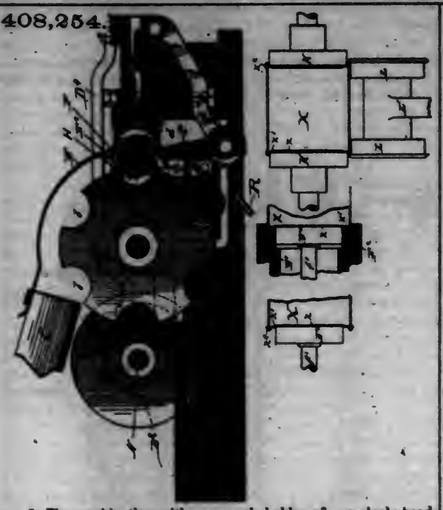
3. The combination, with shaft C, having cam C', of connecting-rod C^2, pawl-lever c, pawl c', ratchet c^3, shaft c^4, bevel-gear c^5, and can-holder turret B, having gear b' on its shaft meshing with said gear c^5, substantially as specified.

4. The combination, with shaft C, having cam C', of connecting-rod C^2, pawl-lever c, pawl c', ratchet c^3, shaft c^4, bevel-gear c^5, and can-holder turret B, having gear b' on its shaft meshing with said gear c^5, said turret having recesses b^3, a locking-bolt b^3, spring b^4, and a cam b^5 on said connecting-rod C^2, substantially as specified.

5. The combination, with shaft C, having cam C', of connecting-rod C^2, pawl-lever c, pawl c', ratchet c^3, shaft c^4, bevel-gear c^5, and can-holder turret B, having gear b' on its shaft meshing with said gear c^5, soldering-tool D, its sliding shaft d', gear d^3, gear d^4 on said shaft C, cam d^5, and arm d^6, secured to said shaft d', substantially as specified.

6. The combination, with shaft C, having cam C', of connecting-rod C^2, pawl-lever c, pawl c', ratchet c^3, shaft c^4, bevel-gear c^5, and can-holder turret B, having gear b' on its shaft meshing with said gear c^5, said turret having recesses b^3, a locking-bolt b^3, spring b^4, a cam b^5 on said connecting-rod C^2, soldering-tool D, its sliding shaft d', bevel-gear d^3, bevel-gear d^4 on said shaft C, cam d^5, and arm d^6, secured to said shaft d', substantially as specified.

408,254. CAN HEADING AND CRIMPING MACHINE. EDWIN NORTON, Maywood, assignor to himself, and Oliver W. Norton, Chicago, Ill. Filed Oct. 15, 1888. Serial No. 288,101. (No model.)



Claim.—1. The combination, with a can-body-holding device, of can-head-applying plungers, a pair of reciprocating can-revolving chucks and a pair of crimping rollers or devices, and a can-body carrier for conveying the can from said plungers to said crimping devices, substantially as specified.

2. The combination, with a can-body-heading mechanism, of a reciprocating revolving chuck and an opposing revolving chuck, a crimping roller or device, and a can-body carrier for conveying the can from said heading mechanism to said crimping device, substantially as specified.

3. The combination, with a can-body holder, of a reciprocating hollow heading-plunger, and a follower inside the same for holding the can-head upon the body as the heading-plunger is withdrawn, substantially as specified.

4. The combination, with a can-body holder, of a can-body-heading plunger and a reciprocating sleeve surrounding said plunger, and the rod H', passing through a hole in the bracket H^3, in which it fits loosely, the rod H' being provided with collars or shoulders A^3 A^4, one on each side of the bracket H^3, so that the rod H' will be given a more limited movement than the plunger F, to which said bracket H^3 is secured for bending or squeezing the flange of the can-head upon the can-body, substantially as specified.

408,254.

5. The combination, with a can-body holder, of a can-body-heading plunger and a reciprocating sleeve surrounding said plunger for bending or squeezing the flange of the can-head upon the can-body, said heading-plunger being hollow and provided with a follower inside the same for holding the can-head upon the can-body as the heading-plunger and its surrounding sleeve are withdrawn, substantially as specified.

6. The combination, with a can-body holder, of a can-body-heading plunger and a reciprocating sleeve surrounding said plunger for bending or squeezing the flange of the can-head upon the can-body, said heading-plunger being hollow and provided with a follower or holding-plunger inside the same for holding the can-head upon the can-body as the heading-plunger and its surrounding sleeve are withdrawn, and a spring for actuating said holding-plunger, substantially as specified.

7. The combination, with an intermittently-revolving can-body carrying turret B, of a can-holder slide D, a curved guard E, a can-head-applying plunger, a pair of revolving chucks for revolving the can, and a crimping-roller, substantially as specified.

8. The combination, with turret B, of can-holder slide D, heading-plunger F, its surrounding sleeve F^2, reciprocating revolving chucks K K, and crimping-rollers L L, substantially as specified.

9. The combination, with turret B, of can-holder slide D, heading-plunger F, its surrounding sleeve F^2 and its spring-actuated holding-plunger F', reciprocating revolving chucks K K, and crimping-rollers L L, substantially as specified.

10. The combination, with a can-body holder, of a can-head-supply chute, a can-head-applying plunger, and a can-head guide-ring having two opening and closing parts H H, substantially as specified.

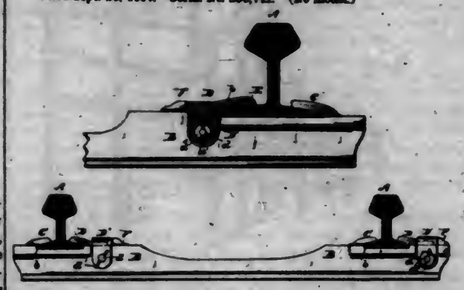
11. The combination, with a can-body holder, of a can-head-applying plunger, a reciprocating sleeve surrounding the same, and a guide-ring made in two opening and closing parts to permit said surrounding sleeve to advance, substantially as specified.

12. The combination, with a can-body holder, of plunger F, two-part opening and closing guide-ring H, mounted on a slide connected with said plunger, and reciprocating sleeve F^2, surrounding said plunger and provided with a pin or wedge for opening the parts of said ring H, substantially as specified.

13. The combination, with a can-body holder, of plunger F, two-part opening and closing guide-ring H, mounted on a slide connected with said plunger, reciprocating sleeve F^2, surrounding said plunger and provided with a pin or wedge for opening the parts of said ring, and a can-head-supply chute, substantially as specified.

14. The combination, with a can-body holder, of plunger F, two-part opening and closing guide-ring H, mounted on a slide connected with said plunger, reciprocating sleeve F^2, surrounding said plunger and provided with a pin or wedge for opening the parts of said ring, a can-head-supply chute, a can-body carrier, and a crimping device substantially as specified.

15. In a can heading and crimping machine, the combination with a can-body holder, of a heading-plunger, a reciprocating sleeve surrounding said plunger for bending or squeezing the flange of the can-head upon the can-body, a can-body carrier, and means for crimping the seam, substantially as specified.

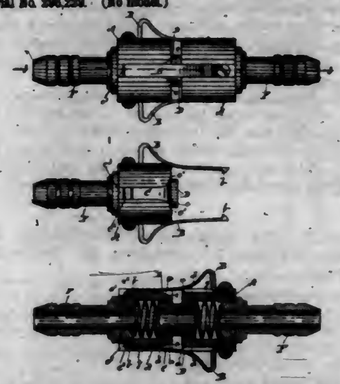


16. In a can heading and crimping machine, the combination, with means for bending or squeezing the flange of the can-head upon the can-body, and a can-body carrier, of a seam crimping or rolling device, substantially as specified.

17. In a can heading and crimping machine, the combination, with a can-body carrier, of a can-body holder, a heading-plunger, a flange-closing device, and a crimping-roller, substantially as specified.

18. The combination, with a can-carrier, of a can-body holder, a heading-plunger, a flange-closing sleeve surrounding the same, can-revolving chucks, and a crimping-roller, substantially as specified.

19. In a can heading and crimping machine, the combination, with a can-body carrier, of a can-body holder, a heading-plunger, a flange-closing device, a crimping-roller, and reciprocating revolving chucks for revolving the can during the crimping operation, substantially as specified.

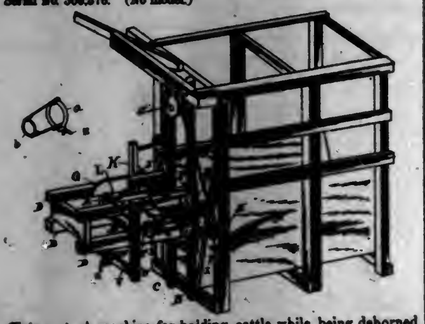


408,255. RAILROAD-TIE. CORYDON R. PALMER, Detroit, Mich. Filed Sept. 26, 1887. Serial No. 250,741. (No model.)

Claim.—1. The combination, with the tie having the longitudinal rib, of the removable lug and its retaining-strap secured thereto by a bolt, and a resisting knob or shoulder upon said rib adapted to prevent pivotal movement of the strap upon the bolt and hold the lug to its place, substantially as described.

2. The combination, with the rail and removable lugs for securing the same to the tie, of a metallic tie having the recess *b*, the recess *b'*, and the knob or shoulder F, the latter cast integral with the tie, substantially as described.

408,256. HOSE-COUPLING. CHARLES PARENT, Boston, assignor of one-half to Charles R. Sawyer, Braintree, Mass. Filed Jan. 14, 1888. Serial No. 296,229. (No model.)



Claim.—1. The combination of a shell A, open throughout its length, a spring-seated gasket inside the shell and projecting beyond its face, grooved longitudinal guideways formed in the rim of the shell and extending from the front face rearward, each groove having in the bottom a beveled notch c^2, and spring-latches B on the side of the shell between the grooves, adapted to be received in similar grooves and notches on another like shell, substantially as described.

2. A coupling consisting of two shells A, each having an open passage throughout its length, a spring-seated gasket inside the shell and projecting beyond its face, grooved longitudinal guideways formed in the rim of the shell and extending from the front face rearward, each groove having in the bottom a beveled notch c^2, and spring-latches B on the side of the shell between the grooves, adapted

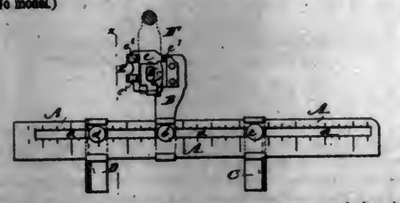
to enter the grooves and engage in the notches of the other shell, the two gaskets being thus compressed together and forming a tight joint, substantially as described.

3. A coupling consisting of two shells A, each having an open passage throughout its length, a spring seated gasket inside the shell and projecting beyond its face, and grooved longitudinal guideways formed in the rim of the shell and extending from the front face rearward, each groove having in the bottom a series of beveled notches, in combination with spring-latches B on the side of the shell between the grooves, adapted to enter the grooves and engage in the notches of the other shell, substantially as described.

408,257. DEVICE FOR HOLDING CATTLE WHILE BEING DEHORNED. ALBERT C. PATTEN, Brookville, Kans. Filed May 2, 1889. Serial No. 309,376. (No model.)

Claim.—1. A machine for holding cattle while being dehorned, consisting of a fixed support and a head-supporting frame hinged thereto and adapted to swing in a horizontal frame, substantially as set forth.

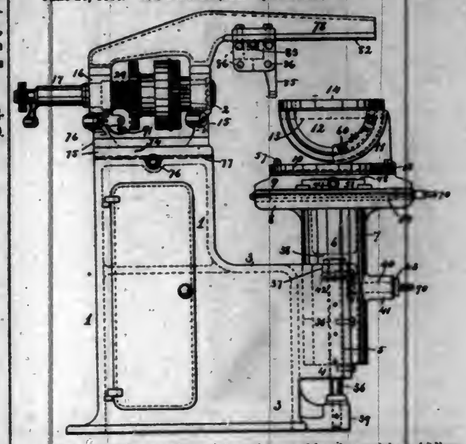
2. A machine for holding cattle while being dehorned, consisting, essentially, of a vertically-adjustable horizontally-swinging frame and the head-rest adjustably supported on said frame, as set forth.



3. The combination, with a fixed support, of a horizontally-swinging frame mounted thereon and having a laterally-projecting arm, and a bail arranged at one side of the swinging frame and adapted to engage said lateral arm, as set forth.

4. The combination, with a fixed support, of a horizontally-swinging frame mounted thereon, a head-rest mounted on the said swinging frame and adapted to slide longitudinally thereon, and the cheek-supports mounted on the said head-rest, as set forth.

5. The combination, with a fixed support, of a horizontally-swinging frame, an adjustable head-rest mounted thereon, a stationary cheek-support secured on the head-rest, a carrier mounted on the head-rest, a movable cheek-support secured to said carrier, and means for moving the carrier, as set forth.



6. The combination, with a fixed support, of a horizontally-swinging frame, a head-rest adjustably mounted on said swinging frame, hangers depending from the head-rest, a windlass mounted in said hangers and provided with a radial pin, and a securing-rope having a long loop at one end adapted to pass over the neck of the animal and engage the said radial pin and provided with a nose-band, as set forth.

408,258. TUCK-FOLDER FOR SEWING-MACHINES. LUCY J. PEARSALL, Fort Edward, N. Y. Filed Feb. 4, 1887. Serial No. 226,551. (No model.)

Claim.—In a tuck-folder for sewing-machines, a main bar A, made of a single flat plate and having a continuous longitudinal slot *a*, extending from end to end thereof, in combination with a plate or guide B, arranged at right angles to said main bar, and on which the main bar is adjustable longitudinally, means for clamping said main bar to the plate or guide at any desired longitudinal adjustment, a sheath at the inner end of the plate or guide for detachably connecting said plate and main bar to the presser-foot of a sewing-machine, and gages adjustably connected to the main bar on opposite sides of the plate or guide, substantially as described, for the purpose set forth.

408,259. BORING-MACHINE. ALBERT D. PRATT, Elizabeth, N. J., assignor of one-half to Abraham Vanderbeek, New York, N. Y. Filed June 20, 1888. Serial No. 277,621. (No model.)

Claim.—1. In a boring-engine, the combination, with a hollow spindle and a hollow sleeve movable longitudinally through the same, of an arm projected from the upper side of the spindle-bearing and a boring-bar guide adjustable thereon, as and for the purpose set forth.

2. In a boring-engine, the combination, with a hollow spindle and a hollow sleeve movable longitudinally through the same, of an arm projected from the upper side of the spindle-bearing, a carriage movable on such arm, and a boring-bar guide detachably held on such carriage, as and for the purpose set forth.

3. In a boring-engine, the combination, with a hollow spindle and a hollow sleeve movable longitudinally through the same, of a head to sustain such hollow spindle and a hollow arm bolted upon such head and projected above the line of the boring-bar, a carriage movable on such arm, and a boring-bar guide detachably held on such carriage, as and for the purpose set forth.

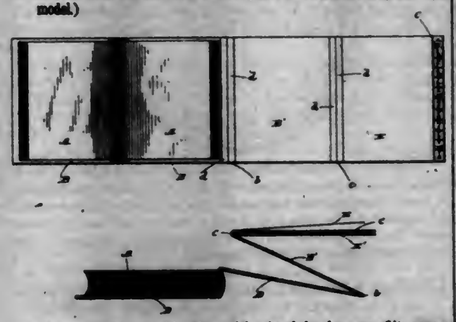
4. In a boring-engine, the combination, with a hollow spindle and a hollow sleeve movable longitudinally through the same, of an arm projected from the upper side of the spindle-bearing, a carriage movable on such arm, and a boring-bar guide held reversibly on such carriage, as and for the purpose set forth.

5. In a boring-engine, the combination, with a hollow spindle and a sleeve movable longitudinally in the hollow spindle and provided with an annular groove open at one side, of a socket projected from the spindle-bearing, a nut movable longitudinally in such socket and provided with a collar fitted to such annular groove, and a screw rotated to feed the nut and sleeve through the spindle, substantially as herein set forth.

6. In a boring-engine, the combination, with a hollow spindle and a sleeve movable longitudinally in the hollow spindle and provided with an annular groove open at one side, of a socket projected from the spindle-bearing, a nut movable longitudinally in such socket and provided with a collar fitted to such annular groove, a screw journaled in such socket, and an inclined shaft extended from the bearing of the screw-journal to the front of the head and connected by suitable gearing with the screw and with the spindle, as and for the purpose set forth.

7. In a boring-engine, the combination, with the rotary work-table, of the carrier provided with vertical cheeks fitted to segmental guides, the carrier being adjustable in the guides about a horizontal axis, and the table rotary in various inclined planes, as and for the purpose set forth.

8. In a boring-engine, the combination, with the rotary work-table, of a carrier adjustable about a horizontal axis and the carrier-clamps mounted upon a rotary plate to turn the inclined plane of the work-table in every direction, as and for the purpose set forth.



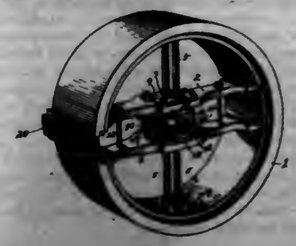
9. In a boring-engine, the combination, with the rotary work-table, of a carrier adjustable about a horizontal axis, carrier-clamps mounted upon a rotary plate to turn the inclined plane of the work-table in every direction, the block 9 and bed 8, provided with the seats 48 and 45 at right angles, as described, and the cruciform slide 51 and 52, fitted to such seats and held adjustably therein, as and for the purpose set forth.

10. In a boring-engine, the combination, with the rotary work-table, of a carrier adjustable about a horizontal axis, carrier-clamps mounted upon a rotary plate to turn the inclined plane of the work-table in every direction, the block 9 and bed 8, provided with the seats 48 and 45 at right angles, as described, the cruciform slide 51 and 52, fitted to such seats and held adjustably therein, the frame 1, carrying the spindle-head and spindle 2, the vertical grooves 5 in the frame, and the column 7, having tongues 6, fitted to such grooves, and having the bed 8 affixed to its upper end, as and for the purpose set forth.

11. In a boring-engine, the combination, with the rotary work-table, of a carrier adjustable about a horizontal axis, carrier-clamps mounted upon a rotary plate to turn the inclined plane of the work-table in every direction, the block 9 and bed 8, provided with the seats 48 and 45 at right angles, as described, the cruciform slide 51 and 52, fitted to such seats and held adjustably therein, the frame 1, carrying the spindle-head and spindle 2, the vertical grooves 5 in the frame, the column 7, having tongues 6 fitted to such grooves and having the bed 8 affixed to its upper end, screws 54, for adjusting the cruciform slide in the block and bed, a stationary screw 36, supported in the column, a rotary nut 37, fitted to the screw and to a bearing 38 upon the column, a hand-shaft 40 and gears 42, retaining such nut, and annular micrometer-scales fitted to the said shaft and to the screws of the cruciform slide, as and for the purpose set forth.

12. In a boring-engine, the combination, with a hollow spindle and a hollow sleeve movable longitudinally through the same, of an arm projected from the upper side of the spindle-bearing, a carriage and boring-bar guide movable upon such arm, a rotary work-table and a carrier for the same adjustable about a horizontal axis, as and for the purpose set forth.

408,260. COMBINED BOOK AND INDEX. HENRY E. PRATT, Lambertville, N. J. Filed Feb. 23, 1889. Serial No. 301,462. (No model.)



Claim.—1. The combination, with a book having one of its covers extended to form a folding extension, of an index hinged at its back to the free edge of the extension, substantially as set forth.

2. The combination, with a book having its cover extended beyond the edge of the book, of an index having its back hinged to the free edge of the cover-extension and provided with a cover of less width than the said cover-extension, substantially as set forth.

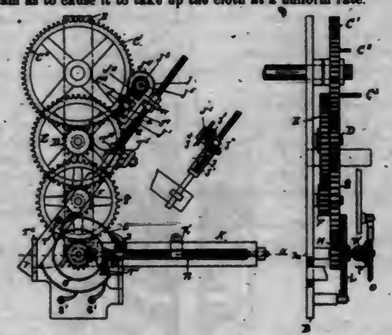
3. In combination, a book, an index provided with a back and front cover, the front cover being narrower than the back cover to expose a column of initial-letters, and a projecting portion of the book-cover connecting the index with the book and forming flexible joints at the front edge of the book and at the back edge of the index, whereby the index may be folded within the cover of the book with its column of initial-letters at all times exposed, substantially as set forth.

408,261. PULLEY. ALBION E. PRESTON, Battle Creek, Mich. Filed May 7, 1889. Serial No. 309,910. (No model.)

Claim.—1. In a pulley, the combination of a rim, the parallel adjustable arms or bars, the spokes intermediate of the arms and rim, and a sectional hub arranged between said arms and adjustable thereon in a line at right angles to the adjustment afforded by the arms and spokes, substantially as and for the purpose described.

2. In a pulley, the combination of a rim, the arms or bars extending across the rim near its center and connected at their ends thereto in such a manner that they can move a limited distance on the same, the adjustable spokes intermediate of the rim and arms, and the sectional hub adjustably connected to the arms and arranged between the same, substantially as and for the purpose described.

3. In a pulley, the combination of a rim, the adjustable arms or bars arranged across the rim, the bolts connecting said bars, the radial spokes intermediate of the rim and the arms, and a sectional hub arranged between the arms or bars substantially in line with the radial spokes and adjustable on said arms longitudinally thereof, substantially as and for the purpose described.



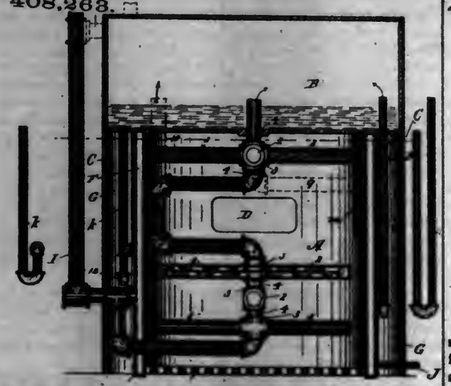
4. In a pulley, the combination, with the arms or bars, of the stationary supporting-plates, the divided hub having one of its members fitted in each of said plates, and the adjusting-screws working in the plates and adapted to bear upon the member of the hub fitted therein, substantially as and for the purpose described.

5. In a pulley, the combination of a rim, the parallel arms or bars, the plates secured to the rim at diametrically-opposite points thereof and having the threaded bosses, the plates arranged on the outer faces of the arms and each having a threaded boss, the radial threaded spokes tapped in the bosses of said plates on the rim and arms, the bolts passing through the arms and plates thereon, and a hub supported between said arms or bars, substantially as and for the purpose described.

6. In a pulley, the combination of a rim, the adjustable arms or bars, the radial spokes intermediate of the arms and rim, the bolts connecting the arms to each other, the stationary plates secured to the arms between the opposing faces thereof, the sectional hub having its members provided with flanges, which are fitted in said plates, and regulating-screws fitted in the supporting-plates and adapted to bind on the flanges of the hub-sections, all arranged and combined for service substantially as herein shown and described.

408,262. TAKE-UP MECHANISM FOR LOOMS. RUDOLF RIECHENBACHER, Paterson, N. J. Filed June 1, 1888. Serial No. 275,701. (No model.)

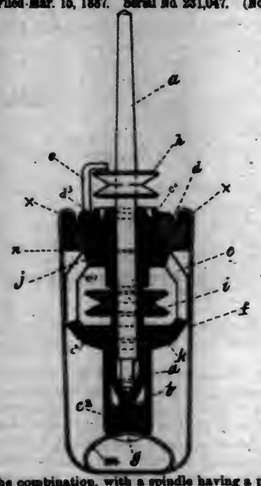
Brief.—The object of the invention is to so actuate the cloth-beam as to cause it to take up the cloth at a uniform rate.



Claim.—The combination, with the cloth-beam and the gear C thereon, ratchet L, the gearing intermediate said ratchet and the gear C', the lever N, a pawl or pawls thereon, and means for vibrating said lever, of screw R, nut R', to which said vibrating means are connected, the bevel-gear on said screw, the bevel-gear P, the ratchet O, to which gear P is connected, the bar T, pawls carried thereby and engaging said ratchet O, the frame B, the spring Z, the bracket carried by said bar T, the screw-threaded rod mounted in said bracket, the bevel-gears J^2 J^3, the ratchet J^4, the pins C^2 C^3, and the nut J^5, carrying pin J, all arranged and operating substantially as described.

408,263. HEATING APPARATUS. CHARLES A. SEWIS, Waltham, Mass., assignor of one-half to Herschel A. Bacon, same place. Filed Feb. 26, 1889. Serial No. 301,194. (No model.)

Claim.—1. In a steam-generating or hot-water circulating apparatus, the combination of the fire-box or furnace, a hot-water or steam receptacle adjoining the same, a conduit or receptacle for return-water, a series of substantially horizontal pipes of small diameter internally subdivided into lower and upper flues or passages by horizontal diaphragms, a series of vertical pipe sections or couplings, also

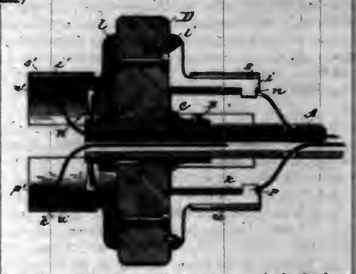


408,263.

of small diameter, connecting the horizontal pipes, the said horizontal pipes and the connections between them being located in the fire-box and constituting a conduit for the passage of small streams of water through the fire-box, and pipes connecting the lower and upper ends of said conduit, respectively, with the return-water conduit or receptacle and the hot-water or steam receptacle, as set forth.

2. In a steam or hot-water heating apparatus, the combination, with the fire-box or furnace and the steam or water circulating system, including a return-pipe I, and a receptacle B, located over the fire-box, of a water-conduit extending from said return-pipe to the receptacle B through the fire-box, said conduit consisting of a series of horizontal pipes 2, internally subdivided by horizontal partitions or diaphragms 5, and coupling or connecting pipe-sections adjustably connecting said pipes 2 with each other and with the said return-pipe and receptacle, whereby the pipes 2 may be adjusted or set at various angles, as set forth.

408,264. SUPPORT FOR SPINNING-SPINDLES. FRANCIS SEYMOUR, Paterson, N. J., assignor of one-half to John J. Heywood, Fall River, Mass. Filed Mar. 15, 1887. Serial No. 231,047. (No model.)

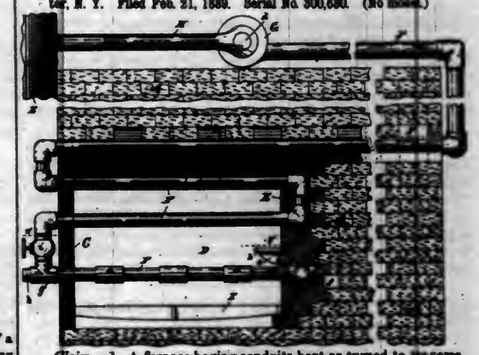


Claim.—1. The combination, with a spindle having a pintle, of a revoluble bearing provided with a step for receiving and supporting the pintle of the spindle, a support for said revoluble bearing, and a spring for suspending said support from a rail or holder, substantially as herein shown and described.

2. The combination, with a rail or holder, of a frame under said rail, a foot-piece below said frame and supporting the same, and a spring supporting the foot-piece, said spring being held on the rail or holder, substantially as herein shown and described.

3. The combination, with a rail or holder, of a frame-piece below it, a foot-piece supporting the frame, a spring supporting the foot-piece and held on the rail, a revoluble bearing in the frame and foot-piece, and a spindle having a pintle which rests upon a step in the revoluble bearing, substantially as herein shown and described.

408,265. COMMUTATOR FOR ELECTRIC MACHINES. SIDNEY H. SHORT, Columbus, Ohio. Filed Oct. 9, 1888. Serial No. 287,613. (No model.)



Claim.—In combination, with an armature-shaft of a dynamo or motor, an insulating-disk D, angular segments *h i j k*, secured to each face alternating in position, each segment having a horizontal extension and a depending lug for attachment to the wires, and wearing-segments secured to the horizontal extensions, substantially as described.

408,266. CAR-WHEEL. WHEELER B. SMITH, Little Rock, Ark. Filed Apr. 20, 1889. Serial No. 307,990. (No model.)

Claim.—The combination, with a rim of a wheel having shoulders on its inner periphery, some of which are grooved transversely, of a web provided with lugs grooved on their periphery to receive the shoulders on the rim, and slotted transversely, and retaining-means passed through said slots and into the grooves in the shoulders on the rim, substantially as shown and described.

408,267. STEAM-BOILER FURNACE. ANTHONY SHELL, Rochester, N. Y. Filed Feb. 21, 1889. Serial No. 300,680. (No model.)

Claim.—1. A furnace having conduits bent or turned to traverse its side walls in parallel sections backward and forward between the front thereof and the bridge-wall, the last or lowest section at each side being turned into the bridge-wall and joined, the said lowest section being provided with jet-tubes turned within the furnace, the forward couplings of the sections reaching beyond the front of the furnace and provided with gates to open or close the passages to said lowest sections, substantially as shown.

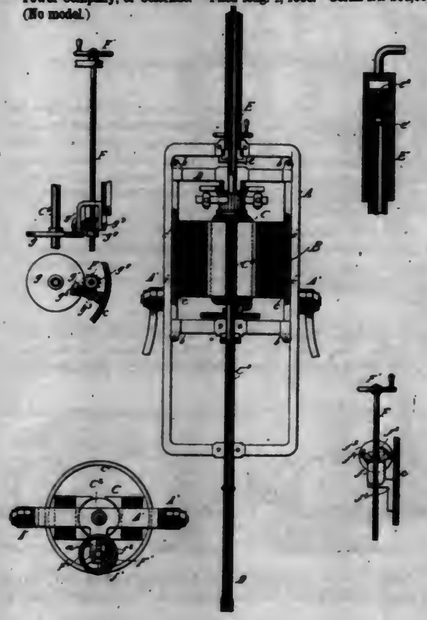
2. A furnace having conduits at its sides and extending through the bridge-wall to complete the communication between the sides, in combination with recesses *k k* in the outer faces of the respective side walls, the said conduits being formed with openings in front and in said recesses, for the purpose specified.

3. A furnace for a steam-boiler having smoke or air conduits at its sides, and jet-tubes joined to the conduits and turned toward the interior of the furnace, in combination with scattering-plates for the air or smoke issuing from said jet-tubes, and means for driving the air or smoke through the conduits, substantially as described.

4. A furnace for a steam-boiler having smoke or air conduits at its sides, and jet-tubes joined to said conduits, in combination with scattering-surfaces for the smoke or air issuing from said jet-tubes, and a fan for driving the smoke or air through said conduits, said jet-tubes being directed toward the interior of the furnace and in an upward direction, substantially as and for the purpose specified.

408,268. EYEGLASS-HOLDER. SIMON R. STEIGER, Marietta, Pa. Filed Apr. 17, 1889. Serial No. 307,621. (No model.)

Claim.—1. An eyeglass-holder having a construction for holding the glass, and having also a mouth-piece, substantially as described.



2. An eyeglass-holder adapted to be held in the mouth and provided with an elastic spring-joint, substantially as specified.

3. The combination, with an eyeglass, of a holder having an elastic spring-joint and a mouth-piece or tooth-plate, substantially as specified.

4. As an improved article of manufacture, an eyeglass-holder formed of wire having one end bent into an annular form, with a hook for holding the glass, the other end bent to hold a mouth piece or plate and between its ends formed into a spiral spring, substantially as described.

5. An eyeglass-holder formed of a single piece of metal and comprising a lateral portion provided with a mouth-piece, a substantially vertical portion having provisions for holding the glass, and an elastic spring-joint at the junction of the lateral and vertical portions, substantially as described.

408,269. ELECTRIC DRILL. ISLE E. STOREY, Boulder, assignor, by direct and mesne assignments, to the Storey Electric Drill and Power Company, of Colorado. Filed Aug. 1, 1888. Serial No. 281,609. (No model.)

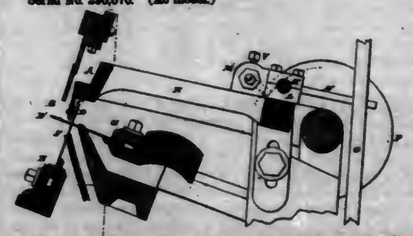
Claim.—1. In an electric drill, a main frame provided with tracks or ways and having an upwardly-extending water-reservoir, a supplemental frame mounted within the main frame and adapted to slide back and forth the full length of the main frame, an electric motor and its main shaft mounted in said supplemental frame, the said shaft of the motor being hollow and extending through both ends of the main and supplemental frames and entering the water-chamber, and a drill-tool attached to the end of the shaft opposite the water-chamber, substantially as described.

2. A main frame provided with a water-chamber, in combination with a supplemental frame adapted to slide within said main frame, and an electromotor mounted within said supplemental frame, the main shaft of the motor being hollow and extending beyond said supplemental frame and entering the water-chamber in said main frame.

3. The combination, with a sliding frame carrying the rotating tool, of a pair of friction-disks and suitable worm-gearing geared to the rotary shaft and to the sliding frame in such a manner that the rotation of such shaft will cause the sliding movement of said frame, as set forth.

408,270. SINKER-SUPPORTING DEVICE FOR STRAIGHT-KNITTING MACHINES. ELI TIFFANY, Bennington, Vt. Filed Feb. 1, 1887. Serial No. 226,143. (No model.)

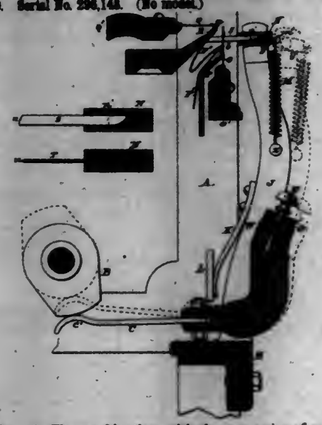
Brief.—The invention relates to provisions connected with the sinker-bar of a straight-knitting machine for more effectually holding, guiding, and supporting the sinkers of such machines in the various positions they assume while in operation.



Claim.—1. The combination, with sinkers A, of the springs R and bar D, having the vertical grooves *p q*, substantially as described, and for the purposes specified.

2. A back guiding and supporting grooved bar for sinkers in straight-knitting machines attached to the main sinker-bar, in combination with a series of sinkers and supporting-springs arranged above said sinker-bar and adapted to sustain the sinkers in position when elevated, substantially as described, and for the purposes specified.

3. The combination, with a series of sinkers in a straight-knitting machine, of a horizontal grooved sinker-bar, a series of springs arranged above said bar adapted to impinge against and support the sinkers when elevated, and a back support for the lower ends of said sinkers grooved for their reception and attached to the under side of said sinker-bar and detachable therefrom, substantially in the manner described, and for the purpose specified.



408,271. STRAIGHT-KNITTING MACHINE FOR MAKING FIGURED KNIT GOODS. ELI TIFFANY, Bennington, Vt. Filed Nov. 6, 1883. Serial No. 290,070. (No model.)

Claim.—1. The bar C, provided with slots *d d*, in combination with a presser-bar and two sets of knitting-needles, arranged to operate substantially in the manner described, and for the purposes set forth.

2. The combination, in a straight-rib-knitting machine, of two sets of needles arranged to co-operate transversely, a presser-bar for pressing the barbs of both sets of needles, provided with a series of notches upon that part of its pressing-edge which in action bears against the upper set of needles, and a pattern mechanism, substantially as shown, for imparting to the bar containing said notches a predetermined intermittent reciprocatory movement, substantially in the manner described, and for the purpose set forth.

408,272. WELT OR HEM FORMING DEVICE FOR STRAIGHT-KNITTING MACHINES. ELI TIFFANY, Bennington, Vt. Filed Jan. 12, 1889. Serial No. 296,148. (No model.)

Claim.—1. The combination, with the two series of needles of a flat-rib-knitting machine, of a longitudinal finger-bar provided with a series of fingers which alternate with the needles of one of the said series, a back-stop in proximity to the other series of needles, and means for vibrating the said finger-bar and carrying the ends of the said fingers against the back-stop, substantially as described, and for the purposes set forth.

2. The combination, with the front and rear needles of a flat-rib-knitting machine, of an inclined back-stop in proximity to the rear set of needles, a series of fingers alternating with the front needles, a finger-bar carrying said fingers, bearings for said bar, in which it is permitted to have a movement about its own longitudinal axis, and means for oscillating said bearings, substantially as described, and for the purposes set forth.

3. The combination, with the vertical and horizontal needles of a flat-rib-knitting machine, of a back-stop beneath the horizontal needles, a series of fingers or blades arranged in a horizontal plane, a finger-bar to which said fingers or blades are secured, pivoted supports in bearings on which said bar is mounted, with capacity for movement about its longitudinal axis, and means for vibrating said supports, substantially as described, and for the purposes set forth.

4. The combination of rock-shaft D, elbow-coupling F C W, and spring-actuated bolt H, and arms J J, carrying the finger-bar N and fingers S, with the inclined back-stop R, substantially as described, and for the purposes set forth.

408,273. VALVED PIPE-COUPLING. HARRY TRASK, Brooklyn, and WILLIAM H. CARMICHAEL, New York, N. Y. Original application filed June 11, 1888, Serial No. 276,669. Divided and this application filed Nov. 21, 1888. Serial No. 291,438. (No model.)

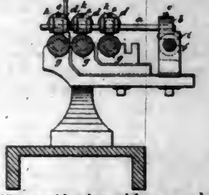
Claim.—1. In a valved pipe-coupling, in combination with the two portions of the piping to be coupled, a pipe-strap *t*, secured to one of said portions, a valve K, secured to the same portion, a hooked lever hinged to said pipe-strap and connected to the stem of said valve K, a coupling-piece secured to the second of said pipe portions to be coupled and having a projecting lug provided with a slot, into which the said hooked lever enters to complete the connection, and the male and female portions A^3 and A^3, forming the joint of the connection, substantially as and for the purposes set forth.

2. In a valved pipe-coupling, in combination with the two portions of piping to be coupled, a pipe-strap *t*, secured to one of said portions, a valve K, secured to the same portion, a hooked lever hinged to said pipe-strap and connected to the stem of said valve K, a coupling-piece secured to the second of said pipe portions to be coupled and having a projecting lug provided with an inclined slot, into which the said hooked lever enters and up the incline of which it moves to open the valve and complete the connection, and the male and female portions A^3 and A^3, forming the joint of the connection, substantially as and for the purposes set forth.

408,274. STEM WINDING AND SETTING WATCH. ALBERT THELLER, Rockford, Ill., assignor to the Rockford Watch Company, same place. Filed Mar. 30, 1889. Serial No. 305,435. (No model.)

Claim.—1. In a stem winding and setting watch, a lever *a* acting at right angles to and adapted to be acted on by a stem-key, in combination with a pin *f* on the yoke F, which pin *f* passes through a slot or hole in the plate B, and is arranged to be acted on by the shifting-lever, substantially as and for the purpose specified.

2. In a stem winding and setting watch, a stem-key having a beveled point, in combination with shifting-lever *a*, with one edge of which the stem-key engages, a spring *s*, and a pin *f*, connected with the yoke F, which pin passes through the plate B, and is arranged to be acted on by the shifting-lever *a*, substantially as and for the purpose specified.

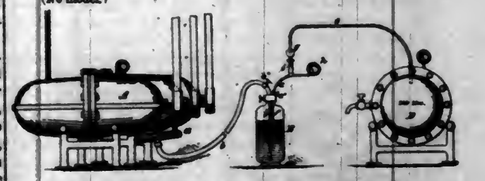


3. In a stem winding and setting watch, the combination of a switch-arbor *h* with the shifting-lever *a*, for the purpose of holding the lever *a* out of action when desired, whereby the same movement is adapted to be used either in a pendant-set case or in an exclusively lever-set case, substantially as specified.

4. In a stem winding and setting watch, a switch-arbor *h*, provided with a pin *i*, in combination with a shifting-lever *a*, provided with a groove *d*, substantially as and for the purpose specified.

5. In a stem winding and setting watch, a shifting-lever *a*, in combination with a switch-arbor *h*, constructed and arranged as described, whereby such switch-arbor can be operated from the outside of the plate B, substantially as specified.

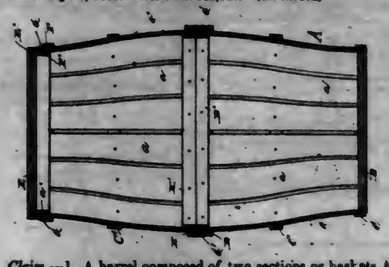
408,275. SUPPORT FOR THE ROLLERS OF SPINNING-FRAMES. EDMUND TWEEDALE, Accrington, County of Lancaster, England. Filed Apr. 17, 1889. Serial No. 307,596. (No model.)



Brief.—The object of the invention is to secure and preserve a correct alignment of the drawing-rollers.

Claim.—1. The combination, with an angular-faced finger and bearing-blocks having holes with angular-bearing sides therein, means for securing the same to said finger, the grooved shaft, the bracket having a hole adapted to receive the angular finger, means for securing the finger in the bracket, and means for securing the bracket to the shaft, consisting of the pin fitting in the groove of the shaft, substantially as described.

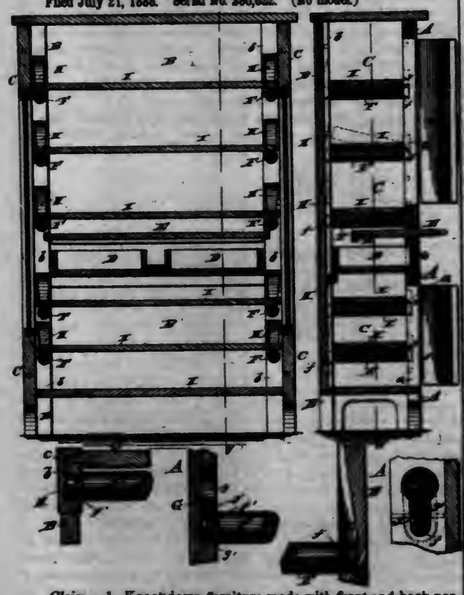
2. In combination, the bearing-blocks, the finger for supporting the same, the bracket for holding the finger, a shaft for supporting the bracket, said shaft being grooved transversely, and the pin inserted in the groove and between the bearing-block and shaft, substantially as described.



408,276. APPARATUS FOR CHARGING SODA-WATER FOUNTAINS. FRANCIS S. WALDO, New York, N. Y., assignor to The Firm of John Matthews, same place. Filed May 28, 1888. Serial No. 275,375. (No model.)

Claim.—1. The fountain B, having a separate liquid-inlet extending nearly to the bottom of the fountain, serving also as a final discharge-pipe, and a gas-nipple *f*, extending to the level of the water in the fountain when filled, both carried as fixtures by the walls of the fountain, combined with the pipe *c*, having float-valve *g*, substantially as described.

2. The fountain B, carrying as fixtures the liquid-inlet pipe b^3 and the gas-nipple *f*, the liquid-inlet pipe extending nearly to the bottom of the fountain, to serve also as a final discharge-pipe, and the gas-nipple extending to the level of the liquid in the fountain when filled, as specified.



408,277. BARREL. JACOB W. WHEATLEY, Pocomoke City, Md. Filed May 20, 1889. Serial No. 312,027. (No model.)

Claim.—1. A barrel composed of two sections or baskets A and A', the section A having its staves secured between the hoops D and D', the hoops D' projecting beyond the ends of the staves, and the section A' provided with the hoops H and H', the hoop H' being arranged a short distance within the ends of the staves, whereby, when the sections are brought together, the hoop D' will lap over the joint at the inside of the barrel, and the metal plates securing the sections together, substantially as described.

2. A barrel composed of the section or basket A, having a stationary bottom and provided with the hoops D and D', the latter projecting beyond the staves and the former being arranged flush with their upper ends, and the section or basket A', having a removable bottom forming the upper head or cover of the barrel, and provided with the hoops H and H', the former being flush with the upper ends of the staves and the latter being arranged a short distance within their ends, said sections being secured together by the metal plates G', substantially as described.

408,278. KNOCKDOWN FURNITURE. ARTHUR WHITE, Sheboygan, Wis., assignor of one-half to Charles Van Nostrand, same place. Filed July 21, 1888. Serial No. 280,622. (No model.)

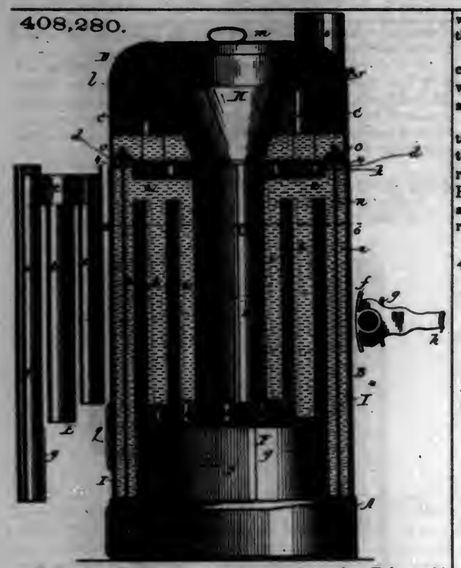
Claim.—1. Knockdown furniture made with front and back portions provided with dovetail-shaped recesses, combined with round cross-bars having round dovetail-shaped end tenons adapted to said recesses, substantially as herein set forth.

2. In knockdown furniture, the combination, with a front A and back D, of opposing recesses G H in said parts, said recesses G having a contracted dovetail-shaped lower portion *g'*, and the inclined recesses H, having a contracted and dovetail shape at the lower portion, and cross-bars F, having dovetail end tenons *f* fitting said recesses, substantially as herein set forth.

408,279. ZINC ELECTRODE FOR GALVANIC BATTERIES. JAMES R. WILLIAMS, Oakland, Cal. Filed Dec. 12, 1885. Serial No. 185,534. (No model.)

Claim.—1. A zinc for galvanic batteries, provided with a cavity to contain mercury entirely within the zinc and having a canal extending obliquely in an upward direction from near the bottom of the cavity to a point on the surface of the zinc which is below the level of the battery-fluid, and a canal extending in an upward direction from the upper portion of the cavity to a point on the upper surface of the zinc which is outside the battery-fluid, substantially as specified, and for the purpose set forth.

2. A body composed of zinc which can be securely fastened to a battery-zinc, said body being provided with a cavity to contain mercury entirely within the lower portion of the body and having a canal extending obliquely in an upward direction from near the bottom of the cavity to a point on the surface of the body a short distance above the bottom of the cavity, and a canal extending in an upward direction from the upper portion of the cavity to a point on the upper portion of the surface of the zinc, and when the body is joined to the zinc the opening of the lower canal to be below the level of the battery-fluid and the opening of the upper canal to be above the level of the battery-fluid, substantially as specified, and for the purpose set forth.

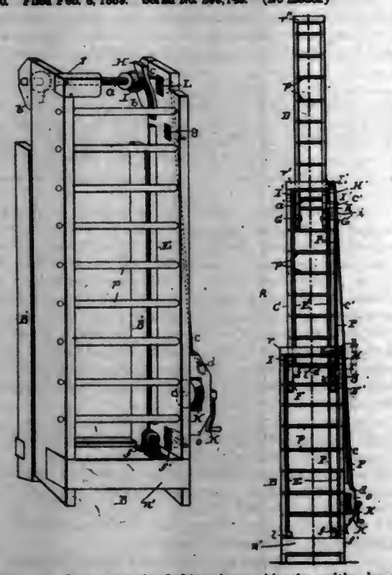


3. The combination of a battery-zinc and a body composed of zinc, said body being provided with a cavity to contain mercury entirely within the lower portion of the body and having a canal extending obliquely in an upward direction from near the bottom of the cavity to a point on the surface of the body a short distance above the bottom of the cavity, and a canal extending in an upward direction from the upper portion of the cavity to a point on the upper portion of the surface of the zinc, and when the body is joined to the zinc the opening of the lower canal to be below the level of the battery-fluid and the opening of the upper canal to be above the level of the battery-fluid, substantially as specified, and for the purpose set forth.

408,280. STEAM-BOILER. GEORGE P. WILSON, Monroe, Wis. Filed Apr. 17, 1889. Serial No. 307,632. (No model.)

Claim.—1. In a steam-boiler, a series of water-tube sections, each consisting of three tubes *a b c*, communicating with each other, each tube *a* being provided with the parts *f* and *g*, the parts *f* forming an outer wall and the parts *g* forming the wall of the fire-chamber, substantially as and for the purposes specified.

2. In a steam-boiler, a series of water-tube sections, each consisting of three tubes communicating with each other, and each section being provided with the parts *f g h*, substantially as and for the purposes specified.

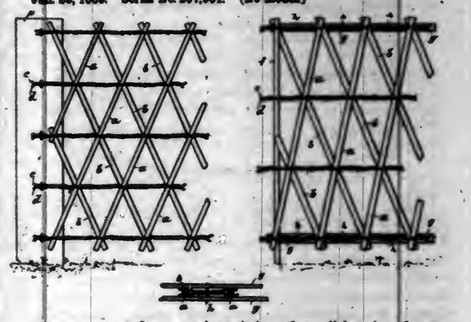


408,280.

3. In a steam-boiler, a series of water-tube sections E, in combination with a water-chamber C above, and combined with the tube-sections E, a smoke-passage *k* between the sections E and water-chamber C, a smoke-chamber above the water-chamber, and flues *j*, communicating at their lower ends with the smoke-passage *k* and at their upper ends with the smoke-chamber above the water-chamber C, substantially as and for the purposes specified.

4. In a steam-boiler, a series of water-tube sections E, each provided with an inside piece *h*, which parts *h* form the wall of the lower part of the fuel-magazine, in combination with a fire-chamber F, water-chamber C, smoke-passage *k*, a smoke-chamber above the water-chamber C, flues *j*, which pass through the smoke-chamber C, and a fuel-magazine G H, substantially as and for the purposes specified.

408,281. EXTENSION-LADDER. GEORGE L. WRIGHT, Kansas City, Mo. Filed Feb. 8, 1889. Serial No. 299,142. (No model.)

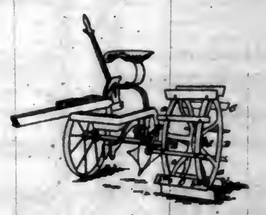


Claim.—1. In an extension-ladder, the combination, with a lower section carrying a track upon its inner sides, the cross-piece *r*, and flanged rollers I at its top portion, of a narrower upper section sliding within the lower section and provided with rollers adapted to run on the track, substantially as shown and described.

2. In an extension-ladder, the combination, with the sections constructed as shown, of the sheaves *f f' g h h' i*, the rope P, and windlass K, all arranged and adapted to operate substantially as shown and described.

3. An extension-ladder consisting of two or more folding sections, the lower sections provided with tracks E E' and guides *r r'* I I', the supporting-arms H H', the upper sections being provided with rollers F F' G G', adapted to run upon the tracks E E', and recesses H'' H''', to receive the supporting-arms H H', the sheaves *f f' h h' i*, arranged as shown, the windlass K, rope P, and cords *c* and *c'*, all arranged and adapted to operate substantially as shown and described.

408,282. WIRE FENCE. DAVID H. ALLEN, Miamisburg, Ohio. Filed Jan. 29, 1889. Serial No. 297,901. (No model.)

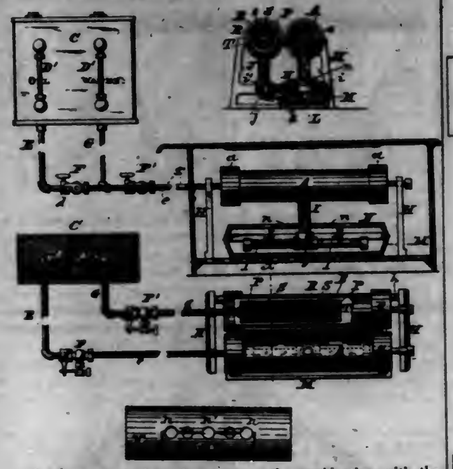


Claim.—1. A fence-panel consisting of parallel series of pales crossing each other at points intermediate their lengths and secured at their junctions by parallel wires twisted together intermediate adjacent junctions, substantially in the manner specified.

2. A fence composed of two parallel series of pales crossing each other at various points and two or more continuous series of parallel wires, those of each series being twisted together intermediate the junctions for binding said bales together at their junctions, substantially in the manner specified.

3. In a wire fence, the combination, with two parallel series of pales crossing each other at various intervals in their lengths, of two continuous wires twisted from a point intermediate two adjacent junctions in opposite directions or toward each junction, substantially in the manner specified.

4. A fence-panel composed of two parallel series of pales crossing each other at various points, and two or more continuous series of parallel wires binding said pales together at their junctions, in combination with the end and horizontal pales or slats secured thereto in the manner substantially as and for the purpose described.

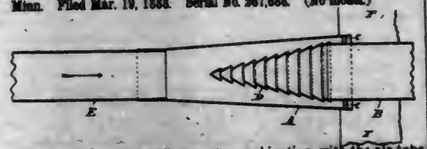


408,283. STALK-CUTTER WHEEL FOR SULKY-PLOWS. BION A. BAKER, Greeley, Iowa. Filed Dec. 18, 1888. Serial No. 294,009. (No model.)

Claim.—1. The combination, with a plow, substantially as described, of a stalk-cutter composed of a wheel having a central hub adapted for mounting on the axle of the plow-sulky, and having a felly with a continuous tread and lugs for the attachment of stalk-cutter knives, and a series of radial knives secured transversely thereto of a length corresponding to practically the width of a furrow, whereby it is adapted to serve as a carrying-wheel for the landward side of the plow and as a stalk-cutter, substantially as set forth.

2. The herein-described stalk-cutter, adapted to be mounted on the axle of a sulky-plow, and consisting of a double-flilled wheel with a single hub, the felly provided with lugs for the attachment of stalk-cutter knives, and knives secured to said lugs, substantially as and for the purpose set forth.

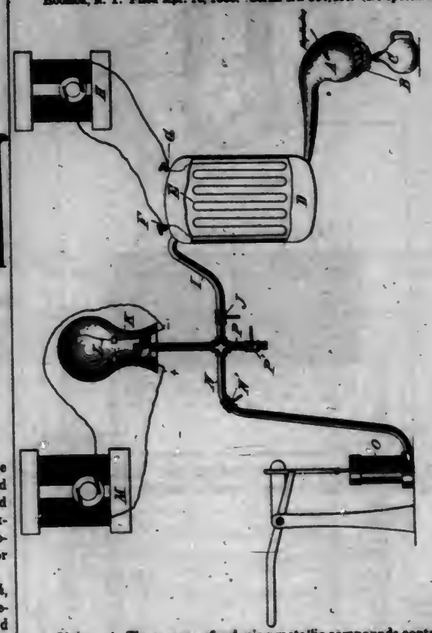
408,284. HYDROCARBON-BURNER. STEPHEN BARNETT, Buffalo, N. Y. Filed Oct. 29, 1888. Serial No. 289,369. (No model.)



Claim.—1. In hydrocarbon-burners, the combination, with the standard H, of the two cylindrical generators A B, having caps and pipes to support them in bearings in said standards, the steam and vapor pipes leading to and from said generators, and the steam-expansion chamber, the latter having the removable cover and lid provided with apertures for the escaping gases, in the manner as and for the purpose stated.

2. The combination, with the standard H, having the tie-rod *h*, of the generators A A, having caps and pipes to support them between said standards, the pipe J, T *i*, pipes V V, elbows *j*, and nozzles *k*, terminating within the steam-expansion chamber M, the latter being provided with a removable cover having detachable lid and escape openings *n*, the pipe I, T *i*, and pipes L, having upwardly-projecting discharge-apertures *l l*, the whole being combined and constructed in the manner as and for the object stated.

3. In hydrocarbon-burners, the steam-expansion chamber M, having two apertures in its side for the passage of the nozzles *k k*, the removable cover N, provided with an excision for the passage of the pipe I and further excisions *n*, and the detachable lid N' in said cover, said lid having excisions corresponding with those in the cover, the whole being combined with suitable generators, in the manner as and for the purpose set forth.



408,285. DUST-COLLECTOR. WILLIAM F. BOEHNING, Minneapolis, Minn. Filed Mar. 19, 1888. Serial No. 267,688. (No model.)

Claim.—1. In a dust-collector, the combination, with the air-tube A, of the air-tube B, having a smaller diameter than the tube A, projecting into the tube A from the direction opposite to the current of air and arranged with an annular space between the tubes, a series of hollow conical sections secured to the end of the tube B, having their smaller ends toward the interior of the tube A and their larger ends inclosing and overlapping each the one next in the series, the annular spaces between them communicating with the interior of said tube B, and a suitable chamber or dead-air space communicating with said tube A, adapted to receive the dust and other impurities deposited therein from said tube, substantially as described.

2. The combination, with the flaring air-tube A, of the air-tube B, projecting into the larger end of the tube A, with an open space between said tubes, and a series of hollow conical sections arranged within the tube A, with open spaces between them communicating with the interior of said tube B, said sections covering the end of the tube B, the smaller end of one being inclosed and overlapped by the larger end of the next of the series, by means of which the dust and other impurities are carried out of said tube A through the space between the tubes, while the air passes between the conical sections and outward through the tube B, substantially as described.

408,286. MANUFACTURE OF INCANDESCENT-LAMP FILAMENTS. TURNER D. BOTTOMS, New York, assignor to John B. Tibbits, Hoosick, N. Y. Filed Apr. 16, 1888. Serial No. 307,660. (No specimens.)

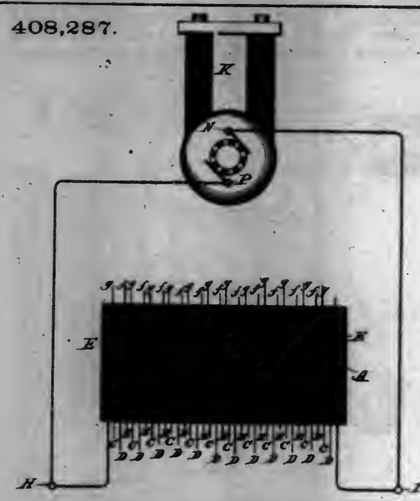
Claim.—1. The process of reducing metallic compounds contained in carbon filaments to the metal, consisting in electrically heating the said carbon in an atmosphere of pure dry and heated hydrogen, substantially as described.

2. The method of treating incandescent filaments, consisting in heating them by electrical means to a temperature at which the carbons become soft in an atmosphere of pure hot dry hydrogen.

3. The method of regulating the electrical conductance of a filament for an incandescent electric lamp, consisting in alternately submitting the same to a treatment incorporating a metallic compound and subjecting the same to a high temperature by electrical means in an atmosphere of heated hydrogen obtained as a product from the destructive distillation of a hydrocarbon, substantially as herein described.

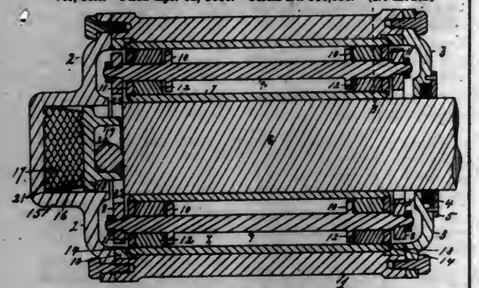
4. The method of treating filaments, consisting in toughening them throughout their structure by electrically heating them until they become soft while inclosed in a chamber containing pure dry and heated hydrogen, as described.

408,287. SECONDARY BATTERY. TURNER D. BOTTOMS, New York, assignor to John B. Tibbits, Hoosick, N. Y. Filed May 28, 1889. Serial No. 312,477. (No model.)



Claim.—1. A storage-pile consisting of a vessel composed of non-conducting material, wherein are placed alternate layers of a paste containing a large proportion of lead crystals, a paste of conductive non-soluble glue, and a metallic plate coated on one side with palladium and on the other with platinum or carbon, substantially as described.

2. A storage-pile consisting, when charged, of alternate layers of a mass of lead peroxide, an insoluble mass of glue, and an alloy of palladium and hydrogenium supported by a metallic plate of lead or zinc coated with platinum or carbon on its reverse side, substantially as herein described.



3. A storage-pile consisting in a number of battery elements arranged in series by simple contact, and composed, essentially, each of a positive paste containing lead or a lead compound and a negative paste not containing lead, but in contact with a body that is a good absorbent of hydrogen and forming an alloy therewith in the form of hydrogenium.

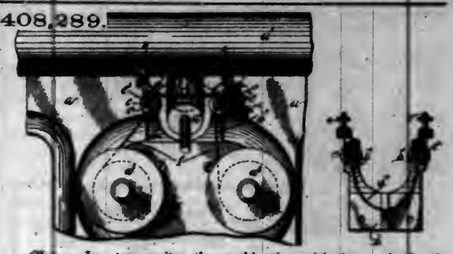
4. A storage-pile consisting in elements composed, essentially, of glue, nitric acid, and aluminium sulphate in varying proportions, one portion of such mass rendered positive by the addition of a quantity of lead crystals to form a heavy good conducting mass, substantially as described, and for the purpose herein specified.

408,287.

408,288. ANTI-FRICTION JOURNAL-BOX. JAMES BREWER, Denver, Colo. Filed Apr. 12, 1888. Serial No. 306,950. (No model.)

Claim.—1. A journal-box consisting of a shell or casing, a plural number of main rollers located therein, an equal number of bolts, one for and passing through each main roller, traveling rings secured to the ends of the bolts and holding the main rollers in a cage-like structure, and two series of a plural number of small rollers within each main roller, one series at each end thereof and surrounding the bolt therein, substantially as set forth.

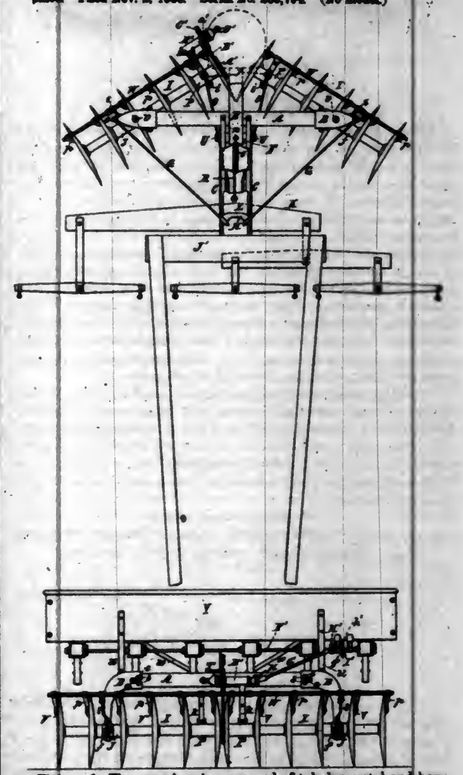
2. A journal-box consisting of a shell or casing, a plural number of main rollers therein, a cap at one end of the casing apertured for the passage of a shaft, and a closed cap at the other end thereof having an interior central recess or chamber, a spring seated therein, a cage or chamber located upon the spring, and a ball-bearing in and of less diameter than the cage or chamber, substantially as set forth.



3. A journal-box consisting of a shell 1, tubular rollers 7, having rounded ends engaging with correspondingly-concaved seats in the shell, traveling rings 8 8, bolts passing through rollers 7 and secured to the rings, smaller rollers within the rollers 7, and a cap or caps apertured for the passage of a shaft, substantially as set forth.

4. A journal-box consisting of a shell 1, tubular rollers 7, traveling rings 8 8, bolts 9, having shoulders or collars 10 and passing through the rollers and secured to the rings, smaller rollers 12 within the tubular rollers, a cap 3, apertured for the passage of a shaft 6, a closed cap 2, having chamber 16 on its interior, a spring seated in such chamber, a cage or chamber composed of base 18 and wall 19, seated on the spring, and a ball-bearing 20 in and of less diameter than its cage or chamber, substantially as set forth.

408,289. RIBBON MOVEMENT FOR TYPE-WRITING MACHINES. LOUIS A. BROTT, Groton, N. Y., assignor to the Crandall Type-Writer Company, same place. Filed Jan. 9, 1888. Serial No. 260,171. (No model.)



408,289.

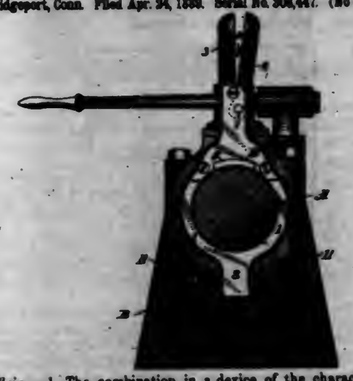
Claim.—In a type-writer, the combination, with the spools a^2 and inking-ribbon f, of the forked holder b, provided with the studs c, the oscillating hubs d', pins d, extended through slots in the holder b, and the spring d', substantially as and for the purpose set forth.

408,290. COMBINED SEEDER AND HARROW. ARTHUR P. BROWN, Dayton, Ohio, assignor to the Stoddard Manufacturing Company, same place. Filed Nov. 2, 1888. Serial No. 288,794. (No model.)

Claim.—1. The cross-bar A, composed of tubular metal and having secured upon its ends the curved tubular castings B, provided with the slots a and clamping-bolts c, in combination with the main frame and the disk-gangs hinged to the vertical spindles of the castings B, substantially as and for the purpose specified.

2. The main frame composed of the tubular cross-bar A, having secured upon its ends the curved tubular castings B, the L-bars C, bolted to the cross-bar A and united at their forward ends by the bar D, and the brace-rods G, extending from the forward ends of the bars C to the castings B, in combination with the disk-gangs hinged to the castings B, substantially in the manner and for the purpose specified.

3. The combination, with the sliding doubletree and its slide L, of the casting N, having vertical slots h, the draw-bars O, having their forward ends inserted through and confined in said slots and their rear ends bent down and hinged to the inner ends of the disk-gangs, the hooks j, uniting the elbows of the draw-bars to upward extensions from the gang-axles, the main frame, and the disk-gangs hinged thereto, substantially as described.



4. The combination, with the seed-box, its feed-shaft, and distributing mechanism, of the main frame, the disk-gangs hinged thereto, a sprocket-wheel upon the convex side of the inner disk of one gang, a second sprocket-wheel carried by said gang, a drive-chain uniting the sprockets, a spindle driven by said sprockets and carried by said gang, and a drive-rod with universal joints uniting said spindle and the feed-shaft, substantially as and for the purpose specified.

5. The combination, with the seed-box, its feed-shaft, and distributing mechanism, of the main frame, the disk-gangs hinged thereto, a sprocket-wheel upon the convex side of the inner disk of one gang, a second sprocket-wheel carried by said gang, a drive-chain uniting the sprockets, a spindle driven by said sprockets and carried by said gang, clutch mechanism uniting said spindle and second sprocket, and a drive-rod with universal joints uniting said spindle and the feed-shaft, substantially as and for the purpose specified.

6. The combination of the doubletree K, slide L, bars C, lever Q, link R, uniting the lever to the slide-rack o, dog n, pivoted to the lever and engaging with the rack, the rear extension T from said dog, and the draw-bars O, connected at their forward ends to the doubletree and at their rear ends to the inner ends of the disk-gangs, substantially as and for the purpose specified.

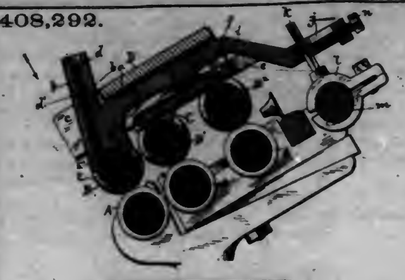
7. The combination, with the hinged disk-gang shafts, of arms projecting upwardly therefrom and movable therewith and carrying scraper-bars adjustable in said arms and provided with independently-adjustable scrapers, substantially as and for the purpose specified.

408,291. BRAKE FOR LATHE-SPINDLES. EDWARD P. BULLARD, Bridgeport, Conn. Filed Apr. 24, 1889. Serial No. 308,447. (No model.)

Claim.—1. The combination, in a device of the character described, with a collar adapted to surround the shaft, of a movable brake-shoe whose operative face forms a part of the bearing-surface of the collar, a rigid handle upon the collar, a complementary handle pivoted to the rigid handle, and a link interposed between the last-named handle and the shoe and whereby the latter is actuated, substantially as set forth.

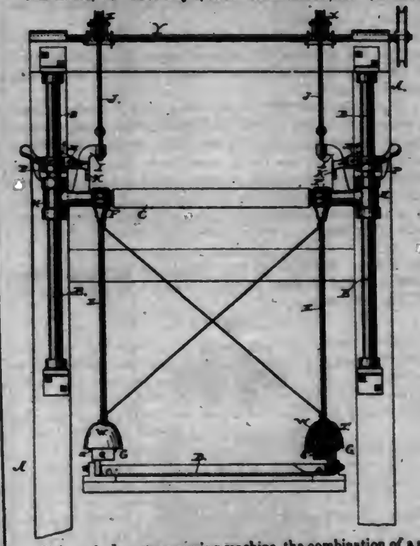
2. In a device of the character described, the combination, with the collar adapted to surround the shaft or spindle, of a projection on said collar, and stops against which said projection may abut, a brake-shoe arranged and movable in the bearing-surface of said collar, and a pair of handles whereby said shoe is actuated relative to the collar, substantially as set forth.

3. The combination, with the collar adapted to surround the shaft, of the brake-shoe arranged and movable in the bearing-surface of said collar, a pair of handles whereby said shoe is operated, and means, as a stop, for limiting the movement of the collar around the shaft, substantially as specified.



408,292. SADDLE FOR TOP ROLLS OF SPINNING-MACHINES. WILLIAM T. CARROLL, Worcester, Mass. Filed Mar. 7, 1889. Serial No. 302,257. (No model.)

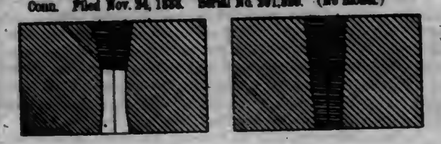
Brief.—The objects of the invention are to facilitate lubrication and to improve the means for holding and adjusting the front roll.



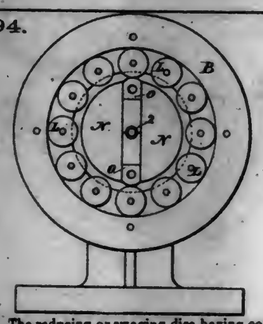
Claim.—1. In saddles for spinning-machines, the combination of the upper saddle having an oil-duct projecting upwardly from its hub or bearing, the clearer having a slot adapted to said oil-duct, and the under saddle having its oil-duct lengthened out beyond the clearer, substantially as shown and described, and for the purpose specified.

2. In combination, the front top roll, the upper saddle having a journal-box formed in its hub, which is the sole journal-box of said roll, and having its stem lengthened out in the rear and formed with a slot, the cap-bar having a pin to enter said slot, and an adjusting set-screw, substantially as shown and described, and for the purpose specified.

408,292.



408,293. MACHINE FOR SAWING STONE. GEORGE DALRYMPLE, Fair Haven, Vt. Filed May 1, 1889. Serial No. 308,199. (No model.)

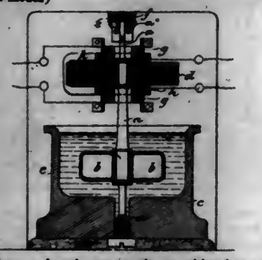


Claim.—1. In a stone-sawing machine, the combination of a saw-frame having a horizontal reciprocating motion in an endwise direction, said saw-frame being suspended by pendulous rods from cross-heads which are fitted to move vertically on guide-rods fixed at opposite ends of the machine, and clamping mechanisms which consist of collars fitted to slide loosely on said guide-rods, and each collar having a lever that is loosely pivoted thereto, one end of said lever being fitted to bear upon a lug projecting from said cross-head and the opposite end of said lever being provided with a cam-face that will bite against a guide-rod and resist a rising movement of said saw-frame, as and for the purpose herein specified.

2. In a stone-sawing machine, the combination of a saw-frame suspended by pendulous rods from cross-heads which are fitted to receive a vertical movement on guide-rods at the opposite ends of the machine, said pendulous rods being journaled on said cross-heads and to said saw-frame, the joints of said pendulous rods with said saw-frame being formed by each having a longitudinally-grooved and radially-perforated sleeve which is inserted in the lower head of said pendulous rods, a box for containing lubricant secured to said saw-frame and provided with a wrist-pin which fits the bore of said sleeve, the latter being submerged, either partially or entirely, in said lubricant, so that the latter will flow into the grooves and perforations of said sleeve, as and for the purpose herein specified.

408,294. SWAGING-MACHINE. WILLIAM H. DAYTON, Torrington, Conn. Filed Nov. 24, 1888. Serial No. 291,289. (No model.)

408,294.



Claim.—1. The reducing or swaging dies having corrugations or ribs at the conical or flaring portion of the opening between the dies, substantially as set forth.

2. The swaging or reducing dies having an opening through between them and provided with screw-threaded ribs or corrugations in the surface of the metal at the tapering portion of the opening, substantially as set forth.

3. The combination, with the revolving head N, having a transverse groove, of the dies C within such groove, there being a central opening through between the said dies, which opening is tapering or flaring at the entrance side for the article to be operated upon, and the screw-threaded corrugations or ribs provided in the surface of the metal of the dies, at the flaring portion thereof, for feeding in the wire or rod to be reduced automatically by the revolution of the dies, substantially as set forth.

408,295. ELECTRIC METER. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Oct. 10, 1888. Serial No. 287,735. (No model.)

Claim.—1. In an electric meter, the combination, substantially as set forth, with the stationary coils, of an unwound rotating armature magnetized thereby, said armature being built up of insulated lamine of iron or magnetic metal, and the mass of metal being so related to the resistance of the coil, as herein described, that the current in the coil cannot magnetically saturate the armature.

2. In an electric meter, the combination, substantially as set forth, of the stationary coils and an unwound rotating armature magnetized thereby, the mass of metal in the armature being so related to the resistance of the coil, as herein described, that the current in the coil cannot magnetically saturate the armature.

3. In an electric meter, the combination of an unwound rotating disk-armature, stationary coils in planes at right angles to the plane of the disk, said coils magnetizing the disk, and a body of fluid in which the weight of the armature is floated or partly floated to lessen the weight upon its pivot.

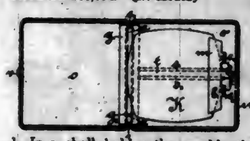
4. In an electric meter, a rotating armature mounted on a spindle, which also carries a float immersed in liquid, whereby the weight of the armature upon its pivot is lessened.

408,296. CONDENSER-HEAD FOR THE EXHAUST-PIPES OF STEAM-ENGINES. ASADORE M. DOANE, Chicago, Ill., assignor to the Leeds-Barratt Supply Company, same place. Filed Feb. 11, 1889. Serial No. 299,523. (No model.)

Claim.—1. In condenser-heads, the combination, with the expanded case and with the steam-inlet pipe joined tightly thereto and discharging therein, of the hood located within said case, inclosing the terminal of the inlet-pipe and open at both of its ends to constitute a mixing-chamber, whereby air may be freely drawn through the space between said terminal and its surrounding hood and be commingled with the steam within the hood to effect the rapid condensation thereof, substantially as described.

2. The combination, with the inclosing-case and its outlet, of the

408,296.



union inlet-pipes and the open hoods encompassing the same, substantially as described.

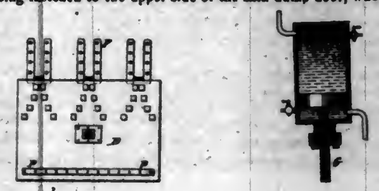
3. The combination, with the inclosing-case and its outlet-pipe projecting thereinto, of the union inlet-pipes and the open hoods therefor, having their lower edges at about the level of the inner end of the outlet-pipe, substantially as described.

4. The combination, with the inclosing-case and its outlet-pipe projecting thereinto, of the union inlet-pipes, the open hoods therefor, and the deflector extending from the outlet-pipe about said hoods and case, the lower edges of the hoods being about level with the inner end of the outlet-pipe, substantially as described.

408,297. CHALK-HOLDER. CARL DUBSICKER, Minden, Westphalia, assignor to Wilhelm Dörge, Braunschweig, Germany. Filed Oct. 13, 1888. Serial No. 288,094. (No model.)

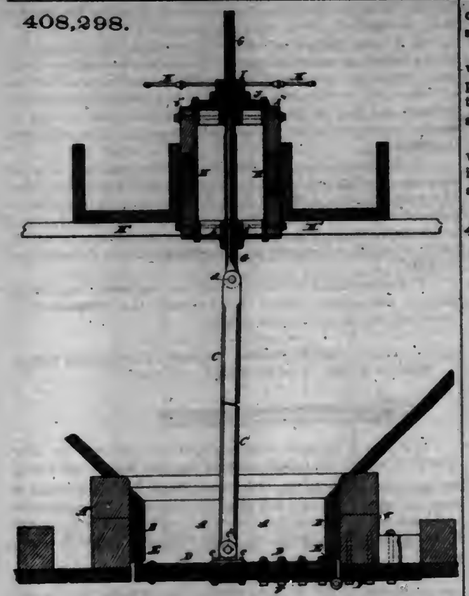
Claim.—1. In a chalk-holder, the combination of sections *o o'*, having a catch at one edge and a slot and hinges at the other, with a clamp attached to the inside of one of said sections but movable toward or from said slot, for the purpose set forth.

2. A pair of sections *o o'*, hinged together to form a casing or holder for the chalk, provided with slot *a*, for allowing the protrusion of the chalk and having rubber strips attached to it at the edge of the slot, for the purpose set forth.



3. The spring-clamp *m*, having an outwardly-extending part, in combination with a spring-catch attached to said part, an inclosing-case provided with a slot for allowing the protrusion of the chalk, a slot at an angle thereto for allowing such outward extension of said part, and a series of perforations parallel to the latter slot for engaging said spring-catch, substantially as set forth.

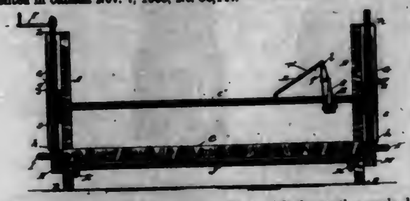
4. In combination with a casing slotted to allow the protrusion of the chalk and having the edge of the slot lined with rubber, a spring-clamp arranged within said casing and movably attached thereto, the jaws of said clamp being also lined with rubber in order that the chalk may be protected at each point of contact against being crushed by the devices which hold it, substantially as set forth.



5. The section *o*, provided with catch *v*, in combination with section *o'*, provided with slots *s' s²*, and plate *t*, having a series of perforations *e*, the clamp-jaws *b' b²*, one of which has two curved pieces *r' r²* extending outward through said slots, the spring *f*, which forces said jaws against the chalk, and the spring-catch *g*, attached to said curved pieces between them and having a stud *i* adapted to enter any one of said perforations, the said sections *o o'* being hinged together at *c' c²* and having a slot *a* between the hinges, substantially as set forth.

408,298. DUMPING-SCOW. JOSEPH EDWARDS, Brooklyn, N. Y. Filed Dec. 21, 1888. Serial No. 294,335. (No model.)

Claim.—1. In a dumping-scow, the combination of the rigid sliding rod G G, connecting-rod C, and swinging dump-door D D, the upper end of the said connecting-rod being fastened to the lower end of the said sliding rod, and the lower end of the said connecting-rod being fastened to the upper side of the said dump-door, whereby the



408,298.

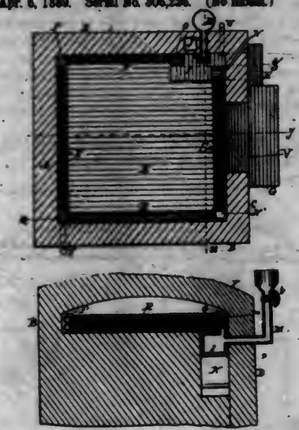
dump-door can be forced open or closed by the vertical movement of the laterally-rigid rod, in the manner and for the purpose set forth.

2. In a dumping-scow, the combination of the rigid sliding rod G G, having a screw-thread and a vertically-stationary threaded nut I thereon, connecting-rod C, and swinging dump-door D D, the said connecting-rod having its upper end fastened to the lower end of the said sliding rod and its lower end attached to the upper side of the said dump-door, whereby the rotating of the said nut will give a vertical movement to the sliding rod and force down or draw up the connecting-rod and open or close the dump-door, according to the direction in which the said nut is rotated, substantially as and for the purpose described.

408,299. BEDSTEAD. CALLISTE ESTHIER, St. Jérôme, Quebec, Canada. Filed Dec. 17, 1888. Serial No. 293,870. (No model.) Patented in Canada Nov. 7, 1888, No. 30,147.

Claim.—In a bedstead, the combination, with the stationary bed-frame, provided with legs and with end pieces A and B, of the guard-pieces *g*, secured to the end pieces, the revoluble screws G, journaled in said guard-pieces and provided with bevel-toothed wheels I, the pieces H, secured to the said end pieces and supporting the lower ends of the said screws, the shaft J, journaled in said pieces H and provided with beveled-toothed wheels K, gearing with said wheels I, and a vertically-movable frame for supporting the patient, provided with cross-pieces *c²*, engaging with the said revoluble screws, the whole being supported by the said bedstead legs and adapted to be moved about to any part of the sick-room, substantially as set forth.

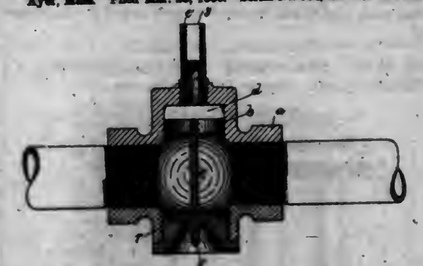
408,300. WAISTBAND-FASTENER. JOHN BUTZ, Washington, D.C., assignor to Ottomar Monger, Philadelphia, Pa. Filed Nov. 9, 1887. Renewed July 1, 1889. Serial No. 316,106. (No model.)



Claim.—1. In a garment-fastening, the combination, with a catch C, of the plate A, having the rounded hook B, provided with a semi-circular slot and the shoulders *c c*, said plate A being perforated at *a a*, substantially as shown and described, and for the purpose specified.

2. In a garment-fastening, the combination, with the plate A, provided with the hook B, of the catch C, consisting of two plates having prongs at each end, said plates being secured one to the other and the prongs bent at right angles thereto, substantially in the manner shown and described, and for the purpose specified.

3. In a garment-fastening, the combination, with the plate A, provided with the hook B, of the catch C, consisting of the body *c*, having prongs *d'* at each end, said prongs being provided with ears *a²*, substantially as shown and described



408,301. HEATING APPARATUS. PETER FOX, Englewood, Ill. Filed Apr. 6, 1889. Serial No. 306,236. (No model.)

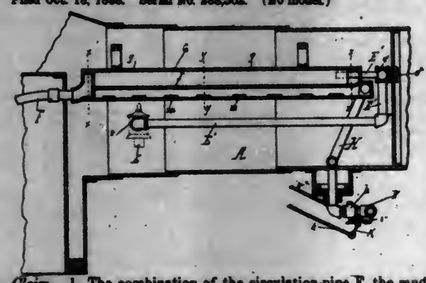
Claim.—1. A heating apparatus consisting of a tank with a furnace thereunder, in combination with a series of pipes communicating therewith, a supply-pipe leading into the tank, a gas-discharge pipe communicating with said pipes at a point about midway of their length from the tank in either direction from it, and tank and pipes filled with oil, as and for the purpose specified.

2. A heating apparatus for ovens, consisting of the tank I, placed in one corner thereof and on a level with the oven-bottom, the heads N' N, communicating with it, the pipe S, lying above the pipes R and the latter pipes communicating with the vertical heads O, P, Q, and N', the tank having a supply-pipe and discharge-pipe, and the tank and pipes filled with oil, in combination with an oven, as and for the purpose specified.

408,302. AUTOMATIC FIRE-EXTINGUISHER. JAMES R. GRAY, Ayer, Mass. Filed Mar. 26, 1889. Serial No. 304,785. (No model.)

Claim.—1. In an automatic fire-extinguisher, a casing adapted to be connected to the water-pipes, and provided with a valve-seat having an opening for the escape of water and with a chamber located in line with the valve-seat, said chamber having an outlet closed by means of a fusible joint, combined with a valve provided with a head connected with and having an area greater than that of the valve and fitted loosely within said chamber, substantially as set forth.

2. In an automatic fire-extinguisher, a vent or outlet and a plug or cap to close the same, the walls of both of such parts being grooved or indented to receive the fusible material which unites them and tapered to release such cap or plug more promptly, substantially as set forth.



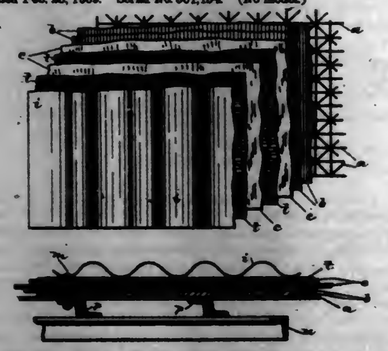
3. In an automatic fire-extinguisher, a vent or outlet and a plug

or cap to close the same, the walls of both such parts being grooved or indented and sealed together by means of fusible material imposed between them and received into the said grooves or indentations, combined with a section of fusible material of a less degree of hardness imposed between the harder fusible material and the internal pressure to prevent the escape of such pressure, substantially as described.

4. The nipple or outlet *i*, having its walls grooved or indented, and the plug *g*, having its walls grooved or indented, the said plug being counterbored to expose its interior to the action of heat, and sealed to the said nipple by means of fusible material imposed between them and received into the said grooves or indentations, substantially as set forth.

5. A casing adapted to be connected with the water-pipes, a valve-seat within the casing having an opening for the escape of water, a chamber located in line with the valve-seat and communicating with the interior of the casing, a valve held to the valve-seat by the internal pressure, a head connected with and having an area greater than that of the valve and fitted within the said chamber, and which permits the pressure to pass freely from the casing into the chamber above the head, and a vent or outlet from the chamber whose area exceeds the leakage into the chamber, substantially as set forth.

408,303. STEAM-BOILER. HERBERT HACKNEY, Topeka, Kans. Filed Oct. 18, 1888. Serial No. 288,502. (No model.)



Claim.—1. The combination of the circulation-pipe F, the mud-drum G, provided with means for blowing it out with the pipe E', which discharges the feed-water into said mud-drum at a point intermediate between the opening through which the circulating water enters and that through which it leaves said mud-drum, as and for the purpose stated.

2. The combination of the mud-drum G, containing the three compartments M M' N, with the circulation-pipe F, the feed-water pipe E', and the discharge-pipe H, as and for the purpose stated.

3. The combination of the boiler A, the circulation-pipe F, and the mud-drum G with the three-winged partition I, dividing said mud-drum into a discharge-passage N, and two circulation-passages M M', connected at one end and opening, respectively, into the circulation-pipe F and the water-space of the boiler, substantially as set forth.

4. The combination of the mud-drum G, the discharge-pipe H, the feed-water pipe E', and the screw-plug e^3, as and for the purpose stated.

408,304. ROOF-COVERING. JOHN T. HEWTHORN, Providence, R. I. Filed Feb. 25, 1889. Serial No. 301,154. (No model.)

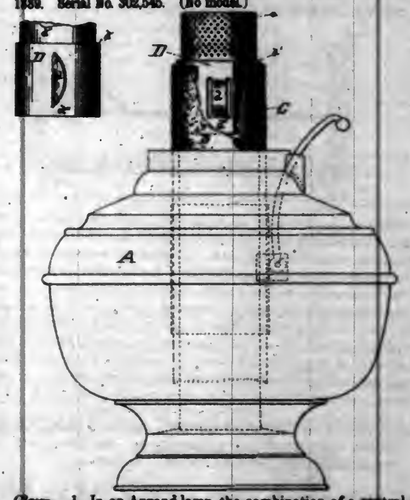
Claim.—1. A composite roof composed of an inner lining or surface of non-conducting incombustible materials, of which asbestus forms the base thereof, purlins or other suitable supports therefor, and an outer covering of metal secured to said lining and purlins, substantially as described, and for the purpose specified.

2. A composite roof consisting of a corrugated-iron exterior surface, a surface of impervious material, as tar-paper, contiguous to the under side of the corrugated iron, an asbestus lining upon which the said impervious surface rests, a surface of wire-netting to support the asbestus, and fixed purlins for supporting the whole, and to which the several surfaces or layers are secured, substantially as hereinbefore described.

3. The combination, with suitably-supported metallic purlins and an outer covering *i* of corrugated iron separated from said purlins, of a metallic netting *a*, resting directly upon the purlins, a surface of asbestus board supported by the netting, and one or more layers of tar-protected impervious material laid upon the asbestus board, the whole arranged and secured together, substantially as described and set forth.

4. A corrugated-iron roof having a lining composed of impervious material and asbestus resting upon a metallic base, substantially as described, and for the purpose specified.

408,305. ERASER-HOLDER. CHARLES A. HOLMES, Irving Park, Ill. Filed Apr. 9, 1889. Serial No. 306,566. (No model.)

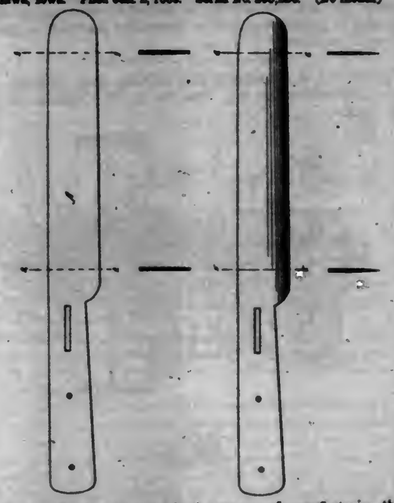


Claim.—1. In eraser-holders, the combination, with the tube, open at its end, of the spindle inserted movably therein and having the spring-fingers projecting therefrom beyond the tube-terminal to clasp the rubber, said tube and spindle being in threaded engagement with each other, whereby the tube may be shifted adjustably against the spring-fingers to regulate the grasp thereof, substantially as described.

2. In eraser-holders, the combination, with the threaded tube, open at its end, of the threaded spindle fitted movably therein, and having the outwardly-bent spring-fingers in piece therewith and projecting therefrom beyond the tube-terminal, the shifting engagement of said tube and spindle causing the tube to bear adjustably against the spring-fingers and regulate the grasp thereof upon the rubber, substantially as described.

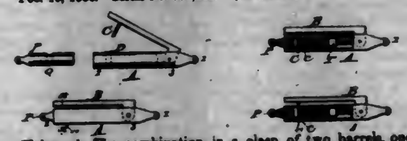
3. As a new article of manufacture, an eraser-holder consisting of an open-ended tube having at one terminal a reversible plug furnished with a knife-blade, and threaded at its opposite terminal to engage with a threaded spindle having outwardly-bent spring-fingers projecting therefrom and beyond the tube-terminal to grasp the rubber, the screw-shift of said spindle and tube causing the tube end to bear adjustably against the fingers, substantially as described.

408,306. ARGAND LAMP. WILLIAM C. HOMAN, Meriden, Conn., assignor to the Edward Miller & Company, same place. Filed Mar. 2, 1889. Serial No. 302,545. (No model.)



Claim.—1. In an Argand lamp, the combination of a central air-supply tube, an inner air-distributer, the lower portion of which is of an interior diameter slightly greater than the exterior diameter of said central tube, and one or more springs formed in said lower portion, substantially as described.

2. In an Argand lamp, the combination of a central air-supply tube, an inner air-distributer, the lower portion of which is of an interior diameter slightly greater than the exterior diameter of said central tube, and one or more springs formed in said lower portion by the indentation of a strip of metal between two parallel slots, substantially as described.



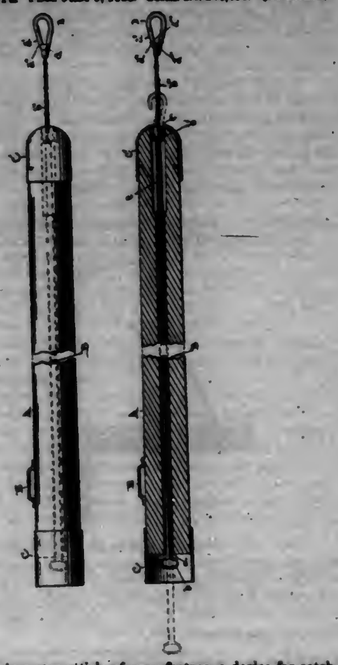
3. In the inner air-distributer of an Argand lamp, the combination of a perforated cylindric portion of an exterior diameter less than that of the central air-supply tube of the lamp, an annular shoulder, a cylindric lower portion of an interior diameter slightly greater than the exterior diameter of said central air-supply tube, and one or more springs in said lower portion adapted to frictional engagement with said central tube, substantially as described.

408,307. MANUFACTURE OF CUTLERY. ALLEN JOHNSON, Ottumwa, Iowa. Filed Jan. 2, 1889. Serial No. 295,220. (No model.)

Claim.—The improvement in the process of manufacturing the blades of table-cutlery, &c., consisting in the following steps: first, stamping from sheet or ribbon metal a blank having the length and greatest thickness requisite in the finished blade, and then wholly shaping said blank by grinding, substantially as specified.

408,308. CLASP FOR NECKLACES. ADAM KELLER, New York, N. Y., assignor to himself, and John C. Downing, Newark, N. J. Filed Feb. 16, 1889. Serial No. 300,205. (No model.)

Claim.—1. The combination, in a clasp, of two barrels, one of which fits within the other, having corresponding holes through each, and a pin on a pivoted arm, which passes through the two barrels and holds them together, substantially as specified.

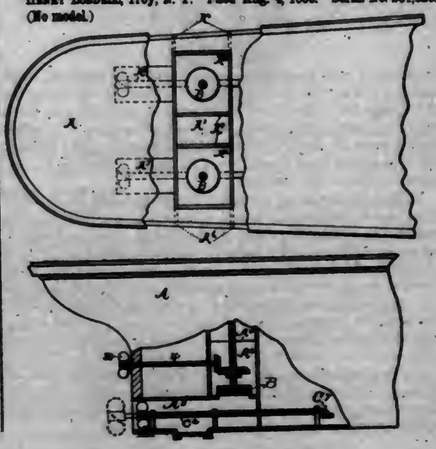


2. The combination, in a clasp, of two barrels, one of which fits within the other, and having corresponding holes through each, a pin on a pivoted arm, which passes through the two barrels, and a spring to retain the pin in the hole, substantially as specified.

3. The combination, in a clasp, of an outer barrel having a hole through it at right angles to the axis, and a buffer T on a spiral spring within the same, which normally closes the hole, substantially as described.

4. The combination, in a clasp, of an outer barrel provided with a buffer and spring and an inner barrel fitting within the outer barrel, the two barrels having corresponding holes through each, and a pin C on a pivoted arm, substantially as specified.

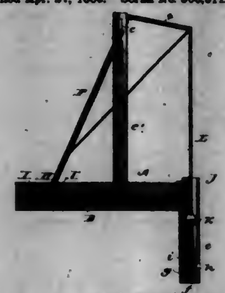
5. The combination, in a clasp, of two barrels, one of which fits within the other, having corresponding holes through each, the outer barrel having a longitudinal slot and the inner barrel a feather to fit into the slot, and a pin on a pivoted arm, and a spring to retain the pin in the corresponding holes through each barrel, substantially as specified.



408,309. DEVICE FOR CATCHING ANIMALS. IRWIN S. KNOX, Connellsville, Pa. Filed June 9, 1888. Serial No. 276,658. (No model.)

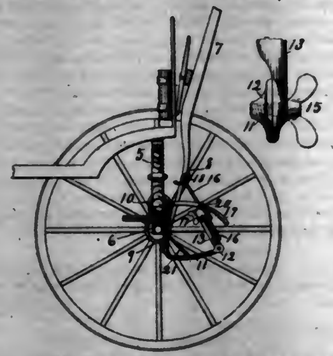
Claim.—1. As a new article of manufacture, a device for catching and holding animals, consisting of an axially-bored handle provided with a centrally-apertured ferrule at each end, one of said ferrules having its opening inwardly tapered or cone-shaped, a rod longitudinally adjustable in said handle, a snap-hook provided with a spring-actuated pivot-tongue adapted to enter the cone-shaped opening in said ferrule, and a flexible connection between said snap-hook and the adjustable rod, substantially as shown and described.

2. In a device for catching and holding animals, the combination, with the handle A, axially bored at *a* and provided with the ferrules C C, the ferrule C having the tapered or cone-shaped tubular projection *c'*, and the rod B, longitudinally adjustable in said handle, of the snap-hook D, normally closed by the spring d^2, and having its upper edge beveled to adapt it to the said cone-shaped tubular projection *c'* of the ferrule C, and the cord or chain b^2, connecting said snap-hook and the rod B, substantially as shown and described.



408,310. WATER-POWER VESSEL-PROPELLING MECHANISM. HENRY LOSDELL, Troy, N. Y. Filed Aug. 4, 1888. Serial No. 281,229. (No model.)

Claim.—1. In a vessel, the combination, with a water way or trunk below the water-line of the vessel, having supply and discharge openings leading from a higher to a lower level, of a water-displacing and vessel-propelling wheel or screw located in or near the discharge-opening and operative by suitable power, and a water-motor located in said water way or trunk.

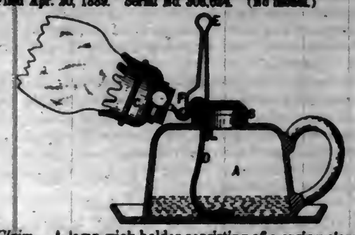


2. In a vessel, the combination, with a water way or trunk below the water-line of the vessel, having supply and discharge openings leading from a higher to a lower level, of a water-displacing and vessel-propelling wheel or screw located in or near the discharge-opening and operative by suitable power, a water-motor located in said water way or trunk, and an auxiliary vessel-propelling screw or wheel connected to and actuated by such motor

408,311. CLOTHES-POUNDER. THOMAS MAITLAND, Williamsport, Pa. Filed Apr. 27, 1889. Serial No. 308,811. (No model.)

Claim.—In a washing-machine, the combination of a body having a corrugated bottom, a frame mounted above said body, a pair of rocker-arms carrying rollers and pivotally mounted in said frame, a throw-arm M, hinged to said frame, a piston-rod L, pivoted to said throw-arm and actuating a pump J, and connecting-rods connecting said throw-arm with said rocker-arms.

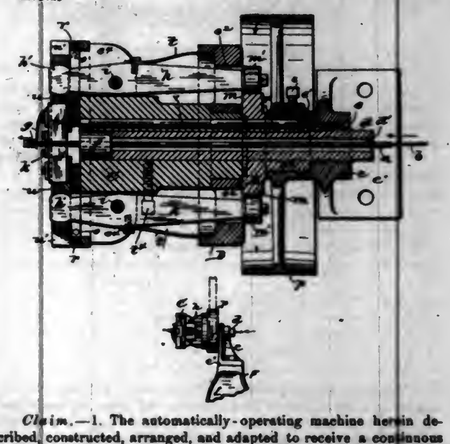
408,312. TONGUE-SUPPORT FOR VEHICLES. W. W. MAYNE, Huron, Dak. Filed Nov. 24, 1888. Serial No. 291,798. (No model.)



Claim.—1. The combination, in carriage-tongue supports, of the shank 9, provided with the hook 10 and the forward arm 11, having half a hinge-joint 12 formed on it, the brace 13, provided with half a hinge 12 and with a longitudinal bore and a binding-screw 17, a forked extension brace 16, fitted to the bore of the brace 13, and a binding-screw 15, adapted to secure the brace 13 rigidly to the arm 11, substantially as shown and described.

2. The combination of the shank 9, provided with the hook 10 and the arm 11, the brace 13, hinged to the arm 11 and longitudinally bored and provided with a stud 20, the forked extension-brace 16, fitted to the said bore in the brace 13, the binding-screw 17, fitted in the brace 13, and the stay-bar 19, hung at one end to the shank 9 and notched to engage the said stud, substantially as shown and described.

3. The combination of the shank 9, provided with the hook 10 and arm 11, the brace 13, hinged to said arm and provided with a forked adjustable extension 16, and the stay 21, permanently connecting the arm 11 and shank 9, substantially as shown and described.



4. The combination of the shank 9, provided with the hook 10 and arm 11, the brace 13, hinged to the said arm, and a curved or flexible support adapted to connect the brace 13 with the vertical portion of the shank, substantially as shown and described.

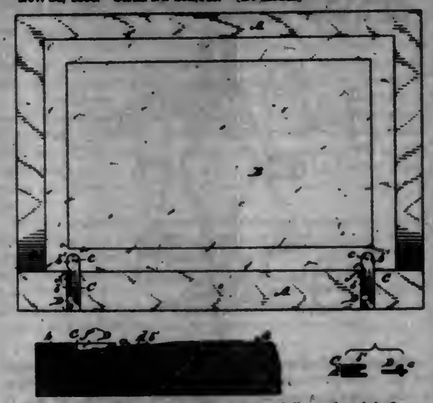
408,313. LAMP-WICK HOLDER. GEORGE B. MEEKER, Boston, Mass. Filed Apr. 20, 1889. Serial No. 308,024. (No model.)

Claim.—A lamp-wick holder consisting of a spring-clamp having one of its jaws provided with an offset or shoulder and the other jaw having a parallel extension, as shown and described, as and for the purposes set forth.

408,314. MACHINE FOR MAKING BEAD-CHAINS. SAMUEL MOREY, Providence, R. I. Filed Mar. 12, 1889. Serial No. 302,973. (No model.)

Claim.—1. The automatically-operating machine herein described, constructed, arranged, and adapted to receive a continuous piece of hollow wire or tubing *a*, having therein a continuous piece of prepared wire *b*, adapted to be easily severed at regular intervals and intermittingly present them to the action of dies, which transforms the tube into segregated units connected by the internal wire.

2. In a machine of the character hereinbefore described, the combination of a hollow arbor or spindle, a series of dies *w*, having formed in their working-faces a series of progressive die cavities or molds, mechanism for intermittingly reciprocating the dies in a radial direction, and a feeding device working conjointly with one or more of said dies, substantially as set forth.



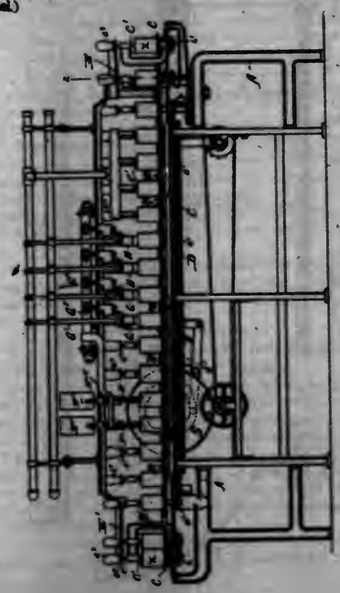
3. The combination and arrangement, in a single machine for producing bead-chain, of a stationary hollow arbor or spindle, a die-actuating cam-disk and pulley mounted to revolve upon the arbor, a head secured to the arbor, a series of radially-arranged die-blocks mounted to reciprocate in the head, levers engaging said cam-disk and die-blocks, an intermittingly-actuated rod engaging a pivoted die-holder carrying a die-block, and a combined guide and check lever to prevent the work from moving rearwardly, substantially as hereinbefore described.

4. In a single machine for producing bead-chain, the combination, with a stationary hollow spindle, and a pulley and cam-disk provided with an adjustably-mounted feed-actuating rod or pusher mounted to revolve around said spindle, of a stationary head having a series of radially-arranged die-blocks mounted in its face, pivoted levers engaging the die-blocks and cam-disk, a pivoted holder *r*, intermittingly actuated by said pusher, and a check-lever arranged to restrain the work from rearward movement, substantially as hereinbefore described.

5. In a machine for producing bead-chain, the combination, with driving and feeding mechanism, substantially as described, of intermittingly-operating bead-forming dies *w*, a stationary head having said dies mounted therein, a hollow spindle through which the stock is intermittingly fed to be acted upon by the dies, and a central guide *g*, mounted at the front of the head to receive the work after its passage through the dies, substantially as hereinbefore set forth.

6. The combination of a series of intermittingly-operating bead-forming dies *w*, a check or restraining device to prevent the stock-tube *a* from rearward movement, and intermittingly-operating stock-feeding mechanism, substantially as hereinbefore set forth.

408,315. DRAWING-BOARD. ERWIN A. NEWMAN, Washington, D. C., assignor of one-half to David L. Smeltzer, Emporia, Kans. Filed Nov. 26, 1888. Serial No. 292,146. (No model.)



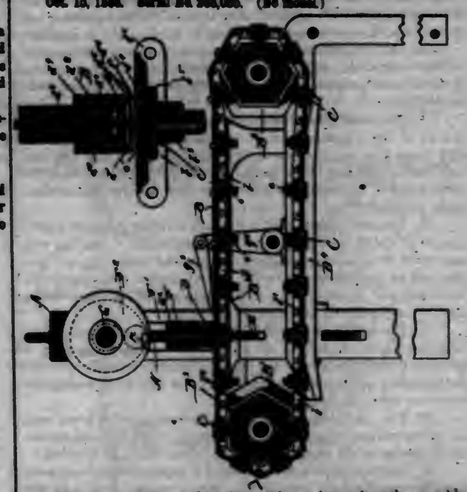
Claim.—1. The combination, substantially as hereinbefore set forth, of the drawing-board having a recess on one side and the pin-carrying fingers arranged in recesses in the edge of the board.

2. The combination, substantially as hereinbefore set forth, of the drawing-board having a recess on one side, the pin-carrying fingers arranged in recesses in the edge of the board, and the catches for holding the fingers in position.

3. The combination, substantially as hereinbefore set forth, of a drawing-board having a recess on one side inclined downwardly toward the edge of the board, a ridge along the margin of the board, the spring-metal pin-carrying fingers arranged in recesses in the edge, and the spring-catches for holding the pin-carrying fingers in position.

4. A drawing-board having a recess on one side inclined downwardly toward the edge of the board and devices for securing the edge of the drawing-paper in the recess.

408,316. CAN-CAP-SOLDERING MACHINE. ERWIN HORTON and JOHN G. HOOSNER, Maywood, assignors to said Erwin Horton, and Oliver W. Horton, Chicago, Ill. Filed Oct. 1, 1888. Serial No. 286,916. (No model.)



Claim.—1. The combination, with a number of series of two or more soldering devices arranged in a line one after another, of an intermittently-moving can-carrier furnished with can-holders and mechanism for moving the can-carrier the space of two or more can-holders at a time, so that two or more cans will be simultaneously presented to said series of soldering devices, and each can successively to two or more of said soldering devices, substantially as specified.

2. The combination, with a series of two or more fluxing devices with a number of series, of two or more soldering devices arranged in a line one after another, an intermittently-moving carrier for presenting two or more cans at a time to each of said series, and a mechanism for moving said carrier the space of two or more can-holders at a time, so that two or more cans will be simultaneously presented to said series of soldering devices and each can successively to two or more of said soldering devices, substantially as specified.

3. The combination, with a series of two or more fluxing devices, of a series of two or more soldering devices arranged in a line one after another, a second series of two or more soldering devices, an intermittently-moving carrier, and a mechanism for moving said carrier a space of two or more can-holders at a time, so that two or more cans will be simultaneously presented to said series of soldering devices and each can successively to two or more of said soldering devices, substantially as specified.

4. The combination, with a number of series of two or more soldering devices arranged in a line one after another, of an intermittently-moving carrier having revoluble can-holder disks C, sliding weighted can-holder disks C' thereon and a stationary cam for raising said weighted disks, and a mechanism for moving said can-carrier a space of two or more can-holders at a time, so that two or more cans will be simultaneously presented to said series of soldering devices and each can successively to two or more of said soldering devices, substantially as specified.

408,317. MACHINE FOR HEMMING CAN-CAPS WITH SHEET-SOLDER RINGS. JOHN G. HOOSNER and ERWIN HORTON, Maywood, assignors to said Erwin Horton, and Oliver W. Horton, Chicago, Ill. Filed Oct. 15, 1888. Serial No. 288,035. (No model.)

Claim.—1. The combination, with an intermittently-movable flexible die-carrier furnished with dies, of an opposing reciprocating die and a guide B^3, for supporting and guiding said die-carrier, substantially as specified.

2. The combination of an intermittently-movable flexible die-carrier furnished with dies, rollers or wheels upon which said carrier is mounted, and an opposing reciprocating die, substantially as specified.

3. The combination of an intermittently-moving endless link chain die-carrier furnished with dies, rollers upon which it is mounted, and an opposing die, substantially as specified.

4. The combination of a movable die-carrier having independently-movable dies mounted thereon, an opposing die, and means for supporting the dies in said carrier against the thrust of said opposing die, substantially as specified.

5. The combination, with an intermittently-movable die-carrier having independently-movable dies mounted thereon, of an opposing reciprocating die mounted on the frame of the machine and means for automatically moving or reciprocating the dies in said carrier to discharge the work therefrom, substantially as specified.

6. The combination, with an endless link chain die-carrier furnished with independently-movable dies, of rollers upon which said carrier is mounted, one of said rollers being furnished with a projection or rim for moving the dies in said carrier to discharge the work therefrom, substantially as specified.

7. The combination, with an intermittently-moving flexible die-carrier having gangs of dies arranged transversely to its line of movement, of a corresponding gang of opposing reciprocating dies and a guide or way B^3, for supporting and guiding said die-carrier, substantially as specified.

8. The combination of an intermittently-movable link chain gang die-carrier having gangs of dies in the links thereof, rollers upon which said carrier is mounted, and an opposing gang of reciprocating dies mounted on the frame of the machine, substantially as specified.

9. The combination, with the gang of reciprocating dies mounted on the frame of the machine, of an intermittently-moving die-carrier furnished with gangs of dies mounted movably thereon and a bar or support to sustain said movably-mounted dies, substantially as specified.

10. The combination, with the gang of dies mounted on the frame of the machine, of an intermittently-moving die-carrier furnished with gangs of dies mounted movably thereon and a movable cross-head or bar for simultaneously actuating the gang of dies on the carrier, substantially as specified.

11. The combination, with an intermittently-moving link-chain die-carrier having gangs of dies mounted movably thereon, of rollers upon which said carrier is mounted, one of said rollers being furnished with rings or projections for simultaneously operating each gang of movable dies to discharge the work therefrom as the same pass around the roller, substantially as specified.

12. The combination, with a reciprocating die mounted on the frame of the machine, of an intermittently-movable die-carrier having movable dies mounted thereon, means for automatically moving said dies to discharge the work therefrom, and a discharge-chute, substantially as specified.

13. The combination, with a gang of reciprocating dies mounted on the frame of the machine, of an intermittently-moving flexible die-carrier furnished with gangs of dies, a guide B^3, for supporting and guiding said die-carrier, and a conveyer K, substantially as specified.

14. The combination, with a gang of reciprocating dies mounted on the frame of the machine, of an intermittently-moving die-carrier furnished with gangs of dies, a conveyer K, and chute K', substantially as specified.

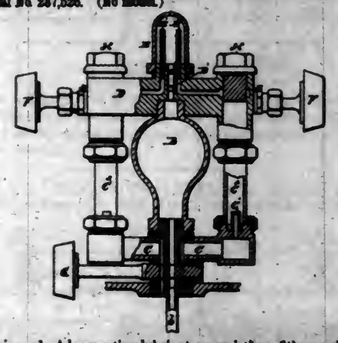
15. The combination, with a die-plate *b*, having guide b^3 and recess b^4, of die C, having shank *c* and bevel-corner *c'*, forming with said recess b^4 an annular groove to receive the solder ring and can-cap, and an opposing die D, having central portion *d*, provided with bevel-flange *d'* for closing the solder ring upon the can-cap, substantially as specified.

16. The combination, with a die-plate *b*, having guides b^3 and recess b^4, of die C, having shank *c* and bevel-corner *c'*, forming with said recess b^4 an annular groove to receive the solder ring and can-cap, and an opposing die D, having central portion *d*, provided with bevel-flange *d'* for closing the solder ring upon the can-cap, sliding stem d^3, and spring d^5, substantially as specified.

17. The combination, with a gang of dies, of a reciprocating cross-head upon which they are mounted, a corresponding gang of movable ejector-pins, a cross-bar mounted movably on said cross-head for actuating said ejector-pins, and a movable cam for operating said cross-bar, substantially as specified.

18. The combination, with a die, of a reciprocating cross-head, an ejector-pin and a movable cam for positively operating said ejector-pin to discharge the blank from the die, substantially as specified.

19. The combination, with a die, of a reciprocating cross-head, cams for operating said cross-head, an ejector-pin, and a movable cam or projection *n*, for operating said ejector-pin, substantially as specified.



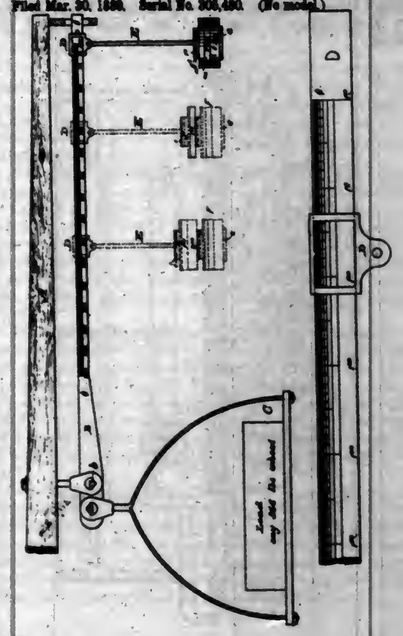
20. The combination, with a gang of dies D, of cross-head F, cams F^3, ejector-pins d^3, cross-bar N, and cams or projections *n* on said cam, and wheels F^2, for operating said ejector-pins, substantially as specified.

21. The combination, with die-plate *b*, having guides b^3 and recess b^4, of dies C, having shank *c* and bevel-corner *c'*, forming with said recess b^4 an annular groove to receive the solder ring and can-cap, and an opposing die D, having central portion *d*, provided with bevel-flange *d'* for closing the solder ring upon the can-cap, sliding stem d^3, and spring d^5, said sliding stem d^3 being hollow and furnished with an extractor-pin d^7, substantially as specified.

22. The combination, with a link chain die-carrier B, composed of hinged die-plate links *b*, having guides b^3 to receive the die-shanks, of movable dies C, having shanks *c*, and rollers B' B^3, said roller B' having a rim B^3, against which the shanks of said dies impinge as the link chain passes around said roller, substantially as specified.

23. The combination, with a die mounted on the frame of the machine, of a movable die-carrier and series of dies mounted thereon, the opposing dies having bevel or conical centering surfaces to insure the proper register of the dies on the carrier with the opposing die on the frame, substantially as specified.

408,318. LUBRICATOR. CHARLES H. FARNHAM, Sr., Detroit, Mich., assignor of one-half to Edward Gruce, same place. Filed Oct. 3, 1888. Serial No. 287,326. (No model.)



Claim.—1. A locomotive-lubricator consisting of the combination, with an oil-reservoir and condenser, of sight-feed glasses located at the sides of the condenser, and in connection therewith the arm D, steam-inlet pipe, equalizing-conduits, and dome E, substantially as described.

2. The combination, with the condenser and sight-feed glasses arranged as described, of the arm D, dome E, equalizers E', and valves F, substantially as described.

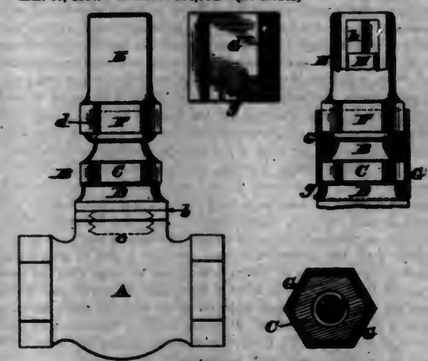
3. The combination of the condenser, the dome, a steam-inlet pipe, one or more equalizing-conduits, one or more sight-feed glasses located at the side or sides of the condenser, the oil-reservoir, one or more oil-exit conduits, and the valves F and G, substantially as described.

4. In a lubricator, the combination, with the steam-admission and oil-exit conduits, of equalizing-conduits terminating in a steam-dome above the condenser, said dome made in the form of a screw-cap adapted to be readily removed for gaining access to said equalizing-conduits, substantially as and for the purposes described.

408,319. WEIGHING-SCALES. GEORGE I. PHELPS, Chicago, Ill. Filed Mar. 30, 1889. Serial No. 305,490. (No model.)

Claim.—1. The combination, with a scale-beam, of weights representing both units of money value and units of weight.

2. A scale-beam graduated as described, combined with weights or counterpoises representing units of weight and units of value.



3. A scale-beam graduated up from the outer end to represent units of value, combined with a sliding marker and weights or counterpoises representing both units of value and units of weight.

4. A scale-beam having longitudinal divisions marked with a list of cereals or other articles of trade and their respective weights for given quantities, and having opposite the name of each of said articles an inwardly-running scale graduated from zero up to the given weight for said article, combined with a sliding marker and with poises representing units of value and units of weight, as described.

5. A scale-beam graduated from the inner to the outer end with units of pounds and having longitudinal divisions, each containing the name of a cereal or other article of trade, with its corresponding weight for a given quantity, and an inversely-running scale to each division marked from zero up to said weight, combined with a sliding marker and poises representing at once units of weight and units of value.

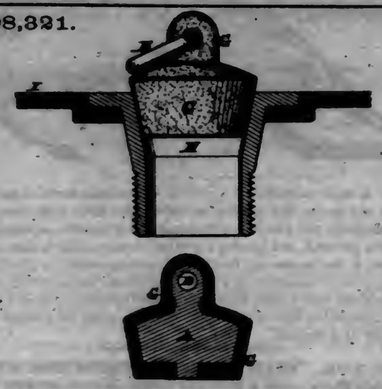
6. The longitudinally-slotted scale-beam herein described, having scales running from the inner to the outer end and graduated to represent units of weight, and scales running from the outer to the inner end and graduated as described, with the names, and giving weights of cereals or other articles opposite said inverted scales, combined with a sliding marker and counterpoises indicating units of value and weight and with a sliding poise or poises on the beam itself.

408,320. COCK OR VALVE. JAMES POWELL, Cincinnati, Ohio. Filed Mar. 20, 1887. Serial No. 232,344. (No model.)

Claim.—1. A cock or valve having a collared neck and a collared stuffing-box screwed thereto, which collars are practically of the same shape in transverse section, in combination with a longitudinally-sliding tube that bears on all sides against the various faces of said collars and locks the stuffing-box when engaged with the neck-collar, substantially as herein described.

2. In combination with a cock or valve having a stuffing-box screwed to its annularly-grooved neck, a tube provided with an inwardly-bent spring tongue or section at one end, which tube completely surrounds the collars of said neck and box, and thereby locks the latter when said tube is shifted longitudinally for the purpose of causing said tongue to engage with the annular groove, said collars being practically of the same shape in transverse section, as herein described.

3. A cock or valve provided with a shiftable tube that surrounds the neck and stuffing-box and locks the latter, said tube having a yielding section and a peripheral flange or rib, as *g'*, for the purpose described.



408,321. WASTEWAY-VALVE. JAMES POWELL, Cincinnati, Ohio. Filed Mar. 27, 1888. Serial No. 268,048. (No model.)

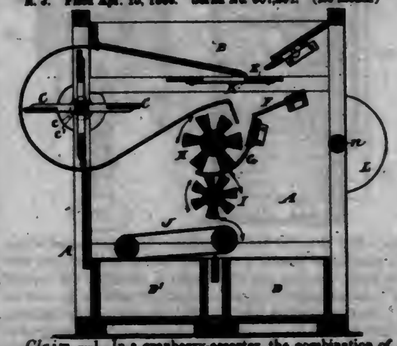
Claim.—1. A non-floating valve or stopper for the wasteways of basins, &c., which valve consists of a light envelope of india-rubber or equivalent material surrounding a relatively heavier core, the latter being provided with a lifting device, substantially as herein described.

2. A non-floating valve or stopper for the wasteways of basins, &c., which valve consists of a light envelope of india-rubber or equivalent material surrounding the body, neck, and perforated head of a relatively heavier core, the latter having a pull or ring attached to it, substantially as herein described.

3. The combination, in a non-floating valve of the class specified, of the heavy core A, having a head C, eye D, and flutes E, said core

408,321.

and head being surrounded by a relatively-lighter envelope G of india-rubber or equivalent material, all as herein described, and for the purpose stated.

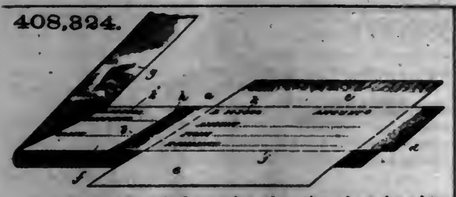


408,322. DIE FOR COMPRESSING VALVE-SEAT BLANKS. JAMES POWELL, Cincinnati, Ohio. Filed May 10, 1887. Renewed May 1, 1889. Serial No. 309,312. (No model.)

Claim.—1. A valve-seat-hardening appliance consisting of the swage-block T, having a pair of communicating bores U U', of unequal diameters, separated by an annular ledge V, in combination with the punch R, having a cylindrical shank S and tapering fillet S', which fillet operates against the counterbore of the valve-seat, as herein described.

2. A valve-seat-hardening appliance consisting of the swage-block T, having a pair of communicating bores U U', of unequal diameters, separated by an annular ledge V, in combination with the punch R, having a cylindrical shank S and tapering fillet S', and an auxiliary punch W, provided with a shank X and side pockets Y Y', as described.

408,328. CRANBERRY-SORTER. ALFRED S. PRICKITT, Red Lion, N. J. Filed Apr. 15, 1889. Serial No. 307,391. (No model.)

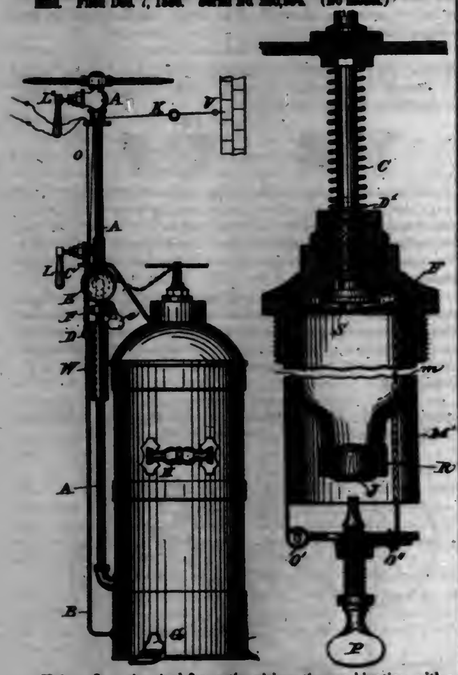


Claim.—1. In a cranberry-assorter, the combination of a concave screen G and two opposite rotary brushes H I, one brush rotating on the inside and the other on the outside of said screen, as and for the purpose set forth.

2. In a cranberry-assorter, the combination, with the concave screen G and brushes H I, of the traveling apron J and drawers D D', arranged substantially as and for the purpose specified.

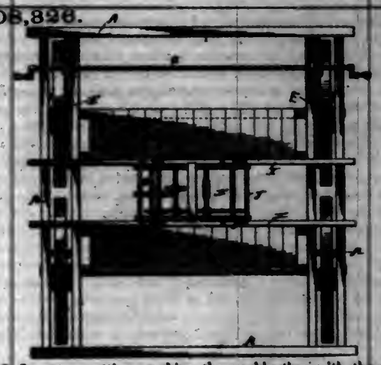
408,324. STUB ENVELOPE-BOOK. WILLIAM A. RADFORD, Washington, D. C., assignor of one-half to Eric M. Noble, same place. Filed Feb. 13, 1889. Serial No. 300,242. (No model.)

Claim.—1. An envelope-sheet having a body portion provided with a number or similar mark, in combination with a stub having a corresponding mark, said sheet being detachable from said stub and provided with flaps upon all sides, for the purpose substantially as described.



408,824.

2. A book composed of a number of envelope-sheets bound together and having like numbers imprinted upon them, each sheet being detachable and provided with a stub which remains permanently bound in the book, and bearing a number corresponding to that upon the stub, in the manner and for the purpose substantially as described.



3. A book composed of a number of sheets having a body portion provided with folding flaps upon all sides thereof, one of said flaps being extended to form a stub, in the manner and for the purpose substantially as described.

408,825. APPARATUS FOR EXTINGUISHING FIRES, GIVING ALARMS, &c. JACOB H. RADCLIFFE, Oldham, County of Lancaster, England. Filed Dec. 7, 1888. Serial No. 292,994. (No model.)

Claim.—In a chemical fire-extinguisher, the combination, with a receptacle adapted to contain a chemical solution and provided with a screw-threaded aperture and a valve-seat at the inner end thereof, of a glass vessel adapted to contain an acid and inverted in said receptacle, a crusher provided with a screw-threaded spindle engaging said aperture and a valve engaging said valve-seat, a spring applied to said spindle so that its resilience will tend to rotate it in a direction to close the valve, a wheel on the spindle, a weight suspended by a flexible support, and a chain detachably connected at one end to the wheel and at the other end to the weight, substantially as described.

408,826. STONE-SETTING MACHINE. CHARLES REYNOLDS, Chicago, Ill., assignor of one-half to James McGuire, same place. Filed May 1, 1888. Serial No. 308,223. (No model.)

Claim.—1. In a stone-setting machine, the combination, with the carrying-frame, the ground-wheels thereof, and the transverse parallel tracks on said frame, of a carriage working on said track, a drum loosely journaled in said carriage, a slidable shaft also journaled on said carriage, cog-wheels on said drum and an axle of the carriage, and cog-wheels on said slidable shaft, adapted and arranged to alternately engage the cog-wheels on said axle and drum, substantially as described.

2. In a stone-setting machine, the combination, with the carrying-frame, the ground-wheels thereof, and a pair of transverse tracks upon said frame, of a carriage working upon said track, a drum journaled on said carriage, a supplemental shaft also journaled in said carriage, a permanent gear-connection between said supplemental shaft and drum, a slidable shaft also journaled on said carriage, and a gear-wheel thereon adapted and arranged to alternately mesh with cog-wheels upon said supplemental shaft and an axle of the carriage, substantially as described.

3. In a stone-setting machine, the combination, with the carrying-frame, the ground-wheels thereof, and a pair of transverse tracks upon said frame, of a carriage working upon said track, a drum journaled on said carriage, a supplemental shaft also journaled on said carriage, a permanent gear-connection between said supplemental shaft and drum, a slidable shaft also journaled on said carriage, and a pair of gear-wheels mounted thereon, one of which is arranged to mesh with a gear-wheel on the drum and the other to alternately mesh with gear-wheels upon the supplemental shaft and axle when the other wheel is out of gear with the drum cog-wheel, substantially as described.

4. In a stone-setting machine, the combination, with the carrying-frame, the ground-wheels thereof, and a pair of transverse tracks upon said frame, of a carriage working upon said track, a drum journaled on said carriage, a supplemental shaft also journaled on said carriage, a permanent gear-connection between said shaft and drum, a slidable shaft also journaled on said carriage, a pair of gear-wheels mounted thereon, one of which is arranged to mesh with the gear-wheel on the drum and the other to alternately mesh with gear-wheels upon the supplemental shaft and axle of the carriage when the other wheel is out of gear with the drum cog-wheel, a friction-pulley upon the supplemental shaft, a friction-band encompassing the same, and a lever for operating said band, substantially as described.

5. In a stone-cutting machine, the combination, with the carrying-frame, the ground-wheels thereof, cog-wheels attached to said ground-wheels, a supplemental shaft journaled in said frame, cog-wheels thereon meshing with the cog-wheels on the ground-wheels, and a pair of transverse tracks upon said frame, of a carriage working upon said tracks, a drum journaled on said carriage, a supplemental shaft also journaled on said carriage, a permanent gear-connection between said shaft and drum, a slidable shaft also journaled on said carriage, and a pair of gear-wheels mounted thereon, one of which is arranged to mesh with a cog-wheel on the drum and the other to alternately mesh with gear-wheels on the supplemental shaft and an axle of the carriage when the other wheel is out of gear with the drum cog-wheel, substantially as described.

408,827. TELEPHONE SYSTEM. JOHN R. SMITH, Bonne Terre, Mo., assignor of three-eighths to Luther A. Young and Henry J. Curtice, both of same place. Filed Feb. 16, 1888. Serial No. 264,208. (No model.)

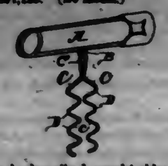
Claim.—1. The combination, with a battery and a coil-magnet, of an armature B, pivoted lever C, spring-pawl E, ratchet-wheel F, cylinder G, having notches g g^2 and a groove g^3, fingers I, insulating-frame J, a telephone-wire, and wires for connecting and disconnecting the fingers with and from other telephones, substantially as shown and described.

2. The combination, with a battery, magnet, and movable armature, of a pivoted lever C, a hinged pawl E, provided with a spring D, a ratchet-wheel F, cylinder G, having a groove and notches, fingers I, having projections i^4, a telephone-wire, and insulated wires for connecting and disconnecting said fingers with and from other telephones, substantially as and for the purpose specified.

3. In a telephone system, the combination of ordinary telephone-batteries, line-wires terminating at the central office in fingers I and switch line-wires Q, switch-batteries, temporary magnets A, armature B, lever C, pawls E, ratchets F, cylinders G, with notches g g^2, grooves g^3, for operating fingers I, and telephone ground or earth wires at each telephone-station completing the circuit between the telephones when their respective fingers I touch their connecting and disconnecting wires k k^2, substantially as and for the purpose set forth.

4. The combination, with ordinary telephones, telephone line-wires coming to a central office, said line-wires having ground or earth wires at the local stations, of a switching mechanism consisting of a ground-wire A^2, coil-magnet A, armature B, pivoted lever C, spring-pawl E, ratchet-wheel F, cylinder G, having notches g g^2, a groove g^3, fingers I, and wires k k^2, which are alternately connecting and disconnecting wires, substantially as and for the purpose set forth.

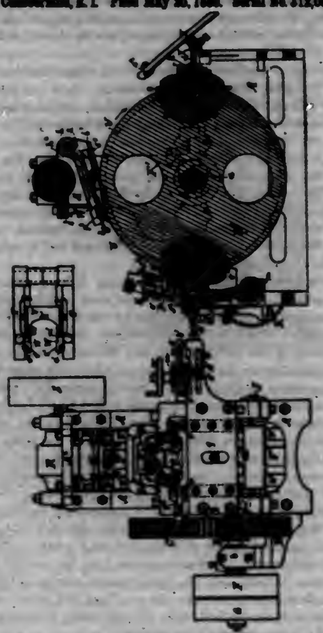
5. A telephone system in which every telephone has a connecting-wire k and a disconnecting-wire k^2 for each other telephone in the system, combined with ordinary telephones, batteries, telephone line-wires terminating at the central office in fingers I, telephone ground-wires at each local station, and switch-dials O, with ground-wires Q^2, switch line-wires Q, and ground-wires A^2, switch-batteries, temporary magnets A, armature B, levers C, pawls E, ratchets F, and cylinders with grooves g^3, notches g g^2, for connecting and disconnecting the fingers I with and from the connecting and disconnecting wires k k^2, substantially as and for the purpose set forth.



6. The combination, with a switch-battery for each telephone in a system, of a ground-wire, a coil-magnet A, armature B, pivoted lever C, spring-pawl E, ratchet-wheel F, cylinder G, having notches g g^2 and a groove g^3, fingers I, connecting and disconnecting wires k k^2, insulating-frame J, a switch line-wire Q, a dial O, crank P, a ground-wire Q^2, and an ordinary telephone, substantially as shown and described.

7. The combination of a dial O, having a rim o^2, and points o^3, connecting crank P, ground-wire Q^2, switch line-wire Q, temporary magnet A, an ordinary battery, a ground-wire A^2, a movable armature for operating a cylinder, which is provided with conducting and connecting fingers I, and connecting and disconnecting wires k k^2, substantially as and for the purpose specified.

8. The combination, with an ordinary battery, a temporary magnet A, and movable armature B, of a pivoted lever C, having a spring for holding the armature up, a hinged pawl E, provided with a spring D, a ratchet-wheel F, cylinder G, fingers I, having projections i^4, a telephone-wire, and connecting and disconnecting wires k k^2, substantially as and for the purpose set forth.



9. In a telephone system, the combination, with ordinary telephones and telephone-wires having their batteries with ground-wires at the local stations, of a switching apparatus consisting of ground-wires Q^2, cranks P, dials O, having a rim o^2 and points o^3, switch line-wires Q, a switch-board having a temporary magnet A, batteries, and ground-wires A^2, cylinders having grooves and notches operated by the said mechanism, and armature B, levers C, having pawls and ratchet-wheels, fingers I, insulating-frames, and insulated connecting and disconnecting wires k k^2, all substantially as and for the purpose specified.

408,828. SPOOL-HOLDER. HENRY W. STRAUSS, Easton, Pa., assignor of one-half to Uzu W. Rubenbush, same place. Filed Jan. 28, 1889. Serial No. 297,135. (No model.)

Claim.—The herein-described spool-holder, the same comprising the pin A, having an eye B in its lower stationary bar, and the loop-shaped wire spring C, bent into an eye at its upper end, loosely engaging said eye B in the pin, side arms c c of said spring being oppositely corrugated and standing in the same plane, the whole adapted for use substantially as and for the purpose set forth.

408,829. HORSESHOE-MACHINE. JAMES H. TAYLOR and CHARLES PUVEY, Archbald, Mass., assignors of one-third to James E. Jones, Cumberland, R. I. Filed May 25, 1888. Serial No. 313,068. (No model.)

Claim.—1. In a horseshoe-machine, the combination, substantially as described, of the bed-plate rotative on a horizontal axis, the series of forming-dies, the die supporters and rockers sustained in circular arcs in the periphery of said bed-plate, the rotary hammer, the gravitating arms, the slide movable in said arms, and the nippers pivoted to said slide, all arranged and to operate essentially as shown.

2. In a horseshoe-machine, the combination, substantially as described, of the bed-plate rotative on a horizontal axis, the series of forming-dies, the die supporters and rockers sustained in circular arcs in the periphery of said bed-plate, the rotary hammer, the gravitating arms, the slide movable in said arms, the nippers pivoted to said slide, and the revolvable auxiliary bed-plates, all essentially as shown.

3. In a horseshoe-machine, the combination, substantially as described, of the bed-plate rotative on a horizontal axis, the series of forming-dies, the die supporters and rockers sustained in circular arcs in the periphery of the bed-plate, the levers P P, fulcrumed to the frame, the bending-rolls pivoted to said levers, the gravitating arms, the slide movable in said arms, the nippers pivoted to said slide, which, together with the said slide, hold the shoe firmly to the die while operated on by the hammer, the revolvable auxiliary bed-plates, and the rotary hammer, all essentially as shown.

4. In a horseshoe-machine, the combination, substantially as described, of the bed-plate rotative on a horizontal axis and provided with peripheral circular arcs, the rockers sustained and movable in said arcs, the forming-dies and supporters connected to said rockers, the swaging devices consisting of the abutments *p p'* and the vertically-movable dies *o o'*, the slide N, operating the said dies *o o'*, the levers P P, the bending-rolls *f' f²*, tapering as set forth and pivoted to said levers, the spring *g'*, connecting them, the gravitating arms, the slide movable in said arms, the nippers pivoted to said slide, the revoluble auxiliary bed-plates, and the rotary hammer sustained and revoluble on an eccentric-supporting shaft, all essentially as shown and set forth.

5. In a horseshoe-machine, the combination, substantially as described, of the bed-plate rotative with a horizontal shaft and having in its periphery circular arcs, the rockers sustained and movable in said arcs, the forming-dies and the supporters connected to the rockers and having pivots *i i*, the spring-cases *k*, fixed to the bed F, the rods *j*, connected to the pivots of the supporters and having heads within the spring-cases, the springs bearing between said heads and the heads of the cases, the auxiliary beds revoluble on hub of the main bed and bearing at their periphery against the die-supporters, the levers P P, the bending-rolls tapered, as explained, and pivoted to the levers, the abutments *p p'*, swaging-dies *o o'*, shears *o² p¹*, passage *x'*, the vertically-movable slide operating the swaging-dies and shears and connected by mechanism with the shaft of the main bed-plate, the gravitating arms, the slide movable in said arms, the nippers pivoted to said slide, and the rotary hammer, essentially as shown and set forth.

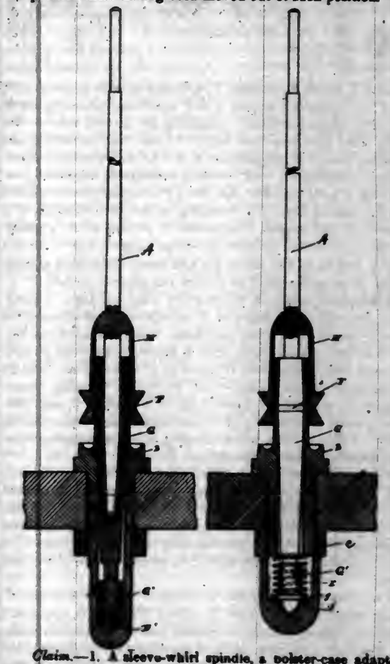
6. In a horseshoe-machine, the combination, substantially as described, of the bed-plate rotative with a horizontal shaft and having in its periphery circular arcs, the rockers sustained and movable in said arcs, the shoe-forming dies and supporters connected to the rockers and to the bed-plate, the auxiliary bed-plates revoluble on the axis of the main bed, the feeding mechanism for advancing the bar into the machine, the abutments *p p'*, the swaging-dies and shears having mechanism for operating them, the levers P P and their tapered bending-rolls, the spring *g'*, the gravitating arms, the slide movable in said arms, the nippers pivoted to the slide, and the hammer revoluble on an eccentric-shaft, all arranged and supported and to operate essentially as shown and set forth.

7. In a horseshoe-machine, the die-supporter H and rocker G, detachably connected to each other and constructed substantially as described, in combination with the bed-plate having peripheral circular arcs and rotative with a horizontal shaft, the rods, spring-cases, and springs connecting the bed-plate and said die-supporter, the auxiliary bed-plates rotative on the axis of the main bed, the levers provided with the tapering bending-rolls and having means for resisting the spread of said rolls while the forming-die with a blank for forming a shoe thereupon is forced between them, the gravitating arms, the slide movable in said arms, the nippers pivoted to the slide, and the hammer revoluble on an eccentric-shaft, all essentially as set forth.

8. In a horseshoe-machine, the gravitating arms independent of each other, and each pivoted at one end to the frame and grooved, notched, and arranged to support the slide V and operate the nippers pivoted to said slide to grip a shoe to the die when moved within said arms, as set forth, in combination with the bed-plate rotative with a horizontal shaft, and having peripheral circular arcs, the rockers sustained and movable in said arcs, the die-supporter connected to the rocker and bed-plate, the forming-die, the auxiliary bed-plates revoluble on the axis of the main bed-plate, and the rotary hammer, all arranged and to operate essentially as set forth.

9. In a horseshoe-machine, the levers P P, with the tapering bending-rolls *f' f²*, said levers having means of resisting the spread of the rolls to cause them to fold the blank against the forming-die when forced between them, substantially as described, in combination with the forming-die, the die-supporter and rocker, the main bed-plate and the auxiliary bed-plates, both revoluble on a horizontal axis, the former having peripheral circular arcs, for the purpose set forth, the gravitating arms, the slide movable in said arms, the nippers pivoted to the slide, and the revoluble hammer, all essentially as shown and set forth.

10. In a horseshoe-machine, the rotary hammer having a body circular in cross-section and supported on a shaft provided with a bearing for said body which is eccentric to the journals of said shaft, substantially as described, in combination with the forming-die, the die supporter and rocker, the main bed-plate and the auxiliary bed-plates, having a common axis, the former having peripheral circular arcs which receive the said rocker and support the same with the supporter and die, the gravitating arms, the slide movable in said arms, and the nippers pivoted to said slide, all essentially as shown and set forth.



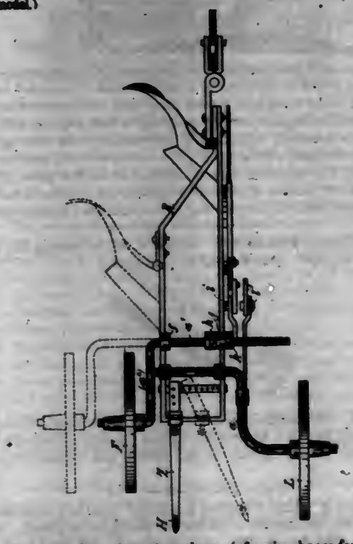
11. In a horseshoe-machine, the chute X, adjustably connected to a shaft pivoted to the machine and provided with an arm connected to a spring secured to the frame, said arm having a set-screw to operate it in a direction against the spring, and the chute having clearers adjustable therein to disengage the shoe from the die, in combination with the die, the die supporter and rocker, and the main bed-plate and the auxiliary bed-plates revoluble on a common axis, the former having peripheral circular arcs to receive the said rocker and support the same with the die-supporter and die, all essentially as set forth.

12. In a horseshoe-machine, the mechanism for feeding the bar into the machine, substantially as described, it consisting of the rolls *s*, the gear *t*, connected to one of said rolls, the gear *u*, engaging the gear *t*, and fixed to an arbor provided with a hand-wheel and a roll *v*, the latter in the same horizontal plane with the rolls *s*, and the slides *x* and *z*, provided with means of adjusting them horizontally, in combination with the passage *x'* and gage p^{13}, and the dies *o o'*, for supporting the bar when fed into the machine, all essentially as shown and set forth.

13. In a horseshoe-machine, the rotary hammer having a body circular in cross-section and supported on a shaft provided with a bearing for said body which is eccentric to the journals of said shaft, substantially as represented, in combination with the forming-die and movable bed, essentially as shown and set forth.

408,830. SUPPORT FOR SPINNING-SPINDLES. HENRY TORRENCE, Fitchburg, Mass. Filed Jan. 10, 1889. Serial No. 295,962. (No model.)

Brief.—The invention relates to self-centering spindles, and has for its object to provide a construction in which the spindle shall not be drawn from concentric position by the pull of the band, shall have the proper degree of resistance to lateral motion under the influence of an unequally-balanced load, and shall be returned promptly to its true position after having been moved out of such position.



Claim.—1. A sleeve-whirl spindle, a bolster-case adapted to be attached to the bolster-rail, and a bearing-tube which receives the spindle and which fills the bolster-case at or near the plane of the band-pull only, and which rests against a conical surface adapted to permit the foot of the bearing-tube to move laterally thereon, and operating to return the tube to its normal position, substantially as described.

2. A sleeve-whirl spindle, a bolster-case adapted to be attached to the bolster-rail, and a bearing-tube which receives the spindle and which fills the bolster-case at or near the plane of the band-pull only and rests against a conical surface adapted to permit the bearing-tube to move laterally thereon, combined with a spring adapted to co-operate with the conical surface to return the bearing-tube to its normal position, substantially as set forth.

3. A sleeve-whirl spindle, a bolster-case adapted to be attached to the bolster-rail, a bolster-bearing for the spindle, which fills the bolster-case at or near the plane of the band-pull only and adapted to be held against a conical surface, a step-bearing for the foot of the spindle resting against a conical surface, and a spring interposed between the said bearings and adapted to operate upon each of the bearings and to co-operate with the conical surfaces to return the bearings to their normal position, substantially as set forth.

4. A sleeve-whirl spindle, a bolster-case adapted to be attached to the bolster-rail, as usual, a bolster-bearing which fills the bolster-case at one point only, and a step-bearing which permits the foot of the spindle to move laterally, one or both of such bearings resting against a conical surface, which permits the bearing to move laterally thereon, combined with a spring to co-operate with the conical surface to resist deflection of the spindle and to return it to its normal and concentric position, substantially as set forth.

408,831. PLOW. AUGUST J. VIETZKI, Grandenz, Prussia, Germany. Filed Apr. 2, 1888. Renewed June 26, 1889. Serial No. 315,909. (No model.)

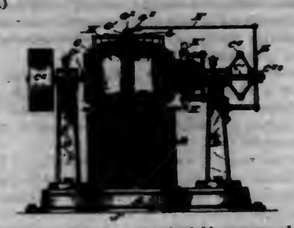
Claim.—1. In a plow, the axles *c d'*, forming knees for the two fore wheels L F, which can be moved by an angle-lever W, provided with two arms, by means of adjustable driving-rods S S', so that the different large adjustments of the two wheels enable the determination of the depth of the furrow, whereby the arm of the angle-lever which places the furrow-wheel in position stands on the dead-point as soon as the wheel has obtained its correct position, in order to enable the placing and displacing of the plow by means of one single lever.

2. The combination, in a plow of the axle *d'*, adjustable in the direction of its length, and the axle *a* of the furrow-wheel, for the purpose of changing the distance of the two fore wheels as may be necessary, and a frame adapted to carry one or two plows, and thus to transform a one-shared plow into a two-shared plow in such manner that the furrow-wheel can in each case be placed in the last furrow and can be kept by this in its correct position.

3. In a plow such as described, the combination, with the furrow-wheel F, the bearings *f*, the regulating-ring *h*, and the arm *h'*, of an axle *d'*, which is capable of being adjusted in the direction of its length within said bearings and ring, for the purpose of using the plow as a single or double share plow, in such a manner that in both modes of working the furrow-wheel can always be placed in the furrow last made, so as to be guided by it, substantially as set forth.

4. In a plow such as described, the connecting-rods S', which can be adjusted as regards their length and made to transmit the motion of the lever W to the axles *a d'*, for the purpose of adjusting the position of the wheels with respect to each other, in combination with said lever and its differently-located arms *s s'*, substantially as set forth.

408,832. CLASP. JULIUS WEBBER, Bridgeport, Conn., assignor to James Alfred Howe, same place, and Parkhurst S. M. Hunt, New York, N. Y. Filed Apr. 24, 1888. Serial No. 306,260. (No model.)



Claim.—1. In a clasp of the character described, the combination, with the staple, the same constituting the female member of the clasp, of a stationary tongue arranged to enter the staple, and a locking-hook having a cam-surface at the outer side of the beak, and a cam-surface at its back, said hook being pivoted and lying parallel with the tongue, substantially as set forth.

2. In a clasp, the combination, with the staple forming the female member and mounted upon one of the edges to be fastened, of the tongue secured upon the complementary edge and adapted to freely enter the staple, and the locking-hook pivoted at its rear end and lying alongside the tongue, said hook having at its under and forward end a cam-surface adapted to engage the lower side of the staple, and thereby raise said hook, and having also a cam-surface at its back adapted to engage the upper side of the staple, and thereby depress said hook after the beak has passed through said staple, substantially as set forth.

3. In a clasp of the character described, the combination, with the plate having the projecting tongue, said plate being curved upwardly from the base to which it is attached, of the locking-hook pivoted beneath the plate substantially in the line with the tongue, the inclined surfaces upon said hook, and the staple arranged upon its complementary meeting edge and adapted to be engaged by the tongue and hook, substantially as specified.

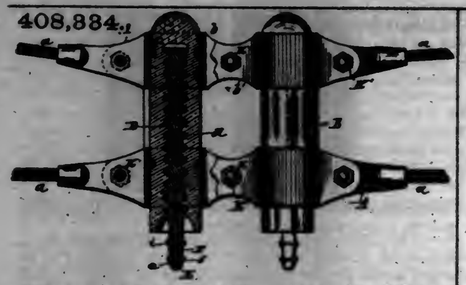
408,833. GOVERNOR FOR ELECTRIC MOTORS. GEORGE H. WHITTINGHAM, Baltimore, Md. Filed Oct. 2, 1888. Serial No. 287,057. (No model.)

Claim.—1. The combination, with the field-magnet and armature of an electric motor, of a series of contact-plates arranged on each pole of the field-magnet and electrically connected with the layers of the coils thereof, and an intermediate shunt-arm electrically connected with the opposite series of plates and mechanically connected with a governor arranged to receive motion from the shaft of the armature, substantially as specified.

2. The combination, with each pole of the field-magnet of an electric motor, of a series of insulated contact-plates, each electrically connected with the coils of one side of the magnet, and an interposed shunt-arm having contact-plates adapted to bear upon opposite surfaces of said contact-plates, and means for moving the shunt-arm plates along the series of contact-plates, substantially as specified.

3. The combination, with the field-magnet of an electric motor, of an insulated bridge, a series of insulated plates at each end of the bridge terminating in a curved line and electrically connected with the coils of the field-magnet, a shunt-arm pivoted on the bridge and terminating in contact-plates, and stops projecting from the bridge to limit the movement of the arm, substantially as specified.

4. The combination of the magnet B, bridge H, having the blocks H^3, the insulated projecting strips J, electrically connected with the coils of the field-magnet, and the shunt-arm G, mounted on the pivot G^3, seated on the bridge and having the contact-plates I, arranged to embrace the plates J, substantially as specified.



5. The combination, with the magnet B, bridge H, and plates J, mounted on said bridge, of the shunt-arm G, pivoted on said bridge and having the plates I, pivot G^3, and the stops H', projecting from said bridge, substantially as specified.

6. The combination of the insulated plates J, the shunt-arm G, pivoted between them, the rock or crank arm G^2, attached thereto, rod F, and lever E, connecting said arm G^2 with the governor C^3, substantially as specified.

408,834. DEVICE FOR SUSPENDING ELECTRIC CONDUCTORS. THOMAS E. ADAMS, Cleveland, Ohio. Filed Jan. 9, 1889. Serial No. 296,231. (No model.)

Claim.—1. In a device for supporting electrical conductors, an insulator-pin constructed with a recess or depression for the reception

408,834.

and attachment of a bent portion of the conductor, substantially as set forth.

2. The combination, with an insulator-pin provided with a recess or depression in its lower end, of a conductor provided with a bend which is fitted into said recess or depression, substantially as set forth.

3. An insulator-pin constructed with a recess or depression for the reception and attachment of a bent portion of the conductor, and a clip that extends beneath said recess or depression, substantially as set forth.

4. The combination, with an insulator-pin constructed with a recess or depression in its lower end and a conductor provided with a bend that fits within said recess or depression, of a clip that encircles the bent portion of the conductor, the lower surface of the clip being in a plane parallel with that of the under side of the straight portions of the conductor, substantially as set forth.

5. The combination, with an insulator-pin constructed with a recess or depression in its lower end, of a clip the opposite ends of which are riveted to the insulator-pin, substantially as set forth.

6. The combination, with an insulator-pin constructed with a recess or depression in its lower end, of a clip provided with laterally-projecting ears, substantially as set forth.

7. The combination, with an insulator-pin provided at its lower end with an elongated concave seat having a recess or depression formed between the ends of said seat, of a clip constructed and arranged to encircle the seat and retain a conductor in contact therewith, substantially as set forth.

8. The combination, with an insulator and a clip for securing a conductor thereto, of an electrical contact inserted through the pin and adapted to engage the upper surface of the conductor, substantially as set forth.

9. The combination, with an insulator-pin and a clip for securing a conductor thereto, of a rivet inserted through the clip and insulator-pin and forming an electrical contact with the conductor, substantially as set forth.

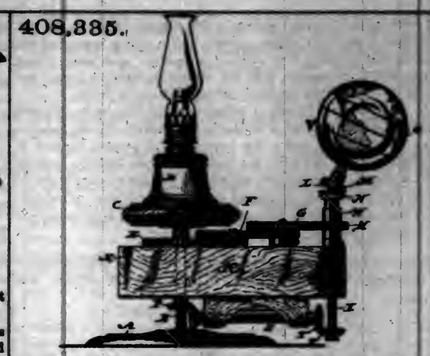
10. The combination, with a clamp, of an insulator secured thereto by yielding or elastic material interposed between the clamp and insulator, substantially as set forth.

11. The combination, with a clamp, of an insulator constructed with a groove or recess on its outer surface, and yielding or elastic material interposed between the clamps and insulator, substantially as set forth.

12. The combination, with a two-part clamp, of an insulator secured between the two parts of the clamp, and yielding or elastic material interposed between the clamp and insulator, substantially as set forth.

13. The combination, with a clamp, of two insulators secured between the two parts of the clamp, each insulator having yielding or plastic material interposed between its outer surface and the surface of the clamp, substantially as set forth.

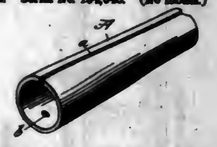
14. The combination, with two insulators and clamps constructed and arranged to engage the insulators at their upper and lower ends, of two suspending-wires attached to the opposite ends of each clamp, substantially as set forth.



15. The combination, with the insulator-pin and its clip, of the conducting-wire formed with an offset or bent portion fitted to the clip, substantially as set forth.

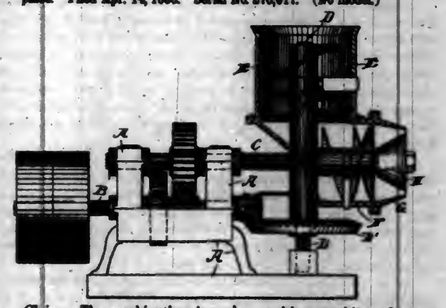
16. The conduction-wire formed with an offset or bent portion and the clip fitted thereto, the clip being provided with a hole at its upper end for connection with the insulator-pin, substantially as set forth.

408,835. TELLURIAN. JAMES A. BOTOS, Wellsborough, Pa. Filed July 31, 1888. Serial No. 281,808. (No model.)



Claim.—A tellurian consisting of a standard A, a fixed post B, mounted thereon and provided with cog-disks P and E, a platform C, mounted on said post for the reception of a lamp D, a swinging-arm K, mounted loosely upon the post B intermediate between the cog-disks P and E, a shaft S, mounted in journals connected with said

408,835.

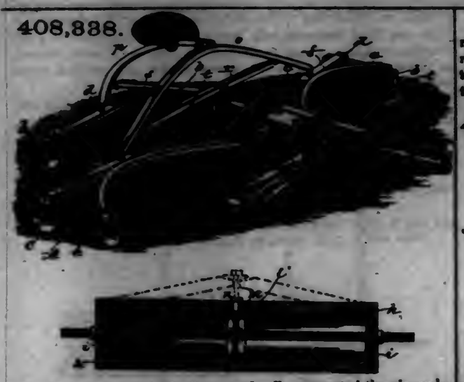


swinging arm K and provided with cog-wheel R, intermeshing with cog-wheel P and a cog-wheel T, a vertical shaft I, mounted in the outer end of the swing-arm K, said shaft being bent at its upper portion to form an angle of twenty-three and a half degrees, and provided at its lower end with a cog U, intermeshing with the cog T, a sleeve W, provided with a cog H and a crown-wheel N, gearing F G, connecting the cog-wheel H with the cog-wheel E, a globe C, into which the bent portion of the shaft I passes, and a crown-wheel M, intermeshing with the crown-wheel N and connected to said globe.

408,836. TOOL-SOCKET. RICHARD R. REED, Pittsburg, Pa. Filed June 12, 1884. Serial No. 134,640. (No model.)

Claim.—The herein-described metallic spring-socket for the handles of tools, having a longitudinal split or opening on one side and adapted for use substantially in the manner and for the purposes described.

408,837. CLAY-WORKING MACHINE. WILLIAM R. CUNNINGHAM, Frankfort, Ind., assignor to the Wallace Manufacturing Company, same place. Filed Apr. 14, 1888. Serial No. 270,617. (No model.)



Claim.—The combination, in a clay-working machine, of a casing consisting of the vertical part E and the horizontal part F, said part E being formed open at the bottom and secured to said part F over a corresponding opening formed therein, the horizontal shaft C, extending into said horizontal casing, carrying the forcing-screw and geared to suitable driving mechanism, the vertical shaft D, extending up into the part E, through the horizontal part F of said casing, at right angles with said horizontal shaft, and provided with a gear-wheel beneath said casing, which is geared to the same driving mechanism that drives said horizontal shaft, all substantially as set forth.

408,838. ROLLER. SPENCER R. DAVIS, Horicon, Wis., assignor to the Van Brunt & Davis Company, same place. Filed Feb. 16, 1889. Serial No. 300,063. (No model.)

Claim.—1. The combination, with a series of independent roller-sections, each consisting of a frame and roller mounted therein, and a seat-supporting frame connecting said sections, of draft attachments connected directly with the several sections, substantially as set forth.

2. The combination, with a series of independent roller-sections,

408,838.

each section consisting of a frame and rollers mounted therein, and a seat-carrying frame supported alike on all of said sections, of draft attachments connected directly to the several sections.

3. The combination, with a series of independent roller-sections, each section consisting of a frame and rollers mounted therein, of a seat-carrying frame pivotally connected to the several sections, and draft attachments connected directly to the several sections.

4. The combination, with roller-sections, each section consisting of a frame and rollers mounted therein, arched supports resting on the sections, braces on the supports, and a seat, of means for applying draft directly to the roller-sections, substantially as set forth.

5. The combination, with roller-sections and seat-frame, of a pole and a whiffletree loosely supported by the pole and connected loosely to the forward roller-sections, substantially as set forth.

6. The combination, with the roller-sections, arched supports resting on said sections, braces connecting the supports, and chains or similar devices connecting the forward end of the rear section with one of said braces, of a pole hooked to this brace, said pole having a slot, hangers or loops thereon, a whiffletree extending through the latter, and chains or similar devices connecting the forward ends of the front sections with the ends of the whiffletree, substantially as set forth.

7. A hollow roller having a removable portion, the latter being made in sections, and means adapted to pass between the adjacent ends of the sections, whereby the removable portion is held in place, substantially as set forth.

8. In a roller, the combination, with the heads, staves, and center-brace, of a removable sectional stave and a screw or similar device adapted to pass between the adjacent ends of the sectional removable stave and into the brace, whereby the sections of this stave are forced outward and against the brace and held in place, substantially as set forth.

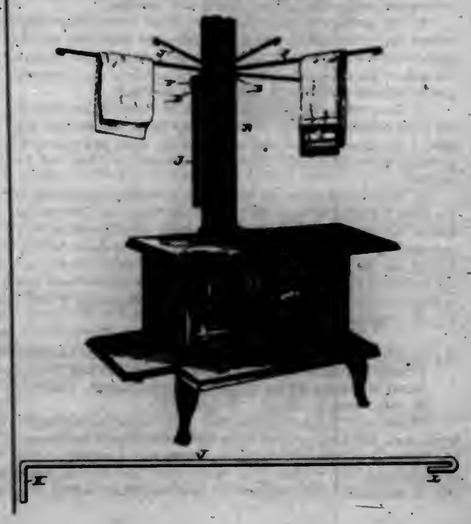
408,839. CLOTHES-LINE STRETCHER. SAMUEL DOBBS, Rochester, N. Y. Filed July 23, 1888. Serial No. 280,776. (No model.)

Claim.—The combination, with a set of clothes-lines A A, of the rings C C at one end and the cranked shaft B, the spools a a, the ratchet g, pawl h, and hangers b b, forming the winding-fixture, at the other end, the whole arranged to operate in the manner and for the purpose specified.

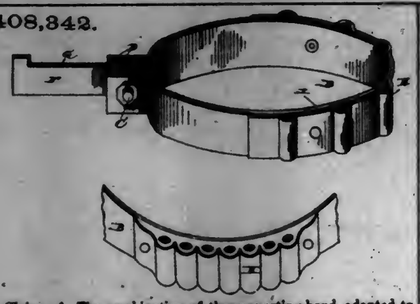
408,840. CRUPPER. LEWIS S. BLAIR, Rainsboro, Ky. Filed May 3, 1888. Serial No. 272,502. (No model.)

Claim.—1. In a crupper, the combination, with a bridge-piece and means of attachment to a harness, of a pair of curved brace-plates pivoted to the bridge-piece, ribs secured to the brace-plates, and straps or similar devices for confining the tail of an animal in place in the ribs, substantially as set forth.

2. In a crupper, the combination, with a bridge-piece hollowed out, padded, and covered, substantially as described, and a branched strap by which the bridge-piece is fastened to a harness, of a pair of split bolts, brace-plates pivoted thereto, slotted U-shaped ribs pivoted to said brace-plates, and straps extending around the ribs and through the slots, substantially as set forth.



408,841. TOBACCO-PIPE. HERBERT C. W. BENNETT and EDWARD CHESHIRE, London, England. Filed Nov. 6, 1888. Serial No. 290,196. (No model.) Patented in England Sept. 6, 1888, No. 12,883.



Claim.—1. A pipe-bowl open at top and bottom and provided with pins extending across it near the latter, in combination with the tube b, leading to the mouth-piece, a movable top cover, and a movable perforated bottom cover, for the purpose set forth.

2. A pipe having a bowl provided with a movable perforated bottom, and pins extending across said bowl a little above the same, substantially as set forth.

408,842. CLOTHES-DRIER. GEORGE L. GERARD, New Haven, Conn. Filed Jan. 28, 1889. Serial No. 297,515. (No model.)

408,842.

Claim.—1. The combination of the supporting-band adapted to be clamped around a stove-pipe and provided with a horizontal supporting-arm having a longitudinal notch in its upper edge and the drier-arms removably supported by the said band or ring, as set forth.

2. The combination of the band or ring adapted to be clamped around the stove-pipe and having vertical corrugations, the guard-plate secured to the inner side of the band and extending over the corrugations, and the drier-arms having their ends engaging said corrugations, as set forth.

3. The drier-arm consisting of a cylindrical rod having one end bent at right angles to its length and its other end bent back or doubled on itself, as and for the purposes set forth.

4. The combination of the band or ring adapted to be clamped around a stove-pipe and provided with a series of vertical bearings H and an arm F, and the removable drier-arms, each consisting of a rod having one end bent at a right angle to form a spindle K, adapted to engage one of the bearings H, and having its other end doubled on itself to form the hook L, adapted to engage the arm F, as set forth.

408,843. STEAM-BOILER. WILLIAM M. GLASSON, Socorro, N. Mex. Filed May 8, 1889. Serial No. 309,963. (No model.)

Claim.—1. The combination, with the boiler and its tubes, of the water-compartment surrounding the same and extending below the water-line, the upper row of tubes being extended through said water-compartment, substantially as shown and described.

2. The combination, with the boiler, of the water-compartment around said boiler and secured thereto below the water-line, and the upper set of tubes extended through the ends of the boiler and through the ends of the water-compartment and one inch from the horizontal portion thereof, substantially as shown and described.

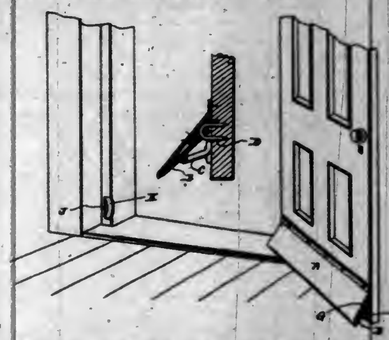
3. The combination of the boiler with its water-compartment, of the tubes extended through the end of the boiler and through the ends of the water-compartment, and the outer water jacket or compartment surrounding said boiler and the furnace, as shown and described.

4. The combination of the boiler with its water-compartment, of the tubes extended through the ends of the boiler and through the ends of the water-compartment, and the outer water jacket or compartment surrounding said boiler and the furnace, as shown and described, and the blow-off pipe extending the full length of boiler and one inch from the bottom of same, with holes in bottom of said pipe to receive the sediment that may be lying on the bottom of boiler and the boiler surrounded by water.

408,844. SUBSTITUTE FOR IVORY, &c. FREDERICK GREENING, Uxbridge, England, assignor of two-thirds to Ogle Robert Peck, Toronto, Canada, and Thomas William Taylor Potts, London, England. Filed Nov. 30, 1888. Serial No. 292,242. (No specimens.)

Claim.—1. The described method of producing substitutes for ivory, horn, and other articles, as set forth, consisting in first preparing fibrous or cellulose substances to constitute a base by treating said substances with a mixture of fuming nitric acid and sulphuric acid in substantially the proportions described, then washing this product and submitting it to a bath of sodium chloride and ammonia-alum, and then dissolving such base in a solvent composed of a distillation of acetate of lead and anhydrous lime mixed with fusel-oil, in substantially the proportions above named, and purified, as set forth.

2. In the manufacture of substitutes for ivory, horn, or other articles, as set forth, the described method of treating a base made from fibrous or cellulose material, consisting in dissolving the same in a solvent composed of a distillation of acetate of lead and anhydrous lime mixed with fusel-oil, in substantially the proportions above named, and purified, as set forth.



408,845. CAR-COUPLING. ANDREW J. GEER, Valley Falls, Kans. Filed June 8, 1889. Serial No. 313,547. (No model.)

Claim.—1. The draw-head D, having a longitudinal slot S in its upper face, a transverse recess R in its front face, having a slot *r* in its bottom, and a vertical slot U, connecting said slot and recess, in combination with the hook H, having a transverse slot *o* near the rear end of its body, the pin P in said longitudinal slot S engaging said transverse slot *o*, and the integral head E of said hook, said head having a beveled front face F, provided with a notch *j*, and also having an upward projection C, for the purpose set forth, the rear end of said transverse slot *o* engaging said pin P, the front face of said upward projection C engaging the front end of said longitudinal slot S, and the notch *j* engaging the bottom slot *r* simultaneously when the hook is drawn forward by the link, as herein specified.

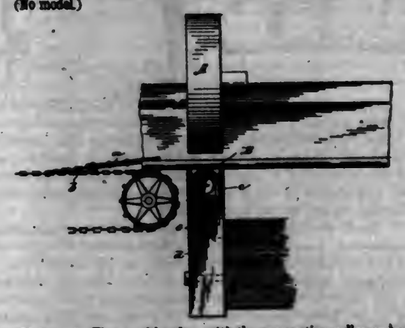
2. The draw-head D, having a longitudinal slot S in its upper face, said slot being provided with a lateral notch *s* in its rear vertical wall, said draw-head also having a transverse recess R in its front face, connected to said slot S, and having a slot *r* in its bottom, in combination with the hook H, having a transverse slot *o* near the rear end of its body, a pin P within said longitudinal slot S, engaging the slot *o* in the hook, whereby the latter is pivoted thereon and may be set in elevated position by engaging its rear end within the lateral notch *s*, and the integral head E of said hook, having a beveled front face F, provided with a notch *j*, adapted to engage said slot *r* in the bottom of the transverse recess R, the whole substantially as shown and specified.

408,846. WEATHER-STRIP. OLIVER B. HATHAWAY, Edison, Ohio. Filed Mar. 8, 1889. Serial No. 302,476. (No model.)

Claim.—The combination, with the door, of the strip B, loosely hung on the door, the spring secured at one end to the door and having its other end projecting beyond the edge of the door, the intermediate portion of the spring bearing on the strip B, the packing-strip secured to the door and extending over the upper edge of the strip B, and the cap secured to the door and covering the strip B and the packing-strip, as set forth.

408,847. FISHING-HOOD. FREDERICK HUBBARD, Berlin, assignor of one-half to F. L. Hungerford, New Britain, Conn. Filed Feb. 28, 1888. Serial No. 301,577. (No model.)

Claim.—1. The combination of the line *a*, hook or hooks *b*, attached thereto, a spring attached by one end to said line, and a hook or hooks attached to the other end of said spring the length of said



408,847.

spring, and the point of its attachment being such that when the spring is contracted the hook or hooks attached thereto are separated from the hook or hooks attached directly to the line, substantially as described, and for the purpose specified.

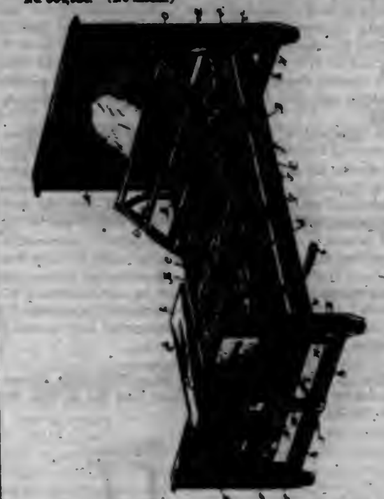
2. The combination of a fishing-line, a hook or hooks at its end, a spring attached by one end to said line, a fish-hook *c* at the other end of said spring, the length of said spring and the point of its attachment being such that when the spring is contracted the hook or hooks attached thereto are separated from the hook or hooks attached directly to the line, and a sliding collar or guide for keeping the hook on the end of the spring close to the line, substantially as described, and for the purpose specified.

408,848. SHARPENER FOR NAIL OR SPIKE BLANKS. JOHN F. JONES, Iron Mountain, Mich. Filed Nov. 30, 1888. Serial No. 292,313. (No model.)

Claim.—1. The combination, with the supporting roller or bearer for the blank, of the oppositely-placed power-driven cutting-disks revolving continuously in a direction which will tend to press the blank toward the supporting-roller, substantially as and for the purpose set forth.

2. The combination, with the blank-supporting roller or bearer and adjustable bearings or boxes in which the journals of said roller are yieldingly supported, of the oppositely-placed power-driven cutting-disks revolving continuously in a direction which will tend to press the blank toward the roller or bearer, substantially as and for the purposes hereinbefore set forth.

408,849. TIRE-HEATING FURNACE. JOHN KIRWIN, Cleveland, Ohio. Filed Mar. 13, 1889. Serial No. 303,092. (No model.)



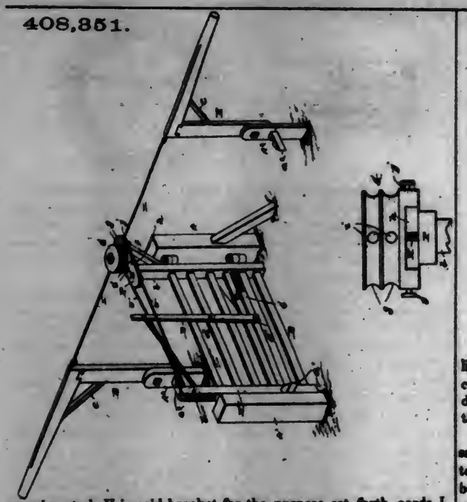
Claim.—1. A tire-heating furnace having a concentric vapor-distributing compartment, and a combustion-chamber for heating the tire adjoining said compartment, with a plate between said compartment and said chamber perforated to pass the vapor to the combustion-chamber, in combination with a vapor-generator and a series of pipes extending radially therefrom into the vapor-distributing compartment, substantially as set forth.

2. In a tire-heating furnace, a walled and covered combustion-chamber in which the tire is heated, and a vapor-distributing compartment adjoining said chamber, with a perforated plate separating it from the combustion-chamber, in combination with a series of supply-pipes provided with openings, through which the vapor enters the said distributing-compartment, substantially as set forth.

3. In a vapor-burning tire-furnace, a series of vapor-distributing compartments, vapor-supply pipes passing through said compartments and provided with openings into each compartment, and a tubular switch extending into each supply-pipe and having openings out of alignment with each other to register with openings in the supply-pipe, whereby when the openings to one compartment are opened those to another compartment are closed, substantially as set forth.

4. In a tire-heating furnace, concentric vapor-distributing compartments, a series of radial pipes traversing the compartments at intervals and extending through the outer compartment, tubular switches seated in the outer extremities of said pipes and each provided with a rigid arm, and a ring extending around the furnace, to which said arms are attached, whereby all the switches may be simultaneously operated, substantially as set forth.

408,850. FAMILY OR INVALID BEDSTEAD. JOHN LEGGETT and JASPER H. LEGGETT, Hagerstown, Md. Filed Mar. 27, 1888. Serial No. 304,926. (No model.)



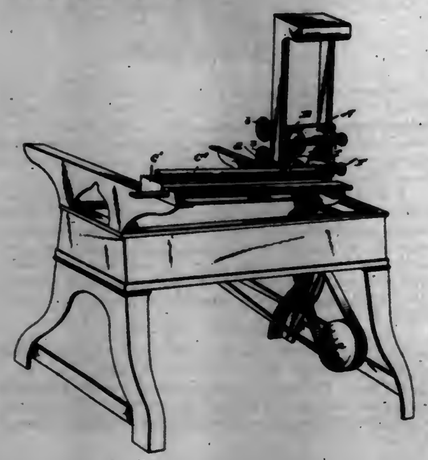
Claim.—1. A bedstead and a sheet supported thereby, in combination with a mattress-carrying frame adjustable vertically on said bedstead beneath said sheet, springs on which said mattress-carrying frame is supported, said springs normally holding said mattress in its uppermost position, and a lever for depressing said mattress-carrying frame, substantially as set forth.

2. A bedstead and a sheet supported thereby, in combination with a mattress-carrying frame adjustable vertically on said bedstead beneath said sheet, springs on which said mattress-carrying frame is supported, said springs normally holding said mattress in its uppermost position, a lever for depressing said mattress-carrying frame, and a locking-catch co-operating with said lever to hold said mattress-carrying frame in its lowermost position, substantially as set forth.

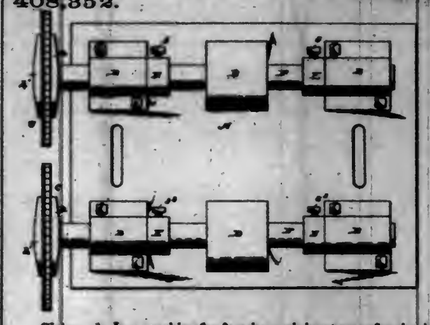
408,851. GATE. LAFAYETTE W. LOOMARY, Monmouth, Oreg. Filed Apr. 27, 1889. Serial No. 308,806. (No model.)

Claim.—1. The gate B, having a bracket F on its rear vertical bar, and the latch-bar C in said gate, in combination with the pulley G, pivoted on said bracket, said pulley having arc-shaped recesses A,

408,351.



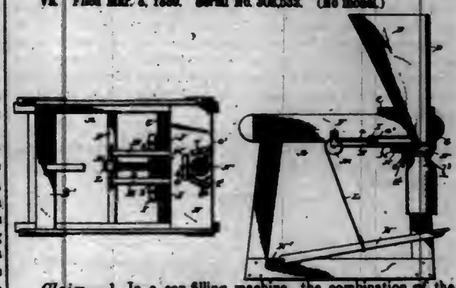
engaging studs H in said bracket for the purpose set forth, cords J, connecting said pulley with said latch-bar and adapted to unlatch it, cords I, wound around said pulley in opposite directions and led therefrom, and levers for drawing on said last-mentioned cords, substantially as described.



2. The pulley G, having the grooves *g*, with pins *i* in the front face thereof, and the arc-shaped recesses A, in combination with the gate B, the bracket F thereon, to which said pulley G is pivoted, studs H on said bracket engaging said recesses A, the latch C, the cords J, connecting said latch to side points of said pulley, levers E, and cords I, wound in opposite directions around said pulley within said grooves and attached to said pins, the whole adapted to operate substantially as described.

3. The latch-post A', carrying the two-way latch *a*, the lever-posts A^3, carrying the one-way latches a^3, the main post A, the gate B, hinged thereto, the spring-operated latch-bar C, sliding in said gate, and the arm D, pivoted to said gate and latch-bar, in combination with the bracket F on the rear vertical bar of said gate, the studs H on said bracket, the pulley G, pivoted on said bracket and having arc-shaped recesses A, engaging said studs, the pulley *b'*, journaled in the front vertical bar of said gate, the cords J, leading from the free end of said arm D around said pulley *b'* and connected to opposite sides of said pulley G, the levers E, pivoted to said lever-posts A^3, and the cords I, leading from said levers and wound in opposite directions around said pulley G, the whole constructed and operating substantially as hereinbefore described.

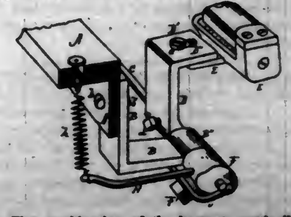
408,352. TENONING-MACHINE. OSCAR MCCULLOUGH, Winona, Minn., assignor to C. F. Schroth, same place. Filed Mar. 23, 1888. Serial No. 268,780. (No model.)



408,352.

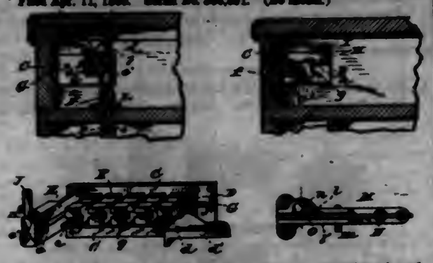
Claim.—1. In a machine for forming sash-bar tenons for check or lip rail sash, the combination of the rotative cutters *b b* and rotative cutters C C, with the interposed cope-head *d*, arranged in the relation described, and a reciprocating carriage adapted to support and guide the stuff, as specified.

2. In a machine for forming sash-bar tenons for check or lip rail sash, the combination of the rotative cutters *b b*, the rotative cutters C C, having endwise-adjustable shafts, the vertically-adjustable bracket-bearings for said shafts, the cope-head *d*, arranged as described, and a reciprocating carriage adapted to support and guide the stuff, substantially as specified.



408,353. CAN-FILLING MACHINE. SAMUEL MORRIS, Kinsale, Va. Filed Mar. 2, 1889. Serial No. 302,532. (No model.)

Claim.—1. In a can-filling machine, the combination of the main frame and the hopper, the strip N, secured beneath the feed end of the hopper and having an opening registering with the outlet of the hopper, and the strips O, O', and O^2, adjustably secured to the lower face of the strip N, adjacent to the opening therein at different angles, and adapted to secure and hold the can while being filled, substantially as and for the purpose described.



2. The herein-described can-filling machine, the same comprising, in combination, a main frame, a hopper having one of its sides flattened and extending in a vertical line from the top to its outlet, a strip arranged beneath the hopper and having an opening coincident with the outlet of the same, the adjustable strips O, O', and O^2, secured to the lower face of the said strip adjacent to the opening therein and formed with groove O^x, a spring-actuated feed-regulating slide at the bottom of the hopper, and means, substantially as described, for withdrawing the slide and uncovering said feed-opening against the tension of the springs actuating the feed-regulating slide, substantially as described.

408,354. LOOM-TEMPLE. THOMAS HORTON, Fall River, Mass. Filed May 20, 1889. Serial No. 312,563. (No model.)

Claim.—The combination of the beam A, vertically-adjustable bracket B, provided with the slot B' and screw *b*, rod C, bracket D, held adjustably on said rod by set-screws *d* and provided with the slot D' for adjustably holding the case E, sleeve F, rod and spring H A, and stop-rod K, substantially as and for the purpose set forth.

408,355. COMBINATION-LOCK. ARTHUR B. PEIRCE, Cortland, N. Y. Filed Apr. 11, 1888. Serial No. 270,251. (No model.)

Claim.—1. In a combination-lock for drawers, a series of rocking tumblers on a journal having one of their ends notched, said notches being adapted to register with each other and to receive an oscillating bar, as set forth.

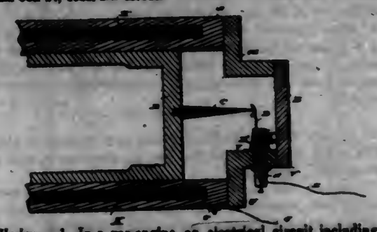
2. In a lock, a series of reversible tumblers having one end journaled in a frame and the other end with a notch at one side the center of its end face, said tumblers adapted to be rocked to bring the notches in alignment to receive an oscillating bar, as set forth.

3. The combination, with a rectangular frame or bracket having a cross-bar or floor therein, of a series of rocking tumblers journaled at one end in the frame, the other end resting on its floor, said tumblers having notches in one end adapted to register and to receive an oscillating bar, as set forth.

4. In a lock-frame, a series of reversible tumblers journaled at one end therein, the other end having a notch at one side the center of its face with one inwardly-inclined wall, part of the tumblers arranged on the journal with the notches below the center and adapted to be rocked to bring all the notches in line with the inclined wall of the rocked tumblers on the same plane with the straight walls of the notches of the stationary tumblers arranged with the notches above the center, and to receive an oscillating bar in said notches, as set forth.

5. The combination, with a lock frame or bracket composed of a side or securing plate, an open slotted end plate extending from one end of the securing-plate, having an arm at right angles thereto, and a closed slotted end plate on the other end of the securing-plate, of a bar pivoted on the right-angled arm and working in the slots of the plates and adapted to take into notches in rocking tumblers journaled in the bracket, as set forth.

6. The combination, with a lock frame or bracket having slotted end pieces with a cross-bar or floor between them, and an arm at right angles from one of said ends pieces, having the end of a bar pivoted thereon that oscillates in the slots and in notches of the rocking tumblers journaled in the frame, of a sleeve on the other end piece provided with a spring-actuated locking-bolt, said bolt being connected with the free end of the bar by a link limiting the movement of the bolt, as set forth.



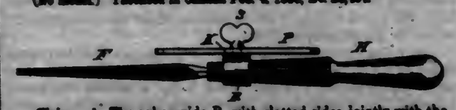
7. The combination, with a desk having a lock frame or bracket secured on its inner side with a series of end-notched rock-tumblers journaled within one side of the frame, and an oscillating pivoted bar on the other side of the frame working in the notches of the tumblers and having its free end connected with a vertical locking-bolt, of a series of spring push-buttons on the side of the desk for rocking the tumblers and a push-button on top the desk for operating the locking-bolt, as set forth.

8. The combination, in a lock-frame, with a series of rocking tumblers having notches in their ends adapted to register and to receive a pivoted oscillating bar, of one of the end plates of the frame re-enforced at one end, with a cut-away sleeve therein, having a vertical locking-bolt recessed in its side, and a link pivoted in said recess and to the free end of the oscillating bar, as set forth.

9. The combination, with a desk having a lock-frame secured on its inner side with reversible rocking tumblers therein having notched ends receiving an oscillating bar, the free end of the bar connected with a vertical bolt in the end plate of the frame, of a shoe secured to the floor of the desk having a pivoted spring-lever therein and underneath said bolt, one end of said lever connected with a bolt extending through the floor and adapted to take into the edge of a spring-actuated drawer beneath, as set forth.

10. The combination, with a desk having a reversible tumbler lock mechanism connected with a vertical bolt, of a shoe beneath the bolt having side plates at one end with a lever pivoted between them, one of said plates having a semicircular recess, a locking-bolt in said recess extending through a sleeve beneath the shoe, the upper part of the locking-bolt having a notch therein to receive one end of the lever and the other end supported by a spring beneath the vertical bolt of the lock, as set forth.

408,356. GAS-ENGINE. RAINER S. RUMAN, San Francisco, Cal. Filed Apr. 9, 1888. Serial No. 269,756. (No model.) Patented in England Oct. 27, 1888, No. 15,468.

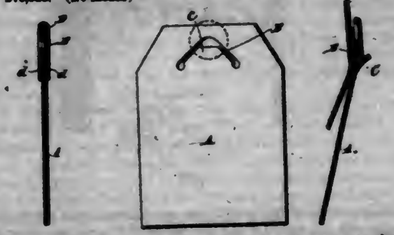


Claim.—1. In a gas-engine, an electrical circuit including the engine-piston, an electrode fixed to the piston and reciprocating with it, and a second electrode fixed within the explosive chamber of the engine and insulated therefrom, whereby the electrical circuit is closed and broken at each stroke of the piston, as described.

2. In a gas-engine, an electrical circuit including the engine-piston and electrode fixed to and reciprocating with the piston, in combination with a second insulated flexible electrode fixed within the engine-cylinder, so that contact is made and broken between the two electrodes at each stroke of the piston, as herein described.

3. In a gas-engine, the spring D, the insulated spring-holder E, having the clamp-block F and the set-nut H, connected with one pole of an electric battery, in combination with a connecting-finger C, attached to the piston B, and the cylinder A, connected with the battery by means of the electric wire J, for the purpose of making the circuit by direct connection with the piston at each stroke of the same, constructed and operated substantially as and for the purpose set forth.

408,357. DEVICE FOR SHARPENING SAWS. WILLIAM ESTEN, Picton, Ontario, Canada. Filed Nov. 20, 1888. Serial No. 292,237. (No model.) Patented in Canada Feb. 4, 1886, No. 28,464.



Claim.—1. The rake-guide B, with slotted sides, jointly with the bevel-guide P, substantially as described.

2. The bevel-guide P, secured as above described, jointly with the rake-guide B, substantially as described.

408,358. CARBON FOR ELECTRIC LIGHTING. CARL A. J. H. BERNHARDI, London, England. Filed May 15, 1888. Serial No. 273,978. (No specimens.) Patented in England Apr. 26, 1888, No. 6,191; in Germany May 12, 1888, No. 47,490; in France May 30, 1888, No. 190,760, and in Belgium June 30, 1888, No. 82,908.

Claim.—The process of treating carbon electrodes for arc lights, which consists in first impregnating the carbons with a dilute solution of calcic chloride and then treating the same with a potassium compound which is soluble in water or its described equivalents, this being done partly with wet solutions, but principally with fused materials, as set forth.

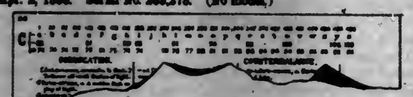
408,359. TAG. WALTON B. SMITH, Prophetstown, Ill., assignor of one-half to George Seyller, same place. Filed Apr. 11, 1888. Serial No. 270,233. (No model.)

Claim.—1. As an improved article of manufacture, a tag having a tongue therein of truncated triangular form whose free edge pro-

jects toward the top of the tag, to provide a bearing-shoulder and an opening between the upper cut end thereof and the adjacent wall of the slot, which opening is adapted to receive and retain a headed fastening device, as set forth.

2. As an improved article of manufacture, a tag having a substantially triangular slit formed therein to provide a flexible tongue whose upper reduced end is cut away, providing an opening for the reception of the head of a fastening device whose free edge projects toward the top of the tag, as set forth.

3. As an improved article of manufacture, a tag having an inverted-V-shaped slit cut therein to form a tongue whose upper angular end is cut away to form a bearing-shoulder and aperture, for the purpose set forth, and provided with a re-enforcement, substantially as described

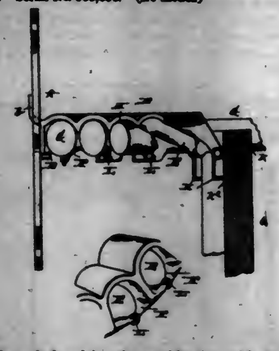


408,860. WATER-PROOF LEATHER AND PROCESS OF MAKING THE SAME. Adolph Sohrer, Berkeley, Cal. Filed July 15, 1882. Serial No. 260,320. (Specimens.)

Claim.—1. The improvement in waterproofing and preserving leather and hide, consisting in impregnating the leather or hide with sulphochlorinated fatty bodies, substantially as described.

2. The improvement in waterproofing and preserving leather and hide, consisting in impregnating the leather or hide with a solution of the sulphochlorinated fatty bodies in oils, fats, resinous substances, or hydrocarbons, substantially as described.

3. Leather and hide impregnated with sulphochlorinated fatty bodies, as set forth.



408,861. INDEX. Harvey A. Stephenson, Allegheny, Pa. Filed Apr. 2, 1888. Serial No. 269,573. (No model.)

Claim.—1. A book having on one or more of its pages a marginal index comprising, first, an initial character or characters; second, a line of letters alphabetically arranged; third, a line of number characters arranged with relation to the letters in the first-named line to indicate the page on which the combination of the initial character and the letter of the first line appear, and, fourth, a line of number characters arranged with relation to the alphabet-line to indicate the page where each alphabet letter becomes an initial letter, substantially as and for the purposes set forth.

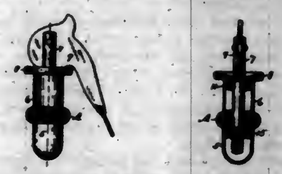
2. A book having on one or more of its pages a marginal index comprising, first, an initial character or characters; second, a line of letters alphabetically arranged; third, a line of number characters arranged with relation to the letters in the first-named line to indicate the page on which the combination of the initial character and the letter of the first line appear; fourth, a line of number characters arranged with relation to the alphabet-line to indicate the page where each alphabet letter becomes an initial letter, and, fifth, a line of numerals arranged in relation to the alphabet-line to indicate in succession the pages where combinations of the initial letter and two or more letters of the alphabet-line will appear, substantially as and for the purposes described.

408,862. CLOTHES-DRIER. Judson R. Story, Bloomington, Ill. Filed Mar. 19, 1889. Serial No. 303,853. (No model.)

Claim.—1. In a clothes-drier, the combination, with a wall-plate provided with the slots C C and the detents D D, arranged below the slots, of the arc-shaped socket-plate provided at its free ends with ears or lugs which engage the slots C C, so that the plate bears on the detents D, and the drying-arms fitting in the sockets in the socket-plate, substantially as specified.

2. In a clothes-drier, the arc-shaped socket-plate provided with a series of sockets to receive the ends of the drying-arms, the sockets being provided at their lower sides with rests F F, having reduced portions or necks L L, and the drying-arms being provided with loops or keepers to engage the said necks to hold the ends of the arms in alignment with their respective sockets, substantially as and for the purpose specified.

408,863. FALLING BAR FOR STRAIGHT-KNITTING MACHINES. Eli Tiffany, Bennington, Vt. Filed Feb. 1, 1887. Serial No. 226,142. (No model.)

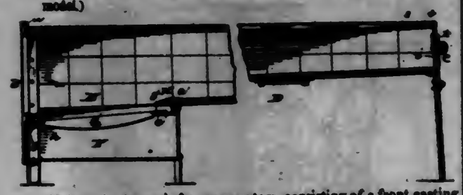


Claim.—1. A falling bar for straight-knitting machines, composed of a main bar, a parallel longitudinally-sliding impact-bar provided with two or more sets of cam-ledges disposed on different horizontal planes, and rotatably-adjustable keys connected with the main bar, said keys being each provided with an index-finger, which is adapted to register the position of the key on a scale on the face of the main bar, substantially as described, and for the purpose set forth.

2. The combination, with the main bar, of the longitudinally-sliding impact-bar provided with contact-ledges, and the interposed adjusting-keys fitted to co-operate independently with said contact-ledges as a means for regulating the lengths of the web and welt stitches independently of each other, substantially as described and set forth.

3. The combination of a series of stakers A, having shoulders *m* and *n*, with a falling bar composed of two parallel pieces, the upper one of which is vertically adjustable with reference to the under one by means of cam-ledges on the under side of the upper bar, and lugs or keys on the lower bar, substantially as shown, and means connected with the upper bar, substantially as shown, for imparting to it an endwise movement to force the cam-ledges up onto the tops of the keys or lugs aforesaid, substantially in the manner described, and for the purposes set forth.

408,864. BOTTLE-STOPPER. Justus A. Trave, New Britain, Conn. Filed May 16, 1889. Serial No. 310,942. (No model.)



Claim.—1. The combination of an expansible block, a central bolt extending through said block, devices for operating said bolt, a cap-plate extending laterally beyond the adjacent parts for resting upon the mouth of the bottle, and the block 6, consisting of sheet metal in the form of a tube open at its upper end and with the lower end rounded and perforated to receive the body of said central bolt, the confronting faces of said cap and the block 6 being provided with a centering projection and recess, respectively, substantially as described, and for the purpose specified.

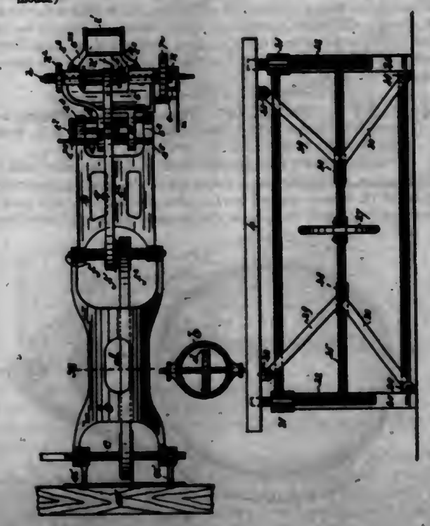
2. The combination of an expansible block, a central bolt extending through said block, devices for operating said bolt, a cap-plate 8, extended laterally beyond the adjacent parts for resting upon the mouth of the bottle, and having also the central inwardly-projecting tenon 11, and the block 6 of sheet metal, having a rounded and perforated lower end and an open upper end, which receives and is fitted to the tenon on said cap, substantially as described, and for the purpose specified.

3. The combination of an expansible block, a central bolt extending through said block and having a threaded lower end, devices for operating said bolt, the cap-plate adapted to rest on the mouth of the bottle, the perforated block 6, and the adjusting-nut 5, consisting of the sheet-metal shell and internal nut 15 at its upper end, the end of the shell and upper face of said nut confronting the expansible block, substantially as described, and for the purpose specified.

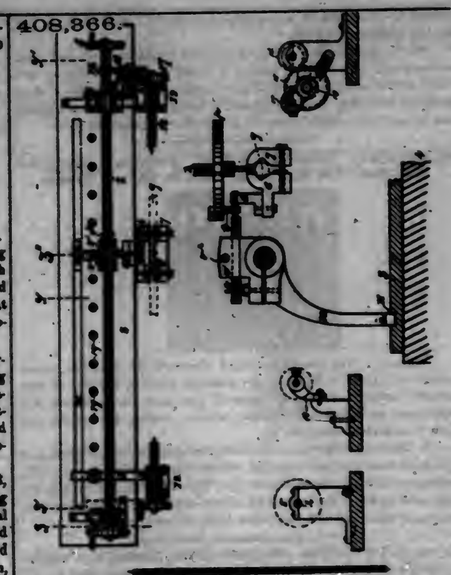
408,865. EVAPORATOR. William Wilson and William A. Wilcox, Garrettsville, Ohio. Filed Jan. 23, 1887. Serial No. 225,215. (No model.)

Claim.—1. An arch for evaporators, consisting of a front casting B, having flanges *c*, *d*, and *e*, and a rear casting C, provided with flanges *l*, *m*, and *n*, in combination with a sheet-metal body D, secured to the flanges of both castings, provided with inclined walls and a flat bottom contracted vertically, and a lining of refractory material, substantially as described.

2. An arch for evaporators, consisting of a front casting B, having flanges *c*, *d*, and *e*, openings *a* and *b*, and a rear casting C, having flanges *l*, *m*, and *n* and transverse opening *i* and door *k*, in combination with a sheet-metal body D, secured to the flanges of both castings and provided with inclined walls and a flat bottom contracted vertically, and a lining of refractory material, substantially as described.



3. An arch for an evaporator, consisting of a front casting B, having flanges *c*, *d*, and *e* and vertical projection *u*, and a rear casting C, provided with flanges *l*, *m*, and *n*, in combination with a sheet-metal body D, secured to the flanges of both castings, provided with inclined sides terminating in horizontal flanges *p q* and vertical flange *v*, and a transverse bar arranged to support one end of an evaporating-pan, substantially as described.



4. An arch for evaporators, consisting of a front casting B, having flanges *c*, *d*, and *e*, and a rear casting C, provided with flanges *l*, *m*, and *n*, in combination with a sheet-metal body D, secured to the flanges of both castings, provided with inclined sides having flanges *p* and *q*, transverse supporting-bar *r*, and plate *s*, constructed to support one end of a heater, and a smoke-stack, substantially as described.

5. An arch for evaporators, consisting of a front and rear casting having flanges *c*, *d*, *e*, *l*, *m*, and *n*, a furnace, and a combustion-chamber contracted vertically from the furnace to the rear end thereof and having inclined sides, in combination with a smoke-opening on top of the arch and a door in the rear casting, substantially as described.

6. An arch for evaporators, consisting of a front casting B, having flanges *c*, *d*, and *e*, transverse bearing-bars *g h* and openings *a* and *b*, a furnace provided with casting H, having flange *e'*, and bearing-bars *b' c'*, in combination with longitudinal grate-bars adjustable upon said bearing-bars, substantially as described.

408,866. ROUTING AND WOOD-WORKING MACHINE. Hosmyn M. Allen, Newark, N. J. Filed Aug. 16, 1888. Serial No. 283,138. (No model.)

Claim.—1. In a routing-machine, the combination, with a routing-tool arranged in bearings formed on vibrating arms, of a lathe, a screw-shaft, and a head *v*, connected with said tool for feeding the routing-tool forward, substantially as and for the purposes set forth.

2. In a routing-machine, the combination, with the routing-tool movable horizontally, as described, of a screw-shaft 2, a head *v*, movable on said shaft and connected with said routing-tool, and means, substantially such as described, for turning the rod or bar worked upon, substantially as and for the purposes set forth.

3. In combination with a lathe, a screw-shaft, a head *v*, and jaws 6 and 7, secured thereto and movable therewith, and a routing-tool having a lateral vibration on arms *b c*, substantially as and for the purposes set forth.

4. The combination, with arms *b c*, pivoted to vibrate horizontally, belts and pulleys arranged on said arms, and a shaft A, having its bearings at the outer end of said arms and having a cutting-tool thereon, of a lathe, a screw-shaft, and means adapted to move said cutting-tool longitudinally in connection with said shaft, substantially as and for the purposes set forth.

5. In combination with vibrating arms *b c*, belts and pulleys, and a shaft *h*, arranged on said arms and having a cutting-tool, a slotted bed, head and tail stocks, a screw-shaft, a feeding-head carried by said screw-shaft, a leg 10, for preventing said head from turning on said shaft, and means for connecting said head with the arm *c*, substantially as and for the purposes set forth.

6. In combination with pivoted arms *b c*, belts and pulleys, and a shaft carrying a routing-tool arranged on said arms, a grooved frame *p*, carrying holding-jaws for steadying the bar to be routed and turned, and a lathe, substantially as and for the purposes set forth.

7. In combination with vibrating arms, pulleys, belts, and shaft carrying a routing-tool, an annular frame secured upon one of said arms, an arm *q*, secured upon said shaft and bearing on said frame, an arm *t*, adjustable on said arm *q*, an arm *w*, head *v*, arm 10, shaft 2, and lathe, all arranged and adapted to operate substantially as and for the purposes set forth.

8. In combination, arms *b c*, belts and pulleys, a shaft carrying a routing-tool, a steadying-frame *p*, secured upon the arm *c*, an arm *q*, secured upon the shaft and engaging said steadying-frame, and a lathe for turning the bar while the same is being routed by the said tool, a screw-shaft, and a head connected with said steadying-frame, substantially as and for the purposes set forth.

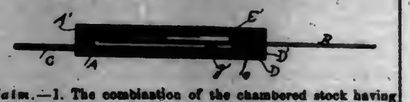
9. The improved routing-machine combining therein the cylindrical arm *b*, a belt *d* therein, arm *c*, pulleys and belt *g*, shaft *h*, and routing-tool, all arranged and combined substantially as set forth.

10. In a wood-working machine, the combination, with a vibrating arm *b*, an arm *c*, pivoted on said arm *b* and consisting of parts *c' c''* shafts *c' c''*, and an adjusting-screw *c''*, of belts, pulleys, shaft *h*, and tool, all arranged and combined substantially as and for the purposes set forth.

11. In a wood-working tool, the combination, with arms *b c*, carrying a wood-working tool, of a gage 32, having a slotted arm 33,

carried by braces 34 34, and clamping-screw 36, substantially as and for the purposes set forth.

12. In combination with a rooting-tool arranged on pivoted arms and actuated by belts and pulleys, a frame secured on one of said arms, a screw-shaft 2, feeding-head *v*, rods u and *t*, adjustable in their bearings, and jaws 6 and 7, adjustable in their relation to one another and to said rods, substantially as and for the purposes set forth.

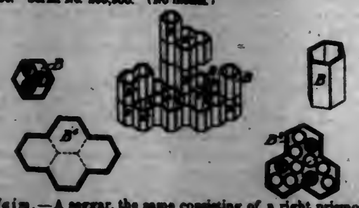


408,367. SECONDARY BATTERY. NATHANIEL B. ALDRICH, Fall River, Mass. Filed Aug. 26, 1886. Serial No. 213,718. (No model.)

Claim.—1. The herein-described electrode for batteries, which consists of a plate or frame of any material, whether metallic or non-metallic, having a coating or layer of iron, zinc, tin, or copper, and superposed upon said layer another layer or coating of lead, the said plate then being formed for use.

2. The herein-described electrode for batteries, which consists of a plate or frame of any material, whether metallic or non-metallic, having a coating or layer of iron, zinc, tin, or copper, and superposed upon said layer by the process of electro-deposition another layer or coating of lead, the said plate then being formed for use.

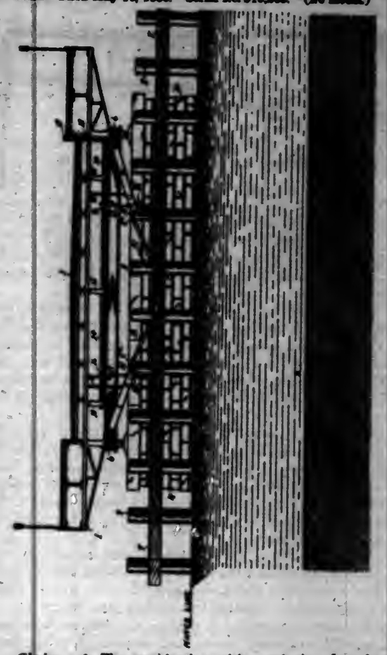
408,368. REVEL. WILLIAM G. AVERY, Cleveland, Ohio, assignor to the W. G. Avery Manufacturing Company, same place. Filed Jan. 31, 1889. Serial No. 298,206. (No model.)



Claim.—1. The combination of the chambered stock having within the chamber an elevated rounded surface D, and a lug *g* within said chamber pierced and threaded to receive the rod C, and the slotted blade B, pivoted within one end of the stock, with the rounded washer D' within the stock and held in place by the pivot-screw *e*, and bearing its flat surface against the blade B and its rounded face opposing the rounded surface D of the stock, and said rod C adapted to have its inner end enter between said rounded surface D and the washer D', substantially as set forth.

2. The combination of the dial-protractor E, the chambered stock having an elevated rounded surface D and a lug *g* within the chamber pierced and threaded to receive the rod C, and the slotted blade B, pivoted within one end of the stock, with the washer D' within the stock, rounded on one of its faces and held in place by the pivot-screw *e*, and bearing its flat surface against the blade B and its rounded face opposing the rounded surface D of the stock, and said rod C adapted to have its inner end enter between said rounded surface D and the washer D', substantially as set forth.

3. The combination, in a bevel, of the rod C, the washer D', having one face rounded, and the chambered stock provided with the rounded elevation D within the chamber, the inner end of said rod C being adapted to enter between said washer D' and the rounded surface D, substantially as set forth.



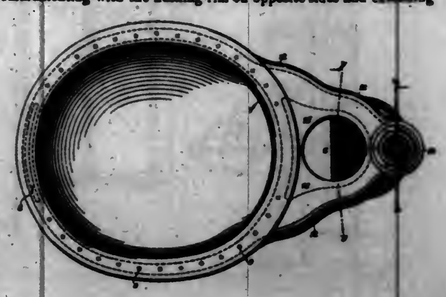
4. The combination, in a bevel, of the dial-protractor E, the rod C, and the washer D', rounded on one side, with the chambered stock having the rounded elevation D within the chamber, the inner end of the rod C being adapted to enter between said washer D' and the elevated rounded surface D, substantially as set forth.

408,369. SEGGAR. THOMAS A. BELL, Trenton, N. J. Filed Jan. 12, 1889. Serial No. 296,955. (No model.)

Claim.—A seggar, the same consisting of a right prismoid the motive of whose exterior form is the hexagon, substantially as above described.

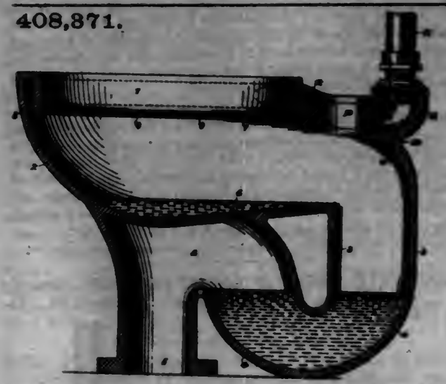
408,370. DRAW-BRIDGE. CHARLES R. BROTHWELL, Bridgeport, Conn. Filed May 10, 1888. Serial No. 310,988. (No model.)

Claim.—1. The combination, with a swinging draw having a suitable stop projection, of a yielding abutment independent of the bridge, which is adapted to be engaged by said projection, as and for the purpose set forth.



2. The combination, with a swinging draw having stop-latches, of a series of guard-spiles suitably connected together, two of said spiles being engaged by the stop-latches when the draw reaches the closed position.

3. The combination, with a swinging draw having stop-latches pivoted thereto and means, substantially as described, for raising and lowering the stop-latches, of a series of guard-spiles connected together, two of said spiles being engaged by the stop-latches when the draw reaches the closed position.

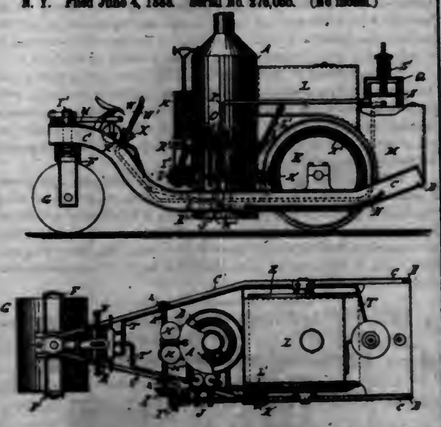


4. The draw having stop-latches with rollers at their outer ends, in combination with a series of guide-spiles connected together, two of said spiles having shoulders 10 and inclines 11, so that as the draw is swung to the closed position one of said latches will ride up one of the inclines and then drop to the engaged position and the other latch will strike the other shoulder squarely, thereby stopping the movement of the draw.

408,371. WATER-CLOSET. WILLIAM BOSTING, Jr., Plumbing, assignor to the Meyer-Griffin Company, (Limited,) New York, N. Y. Filed Nov. 30, 1888. Serial No. 292,175. (No model.)

Claim.—1. In a water-closet having a bowl provided with a flushing-rim, and having also a trunk, the two rearwardly-projecting conduits 12, formed integral or of a piece with the bowl and trunk, communicating with the flushing-rim on opposite sides and extending

408,371.



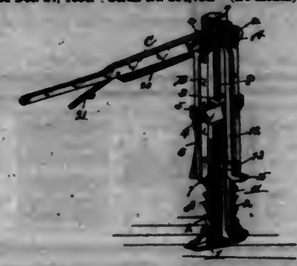
therefrom around the trunk to a common inlet-nozzle, substantially as shown and described.

2. In a water-closet having a bowl provided with a flushing-rim, and having also an open trunk, the two rearwardly-projecting conduits 12, formed integral or of a piece with the bowl and trunk, communicating with the flushing-rim on opposite sides, extending therefrom around the trunk-opening to a common inlet-nozzle, and connected to each other at the front side of said opening by a web or ligament 15 made integral therewith, substantially as shown and described.

3. In a water-closet having a bowl provided with a flushing-rim, and having also a trunk, the two rearwardly-projecting conduits 12, joined to the bowl and the trunk, and communicating with the flushing-rim on opposite sides, and extending to and communicating with a vertically-terminating inlet-nozzle, the bowl, the flushing-rim, the trunk, the conduits, and the inlet being all made from a single piece of earthenware, substantially as shown and described.

4. A water-closet consisting of a bowl provided with a flushing-rim and a dish or basin, a vertical trunk in rear of the bowl, two rearwardly-projecting conduits formed integral with the bowl and trunk and extending from the flushing-rim on opposite sides, and a vertically-terminating inlet-nozzle at the junction of said conduits provided with one or more perforations extending to the inner vertical wall of the trunk above the plane of the bowl's dish, whereby a stream or streams of water may be discharged upon said wall for the purpose of removing any matter which in the washout of the basin may have lodged thereon, substantially as shown and described.

408,372. STEAM ROAD-ROLLER. CHARLES A. CASE, New York, N. Y. Filed June 4, 1888. Serial No. 276,055. (No model.)



Claim.—1. In a road-roller, the combination of the boiler A, frame C, roller E, water-tank M, oil-tank L, and guide-roller G, in supporting-frame F, operatively connected therewith, substantially as shown and described.

2. In a road-roller, the combination of the boiler A, frame C, roller E, tanks M and L, guide-roller G, and steering engine or cylinder R, operatively connected therewith, substantially as set forth.

3. In a road-roller, the combination of the trap Q, provided with a piston S, tank M, engine or cylinder R, pumps O, operatively connected with the trap Q and cylinder R by pipes T, P, N, N', and R', when arranged substantially as shown and described.

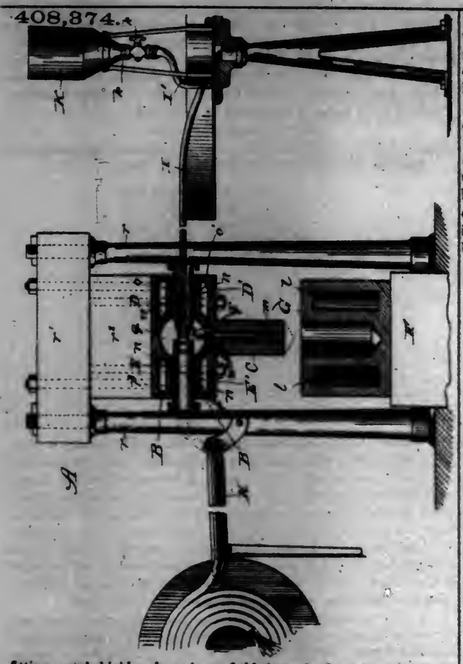
4. In a road-roller, the combination of frame C, having its end turned up at D, engine or cylinder R, guide-roller G, supporting-frame F, tiller U, and frame V, as shown and described.

408,373. LIFTING-JACK. HENRY H. CLEVER, Greensburg, Pa. Filed Dec. 27, 1888. Serial No. 294,722. (No model.)

Claim.—1. The combination of the standard A, having a base-piece and formed with racks 2 on its side edges, and a vertical central hole 3, and provided with a casing 4, having vertically-arranged ways therein, the operating-lever C, having a pivotally-attached weight-block mounted thereon, the lifting-bars B, connected to the operating-lever and projected through the ways in the casing of the standard, with their lower ends formed and arranged to engage the racks of the standard, a guide-rod S, connected to the operating-lever and arranged in the vertical hole of the standard, and springs 6 on the casing to press the lifting-bars in the racks, substantially as described.

2. The combination of the standard A, having a base-piece, and formed with racks on its edges and a vertical hole 3, and a casing 4 mounted thereon, having vertical ways, the operating-lever C, having a pivotally-attached weight-block mounted thereon, the lifting-bars B, connected to the operating-lever and projected through the ways of the casing, with their lower ends formed and arranged to engage the racks of the standard, a guide-rod connected to the operating-lever and arranged in the vertical hole of the standard, springs on the casing to press the lifting-rods in the racks, a bell-crank lever fulcrumed to the operating-lever, having one end connected to a rod provided with spreading-bars at its lower end, said spreading-bars being connected to the lower ends of the lifting-bars, and the other end of the bell-crank lever being connected to a hand-lever, substantially as described.

3. The combination, with the standard having racks on its edges, the lifting-rods arranged in engagement with said racks, and the operating-lever, of levers to disengage the lower ends of the lifting-bars from the racks, consisting of a hand-lever fulcrumed to the operating-lever, a bell-crank lever fulcrumed to the operating-lever and having one end connected to the hand-lever, a connecting-rod jointed to the bell-crank lever, and two spreading-bars pivotally fastened to the lower end of the connecting-rod and their other ends fastened to the ends of the lifting-rods.

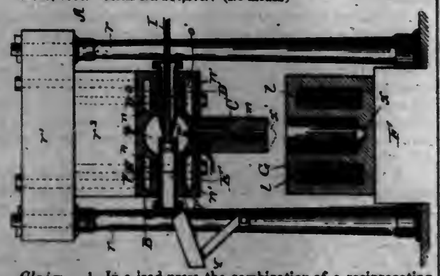


4. The combination of the standard, formed with racks on its edges and having a casing with vertical ways on its upper end and a guide-flange on its side, the lifting-bars arranged in the ways of the casing to engage the racks with their lower ends, the operating-lever fulcrumed to the lifting-rods, and the auxiliary lifting-rod connected to the operating-lever and formed with a foot and provided with a guide-piece to engage the guide-flange on the standard, substantially as described.

5. The lifting-jack herein described, composed of the standard formed with racks on its edges, a central vertical hole, and a guide-flange on its side, a casing having ways to receive the lifting-rods and provided with springs to press the lifting-rods in engagement with the racks on the standards, the operating-lever fulcrumed to the lifting-rods, a weight-block on the operating-lever, the levers, substantially as described, to engage the lifting-bars from the racks, a guide-rod connected to the operating-lever and arranged in the hole of the standard, an auxiliary lifting-rod connected to the operating-lever and provided with a guide-piece to engage the guide-flange on the standard, all arranged and combined substantially as described, and for the purposes specified.

408,374. METHOD OF INCASING TUBING COMPOSED OF PLASTIC MATERIALS. HENRY R. CORE, Wilmington, Del. Filed Oct. 5, 1888. Serial No. 287,369. (No model.)

Claim.—1. The method of coating the exterior surface of tubing formed of plastic material, which consists in molding upon it a close-



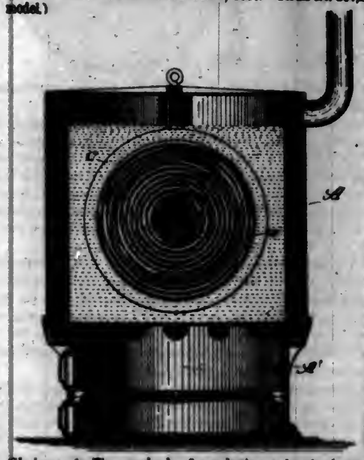
408,874.

fitting metal shield and passing a fluid through the tubing while the shield is being formed thereon, substantially as described.

2. The method of coating with metal the exterior surface of tubing formed of plastic material, which consists in melting the metal, passing the tubing through a suitable die, forcing the metal into the die around the tubing, and passing a suitable fluid through the tubing while the coating is being formed thereon, substantially as described.

408,875. LEAD-PRESS. HENRY R. COBB, Wilmington, Del. Filed Oct. 5, 1888. Serial No. 287,270. (No model.)

Claim.—1. In a lead-press, the combination of a reciprocating lead-cylinder, a stationary hollow plunger in line with and above the lead-cylinder, and a stationary mold above the plunger and communicating therewith, substantially as described.



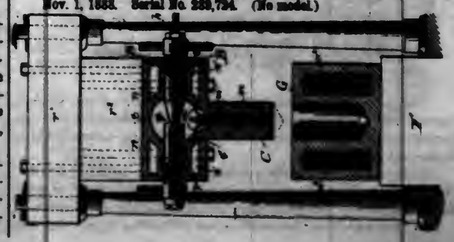
2. In a lead-press, the combination of a reciprocating lead-cylinder having a synclinal bottom, a stationary hollow plunger in line with and above the lead-cylinder, and a stationary mold above the plunger and communicating therewith, substantially as described.

3. In a lead-press, the combination of a reciprocating lead-cylinder G, a stationary hollow plunger C in line with and above the lead-cylinder, a stationary chamber $q\ q'$ above the hollow plunger and communicating therewith, tubes D and E, leading horizontally into the sides of the said chamber and coinciding at their bores near the center thereof, the tube D extending into the adjacent end of the tube E, and a bridge m' in the chamber $q\ q'$ over the opening in the plunger, substantially as described.

4. In a lead-press, the combination of a reciprocating lead-cylinder G, a stationary hollow plunger C in line with and above the lead-cylinder, a stationary chamber $q\ q'$ above the hollow plunger and communicating therewith, tubes D and E, containing each a tube A, surrounded by material g non-conductive of heat and leading horizontally into the sides of the said chamber and coinciding at their bores near the center thereof, the tube D extending into the adjacent end of the tube E, and a bridge m' in the chamber $q\ q'$ over the opening in the plunger, substantially as described.

5. In a lead-press, the combination of a reciprocating lead-cylinder G, having a synclinal bottom, a stationary hollow plunger C in line with and above the lead-cylinder, a stationary chamber $q\ q'$ above the hollow plunger and communicating therewith, tubes D and E, containing each a tube A, surrounded by material g non-conductive of heat and leading horizontally into the sides of the said chamber and coinciding at their bores near the center thereof, the tube D extending into the adjacent end of the tube E, and a bridge m' in the chamber $q\ q'$ over the opening in the plunger, substantially as described.

408,876. METHOD OF MANUFACTURING TUBING. HENRY R. COBB, Wilmington, Del. Filed Oct. 5, 1888. Serial No. 287,271. (No model.)



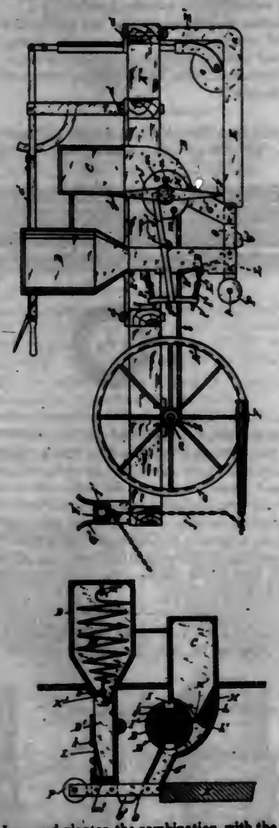
Claim.—1. The method of producing vulcanized-gum tubing, which consists in incasing the plastic-gum tube, combined with a vulcanizing substance, in a flexible metal tube, introducing and retaining an expansible fluid in the bore of the tube, and thereupon coiling and immersing the whole in an open bath having a proper vulcanizing temperature, as set forth.

2. The method of producing vulcanized-gum tubing, which consists in incasing the plastic-gum tube, combined with a vulcanizing substance, in a flexible metal tube, introducing and retaining an expansible fluid in the bore of the tube, and thereupon coiling and immersing the whole in a bath of paraffine or similar oil, maintained at a vulcanizing heat, contained in an unsealed vessel, as set forth.

3. The method of producing vulcanized-gum tubing with a permanent continuous coating of metal, which consists in forming a tube of plastic gum in the usual manner, applying a vulcanizing substance thereto, covering the tube, while soft, with a flexible continuous casing of metal, and immersing the whole in an open bath having a proper vulcanizing temperature, as set forth.

4. The method of producing flexible vulcanized-gum tubing with a permanent continuous coating of metal, which consists in covering the formed plastic-gum tube, provided with a vulcanizing substance, with a flexible continuous casing of metal, introducing and confining an expansible fluid in the bore, and thereupon coiling the tubing and immersing it, while coiled, in an open bath having a vulcanizing temperature, as set forth.

408,877. LEAD-PRESS. HENRY R. COBB, Wilmington, Del. Filed Nov. 1, 1888. Serial No. 289,794. (No model.)



Claim.—1. In a lead-press, the combination of a core-tube and a die, having a passage w between them, and a perforated tube c, surrounded by a water-jacket within the die, substantially as described.

2. In a lead-press, the combination of a core-tube and a die, having a passage w between them, and a tube c within a water-jacket surrounded by non-heat-conducting material within the die, substantially as described.

3. In a lead-press, the combination of a core-tube and a die, having a passage w between them, a tube k within a water-jacket surrounded by non-heat-conducting material within the core-tube, and a tube c, surrounded by a water-jacket within the die, substantially as described.

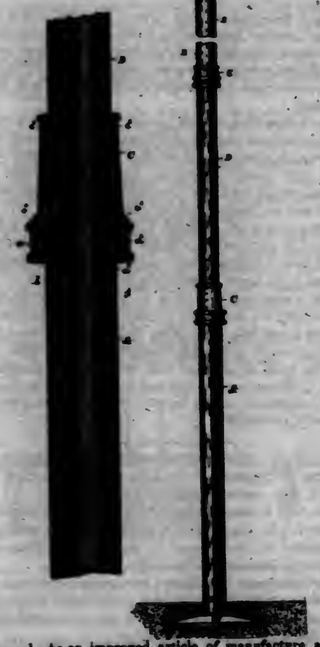
4. In a lead-press, the combination of a core-tube and a die, having a passage w between them, a tube k, surrounded by a water-jacket D^2, comprising chambers $f'\ f^2$, with an opening f^3 between them within the core-tube, a water-supply pipe H, leading into the chamber f', and a drain H', leading from the chamber f^2, substantially as and for the purpose set forth.

408,878. SEED-PLANTER. WILLIAM F. CUMMINGS and HENRY C. MCDUFFEE, Bradford, Vt. Filed Oct. 19, 1888. Serial No. 288,505. (No model.)

Claim.—1. In a seed-planter, the combination, with the fertiliser-box provided with a spout at the bottom, of the upper and lower valves pivoted to the spout, a spring secured to the upper part of said box for agitating its contents and normally holding the upper valve closed, and a pivoted trip-lever provided with a T-head and connected to the said valves by adjustable rods for operating them alternately, substantially as set forth.

2. In a seed-planter, the combination, with the delivery-spout of the fertiliser-hopper, of the upper and lower valves pivoted to said spout, the pivoted trip-lever provided with a T-head, and the adjustable rods hinging the valves to the said head, substantially as set forth.

3. In a seed-planter, the combination, with the fertiliser-box provided with a spout at the bottom, of the upper and lower valves pivoted to the spout, a spring normally holding the upper valve closed, a pivoted lever provided with a T-head, rods connecting said head with the valves, and a revolving disk provided with projecting pins for tripping the free end of the said lever and causing the valves to open and shut alternately, substantially as set forth.



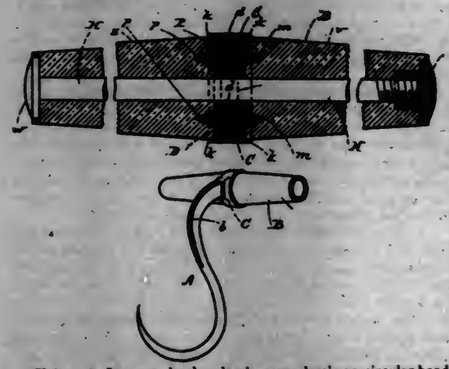
4. In a seed-planter, the combination, with a seed-dropping device provided with a spout, of a fertiliser-distributer located behind the said seed-dropper and provided with a vertical spout divided by a central triangular bar or partition at its lower end, whereby the fertilizer is dropped on each side of the seed, and a wedge-shaped furrow-opener sharp in front and having its rear end bifurcated and secured to the said spouts, substantially as and for the purpose set forth.

5. In a seed-planter, the combination, with a seed-dropping device provided with a spout, of a fertiliser-distributer also provided with a spout having a triangular longitudinal dividing bar or partition across its lower end and located behind the seed-dropper, a wedge-shaped furrow-opener provided with a bifurcated rear end and having the bottoms of said spouts secured thereto, the blades secured to the under side of the bifurcated end of the furrow-opener in front of the fertilizer-spout for covering the seed, and the revolving blades journaled at the extreme end of said bifurcated portion of the furrow opener for covering the fertiliser, substantially as set forth.

6. In a seed-planter, the combination, with the frame, of the concave-faced wheel journaled at the rear of the machine, the seed-dropping device provided with a revoluble seed-drum and a spout, the fertiliser-distributer provided with a spout and with delivery-valves and trip mechanism for operating them, and the wedge-shaped furrow-opener having its front end supported by the frame and its rear end bifurcated and secured to the said spouts in line with the concave-faced wheel, substantially as and for the purpose set forth.

7. The combination, with the revoluble axle, of the wheel provided with ratchet-teeth on one end of its hub and adapted to slide longitudinally upon the axle, a clutch-jaw secured to the axle and provided with ratchet-teeth engaging with the teeth on the wheel-hub, a collar secured to the axle, and a spring interposed between the said collar and the plain end of the wheel-hub, whereby the ratchet-teeth are held in gear during the forward motion of the wheel and adapted to disengage automatically during its rearward motion, substantially as set forth.

408,879. SECTIONAL METAL POLE. JOHN H. CUNNINGHAM, Chelsea, Mass. Filed Mar. 23, 1889. Serial No. 304,489. (No model.)



Claim.—1. As an improved article of manufacture, a hollow metal pole made of two or more sections, which are united by screwing one into the other and by a coupling screwed upon the end of one

and provided with a long sleeve to embrace or receive the end of the other, substantially as described.

2. The combination of the pipe or tube, having at its upper end an interior thread *a'* and an exterior a^2, with the pipe or tube B, having the exterior thread *b* to fit the interior thread of the section A, the sleeve C, having the interior thread *c* to fit the exterior thread a^2 of the section A, and the long section c^2 of a size to receive and sustain the lower part of the said section B, substantially as described.

3. As an improved article of manufacture, a metal pole made of two or more sections, which are united by screwing one into the other and by a coupling screwed upon the end of one and provided with a long sleeve to embrace or receive the end of the other, and the cavity of which sections is packed or filled with a substance of a stiffening character, substantially as described.

408,380. CASE-HOOK. GEORGE B. DUTTON, Medford, assignor of one-half to John Burrill, Boston, Mass. Filed May 20, 1889. Serial No. 312,575. (No model.)

Claim.—1. In a case-hook, a hook proper having a circular head and rectangular shank, in combination with a plate having a face grooved to receive said head and shank, handle-sections, and a bolt secured in bolt-holes in said sections, head, and plate, substantially as described.

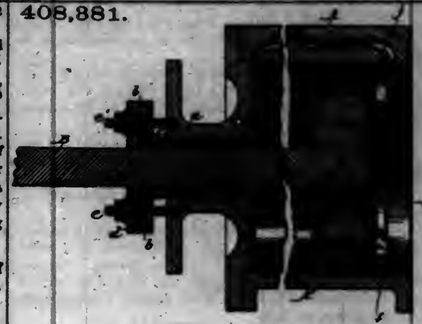
2. In a case-hook, a hook proper provided with a rectangular shank and circular head having a bolt-hole, in combination with a plate having a bolt-hole, grooved face for said head and shank, a peripheral flange on each face, and spurs for entering handle-sections secured to said plate by a longitudinally-disposed bolt, substantially as described.

3. In a case-hook, a hook proper, a plate having a face grooved to receive the head thereof, peripheral flanges on each face of said plate, a cap-plate having a lip to enter said groove, said plates being provided with laterally-projecting spurs and bolt-holes registering with a hole in said head, and a sectional handle secured to said plates by a bolt and nut, substantially as described.

4. In a case-hook, the hook A, having the shank *b*, head *d*, and bolt-hole *f*, in combination with the plate C, provided with the lip *g*, groove *h*, hole *i*, flanges *k*, and spurs *m*, the handle-sections *v z*, bolt H, and nut *y*, arranged substantially as described.

5. In a case-hook, the hook A, provided with the shank *b* and head *d*, having the hole *f*, in combination with the plate C, having the groove *h* and hole *i*, the plate D, having the hole *l*, the handle-sections *v z*, bolt H, and nut *y*, substantially as described.

6. The hook A, provided with the hole *f*, in combination with the plate C, having studs *m* and hole *i*, the plate D, having hole *l* and studs *p*, the sections *v z*, the bolt H, and nut *y*, arranged to operate substantially as described.

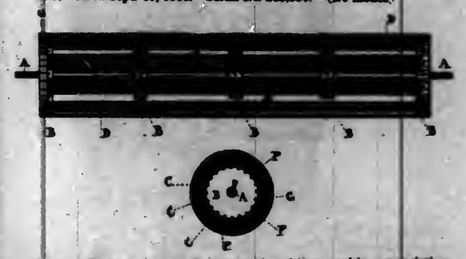


408,381. DEVICE FOR ADJUSTING PISTON-RODS AND PISTON-HEADS IN CYLINDERS. LEONARD FIERAY, Little Rock, Ark. Filed May 7, 1889. Serial No. 309,870. (No model.)

Claim.—1. A cone-shaped ring divided into two or more sections and adapted to be placed upon a piston-rod in the stuffing-box of a steam-cylinder for the purpose of centering the piston-rod in the stuffing-box, substantially as specified.

2. A cone-shaped ring divided into two or more sections, in combination with a divided ring beveled on the inside for the purpose of centering the piston-rod and piston-head in the stuffing-box of a steam-cylinder, substantially as specified.

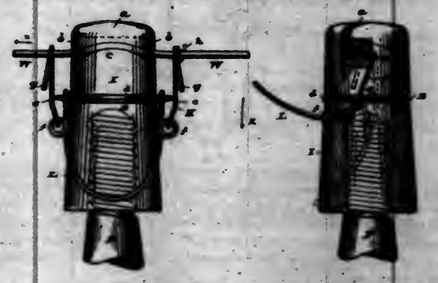
3. A cone-shaped ring divided into two or more sections for the purpose of centering the piston-rod in the stuffing-box of a steam-cylinder, in combination with a piston-rod and stuffing-box of a steam-cylinder, substantially as and for the purpose specified.



408,881.

4. A cone-shaped ring divided into two or more sections for the purpose of centering the piston-rod in the stuffing-box of a steam-cylinder, in combination with a forked gland *b* and a follower *c*, substantially as and for the purpose specified.

5. A cone-shaped ring divided into two or more sections for the purpose of centering the piston-rod in the stuffing-box of a steam-cylinder and a divided bevel-ring *f*, in combination with the piston-rod and piston-head of a steam-cylinder, substantially as and for the purpose specified.



408,382. THRASHING-MACHINE. ALBERT L. GILL, Allentown, N. J. Filed Sept. 15, 1888. Serial No. 285,530. (No model.)

Claim.—1. A skeleton cylinder for thrashing-machines, consisting of the flanged heads B, longitudinal staves C, connected to said heads and separated from each other by intervening spaces, metallic plates D, fastened to said staves, and adjustable wedge-shaped bracing-blocks E, interposed between the staves and connected to the heads.

2. A skeleton cylinder for thrashing-machines, consisting of heads B, longitudinal wooden staves C, separated from each other by intervening spaces, adjustable wedge-shaped bracing-blocks interposed between the staves and connected to the heads, and metallic facing-plates D, provided with lips or flanges *d*, for protecting the forward faces of the staves from wear.

408,383. LINE-WIRE INSULATOR. CARROLL G. CHARLES, Marion, Iowa. Filed Jan. 26, 1889. Serial No. 297,701. (No model.)

Claim.—1. In combination with an insulator having an internal convex surface and a notch in its top admitting the line-wire thereto, and provided with a pair of pivots below said convex surface, a bifurcated lever turning on said pivots and a pair of hooks pivotally attached to said lever and engaging with the line-wire at the respective sides of the insulator, substantially as hereinbefore specified.

2. The combination, with an insulator having an internal convex surface and a notch in its top admitting the line-wire thereto, and provided with a pair of pivots below said convex surface, and a self-locking lever turning on said pivots, of a pair of hooks pivotally attached to said lever and engaging with the line-wire at the respective sides of the insulator, and having elongated extremities, either of which may be wrapped around the line-wire to secure the fastening, substantially as hereinbefore specified.

3. An insulator having an internal convex surface, a diametrical notch in its top admitting the line-wire thereto, diagonally-opposite recesses forming an oblique passage through the insulator below solid overlying portions thereof, and provided with a pair of pivots below said convex surface and in line vertically with said recesses, respectively, substantially as hereinbefore specified.

4. The combination, with the ledge, cover, lifting-rods, and slides, to which the lifting-rods are loosely connected, of a bed carried by the slides which move obliquely upward and forward when the cover is raised, and a table carried by the bed, which is adapted to slide forward over the ledge which supports it, thereby permitting the cover and lifting-rods to be lowered independently of the bed, table, and slides.

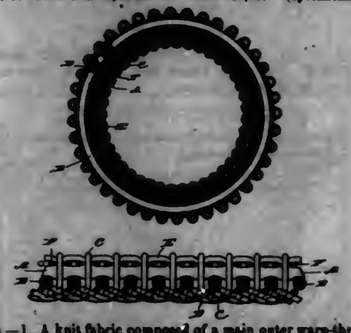
5. The combination, with the cover, lifting-rods, and slides, of a bed carried by the slides which move obliquely upward and forward when the cover is raised, a table having a slot 13, and a screw passing through said slot and engaging the bed, so that the table may be drawn forward when in the raised position, substantially as described.

6. In a type-writer cabinet, compartment 3, ledge 7, and a cover adapted to close the compartment, in combination with slides carrying the bed, lifting-rods connected to the cover and to said slides, and a sliding table connected to the bed and adapted to be drawn forward over the ledge.

7. In a type-writer cabinet, ledge 7, the cover and lifting-rods hinged thereto and having enlargements at their lower ends, in combination with slides having keepers 23, through which the guide-rods slide and which are engaged by said enlargements, oblique slots 18, blocks engaging said slots, a bed carried by said slides, and a sliding table secured to the bed, said parts operating as described, and for the purpose set forth.

8. The ledge, sliding table, and bed, constructed as described, in combination with the cover, the lifting-rods hinged thereto, and the slides, which are connected to said lifting-rods and carry the bed, whereby, when the cover is raised, the bed is lifted obliquely upward and forward and the table may be slid forward over the ledge.

9. The cover, and the lifting-rods hinged thereto and having enlargements at their lower ends, in combination with the slides having keepers through which the lifting-rods pass and which are engaged by said enlargements, and oblique slots 19, blocks lying in said slots, a bed carried by the slides, and a sliding table connected to the bed, whereby, when the table is moved forward and the lifting-rods lowered, the slides and bed will be tilted forward, causing the blocks to bind in the slots and retaining the bed at the raised position.

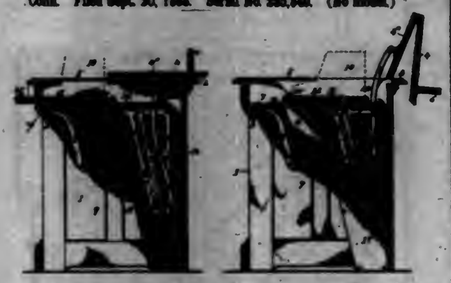


10. The two-part cover, constructed as described, and the lifting-rods pivoted to the back portion thereof and having enlargements at their lower ends, in combination with slides having keepers through which the lifting-rods pass and which are engaged by the enlargements, the bed carried by the slides, and the sliding table connected to the bed.

11. The combination, with the slides, lifting-rods, bed, and sliding table, of a cabinet having a compartment 3, adapted to receive the table, and a type-writer carried thereby, a ledge 7, and a two-part hinged cover, to the back portion of which the lifting-rods are hinged, the front portion being provided with a piece 6, which engages the ledge in the closed position.

12. The combination, with the slides, the lifting-rods loosely connected thereto, and the bed and sliding table, of a cabinet having a compartment 3, adapted to receive the table and a type-writer carried thereby, compartments 17, which inclose the slides, and a cover to which the lifting-rods are hinged, said cover acting, when raised, to lift the bed, sliding table, and type-writer obliquely upward and forward, and when lowered to close compartment 3.

13. The combination, with the cabinet having compartments 3 and 17, ledge 7, and cover 4 4', of the slides having oblique slots, screws having washers wider than the slots, whereby the blocks and slides are held in position, the bed and sliding table carried by the slides, and lifting-rods pivoted to the cover and connected to the slides.

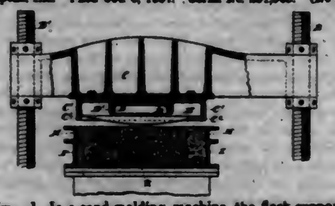


408,384. KNIT FABRIC FOR HOSE. HENRY F. HERRMANN, Brooklyn, N. Y. Filed Dec. 28, 1887. Serial No. 259,209. (Specimens.)

Claim.—1. A knit fabric composed of a main outer warp-thread, a main outer filling-thread, a smaller inner warp-thread, and two smaller inner filling-threads, which are forced down one on each side of the larger filling-thread, all bound together by a continuous binding-thread, which on the inside of the fabric passes around the inner warps, substantially as shown and described.

2. A knit fabric composed of a main outer warp-thread, a main outer filling-thread, a smaller inner warp-thread, two smaller inner filling-threads, which are forced down one on each side of the larger filling-thread, all bound together by a continuous binding-thread, which on the inside of the fabric passes around the inner warps, and a cover-thread, substantially as shown and described.

408,385. TYPE-WRITER CABINET. JAMES KEMPE, Bridgeport, Conn. Filed Sept. 20, 1888. Serial No. 285,849. (No model.)



Claim.—1. In a type-writer cabinet, the combination, with the cover, of lifting-rods hinged thereto, slides engaged by said rods and carried obliquely upward and forward when the cover is raised, a bed carried by the slides, and a sliding table carried by the bed, said parts being so arranged that when the cover is raised the bed and table are lifted upward and forward but retain the horizontal position, and when the table is slid to its extreme forward position the cover may be lowered independently of the bed and table.

2. The combination, with the cover and the lifting-rods hinged thereto, of slides loosely engaged by said lifting-rods and having oblique slots and blocks 19 engaged by said slots, whereby the slides are retained in position and are caused to move upward and forward obliquely when the cover is raised, a horizontal bed carried by said slides, and a sliding table carried by the bed, as and for the purpose set forth.

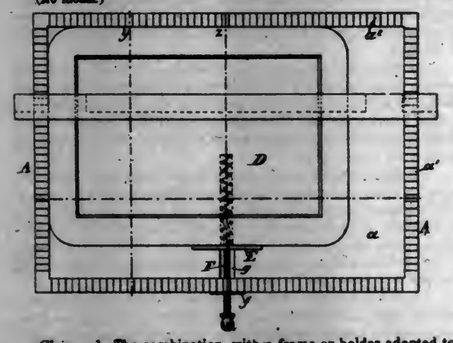
3. The combination, with the cover and the lifting-rods hinged thereto and having enlargements at their lower ends, of the slides having keepers through which the lifting-rods slide and which are engaged by said enlargements, and a bed carried by the slides.

408,386. SAND-MOLDING MACHINE. MATTHEW B. MOORE, Indianapolis, Ind. Filed Oct. 6, 1887. Serial No. 251,565. (No model.)

Claim.—1. In a sand-molding machine, the flask-support P and platen C, with suitable means for moving them forcibly together, in combination with each other and with the flask I and sand-box H, having flush interior surfaces, and with a rim C', rigidly attached to the platen and arranged to be received within the sand-box, and a yielding presser E, covering the area within such rim and adapted to yield irregularly to conform to the pattern, all substantially as and for the purpose herein specified.

2. In a sand-molding machine, the supplementary removable tucking-pieces C^3 C^3, in combination with the tucking-rim C', the yielding presser E, and the platen C, the parts being arranged, as shown, so that the tucking-pieces C^3 C^3 will extend down and depress the surface of the sand beneath them sooner or to a greater depth than the adjacent portions of the surface, as herein specified.

3. In a sand-molding machine, the interior tucking-piece D', in combination with the platen C and yielding presser E, said interior tucker being arranged to depress predetermined portions of the surface of the sand to positive extents while other parts are subjected to the yielding presser, as herein specified.



4. In a sand-molding machine, a rigid platen C, rim C', supplementary tucking-pieces C^3, and an interior tucker D', in combination with each other and with a yielding presser E, arranged substantially as shown, whereby the relative pressures on different parts of the surface of the flask may be adjusted by varying the quantity of fluent material between the yielding presser and the platen, as herein specified.

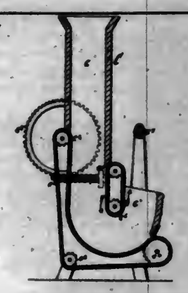
5. In a sand-molding machine having a yielding presser acting over a portion of the sand, combined with unyielding pressers exerting a greater pressure on certain portions, the cock N, controlling the communication to the space above the yielding presser, adapted to admit or discharge the fluent material and afterward confine a fixed quantity to act through the medium of the yielding presser, substantially as herein specified.

6. In a sand-molding machine, the post B, sleeve J, sand-box H, supported by the two sets of levers F and G, pivoted to said sleeve, and a balancing-weight K, combined and arranged, as shown, so that the sand-box may be moved vertically and laterally while preserving a horizontal position, as herein specified.

7. In a sand-molding machine, the post B, revolving sleeve J, sand-box H, and weight K, in combination with the two levers F G, pivoted at different levels at one end to said sand-box, at the other end to the weight, and intermediately to said sleeve, one of said levers being provided with the screw *g* and nut *g'*, for adjusting its length, as and for the purpose specified.

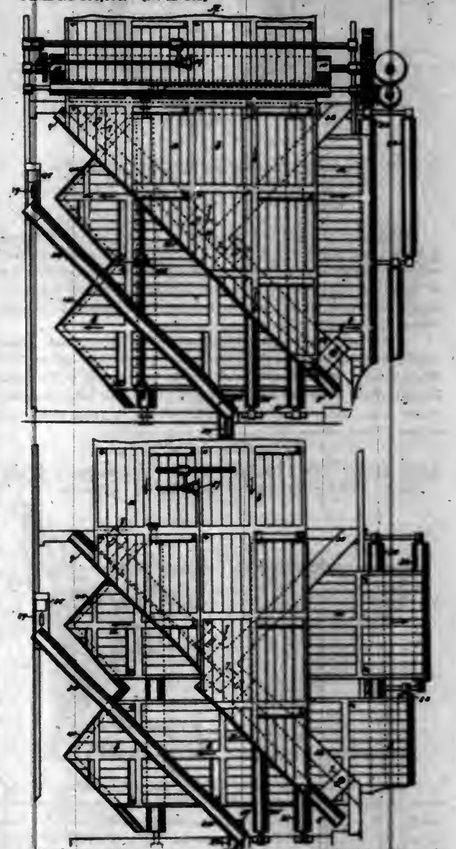
408,387. FRAME FOR RULING SLATES. OTTO OETHLL and WILLIAM ROTTMANN, Union, N. J. Filed Nov. 9, 1888. Serial No. 290,373. (No model.)

Claim.—1. The combination, with a frame or holder adapted to receive a slate or similar article, of a retaining device for securing the slate or similar article in the frame, and an adjustable ruler adapted to engage the said frame or holder upon the side edges thereof and above the slate or similar article, substantially as specified.



2. The combination, with a frame or holder adapted to receive a slate or similar article, of a retaining device for securing the slate or similar article in the frame, said frame being provided with raised sides and ends notched upon their upper surfaces, and an adjustable ruler adapted to engage said notches, substantially as specified.

3. The combination, with a frame or holder adapted to receive a slate or similar article, of a retaining device for securing said slate or similar article in the frame, said frame having raised sides and edges provided with notches upon their upper surfaces and a ruler adapted to engage said notches, said ruler being provided with stops for preventing its longitudinal movement when in position on the frame, substantially as specified.

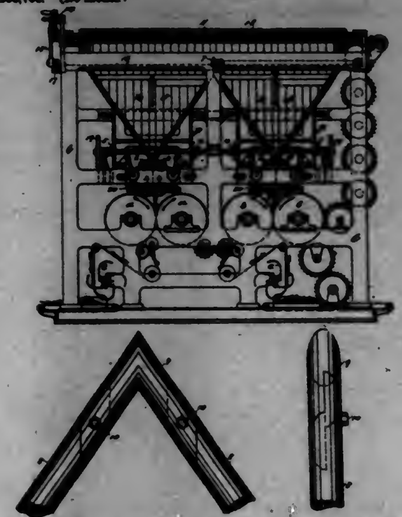


408,388. APPARATUS FOR DYEING. ISAAC R. PALMER, Middletown, Conn. Filed Jan. 20, 1888. Serial No. 261,205. (No model.)

Claim.—A receptacle for receiving fabrics, composed of a J-shaped or U-shaped casing open at both ends and having upper and lower inner curved surfaces, consisting of or formed by traveling aprons, substantially as specified.

408,388.

408,389. DELIVERY APPARATUS FOR WEB-PRINTING MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed Oct. 29, 1887. Serial No. 253,096. (No model.)



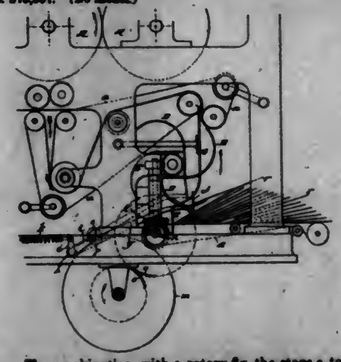
Claim.—1. The combination, with a longitudinal folder, of a pair of turning-bars made adjustable to and from each other, whereby webs of different widths may be turned and properly presented to said longitudinal folder, substantially as described.

2. The combination, with a plurality of folders, of a turning-bar 31, made in sections, which are adjustable with relation to each other, whereby webs of different widths may be turned and properly presented to said folders, substantially as described.

3. The combination, with a pair of folders, of a pair of turning-bars which are adjustable to and from each other, one of said bars being made in sections, which are adjustable with relation to each other, substantially as described.

4. The combination, with a pair of turning-bars 30 31, of the rods 30, having the right and left hand screws for adjusting said bars to and from each other, substantially as described.

408,390. DELIVERY MECHANISM FOR PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed Jan. 14, 1889. Serial No. 296,708. (No model.)



Claim.—1. The combination of a plurality of longitudinal folders composed of internal guides and external turners, said folders being arranged side by side and adjustable to and from each other, substantially as described.

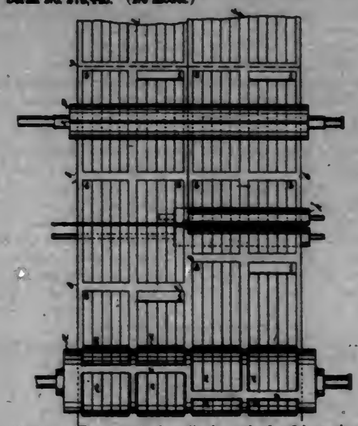
2. The combination of a plurality of longitudinal folders composed of internal guides and external turners, said folders being arranged side by side, and each mounted in an adjustable supplemental frame D, whereby they can be adjusted to and from each other, substantially as described.

3. The combination, with the stationary cutting and folding mechanisms *a b*, of the longitudinal folders A B, composed of internal guides and external turners, said folders being arranged side by side and adjustable to and from each other, substantially as described.

4. The combination, with the longitudinal folders A B, arranged side by side and adjustable to and from each other, of the removable supplemental piece 9, forming extensions of the two inner internal guides of the folders, substantially as described.

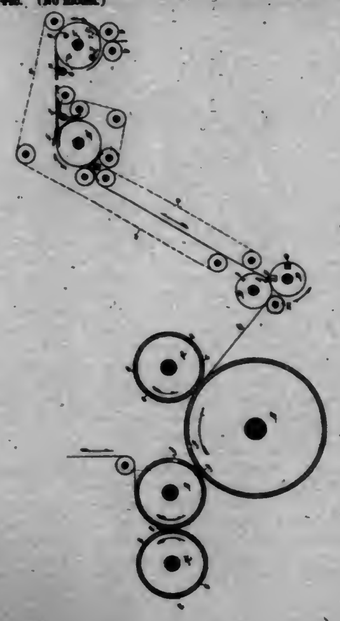
408,391. SHEET-COUNTING MECHANISM FOR PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed June 4, 1888. Serial No. 276,267. (No model.)

Claim.—The combination, with a rotary fly, the stops *c*, to arrest the sheets as they are delivered by the fly, and moving tapes or aprons *d*, to carry the sheets from the fly, of the supplemental stops *f*, mounted to swing to the front of the stops *c* to arrest one or more sheets, and the notched disk *m*, for periodically operating the supplemental stops, substantially as described.



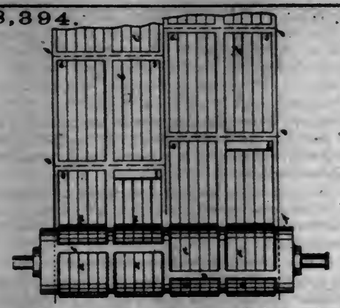
408,392. INKING MECHANISM FOR PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed June 7, 1888. Serial No. 276,579. (No model.)

Claim.—1. The combination, with the fountain-roll, of the ratchet 28 and pawl 9 for advancing the roll, and the pawl 7, periodically engaging with the ratchet to lock the roll against advancement, substantially as described.



2. The combination, with the fountain-roll, of the ratchet 28 and pawl 9 for advancing the roll, the pawl 7, for locking the roll against advancement, and the bar 30, for operating the two pawls, substantially as described.

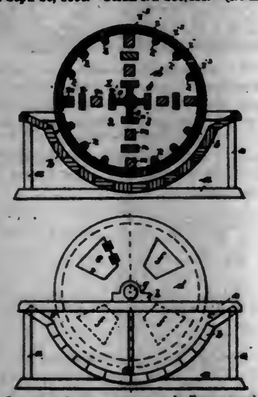
408,393. METHOD OF IMPOSING FORMS UPON PRINTING-CYLINDERS. STEPHEN D. TUCKER, New York, N. Y. Filed June 28, 1888. Serial No. 278,445. (No model.)



Claim.—The herein-described method of imposing the forms upon a printing-cylinder to secure uniformity in the printing, which consists in placing the forms upon the cylinder so that they break joints longitudinally of the cylinder, substantially as described.

408,394. WEB PRINTING AND DELIVERY MECHANISM. STEPHEN D. TUCKER, New York, N. Y. Filed June 28, 1888. Serial No. 278,446. (No model.)

408,394.



Claim.—1. The combination, with a form-cylinder carrying forms which break joints longitudinally of the cylinder, of a pair of cutting-cylinders having a plurality of blades and grooves, each extending a part of the length of the cylinders and located in different positions circumferentially of the cylinders, substantially as described.

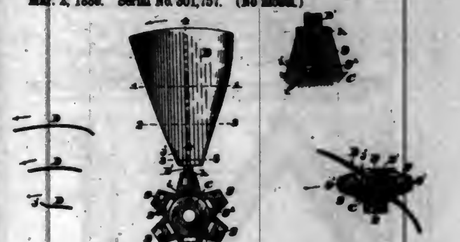
2. The combination, with a form-cylinder carrying forms which break joints longitudinally of the cylinder, of a pair of cutting-cylinders having a plurality of blades and grooves, each extending a part of the length of the cylinders and located in different positions circumferentially of the cylinders, and a sheet-collecting mechanism having its sheet-directing devices timed to direct the sheets from different portions at different times, substantially as described.

3. The combination, with a form-cylinder carrying forms which break joints longitudinally of the cylinder, of a pair of cutting-cylinders having a plurality of blades and grooves, each extending a part of the length of the cylinders and located in different positions circumferentially of the cylinders, and a sheet-folding mechanism having its blades timed to conform to the cutting mechanism, substantially as described.

408,395. TANNING APPARATUS. GEORGE S. TUBSTEAD, Newark, N. J. Filed Sept. 26, 1888. Serial No. 286,416. (No model.)

Claim.—1. In a tanning apparatus, a hollow rotating drum with obliquely-perforated covering, and having longitudinally-extending slats *k* secured to its inner periphery, said drum being also divided into two or more sections by means of bars *m* and *n*, forming perforated partitions with uneven surfaces, each section being provided with a door in the side, as described, and for the purposes set forth.

2. In a tanning apparatus, the combination, with a base and a driving-shaft running in bearings on said base, of a tank adapted to receive the tanning-liquid, and a hollow drum secured to said driving-shaft having an obliquely-perforated covering, and longitudinally-extending slats *k*, secured to its inner periphery, said drum being also divided into two or more sections by means of bars *m* and *n*, forming perforated partitions with uneven surfaces, each section being provided with a door in the side, all as set forth.

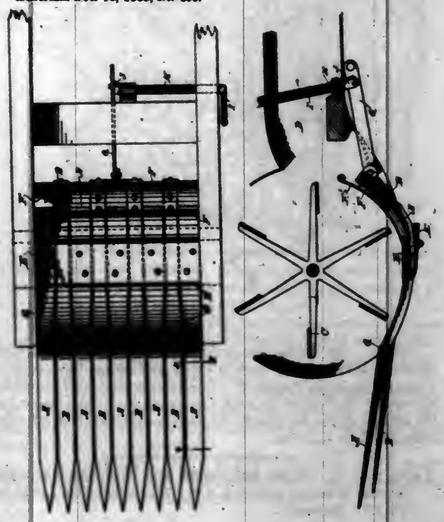


408,396. WINDING-SPINDLE. JOSEPH R. TYRAN, Paterson, N. J. Filed Feb. 7, 1889. Serial No. 299,057. (No model.)

Brief.—The invention relates to spindles for carrying bobbins onto which silk is wound for the purpose of being afterward spun or twisted, and its object is to provide for supporting the spindle concentrically throughout its length and in such manner that the holding-springs shall not come in contact with and injure the conical bearing of the bobbin.

Claim.—The combination, with a winding-spindle, of a head, a portion of which constitutes a friction-roller for driving the same and another portion of which is concentric with but of less diameter than the said roller and is longitudinally slotted, and a spring which is secured to the spindle, and a part of which lies within the said slot, substantially as and for the purpose herein set forth.

408,397. EXHAUST-FAN. JEFFERSON YOUNG, Chelsea, Mass. Filed Mar. 2, 1889. Serial No. 301,757. (No model.)



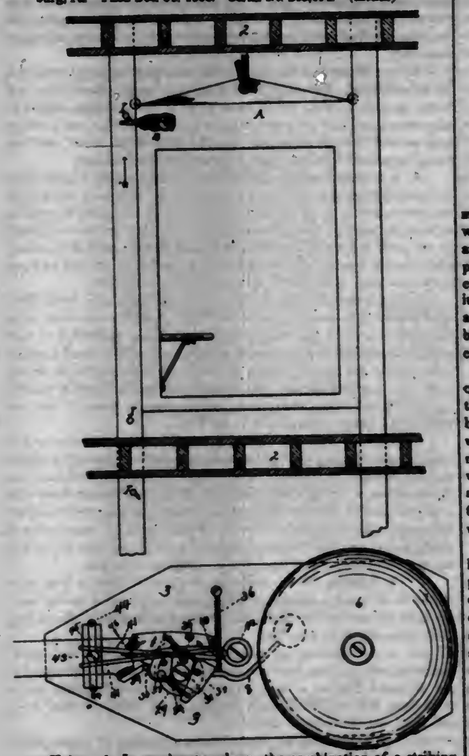
Claim.—1. In an exhaust-fan, a blade having its operating-face concaved transversely and increasing in curvature from the center of its width to its posterior edge and from a point about one-third of its length from its inner end to its outer posterior corner.

2. In an exhaust-fan, a blade having its operative face concaved transversely and increasing in curvature from the center of its width to its posterior edge and from a point about one-third of its length from its inner end to its outer posterior corner, and having its inner anterior corner curved in an opposite direction.

3. In an exhaust-fan, a series of screw-blades concaved transversely and having a progressively-increasing pitch for about two-thirds (more or less) of their lengths from their outer or peripheral ends inward, and having their inner anterior corners curved in the reverse directions.

4. In an exhaust-fan, the combination of the hub C *g*, provided with the radial holes *g'* and the slots *g*², the blade D, provided with a threaded shank, a collar firmly secured to the inner end of said shank within a slot *g*², and a nut fitted upon said shank and arranged to bear upon said hub C *g* to clamp said blade in position.

408,398. HARVESTING-MACHINE. JAMES H. ADAMSON, North Melbourne, Victoria. Filed Sept. 21, 1888. Serial No. 286,044. (No model.) Patented in Victoria Aug. 9, 1882, No. 3,280, and in South Australia Dec. 10, 1883, No. 409.

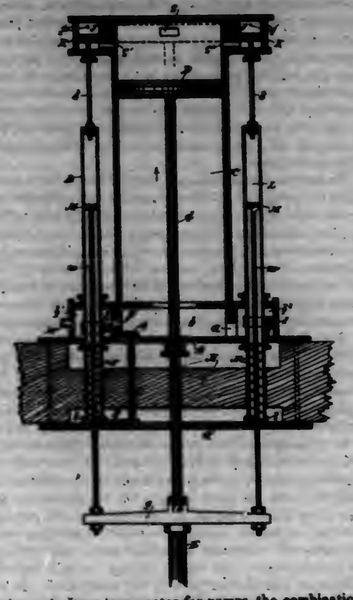


Claim.—1. The harvester-comb composed of alternate fixed and movable teeth, one set diminishing in width toward the rear end and the other set placed alternately with the first and increasing in width toward the rear end, in combination with a mechanism whereby the second set may be drawn backward or moved forward with relation to the first set, substantially as herein described.

2. The alternate teeth A A of the harvester-comb, having their rear ends made broader and fixed to a stationary bar, in combination with the teeth B B, placed alternately between the teeth A, having their rear ends tapering or made narrower than the forward ends and fixed to a movable bar, a lever, and connecting-link by which this bar may be moved forward or backward to close or open the spaces between the teeth A and B, substantially as described.

3. The teeth A, made broader toward their rear end than at the knee or central portion, in combination with the alternate teeth B, narrowing from the center toward the rear, the two-part fixed transverse bar E, the movable bar to which the teeth B are secured, and means for operating said bar, substantially as described.

4. The horizontal two-part fixed guide-bar E, having the upper part made with a cutting forward edge and the teeth A fixed between the upper and lower portions of said bar, in combination with the intermediate teeth B, sliding through said guide-bar, and a mechanism whereby they are reciprocated, substantially as herein described.



408,399. ELEVATOR ALARM-INDICATOR. HENRY AXTHELM, Pittsburg, Pa. Filed Dec. 31, 1888. Serial No. 295,094. (Model.)

Claim.—1. In an elevator-alarm, the combination of a striking-arm, having two contact-plates thereon, two spring-retracted cams adapted to be engaged by said contact-plates, a swiveled turning piece upon which said cams are pivoted, a base upon which said turning piece turns, a spring-retracted bell-hammer arm secured to said turning piece, and a gong, all substantially as shown and described.

2. In an elevator-alarm, the combination of a striking-arm having two contact-plates thereon, two spring-retracted cams adapted to be engaged by said contact-plates, a swiveled turning piece upon which said cams are pivoted, a plate upon which said turning piece turns, a base upon which said plate is set, a spring-retracted bell-hanger arm secured to said turning piece, a gong, a stop set in the base to keep the turning piece from moving too far, and a double-armed spring with guard and cross-piece, all substantially as shown and described.

408,400. STEAM-MOTOR FOR PUMPS. HENRY O. BEATTY, Sacramento, Cal. Filed May 2, 1888. Serial No. 309,267. (No model.)

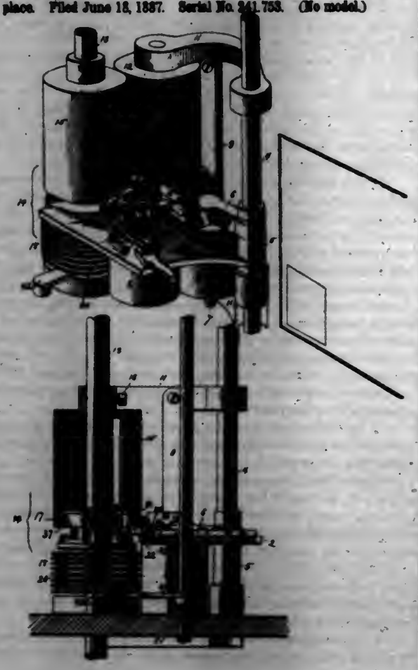
Claim.—1. In a steam-motor for pumps, the combination of a main cylinder, a piston mounted therein and having its rod connected with the pump-plunger, a steam-inlet port and a steam-exhaust port at the lower end of the cylinder and communicating therewith, supplementary cylinders communicating with the upper end of said main cylinder, pistons in said supplementary cylinders, downwardly-extending valve-rods connected therewith, a valve carried by one of said rods and controlling the inlet-port of the main cylinder, and a valve carried by the other of said rods and controlling the exhaust-port of said main cylinder, substantially as described.

2. In a steam-motor for pumps, the combination of the main cylinder, a piston mounted therein and having a rod connected with the pump-plunger, a steam-inlet port and a steam-exhaust port at the base of said main cylinder, supplementary cylinders communicating with the top of said main cylinder, pistons mounted in said supplementary cylinders and having downwardly-extending valve-rods, valves carried by said rods for controlling the inlet and exhaust ports at the base of the main cylinder, and connections from the rod of the piston of the main cylinder to the valve-rods for returning said valve-rods and reversing their valves, substantially as described.

3. In a steam-motor for pumps, the combination of a steam-chest having a steam-inlet, a steam-exhaust and a central receiving-compartment, an inlet-port connecting the inlet-compartment with the central compartment, an open communication between the central compartment and the exhaust-compartment and an exhaust-port for said exhaust-compartment, and main cylinder mounted upon the steam-chest and communicating with the central compartment thereof, a piston in said cylinder, having a rod connected with the pump-plunger, supplementary cylinders communicating with the top of the main cylinder, pistons in said supplementary cylinders, having downwardly-extending valve-rods passing through the inlet and exhaust compartments of the steam-chest, and valves carried by said rods for controlling the inlet-port and the exhaust-port of said compartments, substantially as described.

4. In a steam-motor for pumps, the combination of a valve-chest having an inlet-port and an exhaust-port, a main cylinder communicating with the steam-chest, a piston in said cylinder, having a rod connected with a pump-plunger, supplementary cylinders communicating with the top of the main cylinder, pistons in said supplementary cylinders, having stems, tubular valve-rods connected with said stems and passing down through the steam-chest, valves on said rods for controlling the inlet-port and exhaust-port of said steam-chest, vertically-movable stems in the tubular valve-rods and connected at their lower ends with a pump-plunger, and a contact-connection between said movable stems and tubular valve-rods, whereby the latter are returned and the valves reversed, substantially as described.

5. In a steam-motor for pumps, the combination of a steam-chest having an inlet-port and an exhaust-port, a main cylinder communi-



cating with said steam-chest, a piston mounted in said cylinder and having a rod connected with the pump-plunger, supplementary cylinders communicating with the top of the main cylinder, pistons in said supplementary cylinders, having downwardly-extending stems, tubular valve-rods connected with said stems and passing down through the steam-chest, valves carried by said tubular rods for controlling the inlet and exhaust ports of the steam-chest, movable stems with collars within the tubular valve-rods and passing down through them and connected with the pump-plunger at their lower ends, and springs within the lower ends of the tubular valve-rods, with which the collars of the movable stems come in contact to reverse the valves, substantially as described.

6. In a steam-motor for pumps, the combination of a steam-chest having an inlet-port and an exhaust-port, a main cylinder communicating with said steam-chest, a piston mounted in said cylinder and having a rod connected with the pump-plunger, supplementary cylinders communicating with the top of the main cylinder, pistons in said supplementary cylinders, having downwardly-extending stems, tubular valve-rods connected with said stems and passing down through the steam-chest, valves carried by said tubular rods for controlling the inlet and exhaust ports of said chest, movable stems with collars within the tubular valve-rods and passing down through them and connected with the pump-plunger at their lower ends, springs within the lower ends of the valve-rods, with which the collars of the movable stems come in contact to reverse the valves, and a fixed stirrup or stop-bar against which the lower ends of the valve-rods come in contact to limit their downward movement, substantially as described.

7. In a steam-motor for pumps, the combination of the steam-chest having an inlet-port and an exhaust-port, the main cylinder communicating therewith, the piston in said main cylinder, having a rod connected with the pump-plunger, the supplementary cylinders communicating with the top of the main cylinder, the pistons in said supplementary cylinders, having downwardly-extending stems, the tubular valve-rods connected with said stems and passing down through the steam-chest, the valves carried by said rods for controlling the inlet and exhaust ports of the steam-chest, the movable sliding stems with collars in the tubular valve-rods, the lower ends of which are connected with the pump-plunger, the spring forming the contact between the collars of the stems and tubular valve-rods for reversing the valves, the sliding piston O within the steam-chest, the arm on one of the valve-rods, with which the piston O is adapted to coms in contact, and the stirrup or stop-bar for the lower ends of the valve-rods, substantially as described.

408,401. LETTER POSTMARKING AND CANCELING MACHINE.

AUGUST BERTRAM, Brooklyn, N. Y., assignor to Matthew J. Dolphin, same place. Filed June 18, 1887. Serial No. 241,753. (No model.)

Claim.—1. The combination, with the rotating drum, of a marking device, and a clutch mounted on the marking device and engaging the drum, said clutch consisting of pawls pivoted to the marking device, a bar connecting the pawls, springs tending to hold the pawls in engagement with the drum, and a lug secured to one of the pawls, whereby they may be released, substantially as described.

2. In a letter-marking device, the combination of a letter-feed, an intermittingly-operating letter-marker, a pivoted pawl which stops said letter-marker, a pivoted trip having an arm projecting into the path of the letter and connected with said pawl, said trip and pawl being movable on their respective pivots to permit the stopping of the letter-marker before the letter has completely passed the arm of the trip, substantially as described.

3. In a letter-marking device, the combination of a letter-feed, an intermittingly-operated letter-marker, a pivoted pawl which stops said letter-marker, and a pivoted trip connected with said pawl to withdraw it from engagement with the marker and having a sliding arm permitting the pawl to come into position for stopping the marking device before the letter has passed the arm, substantially as described.

4. In a letter-marking device, the combination of a letter-feed and intermittingly-operated letter-marker, a pivoted pawl which stops the letter-marker, a spring which tends to force said pawl into position to stop the marker, and a pivoted trip connected with said pawl to withdraw it from engagement with the marker, having a sliding arm projecting into the path of the letter, said sliding arm permitting the pawl to be moved by the spring into position for stopping the marking device before the letter has passed the arm, substantially as described.

5. In a letter-marking device, the combination of a letter-feed, an intermittingly-operating letter-marker, a pawl which stops said letter-marker, a spring which tends to force the pawl into position to stop the marker, and a trip consisting of a pivoted portion, and a sliding arm secured thereto extending into the path of the letter, said trip being connected with the pawl, substantially as described.

6. In a letter-marking device, the combination of a letter-feed, an intermittingly-operating letter-marker, a pivoted pawl which stops the letter-marker, a spring which tends to hold said pawl in position to stop the marker, a trip consisting of a pivoted portion connected to the pawl, and a sliding portion extending into the path of the letter, and a spring bearing against said sliding portion of the trip to force it into the path of the letter, substantially as described.

7. In a letter-marking device, the combination of a letter-feed, an intermittingly-operating letter-marker, a pivoted pawl which stops the letter-marker, a trip having a pivoted portion connected to said pawl, and a sliding arm projecting into the path of the letter, a spring connected to the sliding portion of the trip and tending to force the pawl into position to stop the marker, and another spring bearing against the end of the sliding arm and tending to force it into the path of the letter, substantially as set forth.

8. In a letter-marking device, the combination of a letter-feed, a continuously-rotating shaft, a letter-marking cylinder loosely mounted thereon, a clutch interposed between said shaft and cylinder having friction-faces, a spring which tends to force said friction-faces into engagement with the opposing bearing-faces, a stopping-pawl adapted to engage with a projection carried by the clutch to compress said spring and release the frictional faces, and a trip operated by the letters for withdrawing the pawl, substantially as described.

9. The tripping device consisting of a pivoted pawl, a lever connected to the pawl, a sliding arm mounted on the lever, a spring bearing upon the end of the lever, and a spring connected to the sliding arm, substantially as described.

10. In a letter-marking device, the combination of a letter-feed, a continuously-rotating shaft and intermittingly-rotated printing-cylinder mounted thereon, a stop projecting from said cylinder, and a catch-pawl with which said stop engages after being released from said shaft, substantially as described.

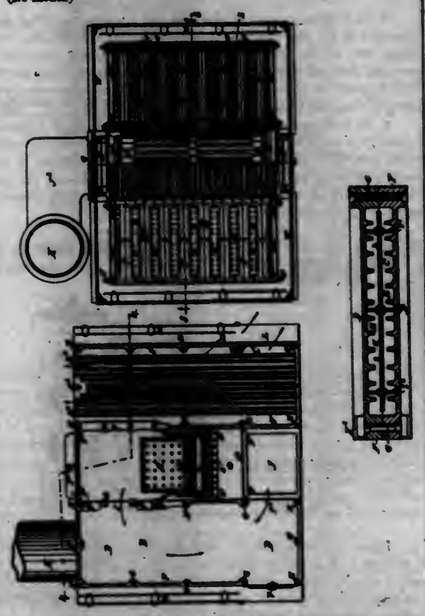
11. In a letter-marking device, the combination of a letter-feed, a continuously-rotating shaft, a marking-cylinder mounted thereon, a clutch device interposed between the shaft and cylinder, a pin carried by the cylinder, a catch-pawl with which said pin engages after the cylinder is released from the clutch, and a spring which forces said pawl into the path of the pin, substantially as described.

12. In a letter-feeding device for a letter-marker, a movable frame provided with a feed-roller, a guide-plate carried by said frame, and a trip having an arm resting adjacent to said guide-plate, substantially as and for the purpose set forth.

13. In a feed for a letter-marking device, a movable frame provided with a feed-roller, and a guide-plate carried by said frame and having formed therein a groove, in combination with a letter-trip having an arm resting in said groove, substantially as and for the purpose set forth.

14. The combination, with separable feed-rollers, of separable impression and printing cylinders, and a controller between the feed-rollers and the impression and printing cylinders, whereby the position of the feed-rollers controls the position of the impression and printing cylinders, substantially as described.

15. The combination, with a marking-roller, an impression-roller having spring-actuated journals, and a feed-roller journaled in a swinging spring-actuated frame, of a lever actuated by the swinging feed-roller, and another lever connected thereto and arranged between said lever and the impression-roller for pressing the latter back from the marking-roller as the feed-roller swings aside, substantially as and for the purpose set forth.



16. In a letter-marking device, the combination of a printing-roller and impression-roller held toward the printing-roller by a spring, feeding-rollers, a lever adapted to be operated when the feeding-rollers are unusually separated, as by a letter of unusual thickness, another lever bearing against the support of the impression-roller, and a link connecting said levers, whereby the printing and impression rollers are separated by the separation of the feeding-rollers.

17. In a letter-marking device, the combination of the stationary portion of the printing-surface, the removable portion seated in the stationary part, a catch for confining said removable portion in its seat, and a spring under compression when the removable portion is in place and tending to force it out of its seat when released, substantially as described.

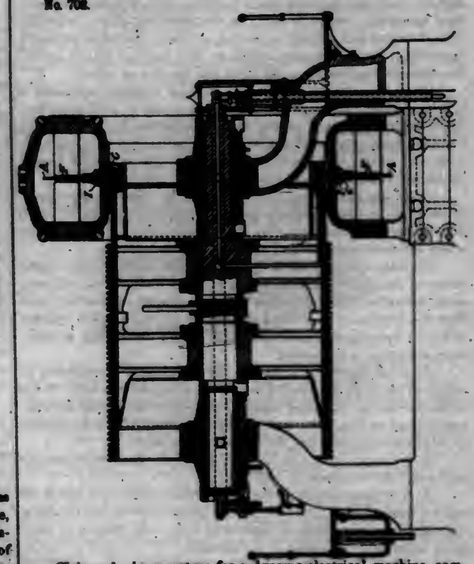
18. A removable type-holder having a type-cell, the inner wall of the type-cell being grooved and the side wall being perforated, and a key seated in said groove and in corresponding grooves in the types, and having an end projecting through said aperture by which it may be easily withdrawn, substantially as described.

408,402. STOVE OR AIR-HEATING APPARATUS.

SAMUEL C. DAVIDSON, Belfast, Ireland. Filed Mar. 18, 1889. Serial No. 303,707. (No model.)

Claim.—1. In a stove or air-heating apparatus having two series of flat vertical chambers on the right and left sides of the fire-place, said chambers presenting their edges to the fire-place and said chambers constituting alternate air and smoke flues, the combination of metal plates each having on both vertical edges two oppositely-projecting flanges, (each plate thus having four projecting flanges,) said plates being fastened together in pairs with their adjacent flanges in contact, whereby the vertical air-chambers are formed between the two plates forming a pair of plates, and said pairs of plates, and said pairs of plates being fastened together with the adjacent outer flanges of adjacent pairs of plates in contact, whereby the smoke-chambers are formed, the flanges, however, which constitute the end walls of the smoke-chambers next the fire-place being cut wholly or partially away above the grate, substantially as set forth, whereby openings are formed for the passage of smoke from said fire-place into said smoke-chambers and space is provided for the expansion of said metal plates.

2. In a stove or air-heating apparatus, a fire-place, with its grate and ash-plate, in combination with metal plates D D, fastened together in pairs, and said pairs of plates being also fastened together, said plates being arranged vertically on opposite sides of said fire-place with their edges next to the fire-place, each plate having on each vertical edge oppositely-projecting flanges F F, the flanges on adjacent plates being in contact with each other, whereby air-chambers are formed between the plates constituting a pair and smoke-chambers are formed between the adjacent pairs of plates, the said flanges constituting the end walls of said air and smoke chambers, the flanges, however, which constitute the inner walls of said smoke-chambers next the fire-place being cut away to form openings I I above the grate for the passage of smoke from said fire-place into said smoke-chambers, and being also cut away below the ash-plate to form openings I^2 I^2 for the passage of the smoke from said smoke-chambers to the chimney, substantially as set forth.



3. In stoves or air-heating apparatus which comprise two series of flat vertical chambers at the respective sides of the fire-place, such chambers being led onto the fire-place and forming alternate air and smoke flues with inlet and outlet openings, the combination, with the plates which form the flues, of thin metal plates or diaphragms which divide the air-flues vertically, whereby the air-heating surface in same is increased, substantially as set forth.

4. In a stove or air-heating apparatus, the combination, with the fire-place A, cast-iron plates D D, flanges F F on said plates, bolted together so as to form with said plates alternate smoke-flues B B and air-flues C C, openings I I at upper part of said flanges, openings I^2 I^2 at lower part of said flanges, and air-inlets L L, of the thin metal plates or diaphragms Z in said air-flues C C, dividing the same vertically, substantially as and for the purpose set forth and shown.

5. In a stove or air-heating apparatus, the combination of the following parts, viz: the fire-place A, cast-iron plates D D, flanges F F, cast on said plates, bolts H H, securing said flanges together, openings I I, I^2 I^2, and I^4 I^4 in said flanges, air-inlets L L, ribs or gills E E, vertical diaphragms or plates Z, and smoke-flue J, substantially as set forth and shown.

408,403. DYNAMO-ELECTRIC MACHINE.

SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Nov. 30, 1888. Serial No. 292,269. (No model.) Patented in England Jan. 15, 1887, No. 702.

Claim.—1. An armature for a dynamo-electrical machine, composed of a number of coils ranged around the circumference of a disk or wheel, and each formed from a corrugated or interlocking strip of metal, so that the several layers of the coil interlock with one another.

2. An armature for a dynamo-electric machine, having the center of each of its coils of insulated conductor filled in with a composite structure of non-magnetic metal and insulation so arranged as to be free from induced currents.

3. An armature for a dynamo-electrical machine, composed of a number of coils ranged around the circumference of a disk or wheel, and each formed from a corrugated or interlocking strip of metal, so that the several layers of the coil interlock with one another and with

the center of the coil filled in with a filling of strips of metal separated by insulating material—such, for instance, as asbestus.

4. An armature for a dynamo-electrical machine, composed of a number of coils or bobbins of insulated conductor held in metal shoes, which are ranged around the circumference of a disk or wheel with insulating material interposed between the wheel and shoes.

5. An armature for a dynamo-electrical machine, composed of a number of coils or bobbins of insulated conductor held in metal shoes, which are ranged around the circumference of a disk or wheel, and, which are formed with radial stems which pass into radial holes formed in the circumference of the wheel, and insulating material interposed between the wheel and shoes.

6. An armature for a dynamo-electrical machine, composed of a disk or wheel having holes formed radially into its circumference and other holes formed at the side, near the circumference, into which the radial holes enter, and of metal shoes carrying coils or bobbins and formed with stems to pass into the radial holes, and of nuts or collars contained in the side holes and screwed or secured onto the radial stems, and of a filling of insulating substance interposed between the sides of the holes and the stems and nuts or collars.

7. An armature for a dynamo-electrical machine, composed of a disk or wheel having metal shoes ranged around its circumference and separated from it by thickly-interposed insulating material, coils of insulated conductor held in pairs in the shoes, and filling-blocks placed between the coils and the bottom of the shoes, lying with one half in one shoe and the other half in the shoe next to it, and insulated from them both.

8. An armature for a dynamo-electrical machine, composed of a disk or wheel having holes formed radially into its circumference, other holes formed at the side, near the circumference, into which the radial holes enter, metal shoes formed with stems to pass into the radial holes, nuts or collars contained in the side holes and screwed or secured onto the radial stems, and a filling of insulating substance—such, for instance, as sulphur—interposed between the sides of the holes and the nuts or collars and stems, coils of insulated conductor held in pairs in the shoes, filling-blocks placed between the coils and the bottom of the shoe, lying with one half in one shoe and the other half in the adjacent shoe, and insulated from them both.

9. An armature for a dynamo-electrical machine, composed of a disk or wheel having metal shoes carrying coils or bobbins of insulated conductor ranged around its circumference, stems projecting from the shoes and secured to the disk or wheel, interposed insulating material, and insulators of porcelain or like material placed around the stems to come between the shoes and the disk or wheel.

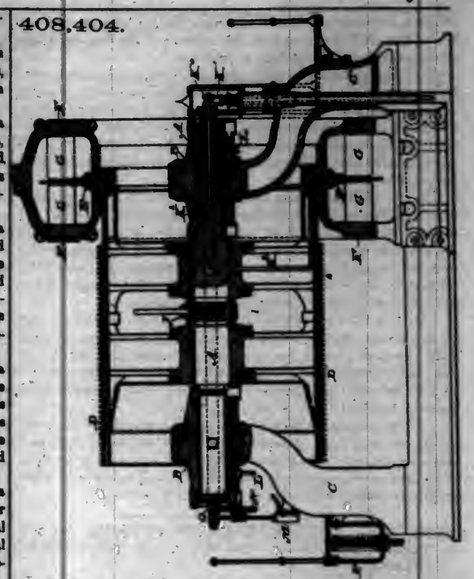
10. An armature for a dynamo-electrical machine, composed of a disk or wheel having metal shoes carrying coils or bobbins of insulated conductor ranged around its circumference, stems projecting from the shoes, interposed insulating material interposed between the stems and wheels, and blocks I of insulating material placed around the stems to come between the shoes and the disk or wheel.

11. In the armature of a dynamo-electric machine, the combination of the insulated bobbins and their supports, the disk or wheel that carries them, and insulating material poured or cast between the wheel and bobbin supports.

12. In an armature for a dynamo-electric machine, the combination of the supporting-disk, wheel, or body, the bobbins, and interposed insulation of less thickness between adjacent conducting parts than the distance over or along the surface of the insulation exposed to the air between the parts which it is desired to insulate, whereby surface-leakage is diminished.

13. An armature for a dynamo-electrical machine, composed of a disk or wheel having ranged around its circumference coils of flat conductor having insulating material between adjacent flat surfaces, and covered at their sides with separately-applied insulating material to come between them and the magnet pole-pieces.

14. A dynamo-electrical machine having the fixed field-magnets insulated from the frame of the machine.

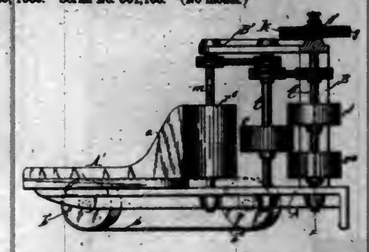


15. A dynamo-electrical machine in which there is a circle of magnet pole-pieces of alternate polarity at the side of the revolving armature, coupled in pairs at their rear ends, and secured by insulating material to the frame of the machine.

408,404. DYNAMO-ELECTRIC MACHINE. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Jan. 14, 1889. Serial No. 296,226. (No model.) Patented in England Feb. 15, 1888, No. 2,316.

Claim.—1. A dynamo-electric machine having a driving-pulley carried between two bearings in which the wheel-shaft is supported, and an armature carried by the rim of said pulley at one side of its driving-surface, substantially as set forth.

2. In a dynamo-electric machine, the combination, with the driving-pulley having a surface for the driving-belt, of the armature carried by the rim of the pulley at one side of said surface and projecting outwardly radially from the rim of the pulley.



408,404.

3. In a dynamo-electric machine, the combination of an armature carried by the rim of a driving-wheel, two standards, one on either side of the driving-wheel, leaning one toward the other and carrying the bearings for the wheel-shaft, frames carrying the fixed field-magnets at the sides of the armature, and connecting-pieces tying the magnet-frames to the standards.

4. In a dynamo-electric machine, the combination of a revolving armature, a circle of field-magnet pole-pieces of alternate polarity on either side of it, an annular frame somewhat of a U shape in cross-section carrying the circle of pole-pieces on each side of the armature, and bolts or other connections securing the outside circumference of the two frames together.

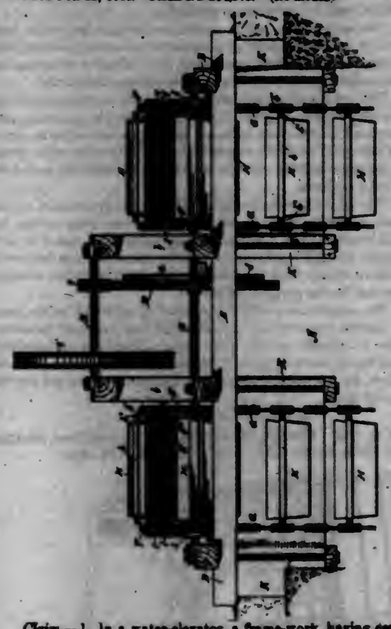
408,405. LETTER FEEDING AND SEPARATING MACHINE. MATTHEW J. DOLPHIN, Brooklyn, N. Y. Filed June 3, 1887. Renewed Feb. 25, 1889. Serial No. 301,163. (No model.)

Claim.—1. An automatic letter-feeding receptacle consisting of a straight wall, a wall partially curved, and an obliquely-moving bottom feed-belt, whereby letters placed in the receptacle are guided, one slightly in advance of the other, and deflected toward feeding-rollers, substantially as specified.

2. The combination, with a letter-separator and feed-rollers, of an automatic letter-feeding receptacle consisting of a straight wall, a wall partially curved, and a moving bottom belt, whereby the moving letters are automatically arranged, one slightly in advance of the other, and are guided and deflected toward and into contact with the feed-rollers, substantially as specified.

3. The combination, with a letter-separator, of an automatic letter-feeding receptacle having a wall partially curved for guiding the letters, one a little in advance of the other, an obliquely-moving bottom feed-belt for deflecting the letters toward the feeding-rollers, and a supporting feed-roller, substantially as specified.

4. In an intermittent letter feeding and separating machine, the combination of the feed-roller r and rollers r' r^2, the roller r arranged to interlap between the rollers r' and r^2, all of said rollers rotating in the same direction, substantially as and for the purpose set forth.



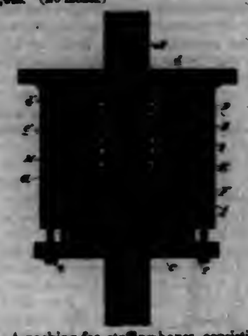
5. In a letter-separating machine, the combination, with the feed-rollers r' r^2, mounted on a shaft journaled in stationary bearings, of the separating-rollers mounted on a shaft journaled in yielding bearings, said shaft connected by a universal joint to a shaft journaled in stationary bearings, substantially as specified.

6. The combination of the stationary journaled feed-rollers, the separating-rollers journaled in yielding bearings and connected by a universal joint to the driving-shaft s, the pulleys g g', and spring-belt k, substantially as specified.

7. The combination, with an automatic letter-feeding receptacle, of a yieldingly-journaled hinderance or check and pressure roller and interlapping feed-rollers, substantially as specified.

8. The combination, with an automatic letter-feeding receptacle, a check and pressure roller, and an interlapping feed-roller, of a letter-separator and feed-rollers, substantially as specified.

408,406. WATER-ELEVATOR. ANDREW H. HAPKE, Phœnix, Arizona. Filed Dec. 22, 1888. Serial No. 294,573. (No model.)



Claim.—1. In a water-elevator, a frame-work having centrally-disposed power receiving and transmitting gearing and shafting and water-troughs located under each end thereof, in combination with a pair of sprocket-wheels over each trough, endless chains passing over said sprocket-wheels, each pair of chains forming a carrier, a succession of pivotally-suspended buckets carried by the chains, and anti-friction rollers on the buckets adapted to come in contact with the sprocket-wheels and turn said buckets through a complete revolution at the top of their movement, whereby they discharge their water into the underlying troughs, substantially as herein described.

2. In a water elevator, the rotary sprocket-wheels F and the endless chains engaged and caused to travel by said wheels, said chains having double links g, the inner one of which is provided with a hole or socket, in combination with the cradles having the end pins or gudgeons k' fitting in the holes or sockets of the inner links of endless chains, whereby said cradles are pivotally suspended and locked in the chains and the buckets secured in the cradles, substantially as herein described.

3. In a water-elevator, the rotary sprocket-wheels F and the endless chains G, engaged and caused to travel by said wheels, in combination with the cradles A, pivotally suspended in the chains, the buckets H in the cradles, and the anti-friction rollers h^3 on the projecting ends of the cradle-sides, adapted to come in contact with the sprocket-wheels, whereby said buckets are made to turn through a complete revolution at the top of their movement, substantially as herein described.

4. A water-elevator comprising a frame-work over the well or other source of water-supply, having a centrally-disposed power receiving and transmitting mechanism, a longitudinal shaft C, with spur-gear D, having a flange d, and a strap-brake L, acting on said flange, sprocket-wheels F at each end of the shaft C, the outer one of which has ratchets I, and retaining-pawls J, engaging the ratchets, endless chains G, passing over said sprocket-wheels and down into the source of water-supply, pivotally-suspended buckets H, carried by the chains, and having anti-friction rollers h^3 at each end for coming in contact with the sprocket-wheels and reversing the buckets to discharge their water, and underlying troughs K at each end into which the water is discharged by the buckets, substantially as herein described.

408,407. PACKING FOR STUFFING-BOXES. CHARLES H. ESSEX, Temescal, and PERE B. WRIGHT, Berkeley, Cal. Filed Mar. 30, 1889. Serial No. 305,662. (No model.)

Claim.—1. A packing for stuffing-boxes, consisting of the combination of the contractible metal rings D and E, fitted about the moving rod and forming a tight joint between them, the movable metal ring F, also fitted about said rod, and the encircling band or ring of compressible or elastic material binding upon said metal rings, and adapted by the movement of ring F to be compressed, so as to hold the rings to place on the rod, substantially as described.

2. A packing for stuffing-boxes, consisting of the combination of the flanged contractible metal rings D and E, fitted about the moving rod and forming a tight joint between them, the movable metal ring F, also fitted about said rod and having a flange, and the band or ring G of compressible or elastic material fitted about said metal rings and confined by their flanges, said band or ring G being compressed by the movement of the ring F to hold said metal rings to place on the rod, substantially as described.

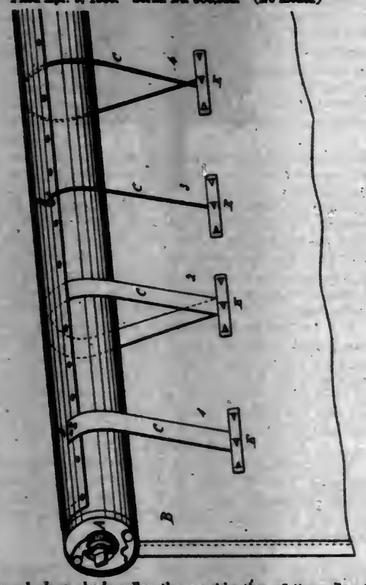
3. In a stuffing-box packing, the combination of the contractible metal rings D and E, having grooves on their inner surfaces for a lubricant, the movable metal ring F, and the compressible or elastic band or ring G, encircling said metal rings and holding them to place, substantially as described.

408,408. SOLDERING-IRON. THEODORE W. EVERSOLE, Garrett, Ind. Filed Jan. 28, 1889. Serial No. 297,495. (No model.)

Claim.—1. The combination, with a tip-holder provided with a hole having a lateral notch, of a tip having a stud to enter the hole, a feather to engage with the notch, and means for fastening the stud to the holder, substantially as described.

2. The combination, with the perforated shield A, of the detachable tip-holder B, closed at one end and having lateral openings b' and end openings b^4, and the tip C, detachably secured against the end of the tip-holder, substantially as described.

3. The combination, with the tip-holder B, having the holes b^4 in its end, of the tip C, detachably secured to the holder and having a chamber c^4, with which the holes b^4 communicate, substantially as described.



408,409. HOSE-COUPLING. ANNIE F. HANSON, San Francisco, Cal., (executrix of WILLIAM W. HANSON, deceased,) assignor to H. D. BOSSE, same place. Filed Mar. 20, 1889. Serial No. 304,094. (No model.)

Claim.—1. A connection for hose-sections, consisting of flanged collars secured upon the ends of the hose-sections, having levers fulcrumed thereon, said levers having hooks upon the outer ends to engage the flanges of the opposing collar, and having the inner ends extended rearwardly behind the collar and bent so as to press upon the surface of the hose and be separated thereby, substantially as herein described.

2. A hose-coupling consisting of the rigid collars fitted into the ends of the hose, with flexible collars fitting the outside of the hose, having the inwardly-projecting flanges, in combination with the exterior rigid collars clamped upon the ends of the hose and the flexible collars and having outwardly-turned flanges, and the hooked levers fulcrumed upon said exterior collars, so that the hooks will engage the flanges of the opposing coupling, while the inner ends of the levers are acted upon by the elastic hose-sections which are coupled thereby, substantially as herein described.

408,410. SHADE-FASTENER. PHILANDER A. HARRIS, Paterson, N. J. Filed Apr. 9, 1889. Serial No. 306,882. (No model.)

Claim.—1. In a shade-roller, the combination of the roller, the shade attached thereto, and a flexible band or cord attached to the roller and also to the shade, the point of attachment of said cord to the shade being just before the shade is entirely unwound nearer perpendicularly to its point of attachment to the roller than to the point measured along the shade where the shade is attached to the roller, whereby the cord is drawn taut and strain upon the shade at its points of attachment to the roller is prevented, substantially as shown and described.

2. In a shade-roller, the combination of the roller A with its attached shade B and the band or cord C, which latter is hung upon the roller A and has its ends attached to the shade, the points of attachment to the shade being just before the shade is entirely unwound nearer perpendicularly to the points where the said cord is tangent to the sides of the roller than to the point measured along the shade where the shade is attached to the roller, whereby the cord is drawn taut and strain upon the shade at its points of attachment to the roller is prevented, substantially as shown and described.

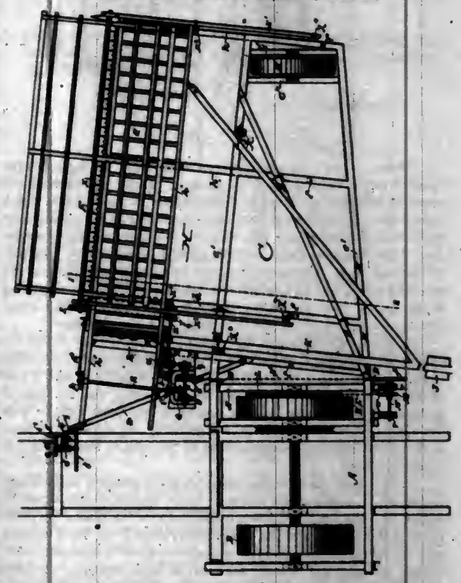
408,411. STAMP-CANCELING AND POSTMARKING MACHINE. GEORGE W. HEY, Syracuse, N. Y., assignor, by direct and mesne assignments, to the International Postal Supply Company of New York. Filed Apr. 14, 1887. Serial No. 234,836. (No model.)

Claim.—1. The combination of a marking-roller normally at rest, a continuously-revolving roller mounted on the marking-roller shaft, a clutch between the two rollers, and a trigger in the letter-path connected to the clutch and actuated by letters fed over the letter-supporting bed, substantially as and for the purpose set forth.

2. The combination of the marking-roller with the revolving roller, both mounted on a common shaft, a clutch for connecting the two rollers, and a trigger for operating the clutch, substantially as and for the purpose set forth.

408,411.

3. The combination, with a marking-roller and a revolving roller, both mounted on a common shaft and detachably connected together, of a stop for stopping the marking-roller after it has registered, substantially as and for the purpose set forth.



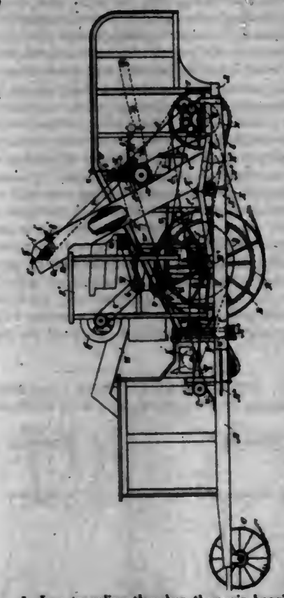
4. The combination, with a marking-roller and a feed-roller both mounted on a common shaft, of a clutch for connecting the two rollers, a trigger for operating the clutch, and a stop for stopping the marking-roller, substantially as and for the purpose set forth.

5. The combination, with an intermittently-revolving marking-roller, a trigger projecting into the letter-path, and a connection, substantially such as described, between the trigger and roller for starting the latter, of a stop for engaging and holding said roller at the proper point for registry with the next letter, substantially as and for the purpose set forth.

6. The herein-described trigger, consisting of the pivoted adjustable lever extending into the letter-path, provided with springs for resetting it to its normal position after the letters have passed its end, said trigger through a suitable connection, substantially as described, transmitting motion from the letters to the marking-roller, substantially as and for the purpose set forth.

7. The combination, with the rollers F F', mounted on the same shaft S, and the pressure-roller against which they rotate, of the marking-roller B, normally at rest, and means, substantially as described, for bringing the marking-roller B into action when the letter in transit encounters the trigger, and the trigger *t*, substantially as and for the purpose set forth.

408,412. HEADER AND THRASHER. BENJAMIN HOLT, Stockton, Cal. Filed July 29, 1887. Serial No. 245,630. (No model.)



Claim.—1. The thrashing-machine frame A, having a frame C hinged to one side in a line parallel to the line of travel of the machine, but having a rearwardly-inclined front timber, in combination with the pulley L, secured to one of the main driving-wheels, the shaft M behind the pulley L, parallel to its axis, the pulley M on the shaft M', chain L', connecting pulleys L and M, the counter-shaft P on the forward part of the machine parallel to shaft M' and driven thereby, the shaft R at right angles to the front timber of the frame C, the bevel gear-wheels U and T between said shafts P and R, the sickle parallel to the front timber of the frame C, and the crank-wheel and pitman connecting the shaft R with the sickle, substantially as herein described.

2. In a combined header and thrasher, the header-frame C, hinged to the thrasher-frame and extending outwardly, with its front timber having a rearward inclination, the supplemental frame H, carrying the sickle and grain-belt and hinged to the frame C at right angles to its front timber, the reel mounted on a shaft parallel to said front timber, and the shaft Z, driving said reel-shaft and parallel thereto, in combination with the main driving-wheels, the shaft M behind said wheels, driven thereby and parallel to their axle, the shaft P in front of said driving-wheel, parallel to shaft M' and driven thereby, and the chain-and-pulley connection between shafts P and Z, substantially as herein described.

3. The thrashing-machine frame A, the header-frame C, hinged to it and extending outwardly therefrom, with the wheel E at the outer end, and the supplemental frame H, hinged to frame C on a line parallel with its front timber and carrying the sickle and grain belt or draper, in combination with the chain-pulleys *e* and *e'* and the chain *e²* upon the thrashing-machine frame, the diagonal bar *m*, extending beneath the timbers of the supplemental frame H, and the link *i*, connecting said bar with the chain *e²*, substantially as herein described.

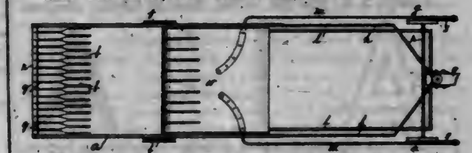
408,413. TRAVELING THRASHER. BENJAMIN HOLT and JAMES DRAPER, Stockton, Cal. Filed Apr. 3, 1889. Serial No. 305,886. (No model.)

Claim.—1. In a traveling thrasher, the main bearing and driving wheel, the counter-shaft with a sprocket-wheel to which power is transmitted from the driving-wheel by a driving-chain, a second sprocket-wheel fixed to said shaft, and a chain J passing around said wheel and around the sprocket-wheel K upon the counter-shaft L and returning in contact with the sprocket-wheel M upon the grain-carrier shaft, in combination with the vertical movable bracket *s*, in which the counter-shaft L is journaled, whereby the tension of said belt may be regulated, substantially as herein described.

2. The counter-shaft L, journaled in the bracket *s*, and having the sprocket-wheel K, through which power is transmitted to it from the primary counter-shaft G, and the sprocket-wheel O, through which power is transmitted from it through the belt S to the beater-shaft, pulley U, and the cleaner-fan, in combination with the guide and holding-bolts of the bracket *s*, the adjusting-screw X, and the locking-bolt Y, substantially as herein described.

3. The grain-elevator case R, having its sides slotted at the upper end, the journal-boxes *i'*, fitting in said slots, and the sliding plates *f'*, to which said boxes are secured, said slides fitting and covering the slots in the case R, in combination with the adjusting screws and nuts attached to the slides, and the bolt *f'*, passing through the elevator-case and through slots in the lower ends of the slides, substantially as herein described.

4. The main driving-wheel D, the sprocket-wheel F, fixed upon the counter-shaft G and receiving power through a chain from the main driving-wheel, the sprocket-wheel I, fixed to the counter-shaft G, the counter-shaft *j*, having the sprocket-wheel *i'*, and the belt *h*, by which power is transmitted from the wheel I to the wheel *i*, in combination with the bracket *y* and the journal-boxes *a'*, in which the shaft *j* turns, said boxes being adjustable upon said bracket, substantially as herein described.



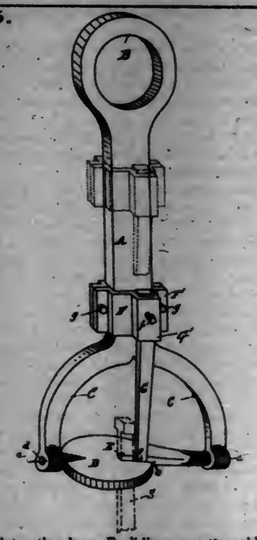
5. The main bearing and driving wheels supported upon a single journal-shaft, and the counter-shaft G, carrying the sprocket-wheels F, H, and I and journaled upon the rear portion of the thrashing-machine frame, in combination with the timbers *c'*, abutting against each other at an angle and against the journal-boxes of the shafts, and the adjusting-screw bolt *q'*, passing through the meeting angle of the brace-timbers and having a nut fitted upon its upper end, substantially as herein described.

6. In a traveling thrasher, the main bearing-wheels and the main driving sprocket-wheel D, the counter-shaft G, journaled in boxes upon the rear of the frame and having the sprocket-wheels F, H, and I, the supplemental chains J and *h*, driving, respectively, the counter-shafts L and *j*, and the supplemental wheels and chains whereby the power is distributed from one of these counter-shafts to the grain-elevator, the beater-shaft and cleaning mechanism, and from the other to the thrashing and feeding mechanism, substantially as herein described.

7. The counter-shaft *j*, having a sprocket and pulley upon its opposite ends, one of which receives power from the main counter-shaft G from one side of the shaft, while the other transmits power to the cylinder at the opposite side of the shaft, in combination with the horizontally-adjustable journal-boxes, whereby the ends of the shaft may be moved in opposite directions, substantially as herein described.

8. The main bearing-wheel and sprocket driving-wheel D, the counter-shaft G, receiving power therefrom, a second counter-shaft L, to which power is transmitted from the shaft G, as described, the chain elevator-belt and buckets, an adjustable shaft and pulley driving said elevator, and an independent adjustable chain transmitting power to drive the elevator from the counter-shaft L, in combination with the auger R', delivering grain into the bottom of the elevator-case, and a sprocket-wheel fixed to the end of the auger-shaft within the elevator-case and around which the elevator-belt passes, substantially as and for the purpose described.

408,414. CRANBERRY-PICKER. JOSEPH R. JEWETT, Mattapoisett, Mass. Filed Jan. 18, 1889. Serial No. 296,751. (No model.)

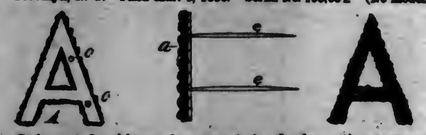


Claim.—1. A cranberry-picker consisting of a box provided with suitable teeth at its forward end for stripping the berries from the plants, mounted on a driving-wheel and having a lateral vibratory motion when propelled along the ground, in combination with a rake working longitudinally in said box, and mechanism connected with said driving-wheel for operating said rake, and a suitable receptacle for holding the fruit after it is drawn backward by said rake, substantially as shown and described

2. A cranberry-picker consisting of the box *a*, having its front end provided with the slats *b* and teeth *g*, and having slots *i* in its sides, mounted on the bearer *y* by means of the bolts *t*, provided with springs *u*, the bearer *y*, provided with the fixed rollers *e* and resting on the axle of the driving-wheel *c*, the drive-wheel *c* having its periphery provided with projections *d*, the grooved pulleys *f*, fixed on the outer ends of the drive-wheel axle, the push-bars *l*, with their front ends inclosing said axle and extending to the rear and secured to the handle *o* and carrying the box *z*, and shaft *p*, the shaft *p* having the grooved pulleys *g*, provided with arms *s* fixed to its ends, the rods *m*, pivoted to the arms *s* and extending forward and through the slots *i* in the sides of the box *a* and rigidly secured to the rake *w*, the rake *w*, the rods *h*, rigidly secured to the rear end of the box *a* and extending to and pivoted on the handle *o*, and the bands *n*, connecting the pulleys *f* and *g*, all as shown, and for the purpose described.

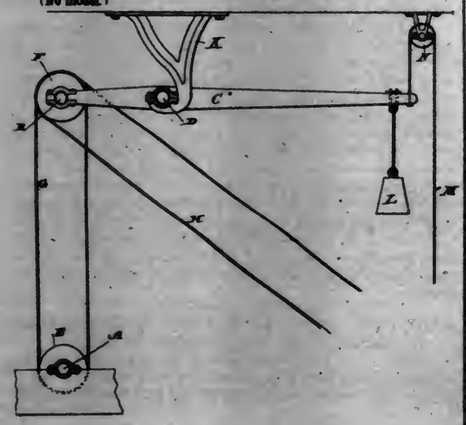
408,415. SUCKER-ROD ELEVATOR. HARVEY KNOX, Rixford, Pa. Filed Sept. 20, 1888. Serial No. 286,094. (No model.)

Claim.—1. In a sucker-rod elevator, the combination, with the rectangular lifting-stem A, provided with a yoke at its lower end, of the jaw D, pivoted between the ends of said yoke and provided with



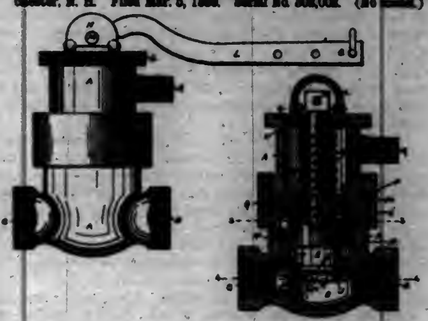
408,415.

the open-ended slot *e*, the sleeve F, sliding upon the said rectangular stem, and the tongue G, secured to one side of the said sleeve and adapted to enter the open end of slot *e*, substantially as and for the purpose set forth.



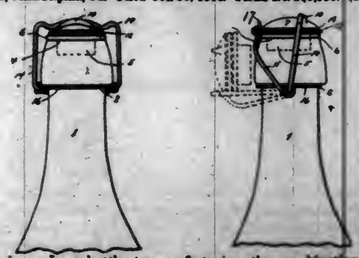
2. In a sucker-rod elevator, the combination, with the rectangular lifting-stem A, provided with a yoke at its lower end, of the jaw D, pivoted between the ends of said yoke and provided with the open-ended slot *e*, the sleeve F, formed in halves and provided with the flanges F', the bolts *g*, and the boss G', the tongue G, adapted to enter the open end of slot *e*, and having its upper end square and inserted in boss G', and a set-screw for securing the said tongue in the boss, substantially as and for the purpose set forth.

408,416. FLORAL LETTER OR DESIGN. WILLIAM C. KRUG, Brooklyn, N. Y. Filed Mar. 1, 1888. Serial No. 265,634. (No model.)



Claim.—A floral letter, figure, or design for decorating purposes, consisting of the flowers *a*, secured to the foundation-piece A, which is formed to create the letter or figure desired, and provided with the holes *c*, in combination with the picks *c*, all as herein described.

408,417. COUNTER-SHAFT AND BELT-TIGHTENER. PETER H. KNOCKER, Santa Rosa, Cal. Filed Apr. 15, 1889. Serial No. 307,321. (No model.)

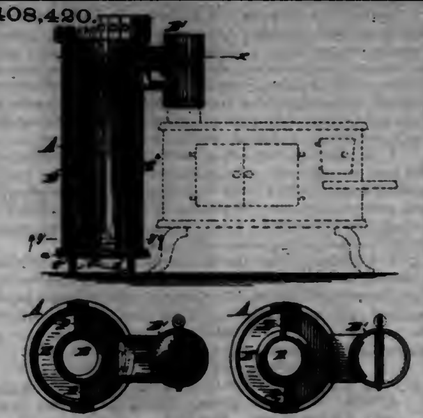


Claim.—The combination of the main driving-shaft, a pivoted frame having a counter-shaft journaled upon its short arm, pulleys on the main shaft and counter-shaft, and a belt-connection between said pulleys, a second belt leading from the pulley on the counter-shaft to the mechanism to be driven, a counter-weight connected with the long arm of the pivoted frame, and the connection for tilting the frame, substantially as and for the purpose described.

408,418. SELF-CLOSING STOP-COCK. JOHN F. LARKIN, Manchester, N. H. Filed Mar. 5, 1889. Serial No. 302,032. (No model.)

Claim.—In a self-closing stop and waste cock, consisting of a shell or case A, having water inlet and outlet passages B C, and interiorly a water-passage D, connecting said passages B C, of a valve-seat J, of water-passage D, of a valve E, having at one end portion a face to seat on valve-seat J and to open and close water-passage D, and at its opposite end portion a stem passing, suitably packed, to the outside of the valve-case, of a spiral spring coiled about valve-stem and confined so as to hold the valve closed and to allow it to be opened, and of means outside the valve-case to open the valve against and to allow the valve to close with the action of said spring, the combination of a water-chamber A^2, surrounding said valve-stem and its spring, an outlet R, for waste water, leading from said chamber, a fixed cross-partition Q, of and located within the valve-case A, between said waste-water outlet R and said valve E, a water-communication P^2, through said partition and connecting water-chamber A^2 with water-passage D and receiving the valve-stem and its spring, a seating-face P of said partition toward the valve E, and a seating-face E^2 of the valve to seat on said face P of partition Q, and located at the opposite end portion of the valve to that of its seating-face E^3 for the seat of water-passage D, substantially as described, for the purposes specified.

408,419. BOTTLE-STOPPER FASTENING. ALEXANDER LEPORTIER, Philadelphia, Pa. Filed Oct. 30, 1888. Serial No. 289,555. (Model.)

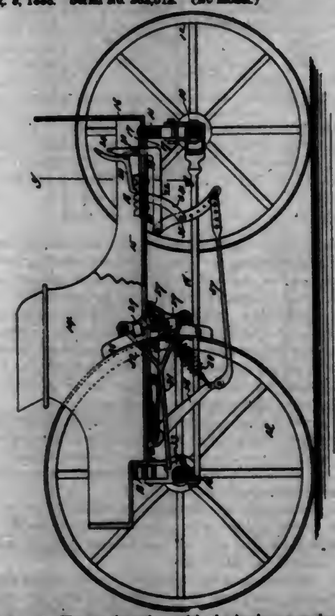


Claim.—In a bottle-stopper fastening, the combination, with the bail 15, provided with an upwardly-projecting stop and pivoted to the bottle-neck, of a cap pivoted to said bail and provided with an upwardly-projecting stop at the opposite extremity of the cap from the pivot, and a second bail pivoted to the bottle-neck and adapted to operate between said stops and to secure the cap to the bottle, substantially as described and shown.

408,420. RADIATOR. JOSEPH LIBBY, Fergus Falls, Minn. Filed Sept. 13, 1888. Serial No. 285,673. (No model.)

Claim.—1. A radiator consisting of the inner and outer spaced casings A B, the inner casing being open at both ends, the opposite partitions D, between the two casings, spaces being formed between the ends of the partitions and the upper and lower ends of the chamber formed between said casings, the ⊣-shaped pipe B', the horizontal arm of which communicates with the upper end of said chamber about at right angles to the partitions D, and is provided with a horizontal portion *d*, the horizontal partition E', extending from the partitions

408,420.



D to partition *d*, and the damper in the vertical arm of said pipe to close it at the partition *d*, whereby the products of combustion may be directed under partitions *d* E' downward under partitions D, thence upward and over partitions E' *d* and the damper, substantially as set forth.

2. A radiator consisting of a hollow body having apertured top and bottom, a longitudinal conical tube opening through the top and bottom of the body, with its smaller end down, an inlet-tube attached to one side, a horizontal partition dividing said inlet-tube, vertical partitions partially dividing the body into two compartments, and a horizontal partition connected with the vertical partitions, substantially as shown and described.

3. A radiator consisting of two spaced tubes or casings, the outer casing having a single horizontally-partitioned opening in one side, and partitions dividing the space between the two tubes or casing above and below the said horizontal partition, whereby the single divided opening will serve for the inlet and outlet of the products of combustion, substantially as set forth.

408,421. VEHICLE-BRAKE. JOHN MAHI, French Gulch, Cal. Filed Aug. 2, 1888. Serial No. 282,312. (No model.)

Claim.—1. The combination, with the brake-operating slide and an adjacent rack, of a latch lever or pawl pivoted to the slide and adapted to engage the rack, the vertical members of said slide and latch-lever having foot-pieces one above the other, substantially as set forth.

2. In a wagon-brake, the combination, with the wagon-body, of an angle brake-lever having a rolling bearing upon the said wagon-body bottom and provided with a foot-rail integral with the upper end, as and for the purpose specified.

3. The combination, with a vehicle-body, a rock-shaft journaled to said body, and brake-shoes secured to said rock-shaft, of a ratchet-plate secured to the body-bottom, an angle brake-lever having a rolling bearing upon the vehicle-bottom and provided above said bottom with an integral foot-rail, a retaining-lever pivoted to said brake-lever, engaging the ratchet-plate, and connections, substantially as shown and described, between the brake-lever and the rock-shaft, as and for the purpose specified.

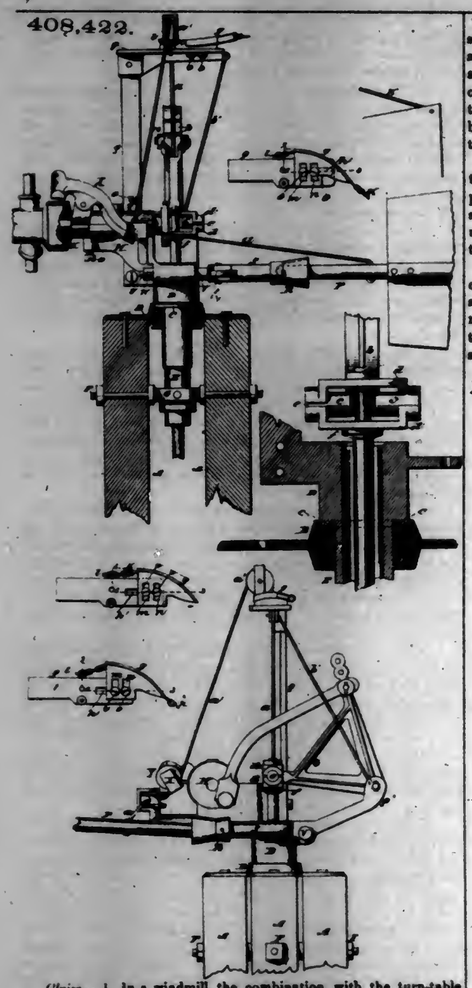
4. In a wagon-brake, the combination, with a brake-shoe provided with a transverse groove or channel and side recesses above and below the said groove, of a brake-shaft, sectional and detachable keepers secured to said shaft, provided with transverse ribs adapted to enter the grooves or channels, and an inwardly-projecting hook adapted to enter the side recess of the brake-shoe, substantially as shown and described.

5. The combination, with the vehicle-body and a longitudinally-slotted ratchet-plate secured to the upper face of the bottom of said body, of a sliding brake-lever fulcrumed upon said ratchet-plate, having a foot-rail integral with the upper end, a retaining-lever fulcrumed upon the brake-lever and engaging the ratchet-plate, a rock-shaft journaled beneath the body, brake-shoes secured to the extremities of said rock-shaft, and connections, substantially as shown and described, between the said rock-shaft and brake-lever, as and for the purpose specified.

6. The combination, with a vehicle-body and a longitudinally-slotted ratchet-plate secured to the upper face of the bottom of said body, a brake-lever adjustably fulcrumed upon the said ratchet-plate, and a retaining-lever fulcrumed upon said brake-lever engaging the said ratchet-plate, of a rock-shaft journaled beneath the body, keepers secured upon the outer ends of the said rock-shaft, and a brake-shoe detachably secured within said keepers, substantially as and for the purpose specified.

7. The combination, with a vehicle-body and a longitudinally-slotted ratchet-plate secured to the upper face of the bottom of said body, an angle brake-lever provided with a rolling bearing upon the ratchet-plate, a retaining-lever pivoted to said brake-lever engaging the ratchet-plate, and a rock-shaft journaled beneath the body, provided with an attached downwardly-extending spring-actuated arm, of keepers secured to the outer extremities of the rock-shaft, brake-shoes detachably secured in said keepers, and connections, substantially as shown and described, between the brake-lever and the rock-shaft arm, as and for the purpose specified.

8. The combination, with the vehicle-body and the axles, a longitudinally-slotted ratchet-plate secured to the upper face of the bottom of said body, an angle brake-lever having a rolling bearing upon the ratchet-plate, an angle retaining-lever pivoted upon the brake-lever, engaging the said ratchet-plate; a rock-shaft journaled transversely beneath the body, and a spring-actuated downwardly-extending arm rigid with the rock-shaft, of brake-shoes held on the extremities of the said rock-shaft, bifurcated guide-rods pivoted to the rear axle, passing through and secured to the brake-shoes, and connections, substantially as shown and described, between the rock-shaft arm and the brake-lever, as and for the purpose specified.

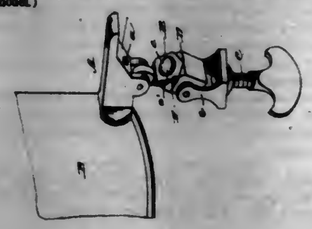


9. The combination, with the vehicle-body and the axles, a longitudinally-slotted ratchet-plate secured to the upper face of the bottom of said body, an angle brake-lever having a rolling bearing upon the ratchet-plate, an angle retaining-lever pivoted upon the brake-lever engaging the said ratchet-plate, a retaining-shaft journaled transversely beneath the body, a spring-actuated downwardly-extending arm rigid with the rock-shaft, and toothed sectional keepers secured to the extremities of the said rock-shaft, of brake-shoes detachably held by said keepers, bifurcated guide-rods pivoted to the rear axle, passing through and clamping the sections of the keepers upon the brake-shoes, and connections, substantially as shown and described, between the rock-shaft arm and the brake-lever, as and for the purpose specified.

10. The brake-shoe keeper or holder consisting of the horizontal plate 27, having transversely-apertured lugs or ears 29^a, the parallel plates 29, having transverse apertures between their ends, a transverse rib 29^c, and inwardly-projecting hooks 29^b above and below said rib, and the bolt passed through the apertured ears and the apertures in the plate, substantially as set forth.

11. The combination, with the brake-shoe or keeper and the attaching-plate to which it is pivoted, of a guide-rod having a forked end connected to the said shoe above and below the pivot, substantially as set forth.

408,422. WINDMILL. FREEMAN P. MAST and HERBERT CRAFT, Jr., Springfield, Ohio, assignors to the MAST, FOOS & COMPANY, same place. Filed June 4, 1887. Serial No. 240,288. (No model.)

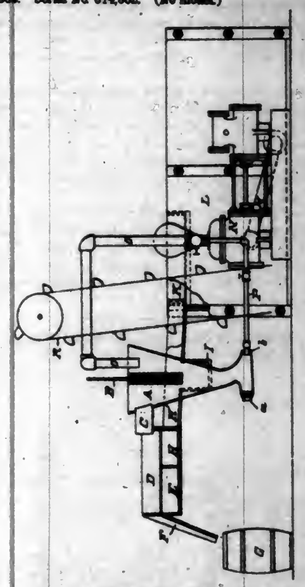


408,422.

Claim.—1. In a windmill, the combination, with the turn-table and a standard extending therefrom, of a cam-arm connected to said standard by a laterally and longitudinally adjustable connection, the tail-vane, and the rod or chain connecting the vane and cam-arm together, for the purpose set forth.

2. In a windmill, the combination, with the turn-table, the tail-vane pivotally connected thereto, and a standard extending upwardly from the table and having a slotted rearwardly-projecting portion at its upper end, of a cam-arm having one end curved and grooved and having two slots at an angle to the slot in the standard, fastening-screws in said slots, and a rod-and-chain connection between the vane and the cam-arm, substantially as described.

408,423. DISCHARGE-COCK FOR FIRE-EXTINGUISHERS. JOSEPH M. MILLER, Chicago, Ill. Filed Apr. 3, 1889. Serial No. 305,881. (No model.)



Claim.—1. A discharge-cock for fire-extinguishers, such as described, the same comprising a head containing a discharge-orifice, a swinging jaw provided with a fastening device, a packing-strip having a protuberant convex-faced portion co-operating with the discharge-orifice, a perforated plate resting upon the packing-strip with the protuberant portion of the latter projecting through the perforation and beyond the surface of the plate, and means for securing the said plate to the movable jaw to hold the packing in place, as set forth.

2. In a discharge-cock such as described, and in combination with the head containing the discharge-orifice and the pivoted block, a packing provided with a protuberant portion, and a plate embracing said packing surrounding the protuberant portion and encircling the movable jaw to sustain the packing in position thereon and support the protuberant portion, substantially as described.

3. A discharge-cock such as described, provided with a head containing a discharge-orifice, a block pivoted to said head so as to swing toward and away from the discharge-orifice, an elastic packing mounted upon the movable block, and a perforated strip overlying the packing and having its ends bent around the movable jaw and secured to the latter, as and for the purpose set forth.

408,424. APPARATUS FOR WASHING AND SEPARATING RUBBER. NATHANIEL C. MITCHELL, Philadelphia, Pa. Filed June 19, 1889. Serial No. 314,902. (No model.)

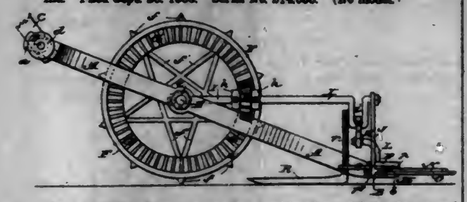
Claim.—1. The combination, with the separator having a diaphragm partially dividing the same, of a rubber-feeding device and water-supply pipe on one side of said diaphragm and an overflow-pipe on the other side thereof, substantially as described.

2. The combination, with the separator having a diaphragm extending part way down the same, of rubber-feeding devices and a main water-pipe on one side of said diaphragm, an overflow-pipe on the other side of said diaphragm, and a smaller water-pipe discharging into said separator below the diaphragm and at the side opposite said overflow-pipe, substantially as described.

3. In a rubber-cleansing apparatus, the combination of the separator, the rubber-feeding device, the water-pipe discharging into said separator, the overflow-pipe for the rubber, the return water-passage, and the pump for maintaining a constant circulation of water through the separator, substantially as described.

4. The combination, with the separator, feeding device, and water-supply pipe, of the overflow-pipe, a screen for receiving the matters discharged by said pipe, and the return water-passage under said screen, substantially as described.

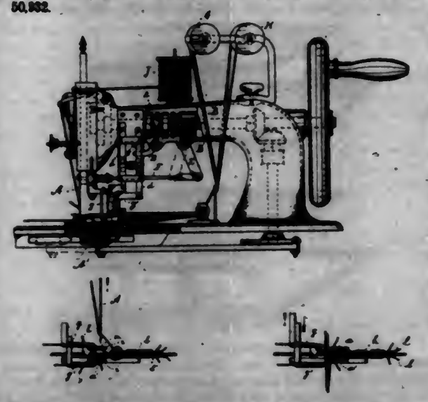
5. The combination of the separator, the water-supply pipe therefor, the reservoir, the pump, the overflow-pipe from the separator, the screen onto which said overflow discharges, and the return-passage leading from beneath said screen to said reservoir, said return-passage being provided with means for purifying the water, substantially as described.



6. In a rubber-cleansing apparatus, the combination, with rubber-feeding mechanism and a water-supply, of a separator consisting of a vessel tapering from the top downward, a vertical diaphragm extending across said vessel and terminating some distance from the bottom thereof, said vessel having an overflow-opening on the side of said diaphragm opposite to the feeding mechanism, a main water-pipe discharging downward on the same side as the feeding mechanism, and a small water-pipe discharging into said vessel near the bottom thereof and in the direction of the overflow, substantially as described.

408,425. ROUGH. GEORGE MOSLEY, Paterson, N. J. Filed Mar. 22, 1889. Serial No. 304,260. (No model.)

Claim.—As a new article of manufacture, a deparator consisting of a flexible core formed of whalebone, with a handle, a rounded head, and a medicated composition extending over the core and head, substantially as shown and described.



408,426. LAWN-MOWER. CHARLES A. OLCOTT, North Vernon Ind. Filed Sept. 20, 1886. Serial No. 214,083. (No model.)

Claim.—1. In a lawn-mower, the combination, with the frame and the bracket-plates secured thereto and having screw-threaded holes therein, of the rearwardly-extending flat shoes having fixed upwardly-projecting threaded stems *r* forward of their centers working loosely in said threaded apertures to allow the stems and shoes free horizontal movement and vertical adjustment, substantially as set forth.

2. The combination, with the L-shaped bar B, carrying the fixed cutters, the reciprocating cutter-bar M, having cutters N secured thereto and resting on said fixed cutters, and the cutter-bar guides P P, having downward-extending front and rear legs overlapping the rear and front edges of the cutter-bar and the rear and top edges of the vertical flange of the bar B, of the side bars A, secured to the bar B at their forward ends, a single drive-wheel journaled between the side bars and having a gear-wheel on one side, a longitudinally-extending crank-shaft I, journaled in the axle of said drive-wheel and in an arm extending up from the bar B, a pinion on said shaft meshing with the gear on the drive-wheel, and a pitman connecting the said crank-shaft and cutter-bar, substantially as set forth.

408,427. SEWING-MACHINE. RICHARD OTTO, Plauen, Saxony, Germany. Filed Nov. 23, 1888. Serial No. 291,730. (No model.) Patented in Germany Mar. 1, 1887, No. 41,227; in England May 11, 1887, No. 6,936, and in Austria-Hungary Nov. 13, 1887, No. 34,963 and No. 50,932.

Claim.—The combination, with a sewing-machine having needle and shuttle, of the horizontally-oscillating loopers *a a'*, the one above and the other below the work-plate, and with a vertically and independently reciprocating thread-carrying guide *g*, substantially as specified.

408,428. BOOK OR MUSIC HOLDER. SUSAN M. PERKINS, Lansing, Kans. Filed Sept. 15, 1888. Serial No. 285,542. (No model.)

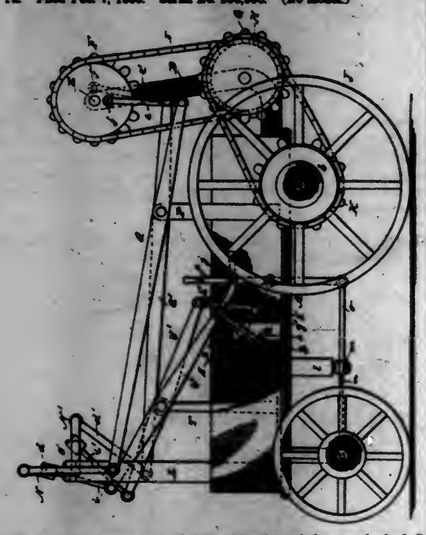
Claim.—In a book or music holder, the combination, with the stretched two-strand wire support B, having looped ends, of the clamps, each consisting of the spring-actuated lever *d* and the base-plate *a*, pivoted to said lever and provided with loops *c*, which are formed of inwardly-bent portions of said plate and embrace the wire strands, thus attaching the clamps adjustably to the latter, as shown and described.

408,429. HAY-STACKER. ARTHUR E. PLATT, Ottumwa, Iowa. Filed Apr. 9, 1889. Serial No. 306,877. (No model.)

Claim.—1. In a hay-stacker, the combination, with the horizontal and upright frames, of the beam having the axle and the reduced curved forward part, the fork formed with the shank-frame F' and having the curved and straight teeth, and the operating-rope, substantially as set forth.

2. In a hay-stacker, the combination, with the horizontal and upright frames, of the beam having the axle, the spring, and the reduced forward part formed with the shoulders and having the pulley in its forward end, the fork having the curved and straight teeth, and the operating-rope, substantially as set forth.

3. In a hay-stacker, the combination, with the horizontal frame having the pulleys and the upright frames, of the beam having the axle, the reduced forward part, and the shoulders, and having the pulley in its forward end, and the recessed rear end, the spring and guides, the fork having the curved and straight teeth, and the operating-rope, substantially as set forth.



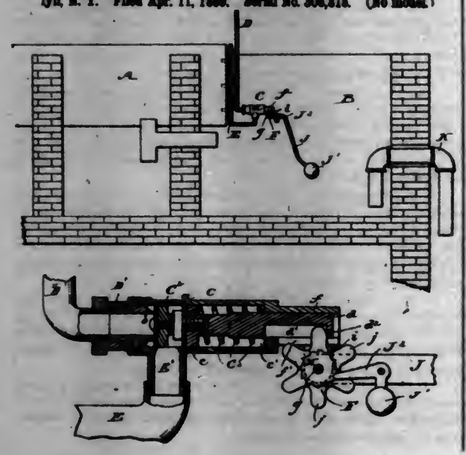
4. In a hay-stacker, the combination, with the horizontal and upright frames, of the beam having the axle, the spring, and the reduced forward part having the shoulders, the notched front end, and the pulley in its front end, the pivoted catch and the sliding plate, the fork having the curved and straight teeth, and the operating-cord, substantially as set forth.

5. In a hay-stacker, the combination, with the horizontal and upright frames, of the swinging beam having the axle and carrying the fork, and the check-springs I and I', secured at their lower ends to the upright frames and connected at their upper ends to the beam-axle by the ropes J and J', substantially as set forth.

6. In a hay-stacker, the combination, with the swinging beam having the flat staple on the side of its rear end, of the L-shaped catch adapted to engage with the same when the beam is elevated, and the rope L', substantially as set forth.

7. In a hay-stacker, the combination of the horizontal frame having the staples at its forward end, the upright frames, and the swinging beam, the fork, and the operating-rope, substantially as set forth.

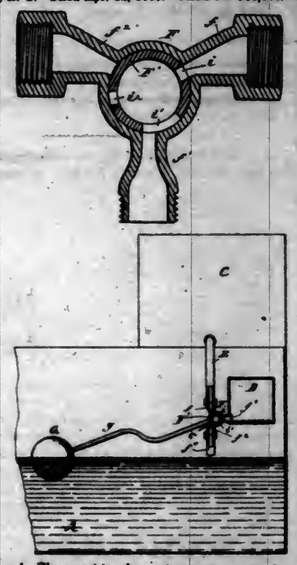
408,430. MOTOR FOR VEHICLES. JONAS POTTER, Johnstown, Pa. Filed Feb. 7, 1889. Serial No. 299,260. (No model.)



Claim.—1. In a motor, the combination of the crank-shaft S, provided with the cranks *g g'* and foot-pedals *k k'*, the levers U U', the crank-shaft M, having the cranks N N' O O', the levers Q Q', the sprocket-wheels F F', provided with the crank-pins *f f'*, the sprocket-wheels H H', the chains I I', the sprocket-wheels G G', the chains *c c'*, and the sprocket-wheels K K', substantially as specified.

2. In a motor, the combination of the crank-shaft S, provided with cranks G G', the levers U U', the lever U being provided with the prolongation *j*, the crank-shaft M, having the cranks N N' O O', the levers Q Q', the sprocket-wheels F F', provided with the crank-pins *f f'*, the sprocket-wheels H H', the chains I I', the sprocket-wheels G G', the chains *c c'*, and the sprocket-wheels K K', substantially as specified.

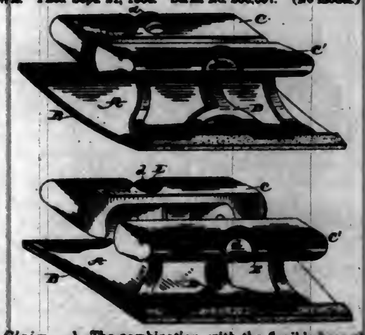
3. The combination, with the body A and front axle C, of the lever *m*, pivoted to the under surface of the body, the hand-lever *p*, the rod *n*, connecting one end of lever *m* to the axle, and the rod *o*, connecting the other end of the said lever *m* to the hand-lever *p*, substantially as described.



408,431. AUTOMATIC RATCHET-COCK. JAMES J. POWERS, Brooklyn, N. Y. Filed Apr. 11, 1889. Serial No. 306,818. (No model.)

Claim.—1. The combination, with the plug or valve of the cock, of a lever, pawl and ratchet, and a star-wheel arranged to withdraw the cock or plug, substantially as described.

2. The main casing *a*, having inlet and outlet connections, and a valve-seat *b*, and the spring-actuated cock or plug C', having the projection d^3, in combination with the star-wheel F, ratchet-wheel H, lever J, and pawl J^3, all arranged to operate substantially as described.

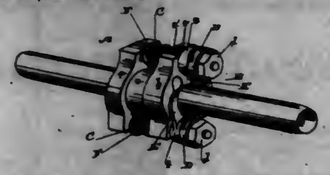


408,432. AUTOMATIC DISINFECTING-TANK. JAMES J. POWERS, Brooklyn, N. Y. Filed Apr. 12, 1889. Serial No. 306,977. (No model.)

Claim.—1. The combination, with a sewage-tank, an elevated reservoir, and a measuring-box connected to the reservoir by a conduit and valve-casing, of a cock fitted in the valve-casing, formed with three passages and provided with a float-arm, whereby the rise and fall of the sewage in the sewage-tank automatically admits chemicals to the measuring-box and automatically empties the same and cuts off the supply, substantially as described.

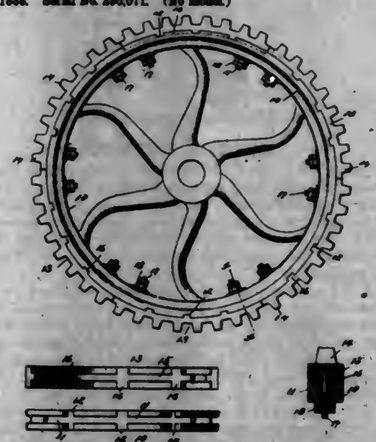
2. The casing F, having the branches *f f'* and spout f^2, in combination with the cock F', fitted in said casing, and formed with passages $f f' f^2$, substantially as described.

408,433. HAND-PAPER HOLDER. THOMAS L. PRETTYMAN, Racine, Wis. Filed Sept. 21, 1888. Serial No. 286,057. (No model.)



Claim.—1. The combination, with the flexible base-plate, of a hand-grasp consisting of two parts attached near opposite edges to said plate, and pivoted clamping-jaws, substantially as described.

2. The combination, with the flexible base-plate, of a hand-grasp consisting of two parts attached near opposite edges to said plate, substantially as described.



3. The combination, with the flexible base-plate, of a hand-grasp attached thereto, and the pivoted clamping-jaws having operating-extensions in close proximity to the said hand-grasp, said extensions being rigidly connected with said clamping-jaws, substantially as described.

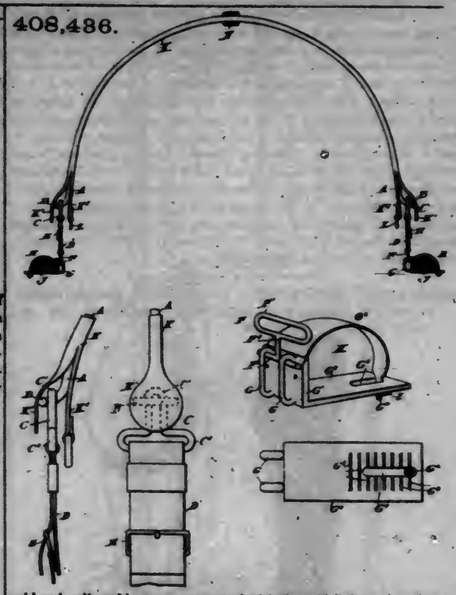
408,434. HOSE-COUPLING. JAMES PRINGLE, Silver King, Ariz., assignor of one-half to Robert Bowen, same place. Filed Mar. 6, 1889. Serial No. 302,143. (No model.)

Claim.—In a hose-coupling, the opposing coupling-heads, one of which is provided with the grooves or bolt-seats *c*, in combination with the bolts C, pivoted in the opposing head, the cam-faced disks on the ends of the bolts, the levers having the cam-faced heads bearing against the disks, the sleeves of said heads, and the springs acting against the sleeves to hold the lever-heads to place, substantially as described.

408,435. TOOTHED WHEEL. JOHN T. REDINGTON, Ambler, Pa., assignor of one-half to Thomas Redington, Jr., same place. Filed Nov. 6, 1888. Serial No. 290,071. (No model.)

Claim.—1. The combination, with a wheel provided with a peripheral groove and diametrical grooves crossing the same, of a series of segmental blocks of a width corresponding to the width of the wheel-rim, and having teeth or sprockets upon the outer face and longitudinal and transverse ribs upon the inner face adapted to enter the corresponding grooves of the wheel, substantially as and for the purposes specified.

2. The combination, with a wheel provided with a peripheral groove and diametrical grooves crossing the same, of a series of segmental blocks of even width with the periphery of the wheel, having teeth or sprockets upon the outer face and longitudinal and transverse ribs upon the inner face adapted to enter the corresponding grooves of the wheel, and means, substantially as shown and described, for locking the segmental block to the wheel, as and for the purposes specified.

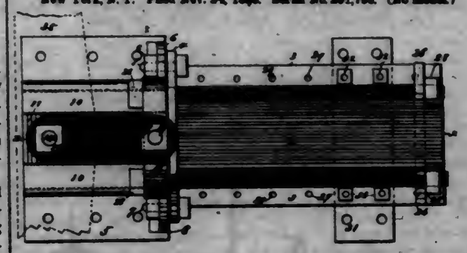


408,436. SAFETY-HARNESS FOR VICIOUS HORSES. ROBERT M. REID, Ann Arbor, Mich. Filed Jan. 3, 1889. Serial No. 295,902. (No model.)

Claim.—1. A harness attachment comprising a metallic rod provided on each end with a T, links adapted to be hooked onto the T ends of the said rod, straps connected with the said links and adapted to be secured to the shafts, substantially as shown and described.

2. A harness attachment comprising a metallic rod provided on each end with a T, links adapted to be hooked on the T ends of the said rod, adjustable straps connected with the said links and each carrying a second link, and a clip secured to each shaft and onto which is hooked the said second link, substantially as shown and described.

3. A harness attachment comprising a metallic rod provided on each end with a T, links adapted to be hooked on the T ends of the



408,436.

said rod, adjustable straps connected with the said links and each carrying a second link, a clip secured to each shaft and provided with parallel vertical rods adapted to be engaged by a T formed on the said second link, substantially as shown and described.

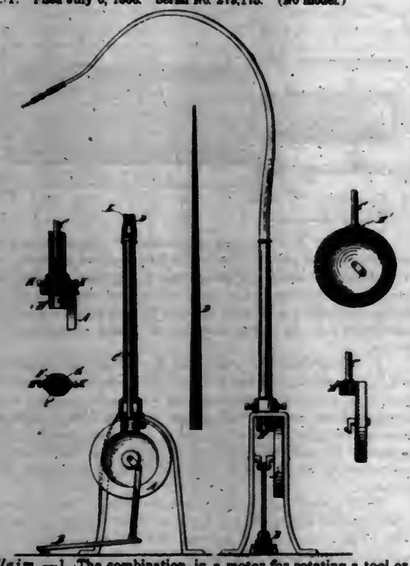
4. In a safety-harness, the combination of a metallic rod adapted to pass through the back-strap of the harness and provided on each end with a T, a leather covering formed on the said rod and split on each end to form straps adapted to be connected with the back band of the breeching, links adapted to be hooked onto the said T ends of the rod, adjustable straps carrying the said links, a second link secured on each of the said straps, and clips secured to the shafts and onto which hook the said second links, substantially as shown and described.

408,437. DRAFT-SPRING FOR VEHICLES. JAMES A. ROSSER, New York, N. Y. Filed Nov. 24, 1888. Serial No. 291,796. (No model.)

Claim.—1. A draft-spring attachment for vehicles, comprising a support, a sliding plate mounted in said support and adapted to carry a whiffletree, a casing projecting from the support, a spring in said casing, a sliding plate in the casing and against which one end of the spring rests, and a connection between the sliding plate carrying the whiffletree and the sliding plate in the casing, substantially as described.

2. In a draft-spring attachment for vehicles, the combination, with a recessed support and a slotted casing secured to the said support, of a sliding whiffletree-carrying plate in the support, a spring arranged in the casing, a sliding plate provided with projections extending through the slots of the casing, and rods secured to the projections of the said sliding plate and to the sliding plate in the support and carrying the whiffletree, substantially as herein shown and described.

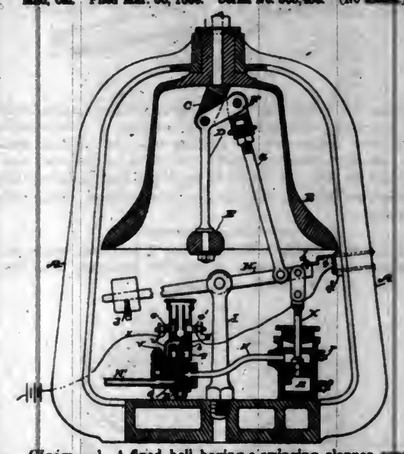
3. In a draft-spring attachment for vehicles, the combination, with a recessed support, of a sliding plate in said support and provided with a bolt at its forward end and with a vertical plate at its rear end, and having at its top a stud and a plate secured to the said bolt and stud, substantially as described.



4. A draft-spring attachment for vehicles, consisting of plate 5, having vertical lugs 6 and ribs 10, forming recess 9, a sliding plate 11, located in recess 9, a vertical bolt 13 on the forward part of plate 11, and a vertical plate 15 on the rear end, with a screw-threaded stud 16, a plate 17, engaging bolt 13 and stud 16 and secured by nuts 19, a casing 2, with transverse plate 4 at its forward end bolted to lugs 6, lateral openings 25 at its rear end and lateral horizontal flanges 3, with bolt-holes 29, a coiled spring 1, located in casing 2, and a sliding plate 24, extending laterally through openings 25 and having a projection 23 engaging the end of spring 1, rods 27, secured at one end to plate 24 and at the other projecting through plates 4 and 15 and secured to the latter, and a plate 31 transverse to and adjustable on casing 2 and secured thereto by bolts 32 passing through holes 29 in flanges 3 and holes 30 in plate 31 and held by nuts 33, substantially as shown and described.

408,438. BICYCLE-TIGHTS. ROBERT G. ROPER, Needham, assignor to George W. Simmons & Co., Boston, Mass. Filed May 16, 1889. Serial No. 311,088. (No specimens.)

Claim.—As a new article of manufacture, a garment forming trousers and stockings of a continuous fabric, having an overlay D D' D² at the junction of the trousers and stockings, substantially as and for the purpose set forth.



408,439. DENTAL ENGINE. LUCIUS T. SHEFFIELD, New York, N. Y. Filed July 6, 1888. Serial No. 279,175. (No model.)

Claim.—1. The combination, in a motor for rotating a tool or drill, of a driving-shaft, a cable tapering from said driving-shaft toward the tool-holder, and a tool-holder rotated by said tapering cable, substantially as described.

2. The combination, in a motor for rotating a tool or drill, of a driving-shaft, a cable tapering from said driving-shaft toward the tool-holder, a flexible tapering sheath or cover inclosing said cable, and a tool-holder rotated by said tapering cable, substantially as described.

408,440. AUTOMATIC BELL-RINGER. WILLIAM W. SLATER, Oakland, Cal. Filed Mar. 30, 1889. Serial No. 305,453. (No model.)

Claim.—1. A fixed bell having a swinging clapper connected with the piston-rod and a piston reciprocating within a cylinder, an air-supply pipe admitting air to one side of said piston, so as to force it to the end of its stroke, and an escape-passage with a controlling screw or cock of smaller capacity than the air-supply pipe, through which the air may escape after the supply has been cut off, substantially as described.

2. The cylinder having the reciprocating piston, the rod of which is connected with the swinging clapper of a fixed bell, said cylinder having an inlet-pipe through which air is admitted to force the piston to one end of its stroke, an air-escape passage of smaller capacity than the supply-pipe, with a regulating cock or screw, and a second escape-passage below the piston, with a regulating cock or screw, substantially as and for the purpose as herein described.

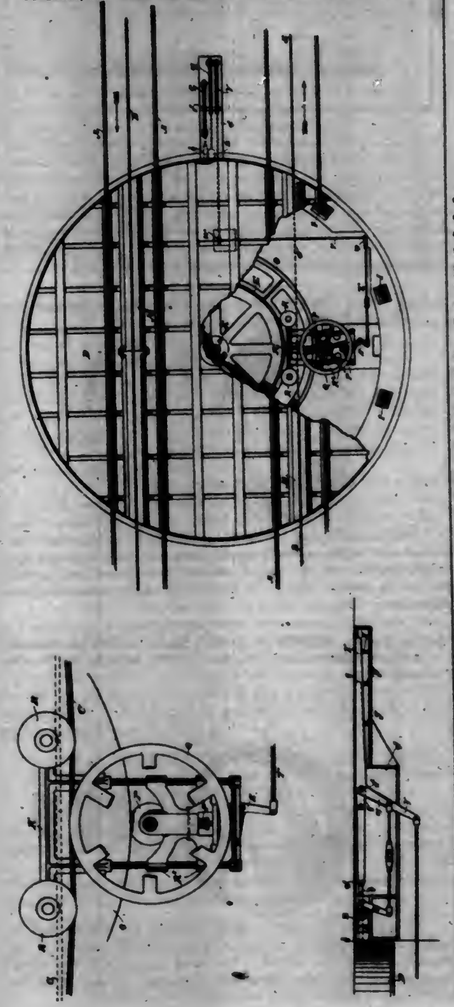
3. The fixed bell with the swinging clapper and the cylinder having the reciprocating piston and piston-rod, whereby the clapper is actuated, and an air-supply pipe leading into said cylinder, in combination with a valve closing said pipe, a second piston moving within its cylinder and acting to open said valve, a passage through which air is continuously supplied above said secondary piston and a second passage through which it is allowed to escape without acting upon the piston, and a valve controlling the escape-passage and operated by an armature of an electro-magnet so as to close said escape-passage and allow the air to act upon the piston in the secondary cylinder so as to open the main air-valve, substantially as herein described.

4. The bell-swinging clapper-piston moving within a cylinder and connected with said clapper so as to actuate it, an air-supply pipe connected with the cylinder and having a valve by which a supply is cut off, a second cylinder with a piston, whereby said valve is opened, and passage through which air is supplied to and escapes from the secondary cylinder without acting upon its piston, in combination with a valve by which said passage may be closed so as to imprison the air within the cylinder, an electro-magnet by which said valve is actuated and contact-point whereby the circuit is closed, one of said points being stationary and the other connected with the upper end of the clapper-actuating piston-rod, so that the clapper returns to its normal condition after contact is made and the valve opened to supply air to the cylinder, substantially as herein described.

408,441. LOCK-HINGE. HENRY W. STEINER, Easton, Pa., assignor of one-half to Thomas T. Miller, same place. Filed Jan. 12, 1889. Serial No. 296,302. (No model.)

Claim.—In a hinge, the leaf A, having its knuckle provided with the projection D, having an inclined shoulder, and the leaf F, provided with a rectangular notch H, the upper shoulder of which is adapted to ride over the inclined shoulder of the projection, and the lower

408,441.



shoulder contacting with the straight under side of the projection, thereby preventing the separation of the parts of the hinge, as set forth.

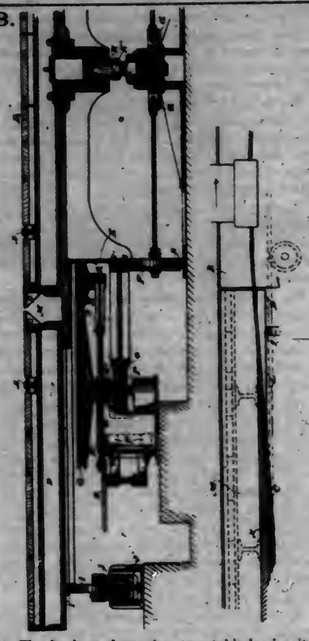
408,442. CIGAR. JOHN H. STEVENS, Newark, N. J., and JOHN E. H. HYDE, New York, N. Y. Filed Aug. 2, 1888. Serial No. 281,766. (Specimens.)

Claim.—1. A cigar having its lighting end impregnated with a non-inflammable solution of substances, substantially as described, which, while not inflammable alone, when combined with the tobacco forms therewith a tinder.

2. A cigar having its lighting end impregnated with nitrate of potash and dextrine to form, in combination with the tobacco, a tinder at the end of the cigar, substantially as set forth.

408,443. CABLE-RAILWAY TURN-TABLE. JOHN C. H. STUT, San Francisco, Cal. Filed Jan. 19, 1889. Serial No. 296,905. (No model.)

Claim.—1. The horizontal rotating turn-table having its center of motion between the lines of two cable-railway tracks, a central cylindrical flanged portion extending downwardly between the main cables and below their plane of travel, and bearing wheels or rollers, upon which the flange is supported on a circular track, upon which the said wheels travel when the table is rotated, in combination with wheels or rollers around the circumference of the table and journaled upon stationary radial axes beneath the periphery of the table, substantially as described.



2. The steel or iron turning table, with its center of motion central between two lines of cable-railway tracks, a central cylindrical flanged portion extending downward between and below the line of travel of the cables, and wheels upon which said cylinder rests and turns, and a second set of wheels or rollers journaled upon radially-fixed axes beneath the periphery of the table, in combination with the horizontal troughs or channels built in the table in lines which correspond with the cable tube or channel of the road-bed, and having slots corresponding with the slot therein, whereby the grip may enter said channels when disengaged from the cable, substantially as described.

3. The horizontal rotating table having its axis between the two parallel lines of cable-railway track, corresponding tracks upon its surface upon which the cars can be received from either of the lines of track, and tubes or channels with slots in the top through which the grip-shank and grip may pass as the car passes over the table, and the exterior and interior sets of wheels or rollers upon which the table is supported in its rotation, in combination with the horizontal driving-wheel connected with the central portion of the turn-table beneath the line of travel of the cables, the corresponding pinion through which power is transmitted to the driving-wheel, a grooved pulley fixed upon the shaft of said pinion in the horizontal plane of travel of the cable, and grooved sheaves supported upon a frame or cross-head upon the opposite side of the cable, said cross-head being movable, so that the movable sheaves will force the cable into contact with the grooved driving-pulley, substantially as described.

4. The driving gear-wheel fixed to the lower part of the turn-table beneath the line in which the cables travel, the vertical driving-shaft, grooved wheel, and the movable sheaves, whereby the cable is forced into contact with the wheel, in combination with the pinion through which power is transmitted to the driving-wheel, said pinion being mounted so as to have a vertical or self-adjusting movement upon its shaft to compensate for irregularities in the movement of the driving-wheel with which it contacts, substantially as described.

5. A cable railway and the cable thereof, the turn-table mounted upon bearing wheels and rollers, with channels or troughs through which the grip of the car may pass above the plane of travel of the cable, and the driving-wheel and pinion situated below the plane of travel of the cable and outside thereof, in combination with the sheaves

408,448.

journaled to a movable cross-head upon the opposite side of the cable, rocker-arms, levers, and connecting-rods, whereby said frame or cross-head may be moved so that the sheaves force the cable into contact with the grooved pulley or allow it to travel independent thereof, substantially as described.

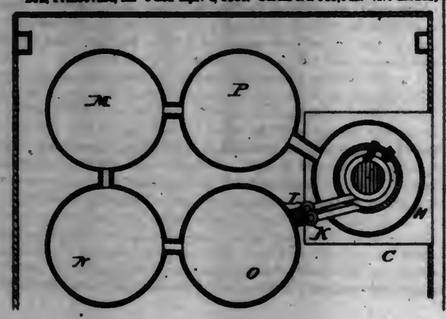
6. The horizontally-rotating turn-table, with its grip channels or troughs, the supporting wheels or rollers upon which it rotates, and the driving-pulley and pinion through which power is transmitted to rotate the turn-table, in combination with the rubber or other elastic springs whereby the contact between the pinion and the wheel is maintained, substantially as described.

7. The horizontally-rotating table, with the U-shaped troughs or strengthening grip-channels, the supporting wheels or rollers, and the corresponding tracks, in combination with the central step and screw-threaded adjustable cone fitting said step supporting the center of the table, substantially as described.

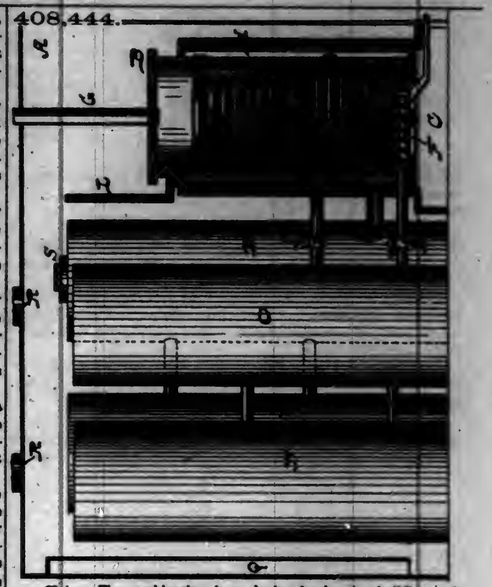
8. The horizontally-rotating turn-table, with central wheels or rollers and cylindrical ring or flange projecting downwardly from the table and resting upon said wheels, in combination with the exterior rollers around the circumference of the table and turning upon stationary shafts, and the vertically-adjustable standards or supports in which said shafts are journaled, substantially as described.

9. The horizontally-rotating table, with the supporting wheels and rollers, the troughs or grip-channels extending across the table in line with the slots and tubes of the roadway, and having the channel for the grip-shank upon the upper sides and the open space or slot near the ends of the lower sides, substantially as described.

10. The U-shaped grip-channels having slots for the shanks upon the upper surface extending across the turn-table in line with the tubes and slots of the railway, having the openings made in the lower sides at the ends toward which the car departs from the table, in combination with depression-pulleys upon the table, whereby the cable is prevented from striking the bottom of the channel when it is taken by the grip, substantially as described.



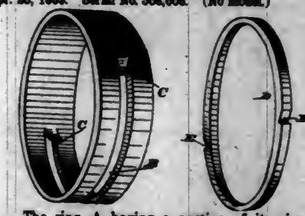
11. The horizontally-rotating table, with the supporting wheels or rollers, the frictional sheaves whereby power is transmitted from the endless traveling cable to rotate the table, a friction-brake acting against the periphery of the table, a latch whereby the table is locked in place when the rails are in line with those of the road, the levers operating the said latch, brake, and also the friction-gearing being journaled upon a single fulcrum-shaft and contained within a box in the road-bed at the side of the table, substantially as herein described.



12. The lever-box fixed in the roadway at one side of the turn-table, with a common fulcrum-shaft for the levers, and having the slots in the top in which the levers lie and the supporting-ribs in the bottom, substantially as described.

13. The parallel moving ropes of a cable railway, a circular turning table pivoted centrally between the ropes and exteeding horizontally above and beyond the cables, and a driving-gear having a common center with the table and projecting horizontally beyond the line of the cables and below them, in combination with a central cylindrical drum extending downward from the table, uniting it with the driving-wheel, and having a diameter less than the distance between the cables, substantially as herein described.

14. The turn-table with the downwardly-projecting central portions, upon each side of which one portion of the cable travels beneath the table, a driving-wheel of greater diameter extending from this central portion beneath the cables, a corresponding pinion engaging said wheel, and a grooved wheel upon the pinion-shaft in the longitudinal plane of the cable and exterior thereto, in combination with sheaves by which the cable is forced into contact with the grooved wheel, said sheaves being mounted between the cable and the central portion of the turn-table, substantially as herein described.



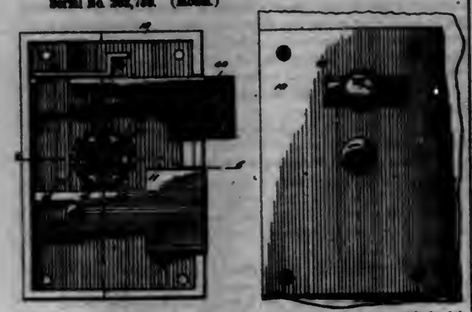
408,444. DEVICE FOR HEATING BUILDINGS. CHARLES M. TAYLOR, Princeville, Ill. Filed Apr. 4, 1888. Serial No. 305,942. (No model.)

Claim.—The combination, in a device for heating buildings, of the following instrumentalities: an inclosure A, a stove having a base C, the two coils of pipes arranged in this stove, the upper coil forming the magazine and the lower coil the fire-box, the grate F, the outlet or chimney G, the surrounding shield H, the tank O, with which said coils communicate, valves I K, safety-vent L, tanks connected together and with the tank O, the cold-air ducts Q, applied to the said inclosure A, the eduction-passage R, and the cover S, applied to tank P, all as specified, and arranged as shown.

408,445. VEIL-FASTENER. PHILO B. TETON, San Francisco, Cal. Filed Apr. 25, 1888. Serial No. 308,606. (No model.)

Claim.—The ring A, having a portion of its circumference slotted, and having inwardly-turned catches at the ends of the slot, in combination with the ring B, adapted to be passed into the slot, and having notches with which the catches engage, substantially as described.

408,446. METHOD OF MAKING MILLING-CUTTERS. CHARLES G. TYLER, Cheshire, Conn. Filed Nov. 17, 1888. Serial No. 291,187. (No model.)



Claim.—1. The process herein described for making toothed cutters, which consists in displacing by compression the metal of the blank in a direction crosswise to the line of the points of the cutting-teeth and parallel to the cutting-face of the tooth formed to form the relief-space of another tooth, substantially as described.

2. The process herein described for making toothed cutters having a series of relieved cutting-teeth, which consists in displacing by successive compressions the metal of the blank in a direction crosswise to the line of the points of the cutting-teeth and parallel to the cutting-face of the tooth formed to form the relief-spaces of the teeth, each successive compression being made forward of the previously-formed tooth, substantially as described.

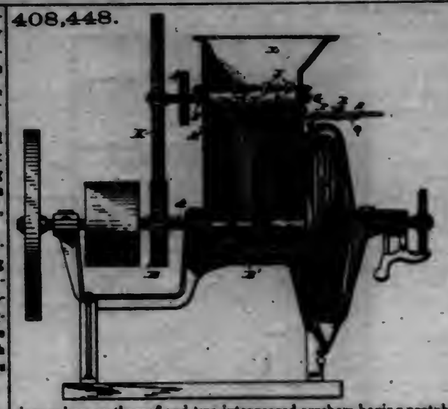
3. The process herein described for simultaneously sizing and toothing milling-cutters, which consists in reducing an oversize blank by successive compressions in a direction crosswise to and advancing along the line of the points of the cutting-teeth, the compressions being made each parallel to the cutting-face of a preceding tooth, substantially as described.

4. The process herein described for making toothed cutters having a series of relieved cutting-teeth, which consists in the reducing of an approximately-shaped and oversize blank to an accurately-sized cutter by successive tooth-forming compressions made, respectively, in directions that are in substantial alignment with the cutting-faces of the cutting-teeth, each compression being made in advance of the preceding one to simultaneously form the relief of one tooth and the cutting-face of the next preceding tooth, all substantially as described.

408,447. LOCK. OLOF VOLKERTS, Sac City, Iowa. Filed Feb. 2, 1888. Serial No. 262,730. (Model.)

Claim.—1. In a lock, the combination, with a bolt provided with a rack, of a tumbler-case provided with teeth which engage said rack, tumblers mounted within the case, adjustable plugs mounted within the tumblers, stems which engage said plugs, springs arranged in connection with the stems, and keepers, substantially as described.

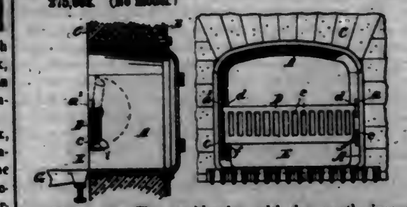
2. In a lock, the combination, with a bolt provided with a rack, of a tumbler-case provided with teeth which engage said rack, tumblers mounted within said case, threaded plugs mounted within the tumblers, stems which engage said plugs, springs arranged in connection with the stems, and keepers mounted at each side of the tumbler-case, substantially as described.



3. In a lock, the combination, with a bolt provided with a rack, of a tumbler-case provided with teeth arranged to engage said rack, tumblers adjustably mounted within said case, stems arranged in connection with the tumblers, springs arranged in connection with the stems, an escutcheon, and a sleeve mounted within said escutcheon and provided with apertures adapted to receive the stem, substantially as described.

4. In a lock, the combination, with a bolt provided with a rack, of a tumbler-case provided with teeth which engage said rack, tumblers mounted within the case, stems connected to the tumblers, springs arranged in connection with the stems, a sleeve surrounding the springs, limit projections carried by the stems and arranged to strike against the edge of the sleeve, an escutcheon, and a sleeve mounted within the escutcheon and arranged to receive the extending ends of the stems, substantially as described.

408,448. CRUSHING AND GRINDING MILL. JAMES F. WHEMELL, Springfield, Ohio, assignor to the Foos Manufacturing Company, same place. Filed Apr. 2, 1888. Serial No. 269,304. (No model.)



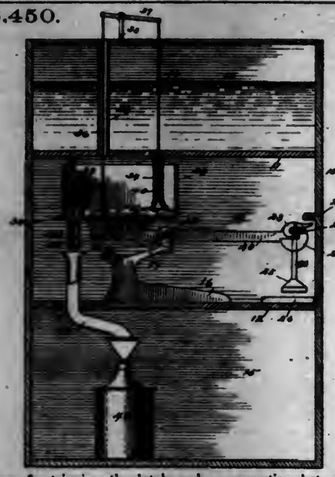
Claim.—1. In a mill, the combination, with the upper portion of the casing or hopper thereof, and crushing and feeding mechanism rotatably mounted therein and provided with a peripheral construction whose sides are at an angle to the axis of rotation, of a cut-off mounted below and near said mechanism and, in the same general direction as the axis thereof and adjustable in said direction to more or less reduce the area of the cut-off, which coacts with said mechanism, the said peripheral construction acting to feed the material in conjunction with the cut-off and to crush the escaped material which is caught by the cut-off.

2. In a mill, the combination, with the upper portion of the casing or hopper thereof and two intergeared crushers having protuberances which extend approximately in line with each other, of a cut-off mounted below and close to said crushers and adjustable to expose more or less of the length thereof, so as to increase the amount of material passing downward from said mechanism.

3. In a mill, the combination, with a casing, a main shaft and grinders, and a crushing-conveyer, of a plurality of crushers mounted in the casing to crush and feed the material to the conveyer, and having protuberances which extend approximately in line with each other and whose sides are at an angle to their axis of rotation, whereby they also act as a conveyer, a cut-off mounted between the said feeding-crushers and the crushing-conveyer substantially in line with the axis of the crushers and adjustable in said direction, and suitable gearing connecting the main shaft with the feeding-crushers.

408,449. ARCH-FENDER FOR STEAM-BOILER FURNACES. GEORGE L. ALLEN, Worcester, Mass. Filed May 31, 1888. Serial No. 275,062. (No model.)

Claim.—1. The combination, with the mouth-piece arch in a steam-boiler furnace, of the perforated feeder-plate extending across the inner end of the arch, as shown, and having its ends rigidly supported in connection with said arch by interlocking lugs that maintain said feeder in upright position, substantially as and for the purposes set forth.



2. The combination of the mouth-piece arch provided with the ears *a a'* and latch-lugs *c*, formed on the inner end thereof, as shown, and the feeder-plate arranged as a barrier across the interior of the arch and furnished at its ends with projections *d*, that engage said ears *a a'* and form hinges on which said feeder is adapted to be inverted within the upper part of the arch, and projections *f*, that latch into the latch-lugs *c* and sustain the lower edge of said feeder when in normal position, substantially as and for the purpose set forth.

3. The combination, with the grate G and arched mouth-piece A, having the closed supporting-ear *a*, an open ear *a'*, formed on the opposite inner sides thereof at central position of its height, and the latch-lugs *c c* below said ears, of the removable feeder-plate having at its upper corners projecting studs *d*, that engage with said ears, and at its lower corners lugs *f*, that engage said latch-lugs, as set forth, whereby said feeder-plate is sustained across the lower part of the mouth-piece, with the open spaces above and beneath the feeder, substantially as shown and described.

408,450. WEIGHING OIL-TANK. REMIE H. RACHELDER and FRED H. LOVEJOY, Portland, Me. Filed Mar. 8, 1889. Serial No. 302,605. (No model.)

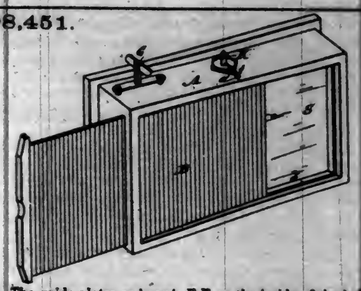
Claim.—1. The combination, with a reservoir, of a scale-beam fulcrumed below the reservoir, a weighing-tank supported upon one arm of the scale-beam, a latch pivoted upon the extremity of the other arm of the scale-beam, a weight-carrier engaging with the said

408,450.

latch; means for tripping the latch, and a connection between the reservoir and the weighing-tank, substantially as shown and described.

2. The combination, with a reservoir and a scale-beam fulcrumed below the said reservoir, a latch pivoted upon the outer extremity of the longer arm of the said beam, and a weight-carrier supported by said latch, of a tank attached to the other arm of the scale-beam, provided with a valved opening in its bottom and a valve-connection between the reservoir and the weighing-tank, and means, substantially as shown and described, for tripping the pivoted latch, as and for the purpose specified.

3. The combination, with a reservoir, a scale-beam fulcrumed below the same having its longer arm provided at the extremity with an essentially hook-shaped pivoted latch, and a weight-carrier notched to receive one end of the said latch, of a tank supported upon the short arm of the weighing-beam, provided with an outlet-aperture in its bottom, a valve adapted to close the said outlet-aperture, having a jointed stem hinged to the lower surface of the reservoir, a trip post or stud held horizontally above the latch of the scale-beam, an outlet-tube extending from the reservoir into the weighing-tank, a valve adapted to close the lower end of the said outlet-tube, and a connection, substantially as shown and described, between the weighing-tank and the said valve of the outlet-tube, all combined for operation, as and for the purpose specified.



4. The combination, with a reservoir, a scale-beam fulcrumed beneath the same, having an essentially hook-shaped latch pivoted to the outer extremity of its longer arm, a weight-carrier provided with a notch in its vertical rod capable of engagement with the inner end of the latch, and a trip post or stud horizontally supported above the outer end of the said latch, of a tank supported upon the shorter arm of the scale-beam, provided with an outlet-aperture in its bottom, a valve adapted to close said outlet-aperture, provided with a jointed stem hinged to the under surface of the reservoir, an outlet-tube projected from the reservoir and extending downward within the tank, a valve capable of closing the lower end of the said outlet-tube, a lever fulcrumed upon the top of the reservoir, a stem connecting one end of the lever and the valve of the reservoir outlet-tube, and a pitman pivoted to the other end of the lever and hinged to the bottom of the weighing-tank, all combined for operation, substantially as shown and described.

408,451. ROLL-HOLDER FOR PHOTOGRAPHIC CAMERAS. ERASTUS B. BARKER, New York, N. Y., assignor to the E. & H. T. Anthony & Company, same place. Filed Oct. 19, 1888. Serial No. 216,645. (No model.) Patented in England Nov. 3, 1885, No. 13,361.

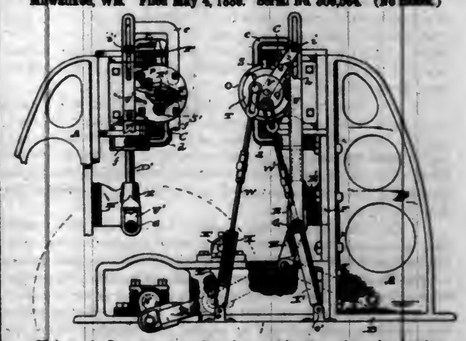
Claim.—1. The combination, with the plate or sensitized sheet holder, of the independent removable light-tight boxes constructed, as described, to carry the sensitized paper and permit the same to be rolled and unrolled and passed from one box to the other in front of the opening of the holder, substantially as specified.

2. In combination with the holder A, having a front opening *b*, and a shutter controlling said opening, the removable light-tight cases or boxes D D, adapted to fit within opposite ends of said holder and provided with light-tight openings *d* for passage of the sensitized sheet in and out of said boxes, also fitted with supply and take-up rollers *c*, adapted at their end or ends to receive a key, essentially as and for the purpose herein set forth.

408,451.

3. The guide plates or boards E E on the inside of the holder A, in combination with the removable boxes D D, for carrying and supplying the sensitized sheet or roll, substantially as specified.

4. The combination, with the holder A and boxes D D, of the back C, provided with an inner board or plate F, flush on its front surface with the faces of said boxes and adapted, in conjunction with the boxes, to support the sensitized sheet at its back in rear of the exposing-opening in the holder, essentially as described.



5. In roll-holders for photographic cameras, provided with a registering and marking wheel adapted to engage with the sensitized paper or film, the registering wheel or rollers I, arranged intermediately of the supply and take-up rollers of the holder and having teeth *n*, and a pricker or marker *o* at one side of the teeth, in combination with a spring applied to said registering wheel or roller and operating to force the latter outward against the sensitized paper or film, substantially as specified.

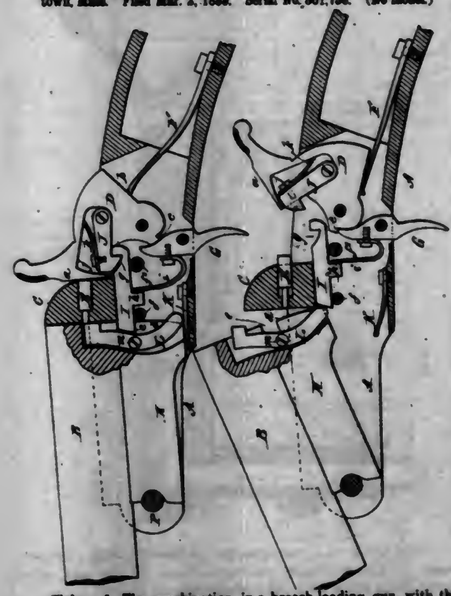
6. In roll-holders for photographic cameras, provided with an exterior rotating indicator actuated by the sensitized paper or film when in motion for determining the extent of movement and final of the sheet, the rotary indicator K, having also a sliding movement in direction of the length of the axis, in combination with the casing A and marking-wheel I, as shown and described, whereby on longitudinally operating the indicator the removal and insertion of the back C is effected, as set forth.

7. The combination, with a photographic roll-holder, of an indicator capable of longitudinal movement in its bearings and provided with a recess in its end and with a spring and a marking-wheel.

8. In combination with a photographic plate and roll holder, detachable boxes or cases containing rollers for holding the sensitized paper.

408,452. VALVE-GEAR FOR STEAM-ENGINES. ANTON NAHA, Milwaukee, Wis. Filed May 4, 1889. Serial No. 309,564. (No model.)

Claim.—1. In a steam-engine, the combination of a valve having a stem provided with a notched disk rigid thereon, a slotted casing surrounding the disk and provided with spring-controlled dogs for alternate engagement with the same, an arm projected into the casing to come in the path of the dogs, and suitable means for actuating said casing alternately in opposite directions and for returning the valve to its normal position after the disengagement of either dog from the notched disk, substantially as set forth.



2. In a steam-engine, the combination of a valve having a stem provided with a notched disk rigid thereon, a slotted and toothed casing surrounding the disk and provided with spring-controlled dogs for alternate engagement with the same, an arm projected into the casing to come in the path of the dogs, a rack-bar connected to the piston-rod of the engine to mesh with the teeth on said casing, and suitable means for returning the valve to its normal position after disengagement of either dog from the notched disk, substantially as set forth.

3. In a steam-engine, the combination of a cylinder, its valve-chambers and ports, an inlet-valve having a stem provided with a notched disk rigid thereon, a slotted casing surrounding the disk and provided with spring-controlled dogs for alternate engagement with the same, an arm projected into the casing to come in the path of the dogs, suitable means for partially rotating said casing alternately in opposite directions, opposing dash-pot plungers connected to said valve-stem, an exhaust-valve and suitable means for actuating the latter valve, substantially as set forth.

4. In a steam-engine, the combination of a cylinder, its valve-chambers and ports, an inlet-valve having a stem provided with a notched disk rigid thereon, a slotted and toothed casing surrounding the disk and provided with spring-controlled dogs for alternate engagement with the same, an arm projected into the casing to come in the path of the dogs, a rack-bar connected to the piston-rod of the engine to mesh with the teeth on said casing, suitable means for returning said inlet-valve to its normal position after disengagement of either dog with the notched disk, an exhaust-valve also provided with a stem, a finger projecting from the latter stem, and a bar also actuated by said piston-rod and provided with fingers to operate alternately upon the valve-stem finger, substantially as set forth.

5. In a steam-engine, the combination of a piston-rod, crank-shaft, links depending from the piston-rod; links pivoted to the engine-standards and said depending links, another link pivotally united to those aforesaid and likewise connected to other links pivotally suspended from said standards, and another link connecting said suspension-links and the one immediately adjacent thereto with said crank-shaft, substantially as set forth.

408,453. BREECH-LOADING GUN. GUSTAVE S. BOMER, Providence, Mass. Filed Mar. 2, 1889. Serial No. 301,736. (No model.)

Claim.—1. The combination, in a breech-loading gun, with the stock, the barrel, and the sliding locking-bolt, of a hammer provided with a catch separate and independent from the bolt and adapted to engage it when thrown forward and to retract it and become disconnected therefrom when raised into the firing position, substantially as set forth.

2. In a breech-loading gun, the combination of the tilting barrel B, provided with the rib H, having the notch *e* and the convex surface *d*, the breech-piece C, the firing-pin E, inserted in the said breech-piece, the hammer D, provided with the spring-actuated catch J, and the spring-pressed bolt I, adapted to be engaged by the catch J, substantially as specified.

3. The combination, with the hammer D, provided with the notch *c*, of the trigger G, adapted to enter the said notch, the barrel B, having the notched rib H, and the double-acting spring *i*, attached to the trigger and adapted to press forward the bolt I, substantially as specified.

4. The combination, with the stock and the tilting barrel, of the transverse screws *f f'*, the locking-bolt sliding thereon, a spring throwing said bolt, and mechanism for retracting the bolt, substantially as set forth.

5. The combination, with the stock and the tilting barrel, of the sliding locking-bolt having a lug on its under side, transverse screws supporting the bolt at opposite sides of its lug, a spring engaging said lug and throwing the bolt into engagement with the barrel, and mechanism for retracting the bolt, substantially as set forth.

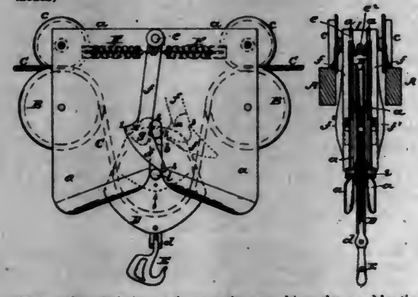
6. The combination, with the stock having the breech-piece C, provided with the firing-pin E, the longitudinally-sliding bolt I thereunder, having a notch in the rear end of its upper side, and the tilting barrel, of the hammer D, provided with a notch *c*, a spring-actuated catch mounted upon the hammer and adapted at its free or outer end to enter the bolt-notch, a trigger G, engaging the hammer, a spring *f'*, bearing at its lower end against the front edge of the trigger above its pivot and at its upper end against the said bolt to throw it forward, and the spring for throwing the hammer, substantially as set forth.

7. The combination, with the stock, the tilting barrel having a rib on its breech end, the firing-pin, and the hammer, of a sliding locking-bolt extending through the breech-piece and in the path of the forward edge of the hammer and the rear face of said rib, whereby, when the barrel is tilted and the hammer cocked, the rib will force the rear end of the locking-bolt into the path of the hammer and prevent it from descending and striking the firing-pin, substantially as set forth.

408,454. DISINFECTANT. CHARLES F. BOND, Chicago, Ill., assignor to William Bannerman, same place. Filed May 16, 1889. Serial No. 311,061. (No specimens.)

Claim.—The within-described compound to be used for disinfecting and deodorizing purposes, the same consisting of slaked lime, red ocher, carbolic acid, creosote, bichloride or mercury, salicylic acid, sulphate of iron, and water, substantially in or about the proportions specified.

408,455. WATER-HEATING APPARATUS. NATHANIEL A. BOYNTON, New York, N. Y., assignor to the Boynton Furnace Company, same place. Filed June 15, 1889. Serial No. 314,496. (No model.)



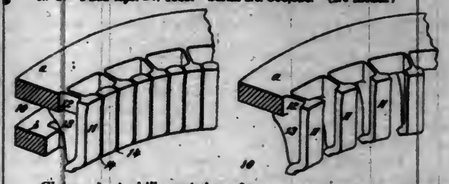
Claim.—1. In a hot-water heating apparatus, a series of transversely-extending water-sections, each of which has vertical water-passages, and horizontal water-passages which connect with the vertical water-passages and the walls of which are at one extremity indrawn or recessed at either side to form a portion of a vertical smoke-passage, substantially as specified.

2. In hot-water heating apparatus, a series of transversely-extending water-sections, each of which has a water-passage which is provided with a horizontal longitudinal bottom protuberance which extends from side to side of the section, and transversely-extending water-passages which have a plain flat top and bottom surface, each of such transverse passages having lateral walls which at one extremity are recessed or indrawn to form on either side a half-flue for the upward passage of smoke, substantially as set forth.

3. In a hot-water heating apparatus, a series of transversely-extending water-sections, each of which has vertical water-passages at the sides of the apparatus, a top horizontal transverse water-passage which has a flat top surface and a tapered or V-shaped bottom surface, a series of horizontal transversely-extending water-passages which are flat at top and bottom and which are curved at their sides, and a horizontal transversely-extending passage which is flattened at its top and which has a longitudinal downwardly-extending protuberance or corrugation which extends from end to end of each passage, substantially as shown and described.

408,456. HOISTING AND CONVEYING MACHINE. ALEXANDER R. BROWN, Cleveland, Ohio. Filed Jan. 2, 1889. Serial No. 295,230. (No model.)

Claim.—In a hoisting and conveying machine, the combination, with the hoist-block or load-supporting device and with the trolley or carriage, of an automatic contrivance for effecting an engagement between said load-supporting device and said trolley, and for also permitting a disengagement of these parts, composed of the following instrumentalities, viz: first, projecting engaging devices on one of the parts to be brought into and thrown out of engagement with each other; second, suitable seats or depressed bearings on the other one of said parts for the accommodation of said engaging devices; third, suitable stops which operate to insure the descent of said engaging devices into said bearings or seats whenever said devices are lowered immediately after having been elevated to or above a proper point, and, fourth, means which insure a complete separation of the said engaging devices and the said seats whenever the former are elevated from engagement with said seats to or above a proper point, all substantially as hereinbefore set forth.

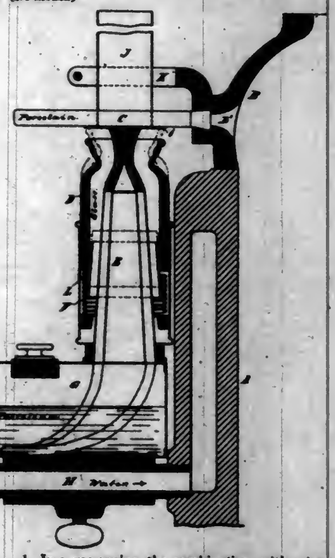


408,457. REVOLVING FIRE-ARM. HOSEA M. CALDWELL, Worcester, Mass., assignor to the Harrington & Richardson Arms Company, same place. Filed Mar. 26, 1889. Serial No. 304,615. (No model.)

Claim.—1. The hand I and spring J, said spring being attached to the hand and extending downward in front of the same to a point below its hinging-axis, in combination with the cylinder-ratchet, the hammer-lifter, and the trigger carrying the lifter-hinge at its upper rear corner, and provided with a notch in front of the lifter-hinge, into which the end of said spring engages, all substantially as and for the purpose set forth.

2. In a revolver, the combination, substantially as described, of the trigger having the notch *m* in its top, the hammer-lifter hinged to said trigger, as shown, and provided with the laterally-projecting integral stud 2 on its side, the hand pivoted on said stud and engaging the cylinder-ratchet, and the flat spring disposed in front of said hand with its lower end supported in the notch on the top of the trigger, said spring being strained in a manner to press the engaging end of the hand toward the ratchet and to force backward its pivot end together with the lifter, as and for the purpose set forth.

408,458. CAR-WHEEL CHILL. FERDINAND R. CANDA, New York, N. Y. Filed Apr. 27, 1889. Serial No. 308,898. (No model.)



Claim.—1. A chill consisting of two or more outer rings and an inner ring comprising segments, some of which segments are connected to one of the outer rings, and the others of which are connected to the remaining outer ring or rings, substantially as described.

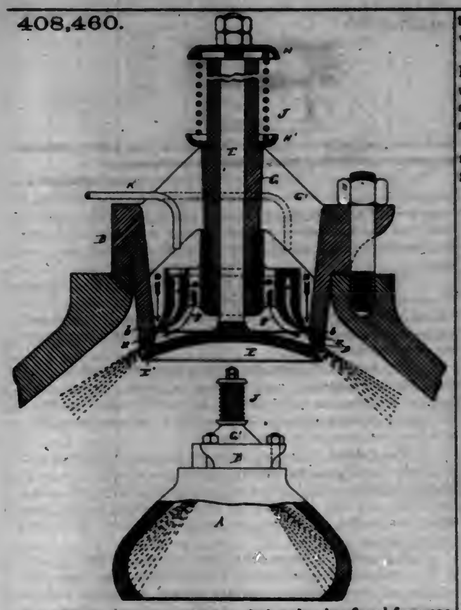
2. A chill consisting of an outer ring made up of auxiliary rings arranged substantially at right angles to the chill-axis, and an inner ring made up of sections or blocks that are alternately connected to the outer rings, substantially as described.

3. In a car-wheel chill, the combination, with an outer compound ring 10, of blocks 11, constituting an inner ring, and webs that are integral with the blocks and with alternate members of the compound ring, substantially as described.

4. In a car-wheel chill, the combination, with an outer compound ring made up of auxiliary rings *a* and *b* and struts or separators 15, of an inner ring made up of blocks or sections 11, webs 12, and brackets 13, substantially as described.

408,459. IGNITING DEVICE FOR PETROLEUM-GAS ENGINES. EMIL CAPITAINE, Berlin, Germany. Filed Nov. 14, 1888. Serial No. 290,789. (No model.)

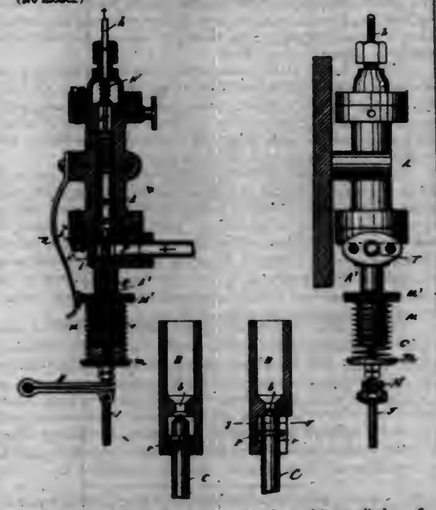
Claim.—1. In a gas-engine, the combination, with a kerosene-burner, of a glass chimney, a spring bearing on said chimney, and an igniting-tube above the burner, substantially as set forth.



2. In a gas-engine, the combination, with a kerosene-burner, of a glass chimney, a spring acting on said chimney, a draft-tube against one end of which the glass chimney is pressed by the spring, and an igniting-tube held in said draft-tube, substantially as set forth.

408,460. ATOMIZER FOR PETROLEUM-GAS ENGINES. EMIL CAPITAINE, Berlin, Germany. Filed Nov. 14, 1888. Serial No. 290,791. (No model.)

Claim.—1. In a petroleum-engine, the combination, with an explosion-chamber flared from one end to the other and slightly contracted at the larger end, of an atomizer for atomizing oil located at the smaller end of said chamber, substantially as set forth.

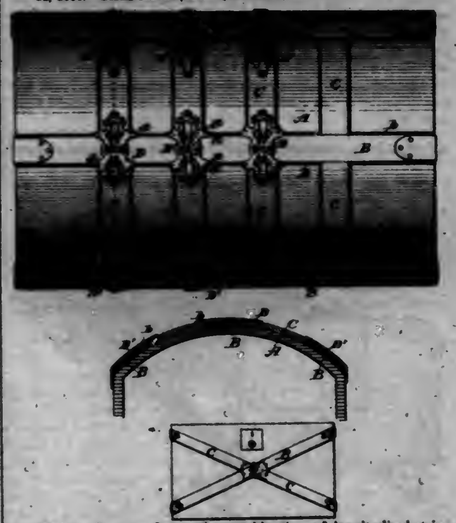


2. In a petroleum-engine, the combination, with an explosion-chamber, of a bushing in an opening of said chamber, a valve fitting against a seat formed at the inner end of said bushing, and a nozzle located within said casing so as to form air-passages on the inner and outer surfaces of said nozzle, substantially as set forth.

408,460.

3. The combination, with an explosion-chamber flared from one end to the other, of a bushing located in an opening in the smaller end of the explosion-chamber, a valve seating against the bottom edge of said casing, an annular nozzle within said bushing having its bottom flared outward to be in close proximity to the bottom edge of the inner surface of said bushing, said nozzle being so located as to form air-passages on its inner and outer surfaces, substantially as set forth.

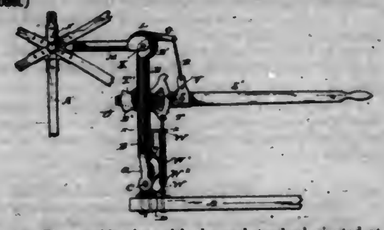
408,461. FUEL-INJECTOR FOR EXPLOSIVE ENGINES. EMIL CAPITAINE, Berlin, Germany. Filed Nov. 14, 1888. Serial No. 290,792. (No model.)



Claim.—1. In a pump, the combination, with a cylinder, of a tubular piston having a port in its lower end and a rod movable in the direction of the length of the piston and serving to move said piston and close the port in the lower end of the same, substantially as set forth.

2. The combination, with a cylinder, of a tubular piston mounted to work in the same and provided with a port in its lower end, a longitudinally-movable rod for moving said piston and closing the port in the lower end of the same, and a spring pressing said spindle downward and a lever for pressing it upward, substantially as set forth.

3. The combination, with the cylinder A, of the tubular piston B, provided with the port *b* in its lower end, the spindle C, having its upper end shaped to close the port *b*, the adjustable sleeve M, the spring *c*, the plate *m* on the spindle C, and the lever N, acting on said spindle, substantially as set forth.

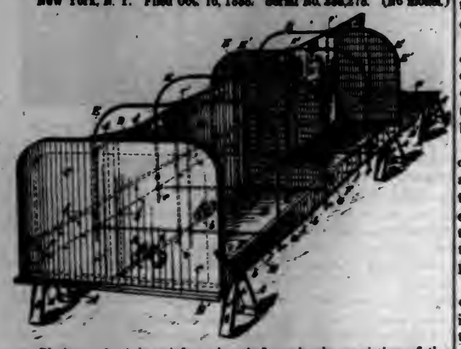


4. The combination, with the cylinder A, of the piston B, having the bottom port *b*, the spring *a*, and the spindle C, substantially as set forth.

408,462. TRUNK. PHILIP CARPMILL, Milwaukee, Wis. Filed May 11, 1888. Serial No. 301,801. (No model.)

Claim.—In a trunk-top, the combination of longitudinal strips, one at each edge and one in the center, extending the entire length of the top and beveled at each edge with series of intermediate cross-strips intersecting the longitudinal strips and likewise beveled at each edge and having their ends beveled in a contrary direction to the bevel of the side edges to form a close joint with the longitudinal strips, and a series of central covering-plates provided with downwardly-projecting lips, whereby the different sets of strips are clamped together, and the joints at their points of contact are covered, and other series of covering-plates arranged at the intersection of the front and rear edge longitudinal strips, with the cross-strips having similar downwardly-projecting lips at the described points of junction of the said different series of strips, and downturned ends extending over and secured to the front and rear side edges of the trunk-top, substantially as set forth.

408,463. REEL-ADJUSTING MECHANISM FOR HARVESTERS. HENRY F. CRANDALL, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Nov. 14, 1887. Serial No. 255,064. (No model.)



Claim.—1. The combination, with the reel-standard pivoted at its base and casting pivoted to said standard on a pivot parallel to the pivot of the standard, of a link connecting said casting with the seat-plank, a spring surrounding said link and suitably supported at its lower end, and a slotted horizontal flange projecting from the standard and straddling the link above the spring and bearing against the upper end thereof, and means for locking the casting in adjustment relatively to the reel-standard, substantially as set forth.

2. The combination, with the reel-standard pivoted at its base and a flange fixed to the reel-standard and projecting in the plane of motion of the standard and having horizontal indentations one above another, of two castings parallel to said flange, a bolt pivoting them to the standard and to each other, a spring surrounding said bolt and interposed between the head of said bolt and the outer casting, an operating-lever connected to the outer casting, a link connecting the rear end of the inner casting to the seat-plank, and a latch located in the front end of the inner casting and controlled by the outer casting for engagement with said indentations, and thereby locking the inner casting to the said flange of the standard, substantially as described.

3. The combination, with the reel-standard pivoted at its base and the arm of the reel-shaft pivoted to said reel-standard, of two castings pivoted side by side on said reel-standard, one casting provided with a lever and linked to an extension on the rear end of the arm of the reel-shaft and the other casting linked to the seat-plank, and connecting mechanism, substantially as described, between the two castings, whereby the reel-standard and arm of the reel-shaft may be adjusted either separately or together by one and the same lever, as set forth.

408,464. KNOCKDOWN BENCH FOR DOGS, &c. CHARLES A. CRUFT, London, England, assignor to the Spratts Patent, (America,) Limited, New York, N. Y. Filed Oct. 16, 1886. Serial No. 216,276. (No model.)

Claim.—1. A knockdown bench for animals, consisting of the floor B, the ends C, the partition or back D, the side partitions E, and the front board F, erected on the floor B and connected together, substantially as described, and for the purpose set forth.

2. The bench for animals, consisting of the floor B, having the holes *b*, the ends C, and central partition D, erected on the floor B, the partitions E, connected to the floor B by the holes *b* and to the partition D, and the front board F, secured to the partitions E, all constructed and connected together substantially as described, and for the purpose set forth.

3. The bench for animals, consisting of the floor B, having the holes *b*, the ends C, and partition D, erected on the floor B, the partitions E, connected to the floor B by the holes *b* and to the partition D by the hooks *c'*, and the front board F, secured to the partitions E by the hook G and the ring-clamp H, all constructed and connected together substantially as described and supported by the horses A A', as and for the purpose set forth.

4. In a knockdown bench for animals, the combination, with the floor B, central partition or back D, and front board F, of the wire partitions E, as and for the purposes set forth.

5. In a bench for exhibiting animals, having stalls divided by partitions, the attaching device H, formed to lie under and on each side of the partition and having the ends *h*, adapted to receive the chain-rings, and thereby fastened to the bench, as and for the purpose set forth.

6. In a knockdown bench for animals, the combination of the floor B, ends C, partition or back D, and movable partitions E, arranged and connected together substantially as and for the purpose set forth.

408,465. METHOD OF MAGNETICALLY REDUCING FRICTION. MARK W. DEWEY, Syracuse, N. Y., assignor to the Dewey Corporation, same place. Filed June 6, 1889. Serial No. 313,363. (No model.)

Claim.—1. The method of decreasing friction between the bearings of two magnetic parts, consisting in subjecting the bearing parts to magnetism of like polarity to separate the parts or reduce the pressure between the bearings.

2. The method of decreasing friction between the bearings of two paramagnetic parts, consisting in subjecting the bearing parts to magnetism of like polarity and subjecting to magnetism of unlike polarity another paramagnetic part in proximity to one of the said

408,465.

parts and diametrically opposite the other of said parts to separate the parts or reduce the pressure between their bearings.

3. The method of decreasing friction between the bearings of a magnetic part upon a non-magnetic part, consisting in subjecting to magnetism of a certain polarity another part in proximity to the magnetic part and diametrically opposite the non-magnetic part to separate the latter two parts and reduce the pressure between their bearings.

4. The method of decreasing friction between the bearing parts of a vehicle, consisting in establishing an electric circuit on the vehicle, including the coils of electro-magnets, and subjecting the bearing parts to magnetic force tending to separate the bearings or reduce the pressure between them.

5. The method of decreasing friction between the bearing parts of a vehicle, consisting in establishing an electric circuit on the vehicle, including the coils of electro-magnets wound to produce in the bearing parts magnetism of like polarity to separate the bearings or reduce the pressure between them.

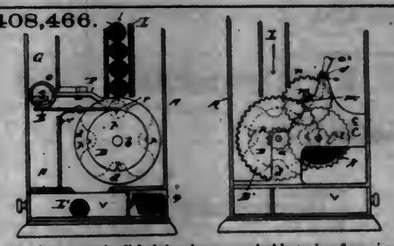
6. The method of decreasing friction between the bearing parts of an electrically-propelled vehicle, consisting in establishing a shunt-circuit around the electric motor on the vehicle, including the coils of electro-magnets, and subjecting the aforesaid bearing parts to magnetic force tending to separate the bearings or reduce the pressure between them.

7. The method of decreasing friction between the bearing parts of an electrically-propelled vehicle having line-working conductors along its path and a conductor passing through the motor, with its terminals in movable contact with the line-conductors, consisting in establishing a shunt-circuit around the motor on the vehicle, including the coils of electro-magnets, and subjecting the aforesaid bearing parts to magnetic force tending to separate the bearings or reduce the pressure between them.

8. The method of decreasing friction between the bearing parts of a vehicle, consisting in establishing an electric circuit on the vehicle, including the coils of electro-magnets, subjecting the bearing parts to magnetic force tending to separate the bearings or reduce the pressure between them during the movement of the vehicle, and arresting said force when the vehicle is at rest.

9. The method of decreasing friction between the bearing parts of a vehicle, consisting in establishing an electric circuit on the vehicle, including the coils of electro-magnets, and subjecting the bearing parts to variable magnetic force tending to separate the bearings or reduce the pressure between them.

10. The method of decreasing friction between the bearing parts of a vehicle, consisting in establishing an electric circuit on the vehicle, including the coils of electro-magnets, subjecting the bearing parts to variable magnetic force tending to separate the bearings or reduce the pressure between them during the movement of the vehicle, and arresting said force when the vehicle is at rest.



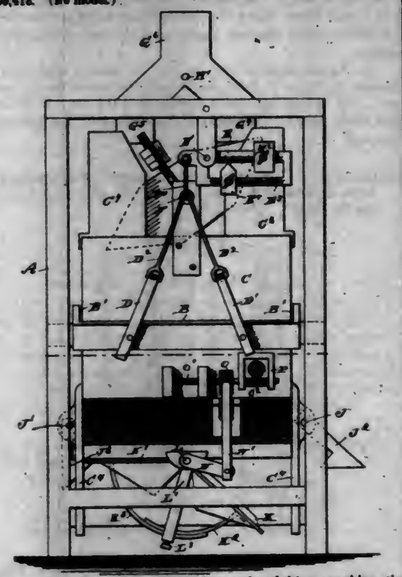
11. The method of decreasing friction between the bearing parts of an electrically-propelled vehicle having line-working conductors along its path and a conductor passing through the motor, with its terminals in movable contact with the line-conductors, consisting in establishing a shunt-circuit around the motor on the vehicle, including the coils of electro-magnets, subjecting the aforesaid bearing parts to magnetic force tending to separate the bearings or reduce the pressure between them during the movement of the vehicle, and arresting said force when the vehicle is at rest.

12. The method of decreasing friction between the bearing parts of an electrically-propelled vehicle having line-working conductors along its path and a conductor passing through the motor with its terminals in movable contact with the line-conductors, consisting in establishing a shunt-circuit around the motor on the vehicle, including the coils of electro-magnets, subjecting the aforesaid bearing parts to variable magnetic force tending to separate the bearings or reduce the pressure between them during the movement of the vehicle, and arresting said force when the vehicle is at rest.

408,466. COIN-OPERATED VENDING APPARATUS. CASPAR DREHMILLER, Brooklyn, N. Y., and JOHN BOYD, West Hoboken, N. J. Filed Dec. 5, 1888. Serial No. 292,690. (No model.)

Claim.—1. A coin-actuated vending apparatus constructed, substantially as herein shown and described, with a spring-actuated vertically-revoluble drum provided with surface grooves or depressions for holding and delivering articles to be vended, with peripheral sockets for the engagement of the coin-actuated lever, and with a ring having bosses for operating the coin-dislodging lever, a coin-actuated drum-

408,466.



releasing lever, a coin-dislodging lever, a suitable train of gearing, an actuating-spring, and a regulating-fan, all arranged and operating substantially as set forth.

2. In a coin-actuated vending apparatus, the combination, with a coin-actuated lever, of a lever adapted and arranged to be moved to dislodge the coin from the first-named lever, substantially as herein shown and described.

3. The combination, with the spring-actuated revolable drum B, having grooves *d*, adapted to receive and deliver articles to be vended and provided with sockets *p* and bosses *f*, of arresting-lever E and dislodging-lever F, all constructed and arranged substantially as herein shown and described.

4. In a coin-operated vending apparatus, the spring-actuated revoluble drum having grooves *d*, adapted to receive and deliver articles to be vended and provided with sockets *p* and bosses *f*, substantially as herein shown and described.

408,467. GRAIN WEIGHING AND REGISTERING MACHINE. ADDUT H. W. DUCETT, St. Charles, Mo. Filed May 3, 1889. Serial No. 309,418. (No model.)

Claim.—1. In a grain registering and weighing machine, the combination, with a grain-receptacle mounted to slide vertically and provided with a vertical central partition forming two compartments, and a tilting grain-bucket discharging alternately into said compartments and mounted in bearings on the said receptacle, of a U-shaped pivoted arm pivotally connected with the said grain-receptacle and a weighing-beam connected with the said U-shaped arm, substantially as shown and described.

2. In a grain registering and weighing machine, the combination, with a grain-receptacle mounted to slide vertically and provided with two compartments, of a U-shaped pivoted arm pivotally connected with the said grain-receptacle, a weighing-beam connected with the said U-shaped arm, a grain-bucket mounted to turn, two fixed spouts discharging into the two ends of the said bucket, and a fixed inlet-spout opening into the said two spouts, substantially as shown and described.

3. In a grain registering and weighing machine, the combination, with a grain-receptacle mounted to slide vertically and provided with two compartments, of a U-shaped pivoted arm pivotally connected with the said grain-receptacle, a weighing-beam connected with the said U-shaped arm, a grain-bucket mounted to turn, two fixed spouts discharging into the two ends of the said bucket, a fixed inlet-spout opening into the said two spouts, a gate held at the upper ends of the said two fixed spouts to alternately connect the latter with the said inlet-spout, substantially as shown and described.

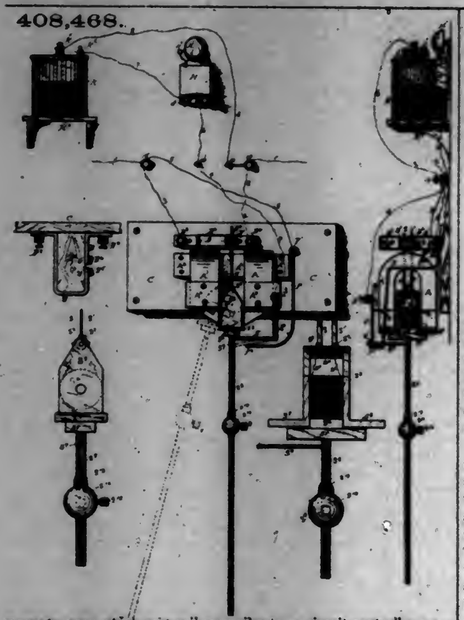
4. In a grain registering and weighing machine, the combination, with a grain-receptacle mounted to slide vertically and provided with two compartments, of a U-shaped pivoted arm pivotally connected with the said grain-receptacle, a weighing-beam connected with the said U-shaped arm, a grain-bucket mounted to turn, two fixed spouts discharging into the two ends of the said bucket, a fixed inlet-spout opening into the said two spouts, a gate held at the upper ends of the said two fixed spouts to alternately connect the latter with the said inlet-spout, and means, substantially as described, for operating the said gate by the oscillating motion of the said grain-bucket, substantially as shown and described.

5. In a grain weighing and registering machine, the combination, with a grain-receptacle provided with two compartments, of a grain-bucket mounted to turn, two spouts discharging into the ends of the said bucket, a fixed inlet-spout supporting and opening into the said two spouts, and a gate for connecting the said inlet-spout alternately with the other spouts, substantially as shown and described.

6. In a grain weighing and registering machine, the combination, with a grain-receptacle provided with two compartments, of a grain-bucket mounted to turn, two spouts discharging into the ends of the said bucket, a fixed inlet-spout supporting and opening into the said two spouts, a gate for connecting the said inlet-spout alternately with the other spouts, and bottoms mounted to swing on the under side of the said grain-receptacle and adapted to alternately close the lower openings of the said compartments, substantially as shown and described.

7. In a grain weighing and registering machine, the combination, with a grain-receptacle provided with two compartments, of a grain-bucket mounted to turn, two spouts discharging into the ends of the said bucket, a fixed inlet-spout supporting and opening into the said two spouts, a gate for connecting the said inlet-spout alternately with the other spouts, bottoms mounted to swing on the under side of the said grain-receptacle, adapted to alternately close the lower openings of the said compartments, and means, substantially as described, for locking the said bottoms by the oscillation of the said grain-bucket, substantially as shown and described.

8. In a grain weighing and registering machine, the combination, with a grain-receptacle provided with two compartments, of a shaft extending transversely between the said compartments at their lower ends, bottoms pivotally connected to the said shaft and adapted to open and close the lower ends of the said compartments alternately, an arm secured on the said shaft and extending between the said two bottoms, and segmental arms extending from the said bottoms and adapted to be locked in place on the said arm, substantially as shown and described.



9. In a grain weighing and registering machine, the combination, with a grain-receptacle provided with two compartments, of a shaft extending transversely between the said compartments at their lower ends, bottoms pivotally connected to the said shaft and adapted to open and close the lower ends of the said compartments alternately, an arm secured on the said shaft and extending between the said two bottoms, segmental arms extending from the said bottoms and adapted to be locked in place on the said arm, a crank-arm secured to the said shaft, and a registering apparatus operated from the said crank-arm and serving to register the opening and closing of the said bottoms, substantially as shown and described.

10. In a grain weighing and registering machine, the combination, with a grain-receptacle mounted to swing up and down, of an oscillating grain-bucket discharging alternately into two compartments of the said receptacle, a gate controlling the inlet of grain to the said grain-bucket, an arrow-head held on the shaft of the said gate, an arm fulcrumed on the said grain-receptacle and provided with two pins engaging the said arrow-head, and a weighted rod pivoted on the said arrow-head and guided on the said arm, substantially as shown and described.

408,468. MAGNETO-ELECTRIC INDIVIDUAL SWITCHING APPARATUS. JOHN W. DUNLAP, Sr., Pittsburg, Pa., assignor, by direct and mesne assignments, of part to Robert J. Shaw, Charles R. Mair, and Willis H. Rowe, all of same place. Filed Aug. 1, 1888. Serial No. 281,673. (No model.)

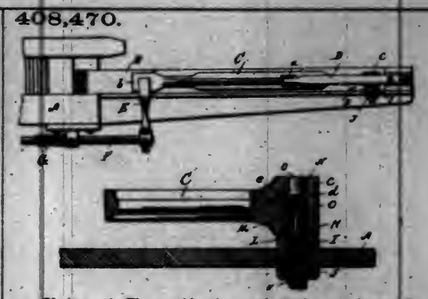
Claim.—1. The combination, in an electric circuit, of several call receiving and transmitting devices, each comprising a pendulum, with an adjustable bob normally at a fixed point, differing for each pendulum or station, a coil in the line-circuit, carried by the pendulum,

408,468.

magnets, near which said coil may vibrate, a circuit-controller operated by the pendulum on reaching a certain extent of motion to close a local alarm-circuit, whereby one station may call another by adjusting its pendulum-bob to a position corresponding to that of the station to be called, and vibrating a pendulum to generate a current on the line, as set forth.

2. A combined transmitter and receiver pendulum consisting, essentially, of a pair of springs, the lower ends connected with the respective end wires of a wire-wound bobbin provided with suitable cheeks supporting a graduated rod with needle and sliding weight, in combination with a pair of magnets with equal poles, and lever-contacts constructed to fall on the oscillation of the pendulum, all substantially as and for the purposes described.

408,469. PORTABLE HEATER. WILLIAM EARLEY, Philadelphia, Pa. Filed Aug. 22, 1888. Serial No. 283,418. (No model.)

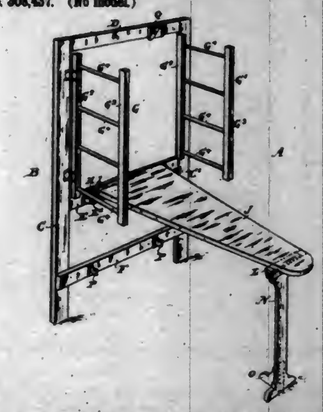


Claim.—In a portable heater, the combination, with the fire-box B in the casing C, having the dome C', with hot-air outlets, mounted on the base A, with the cold-air inlet *a*, of the pipe D, with the partition *d* therein, leading from the rear of said fire-box and communicating with the branches E E of the pipes F F, which pipes communicate with the branches G G of the pipes H H, which latter communicate with the smoke-outlet L through the pipe I and its branch K, the plate A', mounted on the base A, and the plates M M', sustained in the casing C, having the inlets a^3, *m*, and *m'* at alternate ends, as and for the purpose described.

408,470. SHUTTLE-BINDER FOR LOOMS. ELIJ EARNSHAW, Grafton, Mass., assignor of one-half to George W. Fisher, same place. Filed May 22, 1889. Serial No. 311,677. (No model.)

Brief.—The object is to improve the manner of hinging the binder to the lay in order to secure a uniform and regular action of the shuttle and to cause the protector-finger to be moved uniformly by the motion of the binder.

408,470.



Claim.—1. The combination, with the lay of a loom, of a stud attached to said lay and forming a pivot upon which the binder is hinged, said stud being provided with an interior chamber to contain lubricating material, and a binder hinged upon said stud, the hinged end of said binder having a chamber to receive said stud and forming a cap over the end of said stud, in order to prevent the lubricating material from being thrown at each swing of the lay, substantially as described.

2. The combination, with the lay of a loom, of a stud attached to said lay and provided with a longitudinal concentric chamber open at the upper end of the stud, a binder hinged upon said stud and provided with a chamber fitting said stud, and a pin held in said chamber and concentric therewith and fitting the chamber in the stud, substantially as described.

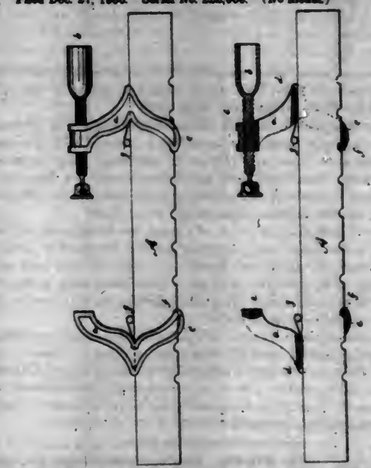
3. The combination, with the lay of a loom, of a stud attached to said lay and provided with a longitudinal concentric chamber open at the upper end of the stud, a binder hinged upon said stud, a pin held in said binder fitting the chamber in said stud and provided with a shoulder resting upon the upper end of the stud, substantially as described.

4. The combination, with the lay of a loom, of stud H, having a chamber L, binder C, pin O, held in said binder and fitting the chamber L, and having shoulder *d* resting upon the end *e* of the stud H, said binder having a chamber M fitting the stud H, substantially as described.

408,471. COMBINED CLOTHES-HORSE AND IRONING-BOARD. LYDIA FAIRWEATHER, Richmond Hill, N. Y. Filed Apr. 24, 1889. Serial No. 308,437. (No model.)

Claim.—1. A combined clothes-horse and ironing-board comprising a main frame provided with upper and lower brackets, clothes-frames hinged on the said main frame, and an ironing-board having pins at its inner end adapted to be hooked on the upper and lower brackets and provided with a leg, substantially as shown and described.

2. A combined clothes-horse and ironing-board comprising a main frame, an ironing-board hooked at one end to the said main frame and provided at its outer end with dovetailed cleats, a dovetail held to slide in the said cleats, a leg pivoted on the said dovetail, and a foot hinged on the lower end of the said leg, substantially as shown and described.



3. A combined clothes-horse and ironing-board comprising a main frame provided with two sets of brackets, clothes-frames hinged on the said main frame, an ironing-board provided with pins adapted to engage either set of brackets, and a leg held removably on the outer end of the said ironing-board, substantially as shown and described.

4. A combined clothes-horse and ironing-board comprising a main frame provided with two sets of brackets, clothes-frames hinged on the said main frame, an ironing-board provided with pins adapted to engage either set of brackets, a leg held removably on the outer end of the said ironing-board, and a button held on the said main frame to lock the said clothes-frames and ironing-board in place, substantially as shown and described.

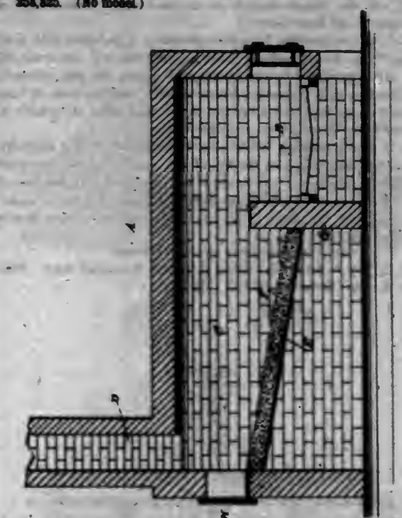
408,472. PROCESS OF REFINING MINERAL OIL. JOHN K. FIELD, London, England. Filed Sept. 5, 1887. Serial No. 248,859. (No specimens.) Patented in England Aug. 27, 1885, No. 10,139, and in Austria-Hungary May 31, 1888, No. 36/1,562.

Claim.—The method of refining mineral oil, which consists in acidifying the oil with fuming sulphuric acid, then subjecting it to agitation in connection with bleaching material, then again acidifying with sulphuric acid, and again subjecting to agitation in connection with bleaching material.

408,473. JOINER'S CLAMP. HERMANN POCKEL, New York, N. Y. Filed Dec. 27, 1886. Serial No. 222,606. (No model.)

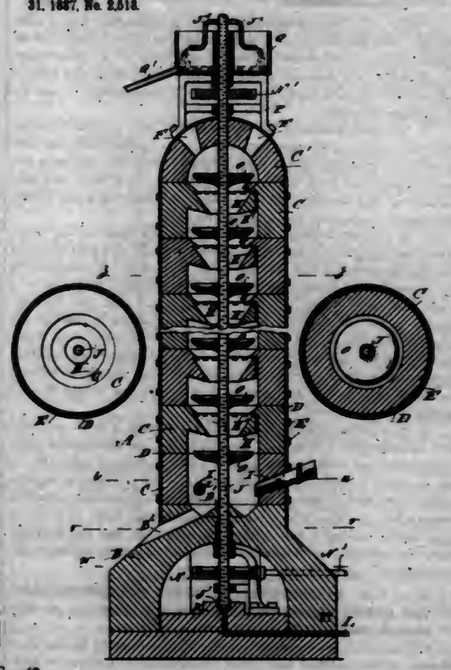
Claim.—The improved joiner's clamp, consisting of the notched bar A, the two longitudinally-movable clamps thereon having the V form described and straddling said bar, each clamp being provided with a bridge or rocker *d*, convex on its bottom and having a spring secured thereto, terminating in an eye-bearing, the transverse bottom piece *e*, convex on its top and provided with a rounded rib *f*, and the clamping-screw *b*, tapped through the upper part of one of the clamps, all constructed and adapted to operate substantially as described.

408,474. CAR-SEAL. LEWIS A. FOOTE, Lansing, Minn. Filed Mar. 28, 1889. Serial No. 304,532. (No model.)



Claim.—1. A sealing-disk consisting of horizontal upper and lower portions held at an equal distance apart throughout their entire length by uniting portions at the end and sides, the end of said disk being formed into a neck of less width than that of the shackle-orifice in the main part of said disk, and the said main part having opposing transverse openings, in combination with a shackle secured at one end to said disk, substantially as set forth.

2. A sealing-disk provided with a central longitudinal orifice and opposing transverse openings, in combination with a shackle, one end of which is inserted in said orifice and secured to said disk, and a sealing-rivet, substantially as set forth.

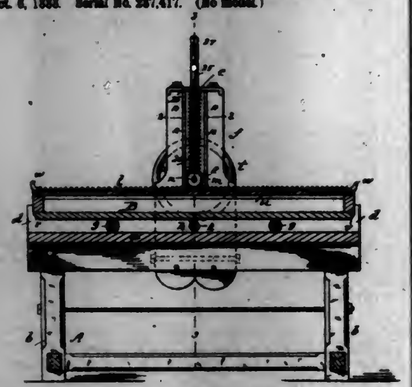


3. A sealing-disk provided with a central longitudinal orifice and opposing transverse openings, in combination with a shackle inserted in said orifice and having openings near its ends registering with said transverse openings in the disk, and a sealing-rivet, substantially as set forth.

408,475. SHEET-HEATING FURNACE. EVAN J. FRANCIS and CHARLES RANFIELD, Locshburg, Pa. Filed Dec. 23, 1887. Serial No. 258,825. (No model.)

Claim.—A bottom for heating furnaces formed of segregated masses, broken pieces or fragments of non-combustible material having interstitial passages, and presenting a broken or uneven surface, substantially as set forth.

408,476. ORE-ROASTING FURNACE. DAVID R. S. GALBRAITH, Auckland, New Zealand. Filed Mar. 5, 1888. Serial No. 266,150. (No model.) Patented in New Zealand Aug. 22, 1887, No. 2,507, and Aug. 31, 1887, No. 2,518.



Claim.—1. In an ore-roasting furnace, the combination, with a shaft-furnace provided with feed-openings F at the top, the inclined offsets G, the inclined and apertured offsets H, under the offsets G, and the gas-inlet openings I, near the bottom, of the rotary shaft J, and the dished disks O on the shaft, substantially as described.

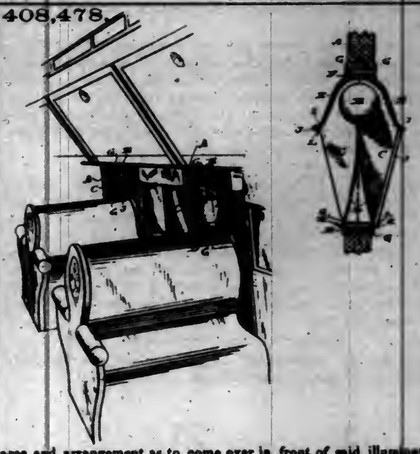
2. In an ore-roasting furnace, the combination, with the sectional furnace A, provided with the openings F, the inclined offsets G H, the gas-inlet openings I, and the exit-opening B², of the rotary hollow shaft J, and the dished disks O on the said shaft, substantially as herein shown and described.

3. In an ore-roasting furnace, the furnace A, provided with feed-openings F, the inclined offsets G, the inclined offsets H, below the offsets G, and provided with the openings H', under the said offsets G, in combination with the rotary hollow shaft J, and the disks O, having dished upper faces and arranged on the shaft under the offsets H, substantially as herein shown and described.

4. In an ore-roasting furnace, the combination, with a shaft-furnace and the reservoir Q on the top of the same, of the hollow shaft J, mounted to rotate in the furnace and provided with the branch pipes J² at its upper end and connected at its lower end with a water-supply pipe, and the disks O on the shaft, substantially as herein shown and described.

408,477. MANGLE. George K. Green, Springfield, Mass. Filed Oct. 6, 1888. Serial No. 287,417. (No model.)

Claim.—1. In a clothes-mangle, the combination, with a table provided with the side rails *d d*, and a transverse roller *h*, supported for rotation from said side rails midway of said table, of an independent mangle-roll *g*, of a diameter slightly greater than that of said median roll, and the longitudinally-movable box B, substantially as and for the purpose described.



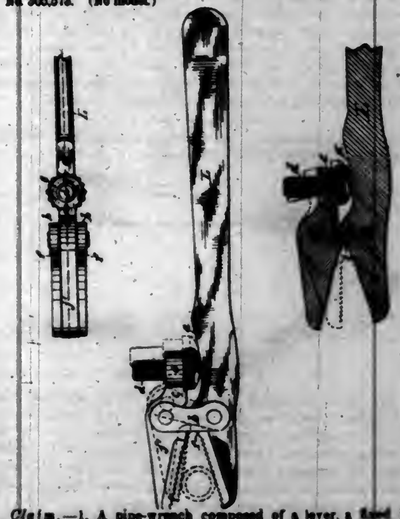
2. In a clothes-mangle, the combination, with a table provided with side uprights, of mangle-rollers *g g*, a longitudinally-movable pressure-box provided with a rack, a transverse shaft *n*, having a pinion engaging said rack, the bearing-blocks for said shaft vertically movable on said uprights, and the springs above and below said blocks, substantially as and for the purpose described.

3. In a clothes-mangle, in combination, the table having bifurcated side uprights *f f*, having the base-sockets 22, and provided with the guide-tongues 12 and the apertured cross-webs 15, mangle-rolls, and a longitudinally-movable pressure-box provided with a rack, a transverse shaft having a pinion engaging said rack, the bearing-blocks *p p* for said shaft having the vertical aperture 29 therein, and provided with the edge-runner grooves and the horizontal ways 30 30, leading thereto, the plunger-rods 20 below said guide-blocks playing in said sockets 22, the springs 23, the tubular guide-rods 25 above said blocks playing through said apertured web, and the springs 26, substantially as shown and described.

4. In a clothes mangle, the combination, with a table provided with side uprights *f f* and with the side rails *d*, and a transverse roller *h*, suspended for rotation from said side rails midway of said table, of one or more independent mangle-rolls *g g*, of a diameter slightly greater than that of said median roll, and the longitudinally-movable pressure-box provided with a rack having the end stops *w*, a transverse shaft *n*, having a pinion engaging said rack, and the bearing-blocks for said shaft vertically movable on said uprights, substantially as described.

408,478. SHIELD AND REFLECTOR FOR INCANDESCENT ELECTRIC LAMPS. George Gibbs, Milwaukee, Wis. Filed Dec. 10, 1888. Serial No. 293,196. (No model.)

Claim.—1. The combination, with an illuminating device, of a reflector having vertical side pieces surmounted by a cover of such



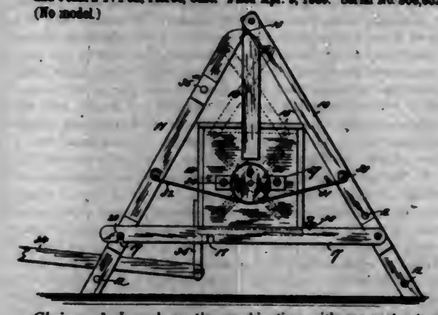
area and arrangement as to come over in front of said illuminating device to shield the latter from direct vision and deflect its rays in a downward direction, substantially as set forth.

2. The combination, with an illuminating device, of a reflector having vertical side pieces surmounted by a cover of such area and arrangement as to come over in front of said illuminating device to shield the latter from direct vision and deflect its rays in a downward direction, and a curtain or analogous device connected to the reflector to shut off the illumination, substantially as set forth.

3. The combination, in a car, of a panel, an illuminating device connected to the panel, and a reflector for the illuminating device, having vertical side pieces surmounted by a cover of such area and arrangement as to come over in front of said illuminating device to shield the latter from direct vision and deflect its rays in a downward direction, substantially as set forth.

4. The combination, in a car, of a panel having an opening therein, an illuminating device arranged within the opening, a reflector arranged to distribute the light in opposite directions, and provided with side pieces surmounted by a cover of such area and arrangement as to come over in front of the illuminating device on both sides of said panel, substantially as set forth.

408,479. PIPE-WRENCH. Julian A. Giles, Oswego, N. Y., assignor to Chauncey C. Place, same place. Filed Apr. 1, 1889. Serial No. 305,573. (No model.)



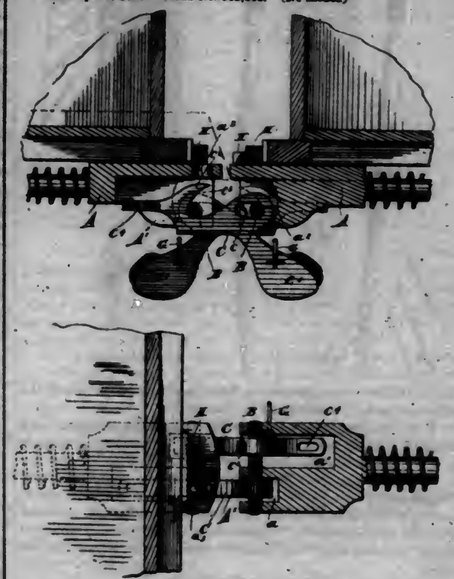
Claim.—1. A pipe-wrench composed of a lever, a fixed jaw integral with one end of said lever, links pivoted at one end to opposite sides of the jaw-carrying end of the lever, a jaw pivoted to the opposite end of said links and formed with a rearward extension, a spring holding the latter jaw in its open position, and a stop between the aforesaid rearward extension and lever and adjustable in length to control the opening of the jaw, as set forth.

2. A pipe-wrench composed of a lever, a fixed jaw integral with one end of said lever, links pivoted to opposite sides of the jaw-carrying end of the lever, a jaw pivoted to the opposite end of said links and formed with a rearward extension and with a screw-threaded eye in said extension and facing the lever, a spring holding the said jaw in its open position and crowding the same forward, a set-screw in said eye bearing on the lever, and stops on the fixed jaw in front of the links, substantially as described and shown.

3. The combination of the lever *l*, formed at one end with the jaw *j*, and with the inclined bearing *a* extending from said jaw rearward, the links *b b*, pivoted at one end to opposite sides of the lever at its junction with the jaw, the jaw *j'*, pivoted to the opposite end of the links and formed with the rearward extension *e*, and screw-threaded eye *c* in said extension and facing the bearing *a*, and the set-screw *d* in the said eye, substantially as described and shown.

4. The improved pipe-wrench, consisting of the lever *l*, formed at one end with the jaw *j*, and with the inclined bearing *a* extending from the jaw rearward, the links *b b*, pivoted at one end to opposite sides of the lever at its junction with the jaw, the jaw *j'*, pivoted to the opposite end of the links and formed with the rearward extension *e*, and with the eye *c* in said extension facing the bearing *a*, the set-screw *d* in said eye, the spring *t*, crowding the jaw *j'* forward and into its open position, and the stops *f* on the jaw *j* in front of the links, all combined to operate substantially as set forth.

408,480. CHURN. Hale H. Hawk, Bucyrus, and Wesley Smith and Joseph P. Fox, Pierce, Ohio. Filed Apr. 9, 1888. Serial No. 306,632. (No model.)



Claim.—1. In a churn, the combination, with opposed sets of connected standards hinged together at the top, and rods or bars projected downward from the upper end of the united standards, of a churn-body connected to the lower extremity of the said downwardly-projecting bars, a dash held to rotate within the churn-body, having attached to one trunnion outside of the body a disk or wheel, and straps attached to the said disk or wheel at one end, the said straps being carried in opposite directions and secured at the other end to the opposed side standards of the frame, substantially as shown and described.

2. In a churn, the combination, with opposed side standards hinged together at their upper ends, and bars or hangers projected downward from the upper extremity of the said united standards, of a churn-body attached at the ends to the lower extremity of the said bars or hangers and provided with a rotary dash, and means, substantially as shown and described, for imparting to the said dash a rotary reciprocating movement when the churn-body is laterally reciprocated, as set forth.

3. In a churn, the combination, with opposed standards hinged together at the upper extremity, cross-bars provided with notches in the lower edge pivoted to one set of standards, and pins projected from the opposed set of standards adapted to engage with the said cross-bars, and connecting bars or hangers pivotally secured to the upper connected ends of the standards, of a churn-body provided with a revolvable dash journaled transversely therein, a lever secured to one side of the churn-body projecting outward beyond one of the standards, and means, substantially as shown and described, for imparting to the dash a rotary reciprocating movement when the body of the churn is laterally reciprocated, as set forth.

4. In a churn, the combination, with opposed sets of standards hinged together at the upper ends, cross-bars provided with notches or recesses in their lower edges pivoted to one set of standards, pins or studs projected from the opposed standards, adapted for engagement with the said cross-bars, and connecting rods or hangers pivoted at the upper extremity to the hinged upper ends of the standards, of a churn-body secured at the ends to the lower extremity of the said hangers, a dash located within the said body, a set-screw passing through one end of the body into one end of the dash, a shaft held to revolve in the opposite end of the body provided with a rectangular inner end capable of entering a similar socket in the corresponding end of the dash, a disk or wheel secured to the outer end of the said shaft, bands attached at one end to the said disk or wheel and wound thereon in opposite directions, and having their outer ends secured to the opposed standards of the frame, all combined for operation, substantially as shown and described.

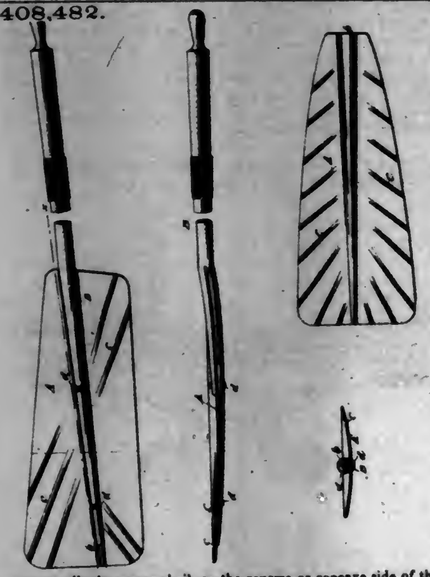
408,481. CAR-COUPLING. Alfred R. Heath, Covington, Ind. Filed Apr. 3, 1889. Serial No. 305,615. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head formed with a recess having a concaved rear wall c^6, of a coupling-hook C, having an oblong slot *c* and pivoted in said recess by a pivot-pin passing through said oblong slot, substantially as described.

2. In a car-coupling, the combination, with the draw-head formed with a partition, forming recesses *a a'*, open at top and bottom, of a pin B, extending across said recess, and a coupling-hook pivoted in recess *a* by the pin B, the portion of said pin in recess *a'* affording an engagement for the hook of an opposing coupling-hook, substantially as described.

3. The coupling-hook C, formed with an oblong transverse slot *c*, weighted rear end c^2, rearwardly-projecting hook portion c^3 on its upper edge, and with a vertical oblong slot c^4 in its forward end, substantially as described.

4. In a car-coupling, the combination, with a recessed draw-head having a pin extending across the recess thereof, of a coupling-hook pivoted in the recess of the draw-head and having a weighted rear end and a vertical slot in its forward end, the hook being adapted to engage the pin of the opposing draw-head and the slot to receive the coupling-pin of an ordinary link, substantially as described.



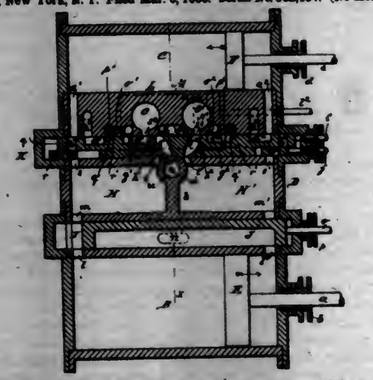
5. In a car coupling, a recessed draw-head having the pin B extending across the recess thereof, and the coupling-hook C, provided with the slot *c*, through which the pin B passes, the weighted rear end c^2, and the vertical slot c^4 in its forward end, the hook being adapted to engage the pin of the opposing draw-head, and the slot c^4, to receive the coupling-pin of an ordinary link, in combination with means for lifting the said hook, substantially as herein shown and described.

6. The combination, with a draw-head, of a weighted coupling-hook pivoted to said draw-head and operating devices for said hook, consisting of the rod G, united thereto and formed with an oblong loop, the said rod being fulcrumed at said loop portion, substantially as described.

408,482. OAR. Horatio F. Hiser, Ashland, Oreg. Filed Feb. 7, 1889. Serial No. 299,266. (No model.)

Claim.—1. In oars having metal blades, the metal blade of dish shape on its face, constructed with a longitudinal channel adapted to receive the handle within it on its convex side, said channel forming

408,482.



a correspondingly-arranged rib on the reverse or concave side of the blade, substantially as specified.

2. A metal oar-blade provided with corrugations on its face, said corrugations being at an angle relatively to the longitudinal axis of the blade, substantially as shown and described.

3. A metal oar-blade of dish shape on its face, constructed with a longitudinal channel in its convex side, forming or leaving a correspondingly-arranged rib upon its reverse or concave side, and with transverse corrugations on opposite sides of said channel arranged angling in relation with the channel, essentially as shown and described.

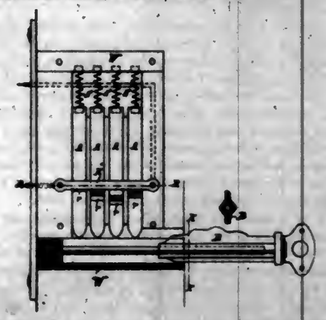
408,483. METHOD OF OPERATING GAS-ENGINES. HENRY HOELLJES, New York, N. Y. Filed Mar. 6, 1888. Serial No. 302,137. (No model.)

Claim.—1. The method of operating a gas-engine, which consists in compressing a certain charge of air or neutral gas into a heating-chamber, compressing a certain charge of explosive mixture, consisting of inflammable gas or vapor and air, igniting this explosive mixture, and causing it to enter in an ignited state into the said heating-chamber, in which the whole charge of compressed air or neutral gas is already contained, thereby heating the air or neutral gas, and finally discharging the heated compressed air or neutral gas and the products of combustion into a power-cylinder, causing them to move a piston, substantially as specified.

2. The method of heating a charge of compressed air or neutral gas by introducing the charge of compressed air or neutral gas into a heating-chamber and causing an ignited explosive mixture, consisting of inflammable gas or vapor and air, to enter into said heating-chamber, in which the whole charge of compressed air or neutral gas is already contained, substantially as specified.

3. The method of preventing the dilution of the explosive mixture in a gas-engine, which consists in compressing a charge of air or neutral gas into a heating-chamber and introducing an ignited explosive mixture into said heating-chamber, in which the whole charge of compressed air or neutral gas is already contained, substantially as specified.

4. The method of operating a gas-engine, which consists in compressing a certain quantity of air or neutral gas into a heating-chamber or the motor-cylinder, introducing an explosive mixture into another chamber or the motor-cylinder, separated from the body of the compressed air or neutral gas by the motor-piston, establishing a communication between the compressed air or neutral gas and the explosive mixture by moving the motor-piston, in the meantime igniting the whole charge of said explosive mixture instantaneously, the exploding gases heating the body of the compressed air or neutral gas, and finally causing the so-heated compressed air or neutral gas and products of combustion to move a piston, substantially as specified.

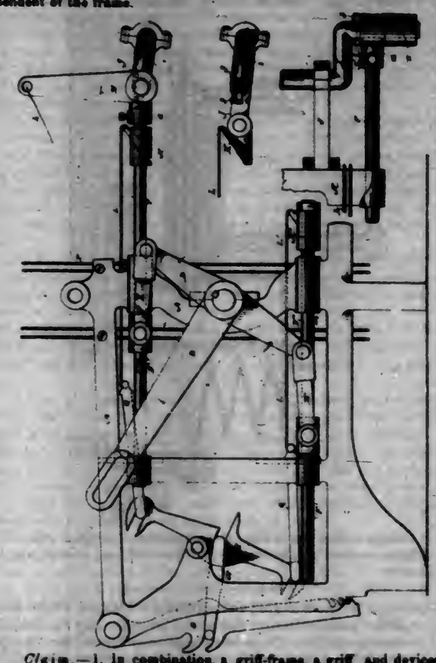


5. The method of operating a gas-engine, which consists in compressing a certain quantity of air or neutral gas into a heating-chamber or the motor-cylinder, introducing an explosive mixture into a chamber separated from the body of the compressed air or neutral gas, igniting the whole charge of said explosive mixture instantaneously and causing the exploding gases to enter through automatic valves, or valves moved by the engine, into the body of the compressed air or neutral gas, thereby heating the same, and finally causing the so-heated compressed air or neutral gas and products of combustion to move a piston, substantially as specified.

6. The method of operating a gas-engine, which consists in compressing a certain quantity of air or neutral gas into a heating-chamber, causing a compressed charge of explosive mixture to flow in a state of flame gradually into the chamber in which the whole charge of compressed air or neutral gas is contained, then heating the body of compressed air or neutral gas, the quantity of which latter being constant and not augmented while being heated, except by the products of combustion of the explosive mixture, and, finally, after the complete combustion of the explosive charge, discharging the heated compressed air or neutral gas and products of combustion into a power-cylinder, causing it to move a piston, substantially as specified.

7. The method of operating a gas-engine, which consists in compressing a certain quantity of air or neutral gas into a heating-chamber or the motor-cylinder, causing a compressed charge of explosive mixture to flow in a jet gradually into the chamber or motor-cylinder in which the whole charge of air or neutral gas is contained, said jet of explosive mixture being ignited when flowing into and thus heating the body of the compressed air or neutral gas, the quantity of which latter being constant and not augmented while being heated, except by the products of combustion of the explosive mixture, the compressed air or neutral gas and products of combustion being caused to move a piston, while the explosive mixture flows into the compressed air or neutral gas and heats the same, substantially as specified.

8. The method of using heating-chambers communicating with the motor-cylinder by suitable valves, into which heating-chambers charges of compressed air or neutral gas and charges of an ignited explosive mixture are introduced intermittingly and successively to each other, each charge of air being first admitted and then being heated by a charge of an ignited explosive mixture, the so-heated air or neutral gas and the products of combustion then being discharged into the power-cylinder to move a piston, substantially as specified.



408,484. ELECTRIC LOCK. LOUIS HUSSNER and RUDOLPH BOSSE, Schweidnitz, Germany. Filed Nov. 23, 1888. Serial No. 291,691. (No model.) Patented in Germany Jan. 3, 1888, No. 44,309.

Claim.—The combination of the tumblers A, bar K', terminals q q', and battery T with the key B, as and for the purpose set forth.

408,485. DOBBY AND JACQUARD MACHINE FOR LOOMS. ALFRED DARLINGTON, Philadelphia, Pa. Filed Sept. 21, 1888. Serial No. 286,036. (No model.)

Brief.—If for any reason it is desired to level the warps when the griff-frame is in its outermost position, this can be accomplished through the described devices by giving the knife a movement independent of the frame.

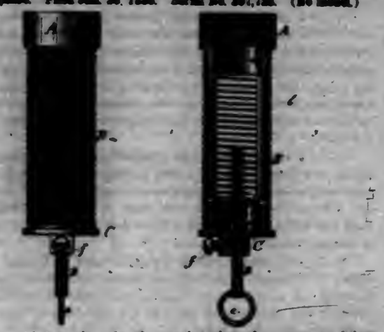
Claim.—1. In combination, a griff-frame, a griff, and devices whereby said griff is connected with said frame, substantially in the manner described, and whereby the griff is normally operated by said frame, but whereby said griff may be given a movement independent of the movement of the frame.

2. In combination, a griff-frame or plungers, a crank-shaft journaled on the griff-frame or plungers, a griff, and a connection between said griff and said crank-shaft, whereby when the crank-shaft is turned the griff moves independently of the movement of the griff-frame.

3. In combination, a griff-frame or plungers, a griff, a crank-shaft, journal-boxes carried by the griff-frame or plungers, within which said shaft is loosely journaled, connections between said griff and crank-shaft, projections upon the journal-box of said crank-shaft at each side of the shaft, and a projection upon said crank-shaft.

4. In combination, a griff-frame or plungers, a griff, a crank-shaft, journal-boxes carried by the griff-frame or plungers, within which said shaft is loosely journaled, a crank connected to said shaft, and a cord or other connection secured to and extending from said crank to the desired point, and connections between the crank-shaft and the griff and the griff-frame or plungers.

5. In combination, a griff-frame or plungers, a crank-shaft journaled on said griff-frame or plungers, a griff supported on said frame or plungers, and a connection between said griff and said crank-shaft, whereby when the crank-shaft is turned the griff can have a movement independent of the movement of the frame or plungers.



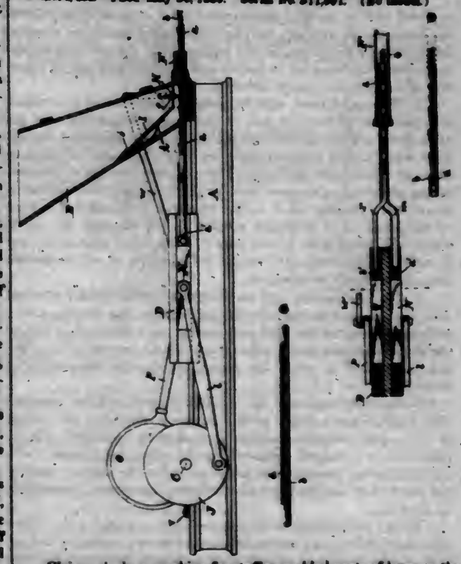
6. In combination, a griff-frame or plungers, boxes on the ends of said griff-frame or plungers, within which said plungers are secured, a crank-shaft loosely journaled within said boxes, a griff, and links connecting said crank-shaft and the griff or knife.

7. In combination, a griff-frame or plungers, boxes on the ends of said griff-frame or plungers, within which said plungers are secured, a crank-shaft loosely journaled within said boxes, projections on one box at each side of said shaft, and a projection on said shaft, a griff the ends of which are supported by said griff-frame or plungers, and links connecting said crank-shaft and the griff or knife.

408,486. COUGH-SIRUP. FRANCIS M. JAGUES, New London, Conn. Filed Apr. 22, 1889. Serial No. 308,314. (No specimens.)

Claim.—The herein-described cough-sirup, consisting of rock polypody, licorice, wild-cherry bark, hoarhound-herb, rock-candy, granulated sugar, glycerine, and rye whisky, in the proportions specified.

408,487. STRAINER FOR SUCTION-PIPES OF PUMPS. OMAR H. JEWELL, Chicago, Ill., assignor to William H. Jewell and Ira H. Jewell, same place. Filed Jan. 26, 1889. Serial No. 297,722. (No model.)



Claim.—1. A strainer for the suction-pipe of a pump or siphon, consisting of a wire spiral secured with one end to a coupling-nozzle provided with a guide-yoke that extends into the spiral, and with its other end to a cap having an eye for the collared shank of an adjusting-screw tapped into the guide-yoke for elongating or contracting said spiral, substantially as and for the purpose set forth.

2. A strainer for the suction-pipe of a pump or siphon, consisting of a wire spiral secured with one end to a coupling-nozzle that extends into the spiral, and with its other end to a cap having an eye for the collared shank of an adjusting-screw tapped into the screw-nozzle for elongating and contracting the spiral, said screw being provided at its lower projecting end with a handle for turning said screw, all substantially as set forth.

408,488. REMEDY FOR CORNS. AMELIE LABOUCHELLE, Hoboken, N. J. Filed May 15, 1889. Serial No. 310,866. (No specimens.)

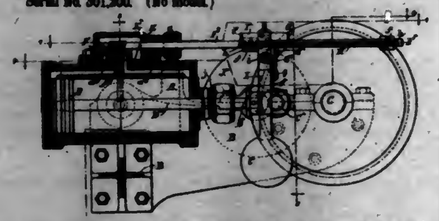
Claim.—A medicinal compound for corns, resulting from the soaking of ivy-leaves, cherry-stems, and pine-buds in vinegar, substantially as herein set forth.

408,489. HARNESS-STUFFING MACHINE. HUGO LEESE, Baltimore, Md. Filed May 20, 1889. Serial No. 311,391. (No model.)

Claim.—1. In a machine for stuffing padded parts of harness, the combination of a hopper, a stuffing-tube leading from the hopper, and two alternately-reciprocating rods, both in the said tube.

2. In a machine for stuffing padded parts of harness, the combination of a hopper, a stuffing-tube leading from the hopper, and two

reds in said tube, each provided with teeth and each having a reciprocating movement independent of the other.



3. In a machine for stuffing padded parts of harness, the combination of a hopper, a stuffing-tube leading from the hopper, a drive-shaft having a crank-head and an eccentric, and two independently-movable rods, both in the said stuffing-tube, one of these rods receiving motion from the crank-head and the other from the eccentric.

4. In a machine for stuffing padded parts of harness, the combination of a hopper, a stuffing-tube leading from the hopper, a drive-shaft having a crank-head, an eccentric loose on the drive-shaft and engaged therewith by a clutch device, a slide having two reciprocating heads, rods connecting the crank-head and the eccentric with different reciprocating heads, and two independently-movable rods, both in the said stuffing-tube and each connected to a different reciprocating head.

5. In a machine for stuffing padded parts of harness, the combination of a hopper, a stuffing-tube leading from the hopper, a slide D, two reciprocating heads, each on an opposite side of the slide, and two independently-movable rods, both in the said stuffing-tube, and each rod having near its end a curve and attached to a different one of the said reciprocating heads.

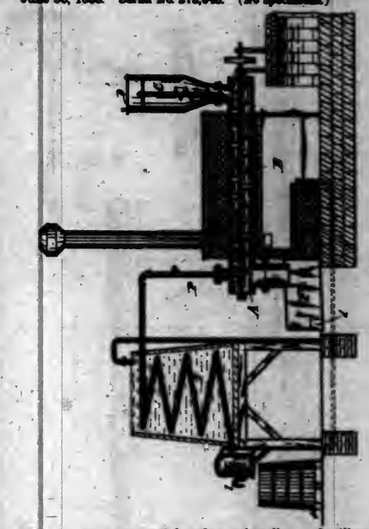
6. In a machine for stuffing padded parts of harness, the combination of a hopper, a stuffing-tube leading from the hopper, a reciprocating rod longitudinally concave, and a second reciprocating rod fitting in the concavity of the first rod, and both of said rods occupying the said stuffing-tube.

408,490. STEAM-ENGINE. GEORGE W. LEWIS, La Salle, Ill., assignor of one-half to Charles Brunner, same place. Filed Feb. 26, 1889. Serial No. 301,300. (No model.)

Claim.—1. The combination, with the piston-cylinder and a steam cut-off valve operated by oscillation of the valve-rod, of a pendulum carried by the piston-rod and engaged with the valve-rod, whereby the latter is oscillated by the inertia of the pendulum.

2. The combination, with the piston-cylinder and its slide-valve provided with an auxiliary steam cut-off valve, of an oscillating valve-rod operating the auxiliary valve by its oscillating movement, a pendulum carried by the piston-rod and engaged with the valve-rod to partially rotate the latter by its inertia, and a spring arranged to rotate the valve-rod in an opposite direction.

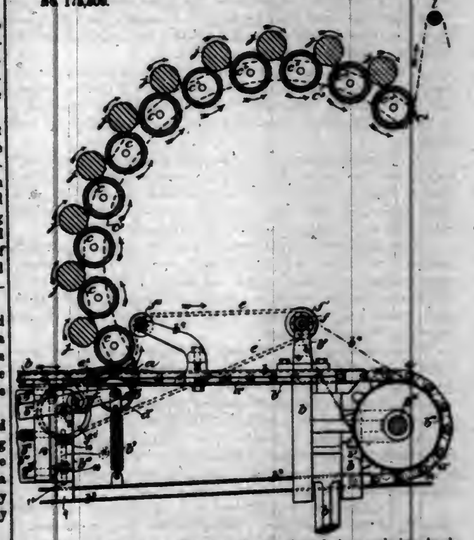
3. The combination, with the piston-cylinder having a valve-seat provided with ports a', a^2, and a^3 and with a steam-inlet into the valve-chest, a slide-valve provided with a central steam-port and exhaust-ways, and an auxiliary valve for said steam-port of the main valve, of a prolonged oscillatory valve-rod provided with tappets and having actuating engagement with the auxiliary valve in its oscillating movement, a parallel rod H on the valve-rod, a standard G, carried by the piston-rod, a pendulum pivoted on the standard, the rod of which is provided with lateral arms i^3, arranged to bear on the rod H, and a spring arranged to oppose the pressure of said pendulum-arms, substantially as described.



4. The combination, with the oscillating piston-cylinder provided with a slide-valve on the side thereof between the trunnions, of a prolonged valve-rod provided with tappets and a standard or arm on the piston arranged to strike the tappets for the reversal of the valve and constructed to guide the prolonged valve-rod, substantially as described.

5. The combination of the oscillating piston-cylinder provided with a valve-chest and with a valve and ports adapted to the running of the engine in either direction, a crank-shaft connected with the piston-rod, a prolonged valve-rod having adjustable tappets, and a standard on the piston-rod arranged to strike the tappets, whereby the crank-shaft may be given an oscillatory movement, substantially as described.

6. The combination of the piston-cylinder provided with a valve-chest and with a valve and ports adapted to the running of the engine in either direction, a crank-shaft connected with the piston-rod, an arm or disk having an arm or projection driven by the crank-shaft, and a spring-stop arranged to strike and arrest the arm or projection when the crank-shaft is on or near a dead-center.



7. In combination, the piston-cylinder, its valve, the valve-actuating mechanism, the crank-shaft, the disk actuated by the crank-shaft and having a projection, and the spring-stop arm for engaging the projection on the disk, and mechanism for detachably locking the spring-arm, substantially as described.

408,491. FERTILIZER. JOHN A. LIGHTHALL, Syracuse, N. Y. Filed June 30, 1888. Serial No. 278,642. (No specimens.)

Claim.—As a new article of merchandise, a fertilizer consisting of tobacco-stems reduced to dry granular charcoal, substantially as set forth.

408,492. MACHINE FOR FINISHING LACE OR OTHER FABRICS. LEONARD LUDLEY, Nottingham, England. Filed Nov. 23, 1887. Serial No. 256,462. (No model.) Patented in England Mar. 19, 1884, No. 5,160, and Sept. 19, 1885, No. 11,152, and in France Feb. 2, 1887, No. 178,809.

Claim.—1. The combination of tentering-chains *a*, chain-wheels for driving said chains, a series of ironing-rollers arranged in an arc, pinions on said rollers, a gear-wheel engaging said pinions, and gearing connecting said gear-wheel with said chain-wheels, whereby the latter and said rollers will operate in unison, substantially as and for the purposes set forth.

2. In combination with the driving-shaft, tentering-chains *a*, and chain-wheels for driving said chains geared to said shaft, a series of ironing-rollers, gearing connecting said rollers with said chain-wheels, whereby the latter and said rollers will operate in unison, pulleys, endless belts *e*, running over said pulleys and bearing against one of said ironing-rollers, and gearing connecting said pulleys with said driving-shaft, substantially as set forth.

3. In combination with the tentering-chains *a* and chain-wheels for driving said chains, a series of ironing-rollers, gearing connecting said rollers with said chain-wheels, so that the latter will operate in unison with said rollers, endless chains *c*, arranged to run against the first roller of the series, pulleys over which said chains *c* travel, and a belt imparting motion from one of said chain-wheels to one of said pulleys, substantially as set forth.

4. The combination, with the tentering-chains *a* and chain-wheels for driving said chains, of a series of ironing or drying rollers, pinions on said rollers, a common gear-wheel meshing with said pinions, and said gear-wheel being geared to one of said chain-wheels, the endless chains *c*, bearing upon one of said ironing-rollers, pulleys over which said chains *c* travel, a belt connecting one of said pulleys with one of said chain-wheels, and the conducting-rollers *j*, substantially as set forth.

5. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said driving-shaft, of a series of ironing-rollers of different diameters, pinions on said rollers, a common gear-wheel meshing with said pinions, and said gear-wheel being geared to one of said chain-wheels, the belts *e*, running against one of said rollers, pulleys over which said belts travel geared with said driving-shaft, and the conducting-rollers *j*, as set forth.

6. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of a series of ironing-rollers of different diameters increasing successively, gears for driving said rollers, a common gear-wheel meshing with said gears, and said gear-wheel being geared with one of the said chain-wheels, the conducting-rollers *j*, the endless chain belts *c*, bearing upon one of said ironing-rollers, and pulleys over which said chains travel, geared with said driving-shaft, as set forth.

7. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said driving-shaft, of two series of ironing-rollers c c^2, respectively, pinions for driving both of said series, the pinions of one series being smaller than those of the other, a common gear-wheel, and all of said pinions being geared with said common gear-wheel, and said gear-wheel being geared to said chain-wheels, the conducting-rollers *j*, the endless belts *c*, bearing upon one of said ironing-rollers, and pulleys over which said belts *c* travel, geared with said driving-shaft, as set forth.

8. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of two series of ironing-rollers c c^2, respectively, arranged above said tentering-chains, pinions for driving said rollers, the pinions of the series remote from the tentering-chains being smaller than the others, gearing connecting said pinions with one of said chain-wheels, the conducting-rollers *j*, the endless belts *c*, bearing upon the end ironing-roller of the series, and pulleys over which said belts *c* travel, geared with said shaft, as set forth.

9. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of two series of ironing-rollers c c^2, respectively, arranged in an arc above said tentering-chains, said rollers being of increasing diameters throughout the series, pinions for driving said rollers, the pinions of the series remote from the tentering-chains being of smaller diameter than the others, gearing connecting said pinions with one of the said chain-wheels, the conducting-rollers *j*, arranged alternately with the ironing-rollers, the chains *c*, bearing upon one of the ironing-rollers, and pulleys over which said chains *c* travel, geared with said shaft, as set forth.

10. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of a series of ironing-rollers, gear-wheels for driving said rollers geared with said chain-wheels, endless belts *c*, bearing against one of said rollers, pulleys for driving said belts *c*, geared with said shaft, conducting-rollers *j*, guide-roller *l*, and winding-on roller *m*, substantially as set forth.

11. The combination, with the driving-shaft, the tentering-chains *a*, chain-wheels for driving them geared with said shaft, and a series of ironing-rollers geared to said chain-wheels, of endless chain belts *c*, bearing against one of said ironing-rollers and having roughened surfaces c' c^2, and pulleys for driving said chain belts *c*, geared with said shaft, substantially as and for the purposes set forth.

12. In combination with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of a number of ironing-rollers of different diameters, pinions of different diameters for driving said rollers, gearing connecting said pinions with one of said chain-wheels, the endless chains *c*, bearing against one of said chain-wheels for driving said chains geared to said shaft, a series of ironing-rollers, gearing connecting said rollers with said chain-wheels, whereby the latter and said rollers will operate in unison, pulleys, endless belts *c*, running over said pulleys and bearing against one of said ironing-rollers, and gearing connecting said pulleys with said driving-shaft, substantially as set forth.

3. In combination with the tentering-chains *a* and chain-wheels for driving said chains, a series of ironing-rollers, gearing connecting said rollers with said chain-wheels, so that the latter will operate in unison with said rollers, endless chains *c*, arranged to run against the first roller of the series, pulleys over which said chains *c* travel, and a belt imparting motion from one of said chain-wheels to one of said pulleys, substantially as set forth.

4. The combination, with the tentering-chains *a* and chain-wheels for driving said chains, of a series of ironing or drying rollers, pinions on said rollers, a common gear-wheel meshing with said pinions, and said gear-wheel being geared to one of said chain-wheels, the endless chains *c*, bearing upon one of said ironing-rollers, pulleys over which said chains *c* travel, a belt connecting one of said pulleys with one of said chain-wheels, and the conducting-rollers *j*, substantially as set forth.

5. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said driving-shaft, of a series of ironing-rollers of different diameters, pinions on said rollers, a common gear-wheel meshing with said pinions, and said gear-wheel being geared to one of said chain-wheels, the belts *c*, running against one of said rollers, pulleys over which said belts travel geared with said driving-shaft, and the conducting-rollers *j*, as set forth.

6. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of a series of ironing-rollers of different diameters increasing successively, gears for driving said rollers, a common gear-wheel meshing with said gears, and said gear-wheel being geared with one of the said chain-wheels, the conducting-rollers *j*, the endless chain belts *c*, bearing upon one of said ironing-rollers, and pulleys over which said chains travel, geared with said driving-shaft, as set forth.

7. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said driving-shaft, of two series of ironing-rollers c c^2, respectively, pinions for driving both of said series, the pinions of one series being smaller than those of the other, a common gear-wheel, and all of said pinions being geared with said common gear-wheel, and said gear-wheel being geared to said chain-wheels, the conducting-rollers *j*, the endless belts *c*, bearing upon one of said ironing-rollers, and pulleys over which said belts *c* travel, geared with said driving-shaft, as set forth.

8. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of two series of ironing-rollers c c^2, respectively, arranged above said tentering-chains, pinions for driving said rollers, the pinions of the series remote from the tentering-chains being smaller than the others, gearing connecting said pinions with one of said chain-wheels, the conducting-rollers *j*, the endless belts *c*, bearing upon the end ironing-roller of the series, and pulleys over which said belts *c* travel, geared with said shaft, as set forth.

9. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of two series of ironing-rollers c c^2, respectively, arranged in an arc above said tentering-chains, said rollers being of increasing diameters throughout the series, pinions for driving said rollers, the pinions of the series remote from the tentering-chains being of smaller diameter than the others, gearing connecting said pinions with one of the said chain-wheels, the conducting-rollers *j*, arranged alternately with the ironing-rollers, the chains *c*, bearing upon one of the ironing-rollers, and pulleys over which said chains *c* travel, geared with said shaft, as set forth.

10. The combination, with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of a series of ironing-rollers, gear-wheels for driving said rollers geared with said chain-wheels, endless belts *c*, bearing against one of said rollers, pulleys for driving said belts *c*, geared with said shaft, conducting-rollers *j*, guide-roller *l*, and winding-on roller *m*, substantially as set forth.

11. The combination, with the driving-shaft, the tentering-chains *a*, chain-wheels for driving them geared with said shaft, and a series of ironing-rollers geared to said chain-wheels, of endless chain belts *c*, bearing against one of said ironing-rollers and having roughened surfaces c' c^2, and pulleys for driving said chain belts *c*, geared with said shaft, substantially as and for the purposes set forth.

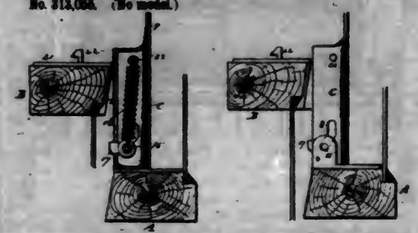
12. In combination with the driving-shaft, the tentering-chains *a*, and chain-wheels for driving them geared with said shaft, of a number of ironing-rollers of different diameters, pinions of different diameters for driving said rollers, gearing connecting said pinions with one of said chain-wheels, the endless chains *c*, bearing against one of said rollers, and pulleys for said chains *c*, geared with said driving-shaft, as and for the purposes set forth.

13. The combination, with the ironing-rollers, of tentering-chains *a*, provided with non-metallic blocks a^2 a^4, adapted to bear against one of such rollers, substantially as set forth.

14. The chain *a*, having the points a^3, and the non-metallic blocks a^2 a^4, projecting above said points, as set forth.

15. The combination, with the driving-shaft and the lowermost ironing-roller having suitable driving mechanism, of the endless belts *c*, pulleys over which said belts travel, geared with said driving-shaft, adjustable brackets in which a pulley of each chain is mounted, and a screw for adjusting said brackets, substantially as set forth.

16. The combination, with the lower roller *c*, gearing for driving said roller, the tentering-chains *a*, having links and extensions a^3, and chain-wheels for driving said chains geared with said gearing, of levers, springs attached to said levers, and rollers d d', journaled to said levers, all adapted to support said links and extensions of the chains, respectively, and bear said chains against the roller *c*, substantially as set forth.



17. The combination, with the lower ironing-roller *c*, having suitable means for driving it, of the pulleys f' f^3, chain belts *c*, running over said pulleys f' f^3, the brackets b^2, rollers f^3, mounted in said brackets and bearing chains *c* against roller *c*, and suitable means for driving said belts *c*, substantially as set forth.

18. The combination, with the driving-shaft, the tentering-chains, chain-wheels for driving said chains geared with said shaft, the ironing-rollers having gear-wheels geared with said chain-wheels, and the frame *b*, of the endless chain belts *c*, bearing against one of said rollers, pulleys over which said chains *c* travel, a belt connecting one of said pulleys with the chain-wheels, and brackets in which said pulleys are mounted, secured to the frame *b*, substantially as set forth.

19. The combination, with the ironing-rollers arranged in an arc, and pinions on said rollers, of a gear-wheel g', engaging said pinions, the shaft *h*, a pinion on said shaft for revolving said wheel g', a worm, a worm-wheel on said shaft *h*, engaged by said worm, tentering-chains *a*, chain-wheels over which said chains travel, a gear-wheel b^{15}, means, substantially as described, whereby said wheel b^{15} is detachably connected to one of said chain-wheels, and a pinion on shaft *h* engaging wheel b^{15}, as set forth.

20. The combination, with the ironing-rollers arranged in an arc, and pinions on said rollers, of a gear-wheel g', engaging said pinions, the shaft *h*, geared with the wheel g', for revolving it, a worm, a worm-wheel on said shaft engaged by said worm, tentering-chains *a*, shaft b^{15}, chain-wheels on said shaft b^{15}, over which said chains travel, a projecting pin affixed to the shaft b^{15}, a pinion h^3 on the shaft *h*, and a gear-wheel b^{16}, movable longitudinally on the shaft b^{15} and adapted to engage said projecting pin and pinion h^3, substantially as and for the purposes set forth.

408,498. FASTENER FOR THE MEETING-RAILS OF SASHES. WILLIAM LIVINGSTONE, Jersey City, N. J. Filed June 4, 1888. Serial No. 313,058. (No model.)

Claim.—1. The combination, with window-sashes, of a box pivoted to one of said sashes and having a longitudinal movement, and a pivoted toe located within said box and adapted to be engaged by the other sash, substantially as set forth.

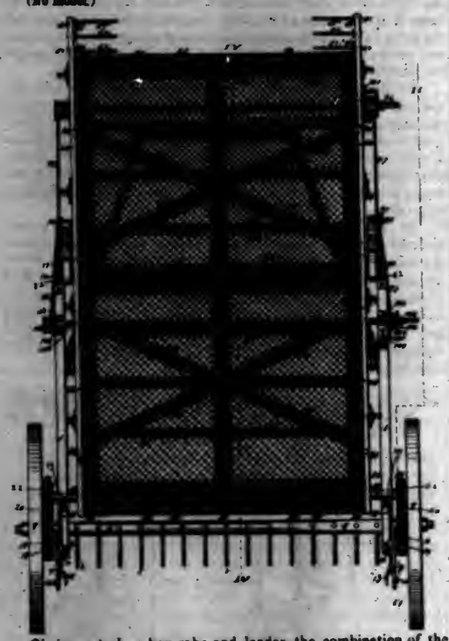
2. The combination, with window-sashes, of a box having slots pivoted to one of said sashes, the pivot-pin passing through said slots, and a toe projecting from said box to be engaged by the other sash to tilt the box and lock the sashes, substantially as set forth.

3. The combination, with window-sashes, of a box having inclined slots pivoted on one of said sashes, the pivot-pin passing through said inclined slots, and a toe projecting from said box to be engaged by the other sash, substantially as set forth.

4. The combination, with window-sashes, of a box having inclined slots pivoted on one of said sashes, the pivot-pin passing through said inclined slots, a spring connected to the box at one end and to said pivot-pin at the other end, and a toe projecting from the box to be engaged by the other sash, substantially as set forth.

5. The combination, with window-sashes, of a plate having ears secured to one of said sashes, a box pivoted between said ears and

provided with slots in three of its faces, a toe projecting through one of said slots, and a plate on the other sash to engage said toe, substantially as set forth.



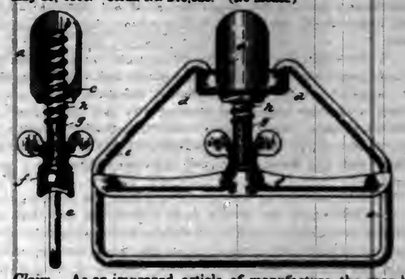
6. The combination, with window-sashes, of a plate having ears secured to one of said sashes, a box pivoted between said ears and provided with slots on three of its faces, a toe projecting through one of said slots, a plate on the other sash to engage said toe, and a hook projecting from said plate to enter a slot in the box and engage one wall of said slot, substantially as set forth.

7. In a sash-fastener, the combination, with the sashes, of a pivoted box made of sheet-metal blanks and provided with slots, the pivot-pin passing through said slots, a toe projecting from said box, a sheet-metal plate on the other sash to be engaged by said toe, and a hook-shaped projection extending upwardly from said plate to engage the box, substantially as set forth.

8. The combination, with window-sashes, of a hook secured to one sash, a longitudinally-movable box pivoted to the other sash and provided with a slot to receive said hook, a pivoted toe located within the box, and a spring for moving the box longitudinally.

9. The combination, with window-sashes, of a hook secured to one sash, a box having slotted sides and adapted to engage the hook, a toe pivoted in bearings outside of the box, and a spring for moving the box longitudinally, substantially as set forth.

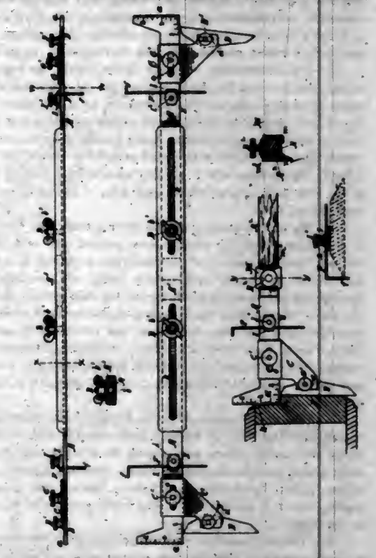
408,494. COMBINED HAY RAKE AND LOADER. HENRY C. LONG and IRVIN B. WALKER, Salem, Mo. Filed Mar. 20, 1888. Serial No. 268,784. (No model.)



Claim.—1. In a hay rake and loader, the combination of the main wheels, the sprocket-wheels 18, shaft 16, having flanged sprocket-disks 26 mounted loosely thereon, drive-chains 20, passing around sprocket-wheels 18 and flanged sprocket-disks 26, a circular series of ratchet-teeth on the inner sides of the latter, disks 23, fixed rigidly to shaft 16, pawls 30, pivoted to said disks, and springs 32, of one piece of wire, coiled around shaft 16, and having tangential ends engaging said pawls to throw them in engagement with the ratchets, substantially as set forth.

2. In a hay rake and loader, the combination of sprocket-wheels 18, shaft 16, flanged sprocket-disks 26, mounted loosely thereon, having ratchet-teeth on the inner sides of the flanges, slotted disks 23, having hubs 24, keys 25, securing disks 23 to shaft 16, pawls 30, pivoted to the slotted disks, the integral double-coil loop-attached springs 32, the two arms of said springs engaging said pawls to engage them with the ratchet-teeth, pins on said pawls projecting through the slots of disks 23, and spring-catches 38, engaging said pins when the pawls are disengaged, substantially as set forth.

3. In a hay rake and loader, an elevator-frame, rollers 50 and 52 52, hangers 8, in which roller 50 is mounted, endless belts 51, and an endless belt of wire-netting passing around said rollers, cross-slats 58, secured to the endless belts and having teeth projecting from them, and inwardly-projecting strips 113, supported by the sides of the elevator-frame on which the lower portion of the endless belt is supported and has bearing, substantially as set forth.

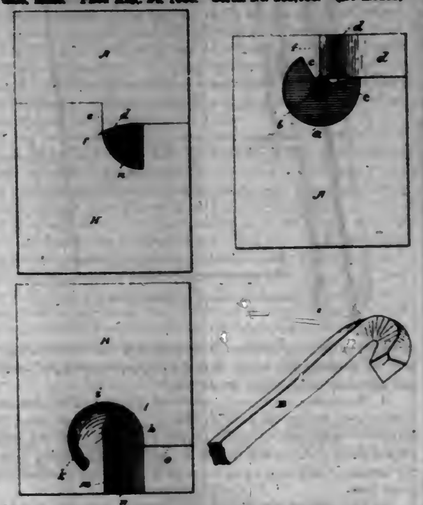


4. In a hay-rake and loader, the combination of the adjustable rake, the sprocket drive-gear, and sectional sprocket drive-wheel that transmits the movement from the ground-wheels to the elevator, the pivoted standard 80, that is provided with the elongated slot 111, the sheaves 88 on the sides of the elevator-frame, and secondary sheaves 91 at the top of the standards, the rotary shafts 93 and 107, journaled, respectively, in the elevator and main frames, the windlass-drums they carry, the hand-cranks that work them, and the ropes 97, arranged to adjust the discharge height of the elevator, substantially as and for the purpose set forth.

408,495. MOP-HEAD. HAMILTON P. LOW, Manchester, N. H., assignor to the Triumph Self-Wringing Mop Company, same place. Filed May 25, 1888. Serial No. 275,025. (No model.)

Claim.—As an improved article of manufacture, the mop-head herein described, comprising the socketed base having apertured ears and a lower spirally-formed lip, the frame having its ends secured to said ears, the follower moving in said frame, and the rod swiveled to said follower and having a threaded portion engaging said spirally-formed lip, and provided with lower wings, substantially as set forth.

408,496. THRESHOLD-MEASURING GAGE. DEAN W. MACKER, Grafton, Mass. Filed Apr. 10, 1889. Serial No. 306,671. (No model.)

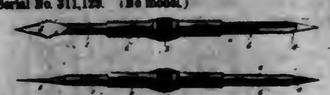


Claim.—1. A gage for the purpose specified, consisting of the extensible bars having squared outer ends, the adjustable laterally-projecting arms fitted to slide longitudinally on the extensible bars and carrying swinging bevel-plates, the inner ends of which are adjustable against the side of said bars, as set forth, with thumb-screws or clamp devices for retaining the several parts at positions of adjustment, all arranged for operation substantially as described.

2. The combination of the slotted center bar A', the extension-pieces A, provided with square end having graduations thereon, the adjustable arms C, the swinging plates D, adjustably attached to said arms, and thumb-screws for retaining the several parts at position of adjustment, substantially as set forth.

3. In a gage for the purpose specified, the combination, with the extension-rod having the end squares a, arms C, and the adjustable bevel-plates D, of the laterally-disposed adjustable gage-fingers F, and clamp devices for retaining the same, substantially as and for the purpose set forth.

408,497. DIE FOR THE MANUFACTURE OF AUGERS. JOHN A. MAGRILL, Brimfield, assignor to the Snell Manufacturing Company, Fiskdale, Mass. Filed Aug. 24, 1888. Serial No. 283,698. (No model.)



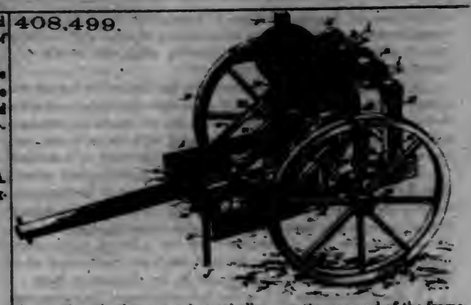
Claim.—1. The herein-described dies for making the heads of single-twist augers, having the neck-opening formed by the parts *d* and *n*, said part *d* having the cutting-edge *f* for completing the neck, as set forth.

2. The herein-described dies for making single-twist augers, which consist in the head-cavity *a*, of substantially the form shown, and the semi-elliptical neck-opening lying without the plane of the head-cavity, whereby the article is made ready for the twisting-machine without beading, chiseling, or filing, as described.

3. The herein-described dies for making single-twist augers, which consist in the dies A and H, said die A having the segmental depression *a*, conical hollow *b*, projection *c*, and lug *d*, and the die H having the depression *h*, bevel projection *i*, circling channel *k*, and channel *n*, whereby the cutting-edge *a'*, opening *c'*, screw-nib *b'*, hollow *i'*, cutting-lip *k'*, and neck *d'* are formed at a single operation and the auger ready for the twisting-machine and lathe without beading, chiseling, or filing, as explained.

408,498. ENGRAVER'S TOOL. GEORGE A. MASON, Washington, D. C., assignor to John Sellers & Sons, New York, N. Y. Filed May 17, 1889. Serial No. 311,129. (No model.)

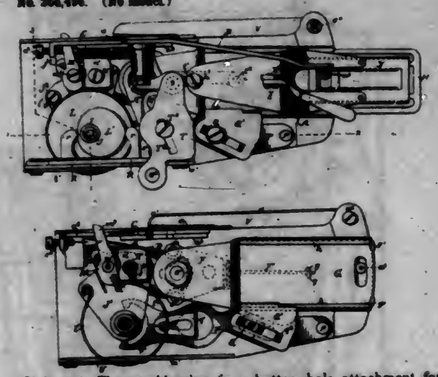
Claim.—1. An engraver's tool having a burnishing-edge and a scraping-edge, both of metal, on opposite ends of the same handle or stock and provided with a cap or hood to protect either edge when not in use, said cap fitting on a suitable co-operating shoulder on the tool.



2. An engraver's tool consisting of a single piece of steel having one end shaped into a scraper and the other end into a burnisher, and a protecting cap or caps to cover the ends, said cap or caps fitting on co-operating shoulders on the tool, as and for the purpose set forth.

408,499. REEL-CARRIAGE. JOSEPH F. MILLER, Hamburg, Iowa. Filed Apr. 26, 1889. Serial No. 308,705. (No model.)

Claim.—1. The combination, with the frame having reel-standards and the reel having a crank, of the handle M, projecting from a reel-standard and suitably braced from the frame, substantially as described.



2. The herein shown and described reel-carriage, composed of the

408,499.

frame, the wheels mounted on spindles near the rear end of the frame, the standards N, the shaft *k*, supported by standards N and having adjustable stops L, the guide-pulley K, mounted on shaft *k*, the reel-standards having notches in their upper ends, pins G, the reel, the shaft H, the brake-wheel on the shaft H, having the arm *i*, the strap or cable J, and the handle M, extending from a reel-standard and suitably braced, substantially as and for the purpose described.

408,500. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. DANIEL MILLS, Philadelphia, Pa. Filed Mar. 6, 1888. Serial No. 266,496. (No model.)

Claim.—1. The combination, in a button-hole attachment for sewing-machines, of the vibrating plate carrying the cloth-clamp, two former-cams, one above the other, mounted substantially as described, and mechanism for operating said cams, and a single former-lever pivoted to the base-plate and connected to the vibrating plate, and having two working-faces on different horizontal planes, one face being acted upon by one cam and the other by the other cam, substantially as set forth.

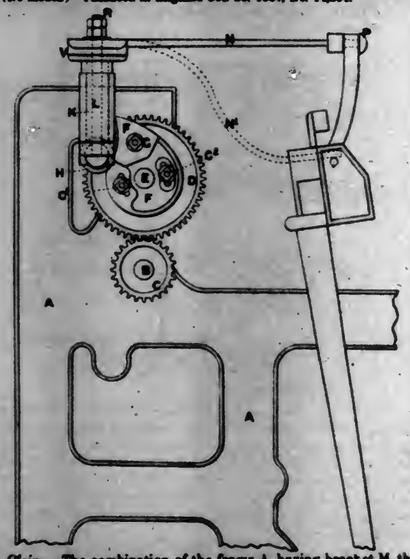
2. The combination, in a button-hole attachment for sewing-machines, of the vibrating plate carrying the cloth-clamp, two former-cams, one above the other, mounted substantially as described, mechanism for operating said cams, and a single former-lever pivoted to the base-plate and connected to the said vibrating plate, said lever having two arms adjustable toward and from each other and in different horizontal planes, whereby one may be acted upon by one cam and the other by the other cam, substantially as set forth.

3. The combination, in a button-hole attachment for sewing-machines, of the vibrating plate carrying the cloth-clamp, a single former-lever pivoted to the base-plate and having a slot, and a block on the vibrating plate adjustable in said slot for varying the bight of the stitch with a revolving former-cam and arms on the lever spanning said cam and adjustable to alter the width of cutting-space, substantially as and for the purpose set forth.

4. The combination, in a button-hole attachment for sewing-machines, of the feed-disk, a feed-lever J, a grip-lever mounted thereon, and a feed-band for the feed-disk attached at one end to the feed-lever J and at the other end to the grip-lever with a friction-disk acting to retard said feed-lever both on its feed and return movement, substantially as and for the purpose described.

5. The combination, in a button-hole attachment for sewing-machines, of the vibrator-plate pivoted to a stud on the base of the attachment and cloth-clamp carried thereby, with a vibrator acted upon by a cam and having a flexible arm engaging with said vibrating plate, substantially as set forth.

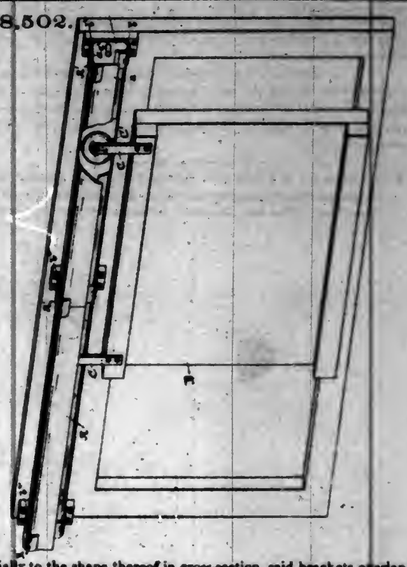
6. The combination of the pivoted vibrating plate, cloth-clamp



carried thereby, the pivoted plate F, having two arms F', a three-cornered cam *e*, and mechanism for operating said cam with a spring-arm F', extending under the said vibrating plate and loosely connected thereto, substantially as set forth.

7. The combination, in a button-hole attachment for sewing-machines, of the cloth-clamp, a lever S, means for connecting said lever to the clamp, a heart-cam L' and mechanism for operating the same, and a bar R, having two arms *r r*, engaging with the said cam, and two arms *r' r'*, engaging with the lever S, substantially as described.

8. The combination, in the cloth-clamp of a button-hole attachment for sewing-machines, of the lower cloth-clamp H, having a central opening for the button-hole and two ribs *y y* on each side thereof, with an upper cloth-clamp having a similar central opening and two ribs *y'* upon each side thereof, the said ribs *y'* of the upper cloth-clamp projecting between the ribs *y* of the lower cloth-clamp when the clamp is closed, substantially as and for the purpose set forth.



9. The combination, in a button-hole attachment for sewing-machines, of the base-plate and the plate V on the under side thereof, having two arms *v' v''*, one of said arms being permanently secured to said base-plate and the other arm being in the form of a spring secured to the base-plate by means of a set-screw, substantially as set forth.

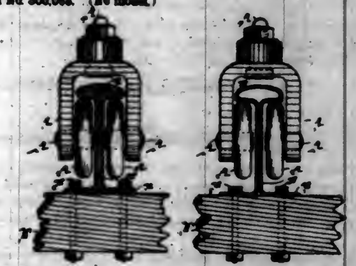
408,501. PICKING-MOTION FOR LOOMS. JOHN MOSS, Preston, County of Lancaster, England. Filed July 11, 1888. Serial No. 278,817. (No model.) Patented in England Oct. 20, 1887, No. 14,391.

Claim.—The combination of the frame A, having bracket M, the wheel D, the picking-tappet F, the vertically-swiveling bush K, the bracket L, in which the bush is carried, said bracket L having an adjustable connection with the bracket M, the picking-arm N, the stud J, carrying the picking-bowl H, and the bolt E, passed through and connecting said picking-arm, bush, and stud, substantially as shown and described.

408,502. SLIDING DOOR. JAMES H. MOSLEY, Florence, assignor of one-half to George Nightingale, Holyoke, Mass. Filed Dec. 3, 1888. Serial No. 292,572. (No model.)

Claim.—1. The trolley-track herein described, of substantially tubular form, having a longitudinal opening in one side thereof, and having a single trough-shaped tread located at one side of said opening, substantially as set forth.

2. The trolley-track herein described, having one side thereof arranged at substantially a right angle to its top and bottom, said track having a longitudinal opening therein, and having a single trough-shaped tread located at one side of said opening, in combination with a hanger extending through said opening and carrying at its upper end a roller the periphery of which in cross-section corresponds substantially with the transverse contour of said tread, arranged and operating substantially as set forth.



3. The combination, with the trolley-track herein described, the same consisting of a substantially tubular body having a longitudinal opening therein and having at one side of said opening a trough-shaped tread, of supporting brackets for said track conforming substantially to the shape thereof in cross-section, said brackets overlapping the meeting ends of the several sections of said track, arranged and operating substantially as set forth.

4. The trolley-track herein described, consisting of a substantially tubular body having the parallel sides *a b* and top *c*, said side *b* being curved inwardly and upwardly at the bottom to form the trough-shaped tread *b'*, said track having an unobstructed opening between the bottom of said side *a* and the edge of said tread *b'*, substantially as set forth.

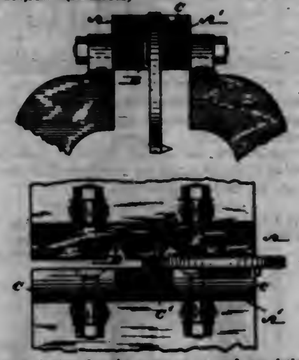
5. The combination, with the track A, having the parallel sides *a b* and top *c*, and having said side *b* curved inwardly and upwardly to form tread *b'*, of hanger C, projecting within said track between side *a* and said tread *b'*, said hanger being provided at its upper end with the laterally-projecting stud *c'* and having journaled upon said stud roller C', adapted to travel within said tread, arranged and operating substantially as and for the purpose set forth.

6. The combination, with track A and its supporting-bracket A', said track having the straight side *b*, top *c*, and curved tread *b'*, of hanger C, carrying at its upper end roller C', moving within said track, and a weight, as door D, secured to said hanger, near the lower end of the latter, in such manner that the center of gravity of said weight will lie in the vertical plane of the transverse center of said roller, substantially as and for the purpose set forth.

408,503. TROLLEY-TRACK. JAMES H. MOSLEY, Florence, assignor of one-half to George Nightingale, Holyoke, Mass. Filed Feb. 15, 1889. Serial No. 300,068. (No model.)

Claim.—1. The combination, with the track consisting of a rail having a base by which it is secured to an overhead support, a head, and a connecting-web uniting said head and base, of a carrier consisting of a yoke having between its ends means for attaching a weight thereto, and having connected thereto near each end by a swivel-joint a substantially U-shaped hanger, said hangers having at or near their upper ends inwardly-projecting studs, upon which are journaled wheels or rollers which bear upon the inner side of the head of said rail upon opposite sides of the connecting-web, substantially as and for the purpose described.

2. The trolley-track herein described, composed of a rail of sheet metal bent to form head *a*, base *a'*, and intermediate web *a²*, substantially as set forth.



3. The trolley-track herein described, having the substantially tubular head *a*, web *a²*, and base *a'*, combined with the cores *a³*, inserted within said tubular head and connecting the meeting ends of separate sections of said track, substantially as and for the purpose set forth.

4. The combination, with two track-sections, as A A², each consisting of a base by which they are secured to an overhead support, a head, and an intervening web, of a third track-section, as A³, corresponding in size and shape with said first-mentioned sections, said last-mentioned section being secured by its base to a pivoted switch-block, whereby one end thereof is adapted to be moved into alignment with the ends of either of said first-mentioned sections, means, substantially as described, for imparting movement to said switch-block, and a carrier suspended from wheels which bear upon the inner side of the head of said track-sections and upon opposite sides of the intervening web, substantially as set forth.

5. The combination, with track-sections A A², suspended from an overhead support, of block B', pivotally suspended from said support near one end by means of bolt *a⁴*, and having its opposite end resting upon plates *a⁵*, secured to said support, stop-pins *a⁷*, projecting from said support into slots *a⁶* in said block, track-section A³, suspended from said block, and means, as the cords *a⁸*, passing over pulleys *a¹⁰*, for moving the free end of said block in opposite directions, arranged and operating substantially as and for the purpose described.

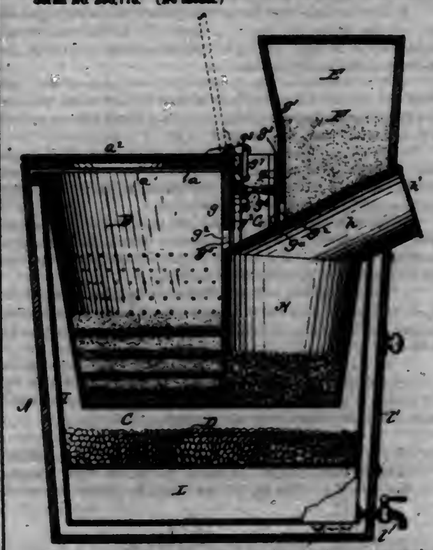
6. The combination, with track A, composed of the head *a*, base *a'*, and web *a²*, of the substantially U-shaped hanger *b'*, having near the outer end of each of its arms an inwardly-projecting stud *b²*, said studs being located in one and the same straight line, and the distance between their adjacent ends being slightly greater than the width of said web *a²* of the track, and wheels *b³*, journaled upon said studs and bearing upon the inner side of the head *a* of the track, substantially as and for the purpose set forth.

408,504. BLACKSMITH'S DEVICE FOR FINISHING HORSE-SHOES. ALBERT R. HUMPHEY, Philadelphia, Pa. Filed Jan. 25, 1889. Serial No. 297,517. (No model.)

Claim.—1. A device for the purpose named, consisting of two members, one having on its inner face depressions adapted to receive the clip of the shoes, and the other member having its upper edge sloping on the ends with an intermediate flat portion, substantially as described.

2. A device for the purpose named, consisting of two clamping members, one of which has its upper face sloping at the sides with an intermediate flat portion, substantially as described.

408,505. SCYTHE-SHEATH FASTENING. ADDISON D. MYERS, Geneva, Ohio. Filed Feb. 26, 1889. Serial No. 301,108. (No model.)



Claim.—1. The heel-ring or band A, formed with a projecting lip *a* at its upper side, in combination with the swinging socket-plate D, pivoted on the under side, and clamping-bolt *c*, the said clamping-bolt passing through said lip *a* and through the swinging end of the socket-plate to connect said parts, whereby both the head and nut of said bolt are provided with metallic bearings, substantially as shown and described.

2. The heel-ring A, formed with a projecting lip *a* at its upper side, in combination with the swinging socket-plate D, pivoted at its upper end to the snath and having at its swinging end a transverse segmental slot, and with the clamping-bolt *c*, the said bolt passing through the socket-plate and through the lip *a* and serving to connect said parts and clamp and hold them to the snath, substantially as shown and described.

3. The combination of the heel-ring A, formed with a projecting lip *a* at its upper side, a swinging socket-plate D, pivoted at its upper end to the under side of the snath and having at its lower end a transverse segmental slot *d⁵* and holding-teeth *d⁶*, a holding-plate E, set into the snath and having teeth *e'* to engage the teeth of the socket-plate, and a clamping-bolt *c*, passing through said lip *a* and through the segmental slot of the socket-plate to clamp and hold said parts to the snath, substantially as shown and described.

408,506. FECULENT RECEIVER. OMAR D. MCCLELLAN, Philadelphia, Pa., assignor, by mesne assignments, to the Sanitary and Fertilizer Company of the United States, same place. Filed Nov. 14, 1888. Serial No. 290,778. (No model.)

Claim.—1. A feculent-matter receiver having a receptacle for receiving and separating the liquid from the solid matter and for detaining the solid matter and decomposing its organic ingredients, a chamber for such separated liquid having a precipitating and decomposing compound for the organic matter in such liquid, and an outlet from said liquid-receiving chamber, substantially as set forth.

2. A feculent-matter receiver having a receptacle for receiving and separating the liquid from the solid matter and for detaining the solid matter and decomposing its organic ingredients, a chamber for such separated liquid having a precipitating and decomposing compound comprising alum as an ingredient thereof, and an outlet from said liquid-receiving chamber, substantially as set forth.

3. A feculent-matter receiver comprising a perforated receptacle B, a chamber C below said receptacle, a precipitating and decomposing compound in chamber C, and an outlet pipe having a coupling-connection for attachment to and detachment from a sewer or other drain-pipe, substantially as set forth.

4. The casing or receiver A, having a seat *e*, seat-lid *e'*, and chambers E and G, with openings and valves for said openings controlled by the movement of lid *e'*, a perforated receptacle B, a chamber C below receptacle B, a precipitating and decomposing compound in chamber C, and an outlet-pipe for the latter, substantially as set forth.

5. A feculent-matter receiver having a chamber for holding a charge of deodorizing and absorbing compound, a perforated receptacle, mechanism for ejecting said compound into said receptacle, a

chamber C below receptacle B and within the receiver, a precipitating and decomposing compound in chamber C, and an outlet-pipe for the latter, substantially as set forth.

6. The combination, with receiver A, having lid a^3 and seat a, of chamber E, valved mechanism between said chamber and lid, perforated receptacles B and H, receptacle I, having chambers C and L, and outlet for the latter, substantially as set forth.

7. In a feculent-matter receiver, a receptacle divided into two chambers by a perforated partition, the upper chamber containing a polyvalent material and the lower chamber a precipitating and decomposing compound, and provided with a drain or outlet, substantially as set forth.

408,507. CASE FOR ROTARY WATER-METERS. LEWIS H. HASH, Brooklyn, assignor to the National Meter Company, New York, N. Y. Filed Jan. 13, 1886. Serial No. 188,462. (No model.)

Claim.—1. A water-meter case formed of a series of alternate projections and recesses having the bearing-surfaces of its chamber-wall formed of hard metal, and a backing of cementing metal or material, substantially as described.

2. A water-meter case formed of a series of alternate projections and recesses, having the bearing-surfaces of its chamber-walls formed of hard-metal facing, a backing of cementing metal or material, and wall-locks, substantially as described.

3. In a water-meter, the combination of an inclosing-case, separated and isolated bearing-surfaces formed of hard metal, and a cementing metal or material uniting said hard-metal bearing-surfaces and case, substantially as described.

4. In a water-meter, the combination of an inclosing-case, separate and isolated bearing-surfaces formed of hard metal, and a cementing metal or material uniting and locking to said metal bearing-surfaces and case, substantially as described.

5. The water-meter case formed with inner wall dovetail projections, in combination with a bearing-surface of hard metal, and a cementing material cast over the wall projections and locked with said hard-metal facings, substantially as described.

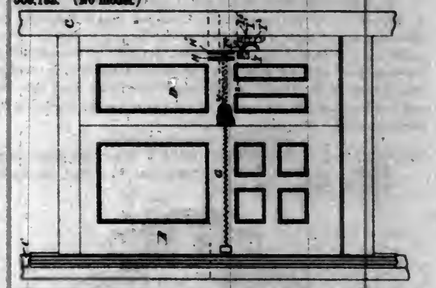
6. The combination, with the chamber-forming body cast, in one piece, of interior chamber-wall projections formed of hard-metal facings, and a backing of cementing substance, substantially as described.

7. In a water-meter, the combination of the piston having circumferential projections, with a chamber-forming case having wall projections of soft metal, and a facing of hard metal permanently fastened thereto, substantially as described.

408,508. APPARATUS FOR CONSTRUCTING WATER-METERS. LEWIS H. HASH, Brooklyn, assignor to the National Meter Company, New York, N. Y. Filed Jan. 13, 1886. Serial No. 188,463. (No model.)

Claim.—1. The means substantially herein described for attaching separate and isolated facings to the chamber-walls of a water-meter, which consists of a core having a surface conformation adapted to hold said isolated facings in proper relative position to said chamber-walls during the operation of attaching them thereto, combined with a suitable molding-surface for confining the sides of the facings, the spaces to be filled by cementing material, and for separating said surfaces from each other.

2. The means for attaching a plurality of separate and isolated facings to the chamber-walls of a water-meter, which consists of a core having a surface conformation adapted to hold said facings in the proper relative position and having grooves therein at the sides of said facings, in combination with removable strips adapted to be set in said grooves, which with said facings form spaces to receive a suitable backing, substantially as described.

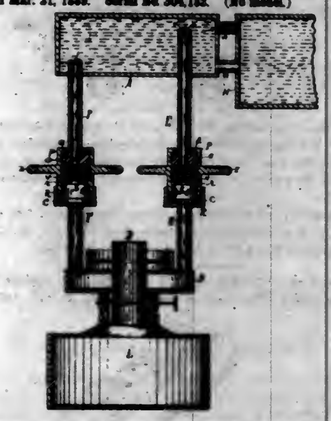


3. The means for attaching facings to the chamber-walls of a water-meter, which consists of a core having a surface conformation adapted to hold said facings in the proper relative position and having seats at the sides of said facings, in combination with removable strips and springs g', the strips being adapted to be set in said seats, which with said facings form spaces to receive a cement backing, substantially as described.

4. The means substantially herein described for centering metal facings and supporting them concentrically within the chamber of a water-meter case for securement to the radial projections of the wall thereof, which consists of a core corresponding to the said metal facings, whereby the latter are supported in proper relation to wall projections in the operation of fixing said facings to form a durable wearing-surface, combined with a suitable molding-surface for confining at their sides the spaces to be filled by cementing material and for separating said surfaces from each other.

5. A cylindrical centering-core having circumferential recess-surfaces d, the counterpart of the chamber-wall projections of a water-meter, and having vertical grooves h on each side of said recess-surfaces d, in combination with removable strips adapted to be set in said core-grooves, whereby to form with the said facings closures for spaces to receive a cement backing in the operation of fixing said facings, substantially as described.

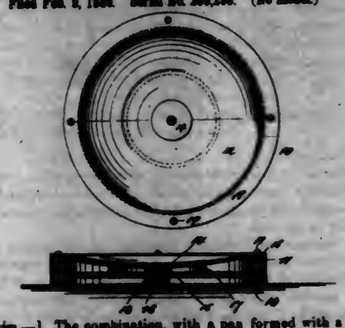
6. The combination of a core B, placed within the chamber of a water-meter, the hard-metal facings placed vertically within and upon said core opposite the chamber-wall projections, leaving an intermediate space, and the vertical strips g, arranged to inclose said space to receive a cementing filling, whereby to permanently secure said facings to said wall projections, as described.



408,509. DEVICE FOR OPERATING ELEVATOR-DOORS. WILLIAM E. NICHERSON, Cambridge, Mass. Filed May 1, 1889. Serial No. 309,182. (No model.)

Claim.—1. In an elevator, the carriage A, its door E, the well-room door D, the spring G, and cleats H H' H^2, substantially as and for the purpose set forth.

2. In an elevator, the carriage A, its door E, the well-room door D, the spring F, the spring G, and the cleats H, H', and H^2, substantially as and for the purpose set forth.



408,510. LAMP-BURNER. LUCIAN R. OAKES, Valparaiso, Ind. Filed Mar. 21, 1889. Serial No. 304,182. (No model.)

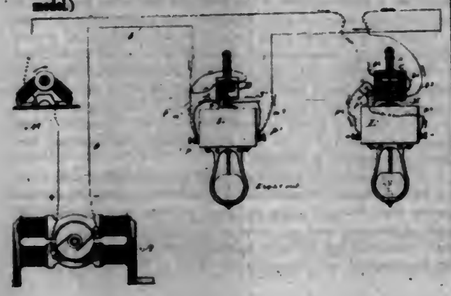
Claim.—1. In a lamp, and in combination with its wick-tube D, the water-jacket B, arranged to inclose said wick-tube immediately below its upper end, so the water will be in contact with said tube to keep it cool, and a reservoir for holding water connected with said jacket, substantially as and for the purpose set forth.

2. In a lamp, in combination with its wick-tube D, the water-jacket B, arranged to inclose said wick-tube near its upper end, the tubes E and F, for connecting said jacket with reservoir A, the reservoir A, and the couplings in said tubes, consisting of the nut P, cup R, packings a c, valve V and seat r, and flange-head O, having its periphery screw-threaded, all arranged to operate substantially as and for the purpose set forth.

408,511. ASTRONOMICAL MIRROR. DENNIS O'BRIEN, Oswayo, Pa. Filed Feb. 9, 1888. Serial No. 263,296. (No model.)

Claim.—1. The combination, with a pan formed with a mirror-seat, of a centrally-apertured mirror, a threaded sleeve passed through said aperture and held therein, and a retaining device engaging the sleeve and passing through the pan, substantially as described.

2. The combination, with a pan formed with a mirror-seat, of a centrally-apertured mirror, a sleeve passed through the mirror-aperture, disks engaging the sleeve and arranged upon opposite sides of the mirror, and an externally-threaded and headed sleeve which passes through the pan and engages an internal thread formed upon the mirror-sleeve, substantially as described.



3. The combination, with a pan formed with a mirror-seat, a central aperture, and an annular flange 17, of a mirror seated upon the pan and formed with a central aperture, a sleeve 13, which passes through the mirror-aperture, disks engaging the sleeve, and an externally-threaded and headed sleeve 16, which passes through the pan-aperture and engages an internal thread formed upon the sleeve 13, substantially as described.

408,512. METHOD OF MAKING HATS. HAWLEY PARTRIDGE, Danbury, Conn. Filed Nov. 16, 1888. Serial No. 291,001. (No model.)

Claim.—The herein-described improvement in the art of making hat-bodies, the same consisting in the forming, sizing, and shaving the bodies in the usual manner, then applying an oil-stiff, and then steaming the bodies in the usual manner, after which they are ready to be stretched, colored, and blocked.

408,513. SYSTEM OF ELECTRICAL DISTRIBUTION. FRANK L. PERRY, Chicago, Ill. Filed Aug. 27, 1888. Serial No. 283,904. (No model.)

Claim.—1. The combination, substantially as set forth, of a single main-line circuit having various devices for electrical translation connected up therewith, and a station-switch in connection with any such device or a group thereof to automatically control the electrical supply thereto by reversal of the line-current, the same comprising an electro-magnet closed to line and having terminals of like polarity, an isolated polarized armature in the field thereof, and a bridge-piece controlled by said armature to make and break the line-connection of the translating device or group.

2. The combination, substantially as set forth, of a single main-line circuit having various devices for electrical translation connected up therewith, and a station-switch in connection with any such device or a group thereof to automatically control the electrical supply thereto by reversal of the line-current, the same comprising an electro-magnet closed to line and having terminals of like polarity, an isolated polarized armature pivoted in the field thereof, and a bridge-piece controlled by said armature to make and break the line-connection of the translating device or group.

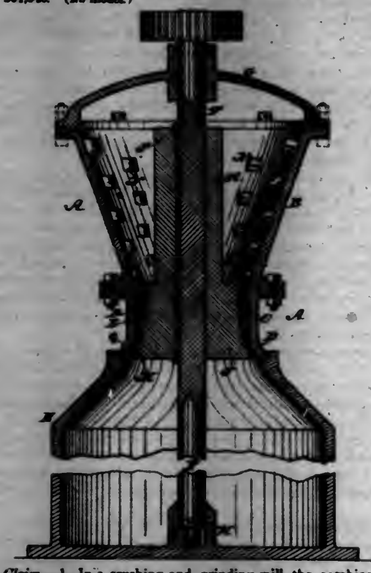
3. The combination, substantially as set forth, of a single main-line circuit having various devices for electrical translation connected up therewith, and a station-switch in connection with any such device or a group thereof to automatically determine the electrical supply thereto under reversal of the line-current, the same comprising an electro-magnet closed to line and having terminals of like polarity, a polarized armature in field thereof, and double bridge-pieces actuated alternately by shift of said armature to respectively make and break the dual terminal connections of the translating device or group with the main-line circuit.

4. The combination, substantially as set forth, of a single main-line circuit having various devices for electrical translation connected up therewith, and a station-switch in connection with any such device or a group thereof to automatically determine the electrical supply thereto under reversal of the line-current, the same comprising an electro-magnet closed to line and having its wire coils wound to form terminals of like polarity, an isolated polarized armature pivoted in the field of said magnet, and a bridge-piece shifting with said armature to make and break the line-connection of the translating device or group.

5. The combination, substantially as set forth, of a single main-line circuit having various devices for electrical translation connected up therewith, and a station-switch in connection with any such device or a group thereof to automatically control the electrical supply thereto by reversal of the line-current, the same comprising an electro-magnet included in the main circuit and having terminals of like polarity, a polarized armature in the field thereof, and a bridge-piece controlled by said armature to make and break the line-connection of the translating device or group.

6. In a system of electrical distribution, the combination, with a single main-line circuit, of a switch appliance connected up therewith to automatically determine the direction of electrical supply under reversal of the line-current, the same comprising an electro-magnet included in main circuit, and having terminals of like polarity, a polarized armature in the field thereof, and a bridge-piece controlled by said armature to change the direction of the main current, substantially as described.

408,514. CAN FOR DISTRIBUTING INSECT-DESTROYERS. ROBERT S. PETTUS, Pinckneyville, Ill. Filed Apr. 11, 1889. Serial No. 306,777. (No model.)



Claim.—1. The combination, with a can adapted to contain liquid insect-destroying compounds, of a heating-furnace secured to the bottom of the can and provided with a vertical partition-plate, the space between the rear wall and partition-plate having perforations, so that air may circulate in said space, substantially as shown, and for the purpose set forth.

2. The combination, with a can or vessel constructed substan-

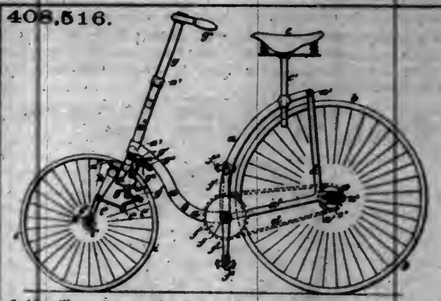
tially as shown, of a removable furnace G, having a rear wall and partition-plate located in front of said rear wall, the bottom and sides of said furnace having perforations and a sliding door, substantially as described, whereby the insect-destroying compounds can be applied in a heated condition.

408,515. MILL FOR CRUSHING BONES, MINERALS, &c. CALVIN C. PHILLIPS, Philadelphia, Pa. Filed Nov. 20, 1888. Serial No. 291,240. (No model.)

Claim.—1. In a crushing and grinding mill, the combination of the elliptical hopper provided with teeth, the cylindrical casing having the rows of spirally-arranged teeth, the flaring rim on said casing, provided with teeth, the runner having the scroll-shaped teeth for operating in conjunction with the teeth of the hopper, and the teeth for operating in conjunction with the teeth of the casing and rim thereof, substantially in the manner and for the purpose described.

2. In a grinding-mill, a hopper, in combination with a cylindrical casing, the latter having a flaring lower rim, the said hopper being provided with horizontal teeth and the casing with spirally-arranged teeth, a runner having a cylindrical portion with scroll-shaped teeth, and the conical portions L and M, said conical portions having teeth, all substantially as and for the purpose set forth.

3. In a crushing and grinding mill, the combination of the elliptical hopper having a series of horizontally-arranged teeth, the cylindrical casing having the rows of spirally-arranged teeth, and the flaring rim having teeth, with the runner having the scroll-shaped teeth for operating in conjunction with the teeth of the rim, and the inclined teeth for operating in conjunction with the teeth of the casing and rim thereof, substantially in the manner and for the purpose described.

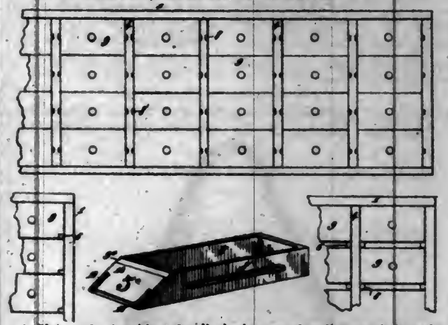


4. In a grinding-mill, the combination of an elliptical hopper provided with teeth on its inner surface, a casing with teeth, and a runner with teeth, substantially as described.

408,516. VELOCIPEDE. WALTER PHILLIPS and ROBERT W. SMITH, Coventry, County of Warwick, England. Filed Apr. 10, 1889. Serial No. 306,642. (No model.)

Claim.—1. In a velocipede of the sociable class, the framing constructed with longitudinal frames a a^4 a^5, the parts a extending rearwardly and upwardly, parts a^4 rearwardly, and the parts a^5 extending vertically and connecting the rear ends of parts a and a^4, cross-pieces a^2 and a^3, steering-pillars a^6, cross-frames a^7, connecting them, central vertical pillar a^8, and front cross-frame A, supported by the latter, for carrying the front wheels, the frames a, a^4, and a^5 carrying the back wheels, substantially as shown and described.

2. The side frames of a velocipede of the sociable class, consisting of backbones a, rearwardly-extending parts a^4, curved inwardly, vertical limbs a^5, connecting the rear ends of parts a and a^4, and brackets a', at the juncture of parts a^4 and a^5, in which the axles of the rear wheels are journaled, substantially as set forth.



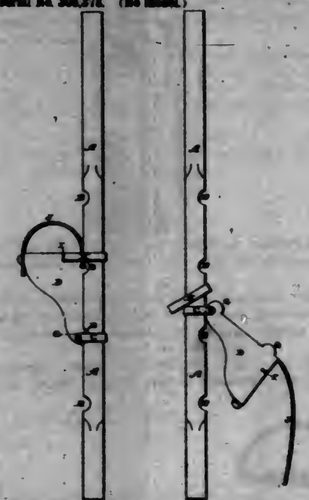
3. In combination with the frame and wheels of a velocipede of the sociable class, the steering or front portion of the same consisting

of side pillars a^6, to receive the steering spindle or spindles, a central pillar a^8, frame a^7, connecting the pillars, and front cross-frame A, pivotally connected with the central pillar and carrying the front wheels, substantially as set forth.

4. A four-wheeled two-track velocipede of the sociable class, constructed with longitudinal frames a a^4 a^5, connected together by cross-frames a^2 a^3 a^7 a^9 a^8 and supporting-saddles c, over or in line or nearly in line with the wheels b, chain-wheels f^2, receiving motion from pedal-cranks f', and communicating motion by chains d to chain-wheels c', fixed on the hubs of the driving-wheels b, front cross-frame A, carrying the steering-wheels i and mounted upon a horizontal axis a^9, carried by the central vertical pillar a^8, such steering-wheels receiving the necessary steering movement through handle-bar g^2, steering-spindle g, lever g', connecting-rod g^3, lever or levers g^4 g^5, central vertical spindle g^6, and connecting-rods i^2 i^3, all in manner substantially as herein shown and described.

408,517. CABINET SHOW-CASE. EMANUEL PFFERLING, Washington, D. C., assignor to Henry F. Sinsteg and Felix L. Rosenthal, both of New York, N. Y., and Emanuel Pfferling, Washington, D. C. Filed Nov. 1, 1888. Serial No. 289,773. (No model.)

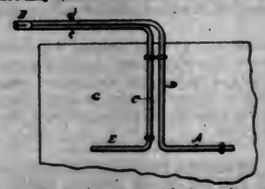
Claim.—1. A cabinet for displaying merchandise, consisting of a series of horizontally-sliding open-top compartments arranged in tiers, the compartments of each upper tier being successively shorter in length than the next underlying one, in combination with upright partitions dividing the compartments of each tier, said partitions being cut away at their front edges in successive steps equal, or substantially so, to the length of the respective compartments when extended upon cleats attached to the side surfaces of the partitions, substantially as described.



2. In a cabinet for displaying merchandise, the combination of the following elements: a show-case having transparent top, sides, and front, and rigid bottom and back frame, a series of transverse parallel partitions 4, firmly adjusted to the back and floor of the case, each of said partitions being cut away forwardly into a series of steps, cleats 6, extending horizontally along the sides of the partitions, and tiers of sliding open-top compartments 9, arranged to be moved forward and backward upon the cleats, each tier of said compartments being successively shorter in length than the next underlying tier of compartments and arranged as described, whereby when said compartments are introduced their full length forwardly between the partitions 4 their front panels 9^a will be in line with the respective risers 5 of said partitions, substantially as described.

3. In a cabinet for exhibiting goods, the combination, with a casing having transparent panels and provided with a series of partitions having their forward edges cut away to form steps separated by inclined or sloping risers, of a series of compartments arranged in tiers, each underlying tier being of greater length than the one above it, the front ends of said compartments being in line with the risers of

the partitions and provided with suitable clips for detachably affixing advertising or other cards, substantially as described.

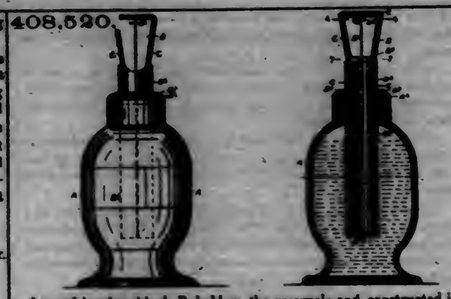


4. In a cabinet for exhibiting goods, the combination, with a case having transparent panels and provided with partitions cut away at their forward edges to form a series of steps separated by sloping risers, of a series of compartments sliding between said partitions and arranged in tiers, each underlying tier being of greater length than the one next above it, the forward end panels of said compartment being sloped to correspond with the inclines of the risers and provided with elastic strips fastened at one end beneath the end of the compartment and having their other ends lying upon the sloping front panel, substantially as described.

408,518. STILT. JAMES M. PORTER, Marietta, Ohio. Filed Apr. 8, 1889. Serial No. 306,378. (No model.)

Claim.—The combination of the leg provided with recesses, with the block provided with corresponding projections, a slide in which the lower end of the block is pivoted, and a holding device applied to the upper corner of the block, the block being adapted to turn upon its pivot at its lower end so as to disengage its projections from the recesses B, substantially as set forth.

408,519. VEHICLE-SPRING. WILLIAM E. POWERS, Hastings, Mich. Filed May 7, 1888. Serial No. 308,963. (No model.)



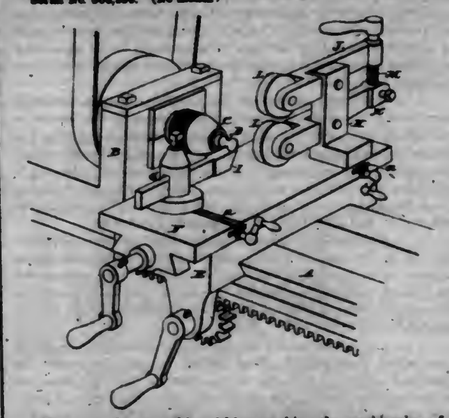
Claim.—1. The combination, with the spring composed of the member C and the arm c, of the re-enforcing spring composed of the member D, the arm d, connected at its outer end with arm c and the arm E, the latter adapted to normally stand at an angle to the support to which the spring is secured, substantially as and for the purpose described.

2. The combination, with the member C, having the spring-arm c, of the member D, having the arm d, which is connected with the arm c, and having the arm E, which stands at an angle to the support to which the spring is secured, substantially as set forth.

3. The herein-described spring, composed of the parallel members C and D, the arms c and d at the outer ends of the members C and D, respectively, extending in the same direction and connected together, and the arms A and E at the inner ends of said members, the arm E extending in an opposite direction to the arm A and projecting up at an angle, substantially as described, for the purpose specified.

408,520. MOISTENER-PAD. CHARLES A. PRATT, Boston, Mass. Filed Feb. 25, 1889. Serial No. 301,147. (No model.)

Claim.—1. A moistener-pad composed of a reservoir for liquid



and a pad head or block B, held on the reservoir and constructed in parts, one made of non-absorbent material, having a chamber B^2, with openings B^3 on the opposite sides of the head and in communication with the reservoir, and the other made of absorbent material, which extends across and passes through said side openings of said chamber of the head, and into and thence through said chamber to the reservoir, substantially as described, for the purposes specified.

2. A moistener-pad composed of a reservoir for liquid and a pad head or block B, held on the reservoir and constructed in parts, one made of non-absorbent material in longitudinal sections, at one end portion hinged together, and having a chamber B^2, with openings B^3 on the opposite sides of the head and in communication with the reservoir, and the other made of absorbent material, which extends across and passes through said side openings of said chamber of the head, and into and thence through said chamber to the reservoir, substantially as described, for the purposes specified.

3. A moistener-pad composed of a reservoir A for liquid, having a mouth A^1 and a chambered pad head or block B, held on and attachable and detachable from the mouth of the reservoir, and having a tubular continuation leading into the reservoir, and all made of non-absorbent material and in longitudinal parts or sections hinged together at the head, in combination with a covering C for said head, having an exposed face or faces, and a continuation leading into said head on its opposite sides and the tubular continuation, and in communication with the liquid in the reservoir and made of absorbent material, substantially as described, for the purpose specified.

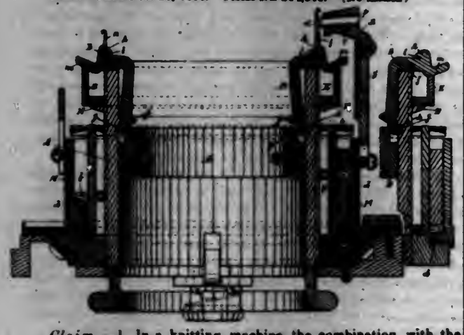
408,521. MACHINE FOR FINISHING AND ORNAMENTING METAL. HENRY M. QUACKENBOSS, Herkimer, N. Y. Filed Apr. 12, 1889. Serial No. 306,990. (No model.)

Claim.—1. In a metal-burnishing machine, the combination of a work holder or support and a smooth burnishing-roller conforming to the contour of the portion to be burnished, the roller being free to rotate upon its own axis, and the work or the roller being arranged to travel about the axis of the work.

2. The herein-described apparatus for ornamenting metal, consisting of a rotary spindle provided with a chuck, a tool-carriage, a cutting-tool carried by said carriage, and a pair of levers, also carried thereby and provided with rollers, the tool and the rollers being fashioned to conform in shape and size to the ornament to be produced.

3. In a machine for ornamenting metal, the combination of a chuck, a cutting-tool of the required pattern, and a pair of compressing and burnishing rollers arranged to act on opposite sides of the ornament simultaneously, the cutting-tool and the rollers being car-

ried by a common support and adapted to be moved one into and the other out of operative position simultaneously, in whichever order desired.



4. In combination with a rotatable chuck or holder, a pair of compressing and burnishing rollers adjustable relatively thereto and to each other, and means, substantially such as shown, for forcing said rollers toward each other.

5. In a machine for ornamenting metal, the combination of post H, levers J K, pivotally supported thereon, rollers L, carried by said levers, and a screw M, or its equivalent, for forcing the rollers toward each other.

6. In a machine for ornamenting metal, the combination of a pattern-cutting tool and a pair of burnishing-rollers having circumferential grooves of a pattern corresponding to that of the cutting-tool, said cutting-tool and rollers being arranged to be brought into action alternately.

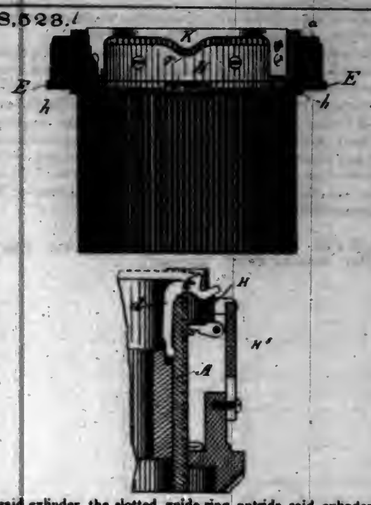
7. In a machine for ornamenting metal rods, stems, &c., the combination of a holder for the rod or stem, rollers for burnishing the same, and means, substantially such as described and shown, for causing a rolling contact between the rollers and the stem circumferentially.

408,522. CIRCULAR-KNITTING MACHINE. JAMES H. REED, Lynn, Mass. Filed Feb. 20, 1888. Serial No. 264,613. (No model.)

Claim.—1. In a knitting-machine, the combination, with the needle-cylinder provided on its inside with an annular groove *h*, and a series of needles carried by said cylinder, of a series of jacks B, placed between said needles and having rounded lower ends *g* to enter said groove, and projections *m*, the ring D, secured within said cylinder with its upper edge above the bottom of said groove, the revoluble flanged ring E outside of said cylinder, to be engaged by said projections, and having a cam-depression in its upper edge and a stop or projection N, the cam-ring M, and the upright P, substantially as set forth.

2. In a knitting-machine, the combination, with the needle-cylinder having the interior groove *h*, and a series of needles carried by said cylinder, of a series of jacks B, placed between said needles and having rounded lower ends fitting in said groove, outwardly-extending projections *m*, and inwardly-extending projections *j*, the ring D, adjustably secured within said cylinder, the revoluble ring E, having a cam-depression in its upper edge and a stop or projection N, the cam-ring M, and the upright P, substantially as set forth.

3. In a knitting-machine, the combination, with the needle-cylinder having the support H, of the revoluble ring E, sustained on said support and having a cam-depression in its upper edge, the needles, the jacks B, having the projections *m*, one or more stops secured to the exterior of the ring E, the upright P, and the cam-ring M, substantially as set forth.



4. In a knitting-machine, the combination, with the needle-cylinder having the support H, of the needles, the jacks B, arranged between said needles and having the outwardly-extending projections *m*, the ring E, resting on said support and having one or more stops, as N, the upright P, the cam-ring M, and the rider K, arranged above the said projections *m* and serving to force the said jacks outward positively, substantially as set forth.

408,523. CIRCULAR-KNITTING MACHINE. JAMES H. REED, Lynn, Mass. Filed June 26, 1888. Serial No. 278,136. (No model.)

Claim.—1. A knitting-machine provided with jacks seated inside the needle-cylinder and extending upwardly and outwardly over said cylinder, and having a guide-ring outside of said cylinder provided with slots which receive the outer ends of the jacks, whereby the jacks are guided and their free movement insured, substantially as shown and described.

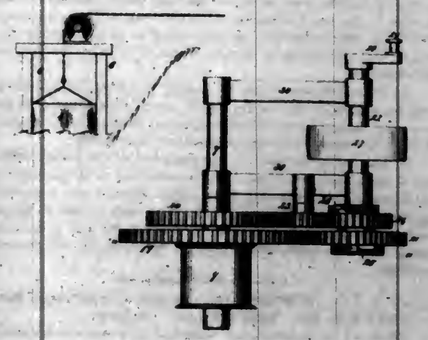
2. The combination, with the needle-cylinder, of the jacks seated inside the needle-cylinder and extending upwardly and outwardly

408,523.

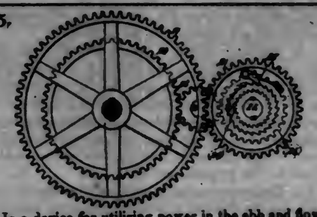
over said cylinder, the slotted guide-ring outside said cylinder, and the cam-ring and its rider, which actuate the jacks, substantially as set forth.

3. The combination, with the needle-cylinder, of the jacks, the slotted guide-ring placed outside the cylinder and resting on the clamping-ring, and the clamping-ring, substantially as shown and described

---



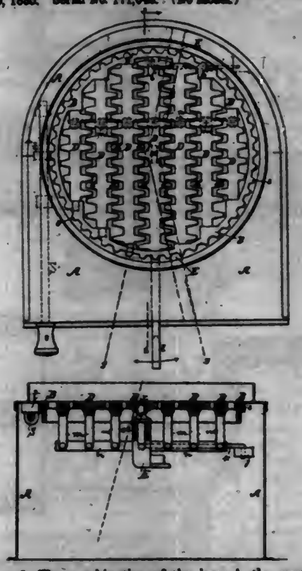
408,524. LAST FOR BOOTS OR SHOES. GEORGE A. REYNOLDS, Utica, N. Y. Filed Mar. 3, 1888. Serial No. 266,047. (No model.)



Claim.—1. In a shell last, the combination of the shell body having recess 4, the sole-piece of less width than the bottom of the shell body and arranged substantially as described with reference thereto, leaving the slotted opening into the interior of the last, except at the point where it is connected at the heel portion, and the supporter pivoted to the toe portion of the sole and having sprockets spanning the opening between the sole-piece and shell and engaging the shell body.

2. The combination, in a last, of the shell body having recesses adjacent to the lower inner edge thereof, the sole-piece having a slotted opening beginning at the breast of the heel and extending from the last to a point near the heel opposite the place of beginning, and the pivoted sprocket-supporter on the toe portion of the sole-piece, substantially as set forth.

408,525. DEVICE FOR UTILIZING TIDE-POWER. JOHN RIDGE, Coronado, Cal. Filed Nov. 26, 1888. Serial No. 292,069. (No model.)



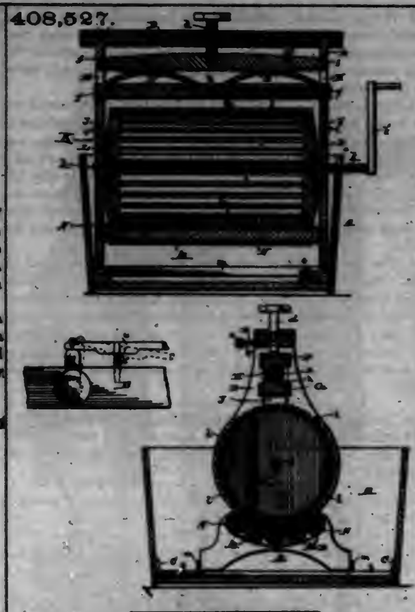
408,525.

Claim.—1. In a device for utilizing power in the ebb and flow of the tide, the pivoted lever, the float connected to the short end of the lever, and mechanism for transmitting the power connected to the long end of the lever, consisting, essentially, of a cable mounted on a drum and connected to the lever, and pulleys over and under which the cable passes, substantially as set forth.

2. In a device for utilizing tide-power, the combination of a pivoted lever, a weighted float connected to one end of said lever, a power-transmitting device, and block and tackle connecting said power-transmitting device to the other end of the lever, substantially as set forth.

408,526. GRATE. THOMAS T. ROCKETT, Philadelphia, Pa. Filed July 9, 1888. Serial No. 171,040. (No model.)

Claim.—1. The combination of the base A, the grate-frame B, and a pivot for said frame, with bars D, pivoted to the frame B and having arms *m*, a rod *n*, connecting said arms together, and a rod connecting the bars to the base, substantially as and for the purpose described.



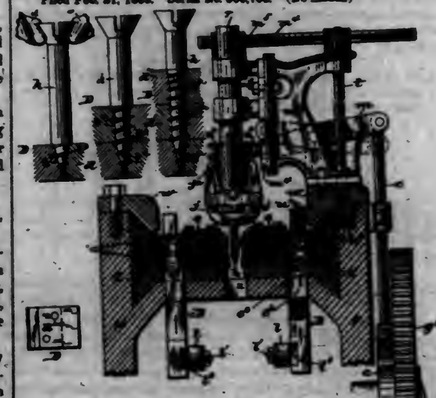
2. The combination of the base A, grate-frame B, and bar E, with the bars D, hung to the frame B and pivoted at *x* to the bar E, a leg *i*, a rod *k*, connected to the base A, arms *m*, projecting from each bar D, and a bar *n*, connecting said arms, all substantially as shown and described.

408,527. WASHING-MACHINE. PETER W. ROUSSEAU, Sidney, Ohio. Filed May 11, 1888. Serial No. 273,560. (No model.)

Claim.—1. The combination of the slotted uprights, the journal-blocks moving in the slots thereof, and the drum journaled therein with the bar G, resting on said blocks, the springs I I on said bar, the bar F, resting on springs I I, the serrated pin *d*, catch-block E, lever *c*, and spring-rod *d'*, all substantially as and for the purpose specified.

2. A washing-machine consisting of the uprights B B, vertically slotted at H H, the blocks J, moving in said slots, the drum K, constructed substantially as described, mounted on a shaft journaled in blocks J, the series of rollers M, concentric to and below the drum, the apron N thereon, the horizontal bar G, springs I I, bar F, and serrated pin *d*, catch-block E, lever *c*, and spring-rod *d'*, all substantially as and for the purpose set forth.

408,527.

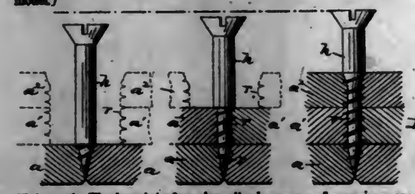


408,528. DIE FOR ROLLING DRIVE-SCREWS. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Feb. 13, 1888. Serial No. 263,869. (No model.)

Claim.—A die for rolling screws, provided with diagonal ribs and grooves for impressing a spiral groove into the metal of a screw-blank and raising the metal at the edges of the groove above the normal surface of the blank to form the threads of a screw, and with plane surfaces between the ribs corresponding to the normal surface of the blank to preserve such surface from distortion by the action of the ribs in forming the groove and thread.

408,529. SCREW-SWAGING MACHINE. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Feb. 21, 1888. Serial No. 300,708. (No model.)

Claim.—1. A swaging-die for forming threads upon screw-blanks, made up of parallel sections which are successively brought into action to compress the metal to form the thread and elongate the blank.



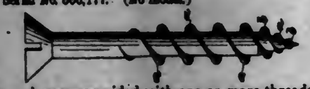
2. The combination, substantially as hereinbefore described, of oppositely-reciprocating cross-heads, sectional screw-threading dies, and simultaneously-moving backing-plates for forcing successively the several sections of the dies into engagement with the screw-blank while the thread is being formed.

3. The combination of revolving gripping-jaws which receive the blank from a feeding mechanism, and hold it while thus revolving in the proper position to be acted upon by the dies, reciprocating sectional threading-dies arranged to simultaneously engage opposite sides of the blank and alternately revolve it repeatedly in forming the thread, and mechanism for forcing the traveling dies into engagement with the revolving blank, and for withdrawing them therefrom after they have completed their work, substantially as hereinbefore described.

4. The combination of revolving gripping-jaws arranged to receive, retain, and release the blank, two oppositely-arranged reciprocating cross-heads, each having mounted therein a thread-forming die divided horizontally into two or more parallel sections, and a cam bar or plate mounted at the back of each die and reciprocating in unison therewith, and means for vertically actuating said cam-plate to successively operate the die-sections, substantially as hereinbefore set forth.

408,530. MODE OF FORMING SCREW-THREADS UPON SCREWS.

CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Feb. 21, 1889. Serial No. 300,709. (No model.)



Claim.—1. The hereinbefore-described process of swaging screw-threads upon screw-blanks, which consists, first, in forming the thread on the point portion by forcing reciprocating swaging-dies into engagement therewith; next, continuing the forming of the thread upon the shank portion by one or more sections of swaging-dies moving to and fro, and, finally, finishing the thread by the joint action of all the said dies.

2. The hereinbefore-described process of swaging screw-threads upon screw-blanks, which consists in forming the thread in connected sections, first producing the thread upon the point portion; next, continuing the thread therefrom upon the shank in one or more successive sections by swaging, and, finally, subjecting the entire threaded portion to the simultaneous action of the swaging mechanism to reduce and finish the threads.

3. The hereinbefore-described process of swaging screw-threads upon screw-blanks, the same consisting in, first, swaging a thread upon the point portion of the mechanically-revolving blank; next, continuing the said thread therefrom upon the cylindrical portion of the shank of the revolving blank by swaging the thread thereon in one or more connected sections, and, finally, subjecting the entire threaded portion to a simultaneous action of the swaging mechanism to finish the threads.

408,531. WOOD-SCREW.

CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Apr. 6, 1889. Serial No. 306,177. (No model.)

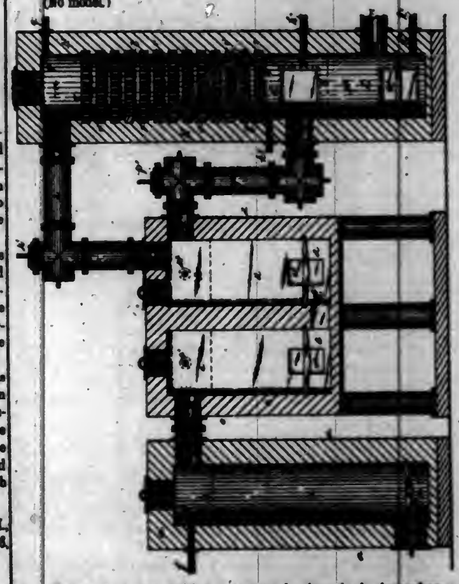
Claim.—A screw provided with one or more threads about its body or cylindrical portion and with one or more auxiliary threads upon its pointed or conical portion between the threads extending from the body.

408,532. PROCESS OF MANUFACTURING GAS.

JAMES M. ROSS, Allegheny, Pa. Filed May 9, 1888. Serial No. 273,279. (No specimens.)

Claim.—1. The improvement in the art of forming gas, consisting in blasting a mass of carbon to incandescence, passing the products therefrom through a mass of refractory material containing hydrocarbon and the resultant products over a bed of heated carbon and burning them to heat a body of fixing material, and then passing a current of steam through said first body of incandescent carbon, a current of steam over said incandescent carbon to superheat it, and the mixed superheated steam and gases through the hydrocarbon-bearing material, and then mixing with the resultant gases a liquid hydrocarbon, and passing the gases and vapors first through the heated fixing material, and then through the second body of incandescent carbon, substantially as and for the purpose set forth.

2. The improvement in the art of making gas, consisting in blasting a mass of carbon in one chamber to incandescence and passing the resultant products through a mass of refractory material containing hydrocarbon, and subsequently passing a current of steam through the incandescent carbon and a current of steam over said incandescent carbon to superheat the same, and the mixed superheated steam and gases through the heated hydrocarbon-bearing material, substantially as and for the purposes set forth.



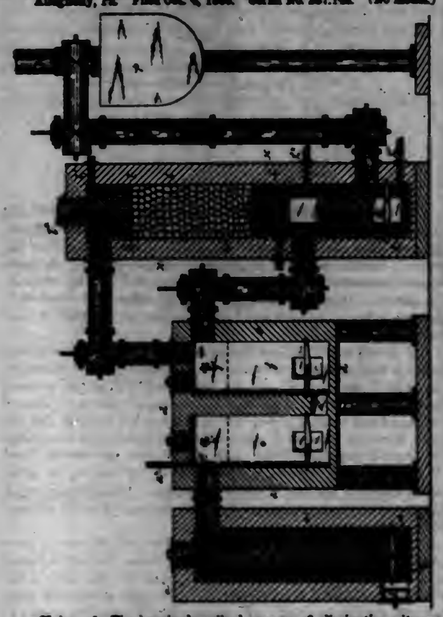
3. The improvement in the art of forming gas, consisting in passing water-gas through a mass of refractory material containing hydrocarbon and the resultant gases through a mass of heated fixing material, and then through a mass of incandescent carbon, substantially as and for the purpose set forth.

4. The improvement in the art of forming gas, consisting in passing water-gas through a heated mass of refractory material containing hydrocarbon, then spraying into the resultant gases steam and liquid hydrocarbon, and then passing the gases and vapors through a heated mass of fixing material and the resultant gases through a mass of incandescent carbon, substantially as and for the purposes set forth.

5. The improvement in the art of forming gas, consisting in passing water-gas through a heated mass of refractory material containing hydrocarbon, then spraying into the resultant gases steam and liquid hydrocarbon, and then passing the gases and vapors through a heated mass of fixing material, substantially as and for the purposes set forth.

408,533. APPARATUS FOR THE MANUFACTURE OF GAS.

JAMES M. ROSS, Allegheny, Pa. Filed May 9, 1888. Serial No. 273,280. (No model.)



Claim.—1. A gas-making apparatus having the hydrocarbon or treating chamber *c*, containing refractory material, the casing N, having a combustion-chamber therein, a fixing-chamber containing checker-work or like heat-retaining material above the combustion-chamber, and a mixing-chamber at the top of the casing above the fixing-chamber, and separate flues leading from the discharge end of the treating-chamber *c* to said combustion-chamber and said mixing-chamber, respectively, substantially as and for the purposes set forth.

2. A gas-making apparatus having the casing N, provided at the base thereof with the carbon-chamber A, for containing incandescent carbon, the fixing-chamber *l* above the same, a purge-outlet above the fixing-chamber, an inlet *p*, for products of combustion, between the carbon-chamber and fixing-chamber, and inlet *r*, for gases, above the fixing-chamber, and a gas-outlet leading to the receiver below the top of the carbon-chamber, substantially as and for the purposes set forth.

3. A gas-making apparatus having a cupola generator, a casing having one or more treating-chambers containing refractory material and provided with an oil-inlet with which said generator communicates, and a casing having a combustion-chamber therein, a fixing-chamber containing checker-work or like heat-retaining material above the combustion-chamber, a mixing-chamber at the top of the casing above the fixing-chamber, and a purge-valve above said mixing-chamber, and separate flues leading from the discharge end of the treating-chamber to said combustion-chamber and said mixing-chamber, respectively, substantially as and for the purposes set forth.

408,534. PROCESS OF MANUFACTURING GAS.

JAMES M. ROSS, Allegheny, Pa. Filed Oct. 4, 1888. Serial No. 287,142. (No model.)

Claim.—1. The herein-described process of eliminating nitrogen from and enriching producer-gas, consisting in introducing steam into the heated producer-gas in the presence of an excess of hydrocarbons, and thereby causing the oxygen of the steam to unite with the carbons present and the nascent hydrogen to unite with the heated nitrogen, forming ammonia-gas or like compound, and enriching the producer-gas through the hydrocarbons, and subsequently absorbing the ammonia-gas from the gases formed, substantially as set forth.

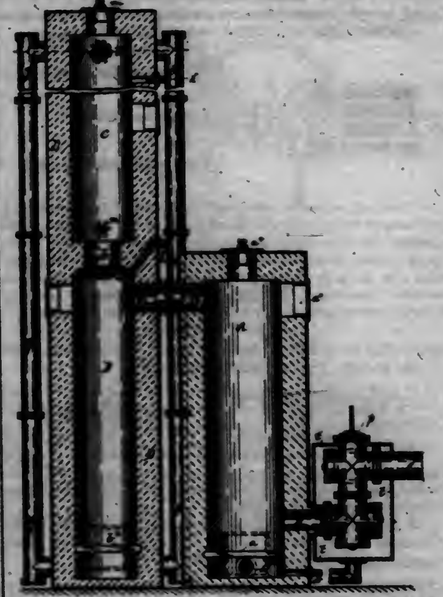
2. The herein-described process of eliminating nitrogen from and enriching generator or producer gas, consisting in introducing steam into the heated producer-gas in the presence of an excess of hydrocarbon and passing the gases or vapors through a heated mass of refractory material, which gradually reduces in temperature from the entrance end toward the delivery end thereof, and wherein the nascent hydrogen unites with the heated nitrogen, forming ammonia-gas or like compounds, and subsequently absorbing the ammonia-gas from the gases formed, substantially as and for the purposes set forth.

408,535. MANUFACTURE OF GAS.

JAMES M. ROSS, Allegheny, Pa. Filed Oct. 16, 1888. Serial No. 288,208. (No model.)

Claim.—1. The herein-described process of forming gas, consisting in passing air through a mass of heated carbon and introducing into the gases so formed heated waste products of combustion, (such as formed in burning carbonaceous materials to heat a body of water,) then passing such gases and waste products through or in contact with heated hydrocarbons and admitting thereto a limited quantity of air, and subsequently passing the resultant gases through a body of heated fixing material, substantially as and for the purposes set forth.

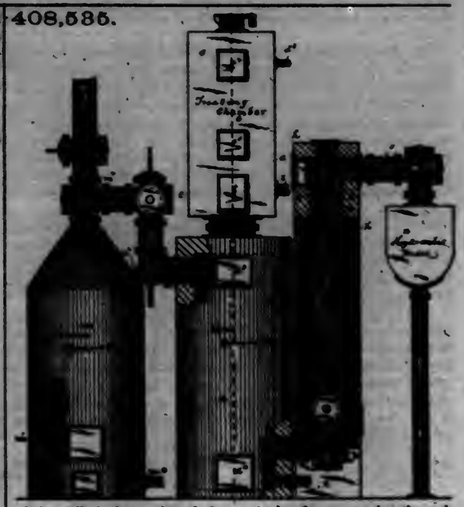
2. The herein-described process of forming gases, consisting in passing air through a body of incandescent carbon and the resultant gas through or in the presence of heated hydrocarbons and during such passage admitting to such gases a limited quantity of air, whereby the oxygen unites with the hydrogen and the carbon is set free to enrich the gas, substantially as and for the purposes set forth.



3. The herein-described process of forming gas, consisting in admitting a limited quantity of air to a body of gases passing through or in the presence of heated hydrocarbons, whereby the oxygen of the air unites with the hydrogen of the hydrocarbons and carbon is set free to enrich the gases, substantially as and for the purposes set forth.

4. The herein-described process of forming gas, consisting in admitting a limited quantity of air to a body of gases passing through or in the presence of heated hydrocarbons, whereby the oxygen unites with the hydrogen and the carbon is set free to enrich the gases, and subsequently passing such gases through heated fixing material to render them stable, substantially as and for the purposes set forth.

5. The herein-described process of forming gas, consisting in passing air through a mass of heated carbon and introducing into the gases so formed heated waste products of combustion, (such as formed in burning carbonaceous materials to heat a body of water,) commingling the gases, and subsequently recarburizing said waste products of combustion, substantially as and for the purposes set forth.

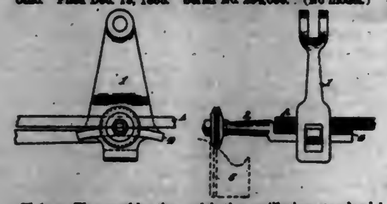


408,536. APPARATUS FOR THE MANUFACTURE OF GAS.

JAMES M. ROSS, Allegheny, Pa. Filed Dec. 3, 1888. Serial No. 292,960. (No model.)

Claim.—1. An apparatus for making gas, having two cupola generators, casings, each having a chamber at the base thereof provided with an oil-entrance for treating the gases, a chamber in the upper part thereof containing refractory material for fixing the gases, and pipes connecting the lower end of the lower or treating chamber of one casing with the upper end of the upper or fixing chamber of the

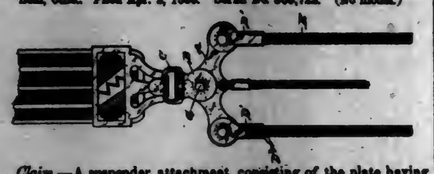
408,585.



other casing, respectively, substantially as and for the purposes set forth.

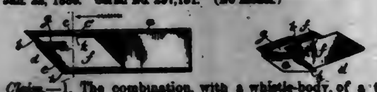
2. An apparatus for the manufacture of gas, having the cupola generator, the casing having the chamber in the lower part thereof provided with an oil-entrance for treating the gases, with the upper end of which the cupola generator communicates, and the chamber above the said lower chamber containing refractory material for fixing the gases and communicating with said lower chamber through a flue in the base thereof, substantially as and for the purposes described.

3. An apparatus for the manufacture of gas, having two casings, each having a chamber in the lower part thereof provided with an oil-entrance, and a chamber in the upper part thereof containing refractory material for fixing the gases, said chambers communicating through a flue, and pipes connecting the base of the lower or treating chamber in one casing with the upper end of the upper or fixing chamber in the other casing, respectively, substantially as and for the purposes set forth.



4. An apparatus for the manufacture of gas, having two casings, each having a chamber in the lower part thereof provided with an oil-entrance for treating the gases, and a chamber in the upper part thereof containing refractory material for fixing the gases, and a valve-controlled flue connecting the upper or fixing chambers in each casing, and two cupola generators communicating with the upper ends of the lower or treating chambers, substantially as and for the purposes set forth.

408,537. SHOE-BEADING MACHINE. SIMON ROSE, Jr., Linwood Ohio. Filed Dec. 19, 1888. Serial No. 294,089. (No model.)

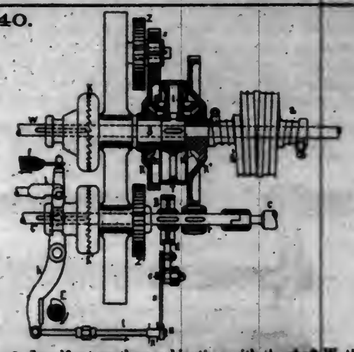


Claim.—The combination, with the oscillating standard 1, of the non-rotating arm 2, rigidly secured to, oscillating with, and projecting from the standard and provided with the beader 6, substantially as described.

408,538. SUSPENDER ATTACHMENT. JOSEPH P. RUSSELL, Mansfield, Ohio. Filed Apr. 2, 1889. Serial No. 305,722. (No model.)

Claim.—A suspender attachment consisting of the plate having the enlarged central and end openings, the disks arranged in said openings, the rise-clamp pivoted to the central disk, the braid-clamps pivoted to the end disks and having depending casings provided with barbs for engaging the braid and securing the same, and the disks connected to the pivots of the braid-clamps for securing them in position, substantially as and for the purpose described.

408,539. WHISTLE. EDWARD S. RUSSELL, Worcester, Mass. Filed Jan. 22, 1889. Serial No. 297,131. (No model.)



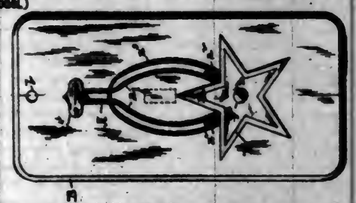
Claim.—1. The combination, with a whistle-body, of a tongue formed from a single piece of sheet metal, and having the elastic wings *f f* to press against the walls of the body and hold said tongue in place, substantially as described.

2. The combination, with the tubular body of a whistle, of the sheet-metal tongue *d*, having oblique body *c*, flanges *g h*, and elastic wings *f f*, substantially as shown and described.

408,540. SPINNING-MULE. OSCAR SCHIMMEL, Chemnitz, Saxony, Germany. Filed Jan. 12, 1889. Serial No. 296,196. (No model.) Patented in France Sept. 6, 1888, No. 192,515, and in Belgium Sept. 6, 1888, No. 82,158.

Brief.—The invention relates to the carriage driving-gear, and consists in the improved means for imparting to the drawing-out pulley or scroll two different speeds during the outward run of the carriage.

408,540.



Claim.—1. In self-actors, the combination, with the shaft W, the run-out pulley S, fixed thereon and having two portions of different diameters, the roller C, the shaft C', and the spur-wheels Z Z', of the pinion *z*, fixed to the wheel Z, the disengaging-coupling K', the parts whereof are connected, respectively, to the shaft C and the wheel Z', the pinion *r*, keyed on the shaft C', and a differential wheel-work gearing with the pinions *z* and *r* and connected to the shaft W, substantially as specified.

2. In self-actors, the combination, with the shaft W, the run-out pulley S, fixed thereon and having two portions of different diameters, the roller C, the shaft C', and the spur-wheels Z Z', of the pinion *z*, fixed to the wheel Z, the disengaging-coupling K', the parts whereof are connected, respectively, to the shaft C and the wheel Z', the pinion *r*, keyed on the shaft C', and a differential wheel-work comprising the sleeve *g*, connected to the shaft W, the loose spur-wheels R and R', gearing with the respective pinions *z* and *r*, and having the bevel-wheel teeth *k k'*, the disk T, keyed to the sleeve *g*, and the bevel-wheel U, pivoted to the disk T and gearing with the teeth *k* and *k'*, substantially as set forth.

3. In self-actors, the combination of the shaft W, two or more pulleys S S' fixed thereon, each having two portions of different diameters, the roller C, the shaft C', the spur-wheels Z Z', the pinion *z*, the disengaging-coupling K', the pinion *r*, a differential wheel-work gearing with the pinions *z* and *r* and connected to the shaft W, ropes *s s'*, connecting the said pulleys with the carriage, and guide-rollers *r'*, substantially as described.

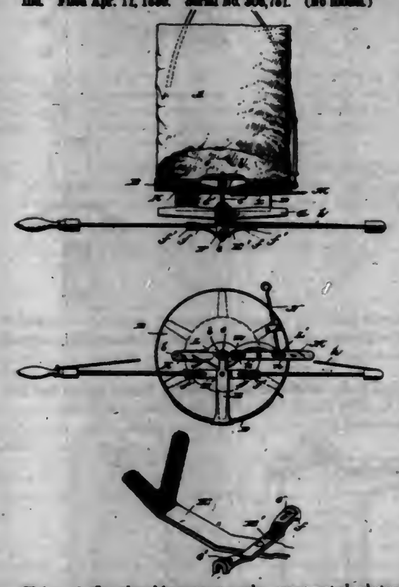
408,541. HOLDER FOR LETTERS, PAPERS, CARDS, &c. DANIEL A. SMITH, Boston, Mass. Filed Apr. 26, 1889. Serial No. 308,761. (No model.)

Claim.—1. The holder for letters, papers, cards, &c., herein described, comprising a substantially horseshoe-shaped bow, of wire, terminating at or near one end in spring-coils and at its opposite or receiving end in an upwardly and outwardly flaring lip, to facilitate the insertion of articles within the holder, in combination with means for securing said holder to a suitable support, substantially as set forth.

2. In a holder for letters, papers, cards, &c., a base or support, a bow, formed from wire, secured at one end to said base and having its opposite end held against said base by spring-pressure, and a center piece projecting from said base between the two sides of said bow, combined and operating substantially as and for the purpose set forth.

3. In a holder for letters, papers, cards, &c., a base or support, a bow, of wire, bent at one end to form an outwardly-flaring lip and being bent near its opposite end into spring-coils, whose axis is parallel with the face of said base, and an independent plate for securing the end of said bow opposite to said lip to said base, said plate having a screw passing therethrough into the base, combined and operating substantially as described.

4. The holder for letters, papers, cards, &c., herein described, consisting of center piece *a*, loops *a'*, coils a^3, and bow a^2, formed from a continuous piece of wire, substantially as described.



5. In a holder of the kind described, base B, bow a^2, having lip a^4, and having coils a^3 and loops *a'* made integrally therewith, and

plate *b'*, covering said loops and having a portion thereof projecting within the latter, substantially as described.

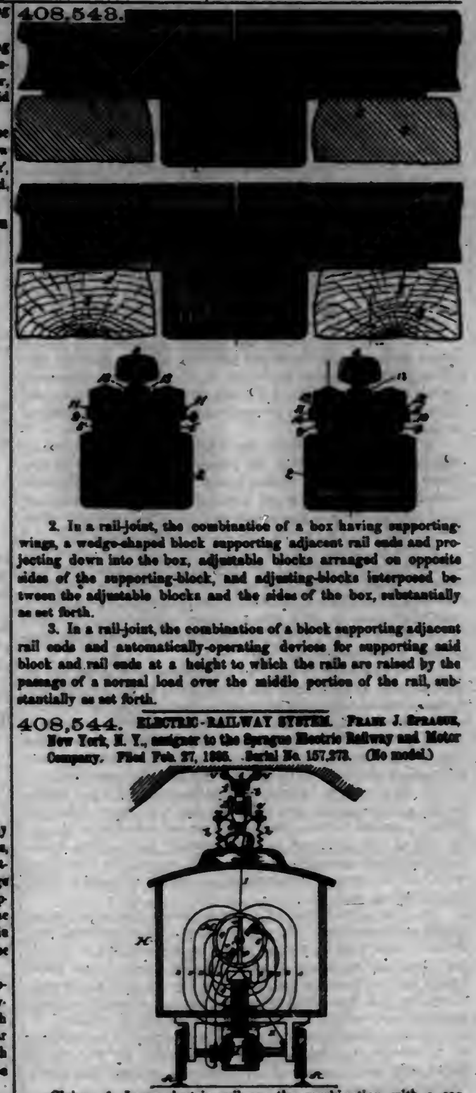
6. In a holder of the kind described, base B, holder A, having loops *a'* at one end thereof, plate *b'*, having within its inner side recesses to receive said loops, and spurs b^3, projecting within the latter, and a centrally-located screw passing through said plate into said base, combined and operating substantially as described.

7. In a holder of the kind described, the combination, with base B, of holder A, composed of center piece *a*, loops *a'*, coils a^3, and bow a^2, formed from a single piece of wire, plate *b'*, covering said loops *a'*, and plate b^4, covering the ends of said wire, substantially as described.

408,542. BROADCAST SEED-SOWER. SAMUEL BRICKER, Goshen Ind. Filed Apr. 11, 1889. Serial No. 306,781. (No model.)

Claim.—1. In a hand broadcast-seeder, constructed substantially as shown and provided with a distributing-wheel and operating means, of a pin C, which forms an upper bearing for the hub of the distributing-wheel, said pin having formed thereon above the seed-discharge opening an enlargement, one side of which is inclined, while the opposite side is rounded, and a transverse metal bearing secured to the upper face of the hopper-bottom and receiving the end of the pin above the enlargement, substantially as shown, and for the purpose set forth.

2. The combination, in a broadcast seed-sower adapted to be operated by hand, substantially as shown, of the castings K and L, pivoted to the under side of the disk, said castings being provided with projecting pins *k'* and *l'*, one of said castings having a circular flange *k*, and a pivoted operating-lever M, having slots *m* and *n*, with which the pins engage, substantially as shown, and for the purpose set forth.



3. In a hand broadcast-seeder, a bow-guide pivoted to the supporting-arm E, said bow-guide having V-shaped openings *e'*, with projecting lugs *f f*, and through which the bow passes, said lugs holding thereon the spiral springs *f'*, substantially as shown, and for the purpose set forth.

4. In combination with a hand seed-sower of the class described, a flexible container A, disk B, having a central concave and opening *b*, seed-regulating slides K and L, pivoted to the under side of the disk B, a hub carrying a seed-distributing wheel, said hub having an upwardly-projecting pin C, with an enlarged portion C', an arm E, carrying a pivoted bow-guide and forming a support for the lower portion of the hub, and a shield D, attached to the disk B, the parts being organized substantially as shown, and for the purpose set forth.

408,543. RAIL-JOINT. RICHARD H. SOLES, Pittsburg, Pa. Filed May 15, 1889. Serial No. 310,899. (No model.)

Claim.—1. In a rail-joint, the combination of a supporting-block arranged beneath adjacent rail ends, plates having inclined engaging-ribs, fish-plates arranged along the webs of the rails, and a U-shaped bolt, substantially as set forth.

408,543.

2. In a rail-joint, the combination of a box having supporting-wings, a wedge-shaped block supporting adjacent rail ends and projecting down into the box, adjustable blocks arranged on opposite sides of the supporting-block, and adjusting-blocks interposed between the adjustable blocks and the sides of the box, substantially as set forth.

3. In a rail-joint, the combination of a block supporting adjacent rail ends and automatically-operating devices for supporting said block and rail ends at a height to which the rails are raised by the passage of a normal load over the middle portion of the rail, substantially as set forth.

408,544. ELECTRIC-RAILWAY SYSTEM. FRANK J. SPRAGUE, New York, N. Y., assignor to the Sprague Electric Railway and Motor Company. Filed Feb. 27, 1889. Serial No. 301,273. (No model.)

Claim.—1. In an electric railway, the combination, with a car provided with an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, and a rocking support for said contact device, whose normal position is vertical, substantially as set forth.

2. In an electric railway, the combination, with a car provided with an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, and a laterally-rocking support for said contact device, substantially as set forth.

3. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, and a hinged support for said contact device, whose normal position is vertical, substantially as set forth.

4. In an electric railway, the combination, with a car and a motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, and a normally vertical support for said contact device hinged on an axis longitudinal of the car, substantially as set forth.

5. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, and a rocking support for said contact device, whose normal position is vertical and which is provided with a spring tending to maintain said support in a vertical position, substantially as set forth.

6. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, and a hinged support for said contact device, whose normal position is vertical and which is provided with a spring tending to maintain said support in a vertical position, substantially as set forth.

7. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car making an underneath contact with said conductor and in lateral engagement therewith, and a rocking support for said contact device, substantially as set forth.

8. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car making an underneath contact with said conductor and in lateral engagement therewith, and a laterally-rocking support for said contact device, substantially as set forth.

9. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car making an underneath contact with said conductor and in lateral engagement therewith, and a rocking support for said contact device, and springs tending to maintain said support in a vertical position, substantially as set forth.

10. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, a support for said contact device adapted to yield downwardly on either side of a center in the direction of length of the car, and a spring tending to raise said support toward a vertical position, substantially as set forth.

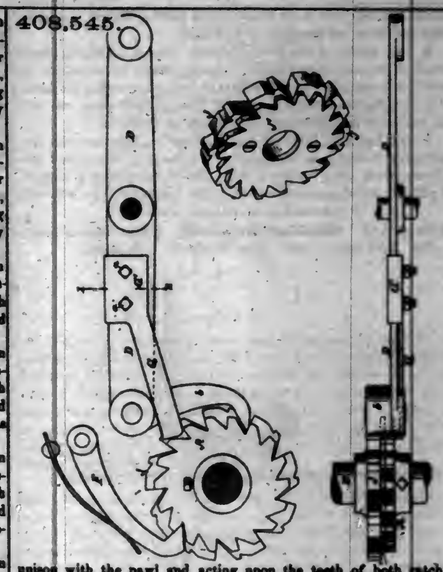
11. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, a support for said contact device adapted to yield downwardly in the direction of length of the car and also in the direction of width thereof, and a spring or springs tending to raise said support toward a vertical position, substantially as set forth.

12. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, and a support for said contact device made flexible at two points, so as to yield downwardly laterally of the car at one point and longitudinally of the car at another point, substantially as set forth.

13. In an electric railway, the combination, with a car and an electric motor mounted upon and propelling it, of an overhead conductor, a contact device carried by the car and traveling on the under side of said conductor, a support for said contact device, whose normal position is vertical and which is adapted to yield downwardly in any direction from such vertical position, and a spring or springs opposing such yielding of the support, substantially as set forth.

14. In an electric railway, an overhead conductor for receiving an underneath traveling contact, consisting of a flat web having downwardly-extending side ribs or flanges for guiding the contact, substantially as set forth.

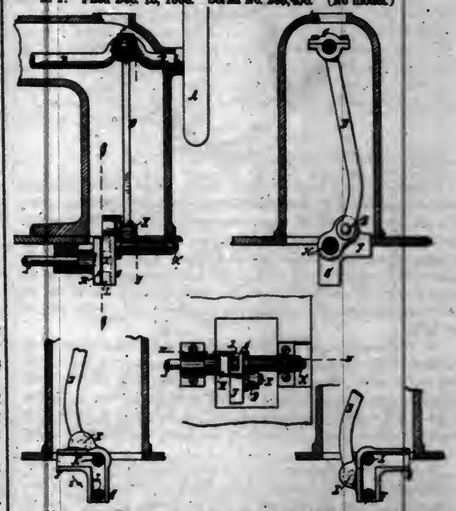
15. In an electric-railway system, the combination of a divided source of electricity, main conductors, and a compensating or balance conductor, dividing the system into two parts, and one or more overhead conductors and one or more other working-conductors for each of said parts of the system, substantially as set forth.



16. In an electric-railway system, the combination of a divided source of electricity, main conductors, and a compensating or balance conductor dividing the system into two parts, two railway-tracks, two conductors situated above each track, each connected with one of said main conductors, and the rails of both tracks connected with the middle or balance conductor, substantially as set forth.

408,545. RATCHET MECHANISM. CHARLES STEVENSON, Philadelphia, Pa. Filed Aug. 24, 1887. Serial No. 247,708. (No model.)

Claim.—1. The combination of the ratchet-wheel, the operating-pawl, its lever, and the stop-finger having jaws embracing the lever and provided with clamping-screws, all substantially as specified.



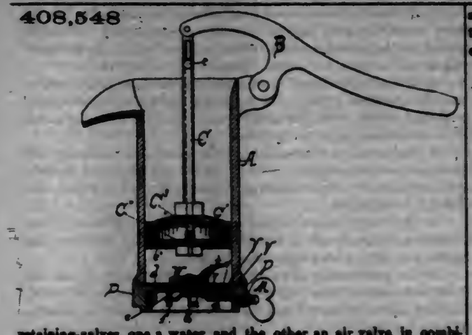
2. The combination of the fast ratchet-wheel A, its operating-pawl, a supplementary loose ratchet-wheel J, having secured thereto a ratchet J', similar to the wheel A, and a stop-finger operating in

408,545.

unison with the pawl and acting upon the teeth of both ratchet-wheels to prevent overrunning of the same, all substantially as specified.

408,546. MECHANICAL MOVEMENT. JAMES P. STILES, New York, N. Y. Filed Dec. 13, 1888. Serial No. 293,450. (No model.)

Claim.—1. The combination, with an oscillating bracket and an oscillating actuating rod or connection for actuating said bracket, of a rock-shaft, and an angular stud-and-groove connection between said bracket and rock-shaft, substantially as described.



2. The combination, with an oscillating bracket having grooves placed at an angle to one another, and an oscillating actuating rod or connection for actuating said bracket, of a rock-shaft having studs made to engage said grooves, substantially as described.

3. The combination, with a bracket consisting of two grooved arms placed at an angle to one another and supported on a pin or pivot, of an actuating rod or connection for oscillating said bracket, and a rock-shaft having studs made to engage the grooved arms, substantially as described.

408,547. PUMP. IRA C. H. SWEET, Sandwich, Ill. Filed Aug. 27, 1888. Serial No. 283,915. (No model.)

Claim.—In a lift or force pump operated by a plunger, two

408,548

retaining-valves, one a water and the other an air valve, in combination with a key or arm extending through the pump tube or cylinder and adapted to lock either valve at will out of action as a valve while leaving the other free to act, substantially as described.

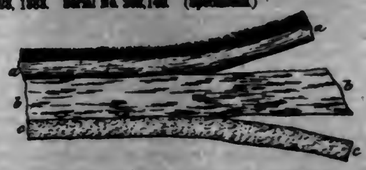
408,548. PROCESS OF PREPARING GELATINOUS MATTER FROM HIDES OR SKINS. FREDERICK W. P. SWINBURNE and LATIMER P. SWINBURNE, London, England. Filed Nov. 26, 1888. Serial No. 292,129. (No model.)

Claim.—1. In the process of preparing gelatine from hide or skin, the improvement which consists in cleansing the hide or skin, subdividing it into thin leaves or pieces, and drying it before decomposition commences.

2. In the process of preparing gelatine from hide or skin, the improvement which consists in removing the superficial layers of the hide or skin and drying its middle portion thoroughly before decomposition commences.

3. In the process of preparing gelatine from hide or skin, the improvement which consists in removing the superficial layers of the hide or skin, subdividing the middle portion into thin leaves or pieces, and thoroughly drying it before decomposition commences.

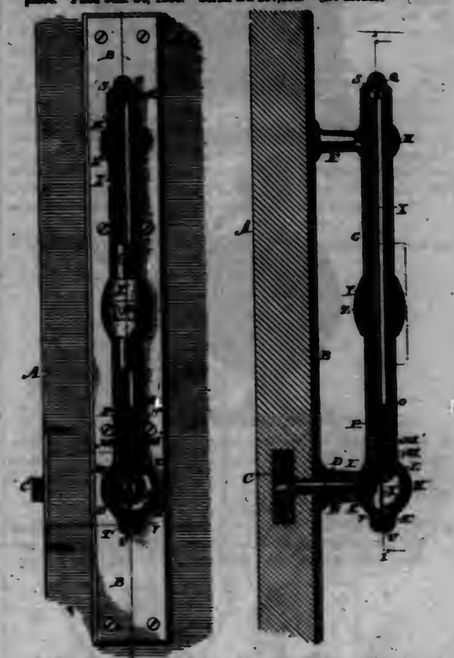
4. In the process of preparing gelatine from hide or skin, the improvement which consists in cleansing the hide or skins, subdividing it into thin leaves or pieces, drying it thoroughly before decomposition commences, and afterward submitting it to the action of hot water to extract a solution of gelatine therefrom.



5. In the process of preparing gelatine from hide or skin, the improvement which consists in removing the superficial layers of the hide or skin and submitting its middle portion to the action of hot water before decomposition commences.

6. In the process of preparing gelatine from hide or skin, the improvement which consists in removing the superficial layers of the hide or skin, subdividing its middle portion into thin leaves or pieces, and submitting them to the action of hot water before decomposition commences.

7. In the process of preparing gelatine from hide or skin, the improvement which consists in removing the superficial layers of the hide or skin, drying its middle portion thoroughly before decomposition commences, and afterward submitting it to the action of hot water.



8. In the process of preparing gelatine from hide or skin the improvement which consists in removing the superficial layers of the hide or skin, subdividing the middle portion into thin leaves or pieces, drying it thoroughly before decomposition commences, and afterward submitting it to the action of hot water.

408,549. PROCESS OF MAKING GELATINE. FREDERICK W. P. SWINBURNE and LATIMER P. SWINBURNE, London, England. Filed Nov. 28, 1888. Serial No. 292,149. (Specimens.)

Claim.—The herein-described process of obtaining gelatinous matter, consisting in first removing superficial layers from the hair side and from the flesh side of hide or skin, treating the middle portion (cut into small pieces or otherwise) with hot water, and then evaporating the odust.

408,550. ROD-HANDLE FOR LOCKS. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Jan. 24, 1889. Serial No. 297,302. (No model.)

Claim.—1. A combined lock and door-handle consisting of a rotary rod or bar turning in one or more guides secured to the door, in combination with one or more locks and a spindle and gearing for transmitting motion from the rod to the lock or locks, substantially as set forth.

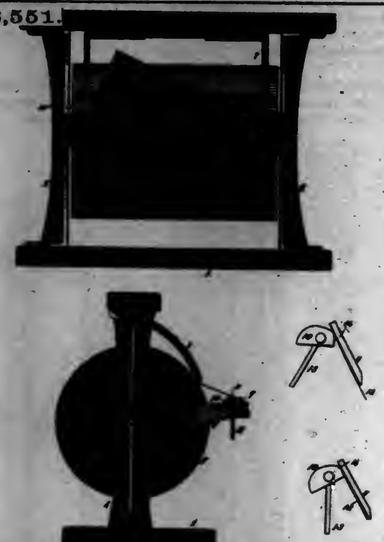
2. In combination with a rotary-rod door-handle, a bracket which guides the rod and mechanism contained therein for transmitting motion of the rod to a lock, substantially as set forth.

3. The combination, in one structure, of a door-plate, two or more brackets rigidly secured thereto, a rotary-rod door-handle guided and supported in said brackets, and a spindle and gearing for transmitting motion of the rod to a lock, substantially as set forth.

4. The combination of a rotary rod or handle G with one or more brackets E, a rotating sleeve I, and gearing K and L for communicating motion of the handle to a lock, substantially as set forth.

5. The combination of a rotary rod or handle G, one or more brackets for guiding and supporting the same, the rotary sleeve I, gearing K and L, and the spring X, substantially as set forth.

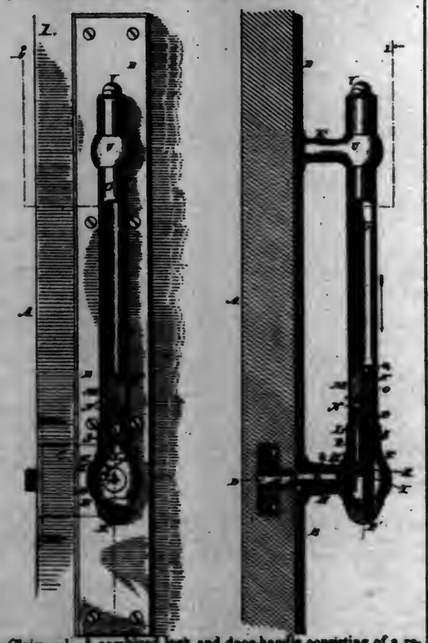
6. The combination of a rotary rod or handle G, one or more brackets E for guiding and supporting the same, the rotary sleeve I, gearing K and L, spring X, and adjusting device U, whereby the action of the spring may be controlled as desired, substantially as set forth.



408,551. ROLL-PAPER HOLDER AND CUTTER. WILLIAM H. TIVY and LEO EHRLICH, St. Louis, Mo., assignors to the American Roll Paper Company, same place. Filed May 22, 1888. Serial No. 274,708. (No model.)

Claim.—1. In a roll-paper cutter, the combination of a suitable support for the roll, knife secured to the support, and a cam pivoted to the support behind the knife and bearing on the latter for confining the end of the paper after cutting, substantially as and for the purpose set forth.

2. In a roll-paper cutter, the combination of a suitable support for the roll, knife secured to the support, and a serrated cam journaled in the support back of the knife and bearing on the latter for confining the end of the paper after cutting, substantially as and for the purpose set forth.



3. In a roll-paper cutter, the combination of a suitable support

408,551.

for the roll, knife secured to the support, cam journaled in the support back of the knife and bearing on the latter for confining the end of the paper after cutting, and an arm 13 on the cam, substantially as and for the purpose set forth.

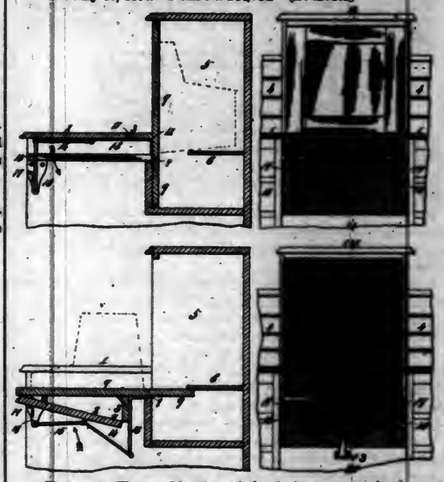
408,552. ROD-HANDLE FOR LOCKS. HENRY R. TOWNE, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Jan. 22, 1889. Serial No. 297,771. (No model.)

Claim.—1. A combined lock and door-handle consisting of a reciprocating rod-handle moving in a guide or guides attached to the door, in combination with one or more locks, and mechanism connecting said rod with said lock or locks for transmitting motion of the rod to the lock or locks, substantially as set forth.

2. In combination with a reciprocating-rod door-handle, a bracket which guides and supports the rod, and mechanism within said bracket for transmitting motion of the rod to a lock, substantially as set forth.

3. The combination, in one structure, of a door-plate, two or more brackets rigidly secured thereto, a reciprocating rod-handle guided and supported in said brackets, and mechanism for transmitting motion of the rod to a lock, substantially as set forth.

4. The combination of a reciprocating-rod door-handle, one or more brackets for guiding and supporting the same, and an arm or projection rigidly secured to said rod and extending from it to a lock to communicate motion to the latter.



5. As a new article of manufacture, a door-handle consisting of a bracket, a reciprocating rod or slide guided and supported therein, and mechanism for communicating motion of the rod to a lock, substantially as set forth.

6. The combination of a reciprocating rod or handle G with one or more brackets E, and an arm for communicating motion of the handle to a lock, substantially as set forth.

7. The combination of a reciprocating rod or handle G with one or more brackets E, the rotary sleeve H, crank I, and crank-pin K, whereby motion of the rod may be communicated to a lock, substantially as set forth.

8. The combination of reciprocating rod or handle G with one or more brackets E, the spring P, and mechanism for communicating motion of the rod to a lock, substantially as set forth.

408,553. TYPE-WRITER DESK. CHARLES H. TYLER, St. Louis, Mo. Filed July 19, 1887. Serial No. 244,744. (No model.)

Claim.—1. The combination of the desk, a receptacle above the same, a machine-support hinged at the bottom of the receptacle, and a table attached to the machine-support and constructed to be brought into position for use as a desk-top when the machine-support is raised to close the receptacle, substantially as set forth.

2. The combination, in a type-writer desk, of the body portion provided with an elevated receptacle, a machine-support hinged at the bottom of the receptacle, and a table hinged to the machine-support, and mechanism to move the same into a horizontal position when the machine-support is raised to close the receptacle, substantially as set forth.

3. The combination, in a type-writer desk, of the body portion, an elevated receptacle, a machine-support hinged at the bottom of the receptacle and adapted to close the receptacle, a folding table 2 3, attached to the machine-support, mechanism to raise the same into position for use as a desk-top when the machine-support is raised, as explained, and suitable devices for supporting the machine-support and table in either of their positions, substantially as set forth.

4. The combination, with a table having an open receptacle and a projection in the rear of said receptacle, of a machine-support hinged intermediate of its ends at the front of said receptacle, one of the ends of said support being adapted to engage the said projection when the support is opened and said support closing said receptacle when raised, substantially as set forth.

5. The combination, in a type-writer desk having a movable table formed of two pieces hinged together, of a machine-support hinged near the back of the table and having one of said movable pieces rigidly secured thereto, and projections for supporting the movable portion when the machine-support is lowered, substantially as set forth.

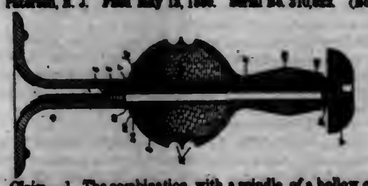
6. The combination, with a table having a movable portion hinged in two parts and a machine-support hinged to the table and to which one of said parts is secured, of an arm secured rigidly to the machine-support, a crank-shaft, brackets on the table, in which the crank-shaft has bearing, a link connecting the crank-shaft and said arm, and projections for supporting the movable portion of the table when the machine-support is opened, the movable portion being thereby automatically lowered, substantially as set forth.

7. In combination with a desk having parts 1 and 5, the portion 6 in the back of part 5, machine-support 7, hinged to the body of the desk, near the bottom of part 5, a table made in two parts 2 3, hinged together, part 3 being rigidly secured to the machine-support 7, arm 13, secured to the latter below part 3, link 14, connected with said arm, crank-shaft to which it is also connected, and brackets 16 on the table, provided with projections 17, in which brackets the crank-shaft has bearings, said projections supporting the part 2 of the table in its lower portion, all substantially as and for the purpose set forth.

8. In combination with a desk having a receptacle 5, a machine-support 7, hinged in front of said receptacle, having a downward extension 9, a partition 6 at the rear of said receptacle with which the extension engages, a movable portion in front of said receptacle divided into two parts 2 3, hinged together, part 3 being rigidly secured to the machine-support, projection 17 of bracket 16, on which the movable portion is adapted to be supported in its lower position, and connections for supporting it in and releasing the movable portion from its upper position, consisting of an arm 13 on the machine-support, crank-shaft 15, having bearing in brackets 16 on the table, and a link connecting the arm 13 and crank-shaft 15, substantially as and for the purpose set forth.

9. In a type-writer desk, the combination of the receptacle for receiving the machine when not in use, a door to the receptacle, which serves as a base or support for the machine when the latter is in using position, a jointed table secured to the door and having arms projecting therefrom, brackets fixed to the desk, and stops for limiting the movement of the jointed table, substantially as and for the purpose set forth.

408,554. LATCH. CHARLES C. VAN BROCKLIN, Hills, Ill. Filed Mar. 30, 1888. Serial No. 305,492. (No model.)

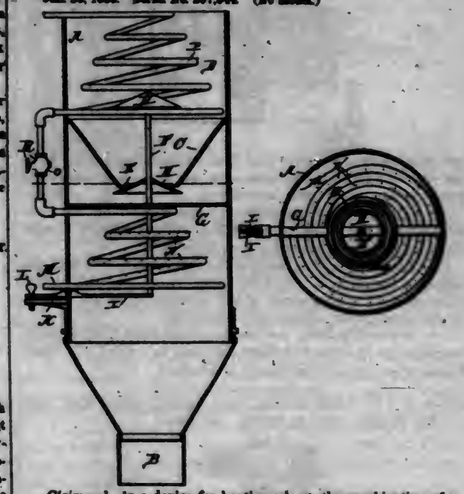


Claim.—1. The combination, with the latch-casing provided with the lateral stud near its rear end and intersecting openings at its front end, of the spring-pressed latching-lever provided with the laterally-projecting finger-pieces, the cross-head formed in one piece and provided with beveled ends and notches on opposite sides of said latching-lever, and a keeper having a beveled end slot for receiving the cross-head of the latch, substantially as specified.

2. The combination, with the latch-casing and the latch having a cross-head provided with notches in its face and a hasp-opening above them, of a keeper-plate having a slot bounded by beveled ends, and an interchangeable ball removably seated in the outer flange of said keeper-plate, substantially as specified.

3. The combination, with the reversible latch-casing having openings at its front end and a pivot-stud near its rear end, of the latch-lever provided at its rear end with a depending hook, near its front end with laterally-projecting finger-pieces, at its front end with a notched and bevel end cross-head having a hasp-opening, and a keeper-plate provided with a latch-opening having beveled ends, and a removable reversible ball seated in the flange of the keeper, substantially as specified.

408,555. APPLIANCE FOR ROTARY FANS. CHARLES E. WALDON, Paterson, N. J. Filed May 13, 1889. Serial No. 310,922. (No model.)



Claim.—1. The combination, with a spindle, of a hollow or chambered drive-pulley loose on the spindle and a loose tubular shaft or hub having fan-blades mounted thereon and driven by the said pulley, the hollow of the pulley acting as a reservoir for supplying lubricant to the bearings of the pulley and the said fan-blade-carrying shaft or hub, substantially as and for the purpose set forth.

2. The combination, with a spindle, of a drive-pulley 8, having an integral tubular extension 11 12 for carrying the fan-blades, substantially as and for the purpose set forth.

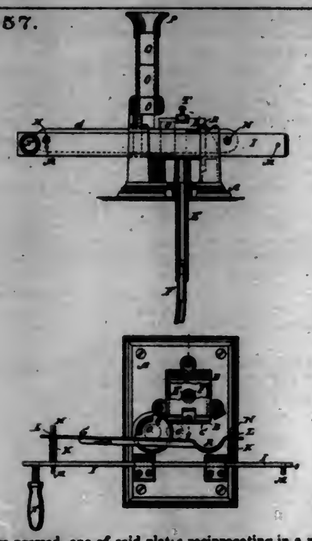
3. The combination, with the fixed spindle 7, of the single hollow casting comprising the globe-shaped pulley 8, having hollow interior 9 and one or more circumferential grooves 15, the hub or extension 11, aperture 22, and the fan-carrier 12, for carrying the fan-blades 14 14, and means for holding the casting in position on the spindle, the hollow interior 9 of the pulley serving as an oil-reservoir, substantially as and for the purpose set forth.

4. The combination, with the attaching-stand 4 and the vertical spindle 7, fixed thereto, of the single casting comprising the globe-shaped drive-pulley 8, formed with hollow interior 9, and having the radial tubular extension or hub 11 prolonged into the fan-hub 12, the aperture 22, diametrically opposite the extension 11, the exterior of the globe-like pulley being formed with one or more circumferential belt-grooves 15, the collars 16 and 19, for mounting the parts on the spindle, and the hollow interior 9 of the pulley acting as an oil-reservoir, substantially as and for the purpose set forth.

408,556. GRAIN-HEATER. ADOLF WAGNER, Cologne, Minn. Filed Jan. 26, 1889. Serial No. 297,844. (No model.)

Claim.—1. In a device for heating wheat, the combination of a hopper or casing having a hopper-shaped diaphragm, a vertically-movable adjustable stem carrying a conical valve adapted to regulate the opening in said hopper-shaped diaphragm, a perforated steam-pipe coiled in said casing below said diaphragm, and means for retaining said valve-carrying stem in any position to which it may be adjusted, substantially as set forth.

2. In apparatus for heating wheat, the vessel A, having the diaphragm C, with opening E, the valve to regulate the said opening, the live-steam coil in the lower part of the vessel and having the perforations, and the heating non-perforated coil in the upper part of the vessel, substantially as described.



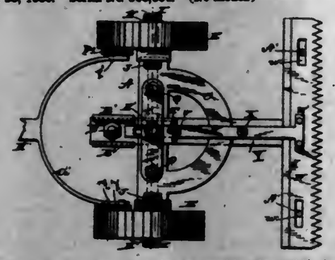
3. In apparatus for heating wheat, the vessel having the diaphragm with opening E, the perforated steam-pipe M, coiled in the lower part of the vessel, the non-perforated pipe P, coiled in the upper part of the vessel and communicating with the coil M, and the valve R, to establish and cut off communication between the said coils, for the purpose set forth, substantially as described.

4. An apparatus for heating grain, comprising a casing or hopper having a funnel-shaped diaphragm open at its lower end, the perforate steam-pipe coiled in the lower part of the casing, a non-perforated steam-pipe coiled in the upper part of the casing, a central vertical rod having a deflector at its upper end and carrying a conical valve arranged below the opening in the funnel-shaped diaphragm, a lever mounted in the side of the casing and supporting said vertical rod, and a set-screw arranged in the outer end of said lever and engaging a bracket extending laterally from the side of the casing, substantially as and for the purpose set forth.

408,557. CORK-BRANDING DEVICE. ALBERT R. WEBB, Brooklyn, assignor to Budde & Westermann, New York, N. Y. Filed Jan. 31, 1889. Serial No. 298,508. (No model.)

Claim.—1. The combination, in a cork-branding machine, of a chute for feeding the corks, with two pressure-plates between which

408,557.



the corks are pressed, one of said plates reciprocating in a right line and yielding to and from the other plate, and a heater for one of said pressure-plates, substantially as described.

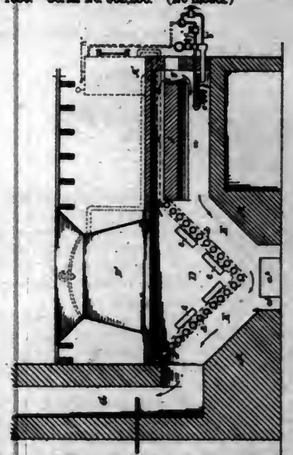
2. In a cork-branding machine, the combination, with two pressure-plates, one of which is provided with a receiving-recess, of a heater for one of said plates, substantially as described.

3. In a cork-branding machine, the combination, with the pressure-plates, one of which is provided with a receiving-recess, of a funnel or chute for guiding a cork to said receiving-recess, and a heater for one of said plates, substantially as described.

4. In a cork-branding machine, the combination, with two pressure-plates, one of which is yieldably connected to a slide I, of a heater for one of said plates, substantially as described.

408,558. LAWN-MOWER. LOUIS WEBBER, Preston, Minn. Filed Feb. 23, 1889. Serial No. 300,661. (No model.)

Claim.—1. In a lawn-mower, in combination with the herein-described pivoted operating-bar provided with an elongated slot near its rear end and a slot intersecting the same centrally, the rotating cross-head provided with downwardly-projecting pin or stud, said pin or stud carried by the cross-head, and by this means imparting a reciprocating motion to the sickle-bar, and the vertical shaft passing centrally through the cross-head and imparting rotary motion thereto, substantially as set forth.



2. In a lawn-mower, the combination of the inwardly-flanged drive-wheels, said flanged portion being provided with inner cogs, circular plates or disks provided with apertured hubs adapted to pass through central openings in the drive-wheels, and also having upper bulged portions forming recesses or chambers, the transverse shaft, the outer half-clutches mounted loosely upon opposite ends of said shaft, pinions keyed to said half-clutches, inner half-clutches sliding upon feathers on the transverse shaft, and the springs, said springs and inner half-clutches located within the upper bulged portions of the disks, substantially as herein shown and described.

3. In a lawn-mower, the combination of the frame, the sickle-supporting stationary bar, the operating-bar oscillating thereon and provided in the rear end thereof with an elongated slot, and having a cross-slot intersecting said elongated slot centrally, the rotating cross-head provided with flanged portion, said flanged portion carrying a pin or stud, the latter describing a circle with the cross-head, and thereby imparting oscillating movement to the operating-bar, and the vertical shaft passing centrally through the cross-head, substantially as set forth.

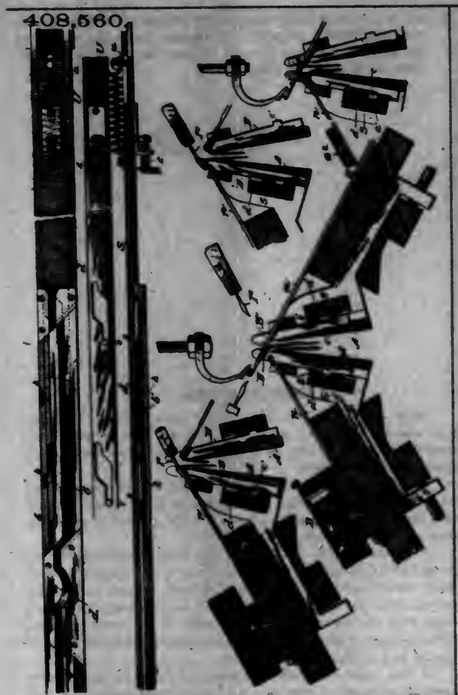
4. In a lawn-mower, the combination of the stationary sickle-supporting bar, the stationary sickle secured to the upper face of said bar and provided with upwardly-extending pins or bolts, the hangers secured to the rear end of the stationary sickle-supporting bar and having a wheel journaled thereon, the operating-bar, and the upper sickle or cutter provided with elongated slots within which the pins or bolts work, and also having a central keeper for the reception of the end of the operating-bar, substantially as set forth.

5. The combination of the drive-wheels having inwardly-extending toothed flanges, the circular plates or disks provided with apertured hubs extending through the central openings of the drive-wheels and provided with the bulged portion and upper chambers or recesses, the main bar or plate provided with upwardly-extending flanges, the bolts for securing the latter to the circular plates or disks, the transverse shaft carrying the central bevel-gear, the clutch mechanism located on each end of the transverse shaft, the pinion keyed to the outer section of the clutch, the springs, the inner plate, the blocks disposed beneath each end of said plate, the bolts for securing the same to the main bar or plate, the vertical shaft carrying on its upper end the bevel-gear, the rotating cross-head provided with flanged portion, the pin or stud passing through said flanged portion into the slots of the operating-bar, the pivoted operating-bar provided in its rear end with an elongated slot, said slot intersected by a curved cross-slot, into which the vertical shaft passes, and on its forward end with a sickle or cutter, and the supporting-bar and sickle located beneath the main cross-bar of the machine, substantially as set forth.

408,559. REFUSE-FURNACE. HENRY W. WHITING, Philadelphia, Pa., assignor of one-half to Albert E. Peterson, same place. Filed Mar. 7, 1888. Serial No. 302,258. (No model.)

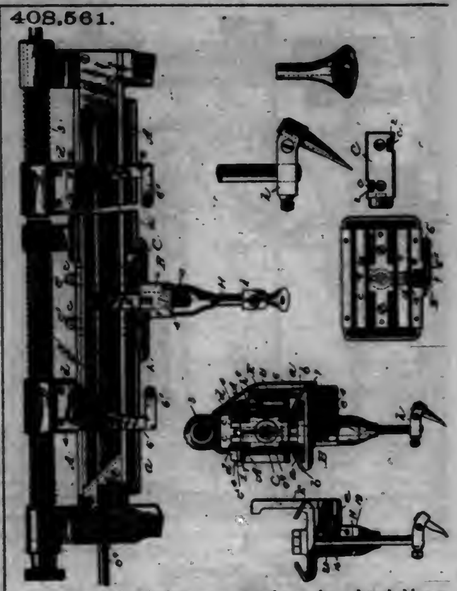
Claim.—1. The combination, in a garbage-furnace, of the combustion-chamber *a*, and the main chamber E, and garbage-chamber D, and grates separating the chambers E and D, with a flue connecting the garbage-chamber with the front of the combustion-chamber, substantially as and for the purpose described.

2. The combination, in a garbage-furnace, of the combustion-chamber and the main chamber with the garbage-chamber above the main chamber, having a tapered bottom formed of a series of transverse tubes, substantially as described.



3. The combination, in a garbage-furnace, of the combustion-chamber and the main chamber with the garbage-chamber having a tapered bottom composed of a series of tubes communicating with each other, and with a water-supply pipe and a steam-dome, substantially as described.

408,560. STRAIGHT-KNITTING MACHINE. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Knitting Machine Company, Jersey City, N. J. Filed Nov. 10, 1888. Serial No. 290,494. (No model.)



Brief.—The object of the invention is to provide improved means for drawing down the fabric as the knitting progresses.

Claim.—1. In combination, the row of needles, operating means and a row of sinkers therefor, a second row of sinkers arranged opposite the first, said sinkers being movable across the path of the needles, each of said second sinkers being in position across the path

408,560

408,561.

of the opposite needle to force back the loop thereon as said needle moves forward, and means for moving the sinkers, substantially as described

2. In combination, a row of needles, operating means and a row of sinkers therefor, a second row of sinkers arranged opposite and normally across the path of the needles and in position to force back the loops thereon, said sinkers being movable, and means for moving them, substantially as described.

3. In combination, a row of needles, the stitch-cam, a row of sinkers therefor, a second row of sinkers arranged opposite the first, said sinkers being movable across the path of the needles, each of said sinkers being in position to force back the loops on the opposite needles as said needles move forward to take the thread, and means for moving said sinkers from across the path of the needles, consisting of a slide-bar and a fixed cam *a'*, substantially as described.

4. In combination, two rows of needles, operating means and two rows of sinkers for forming loops, the sinkers on each side being movable across the path of the opposite needles for forcing back the stitches thereon as they move forward, and means for operating the sinker, substantially as described.

5. In combination, a row of needles, operating means and a row of sinkers therefor, a second row of sinkers extending across the path of the needles to force back the loops thereon, stitch-transferring mechanism, and means for moving the second row of sinkers, substantially as described.

6. In combination with the needles and stitch-cam of a knitting-machine, and with the mechanism for transferring stitches on said needles, vertically-movable sinkers, a slide-bar therefor, a fixed cam on the slide-bar and a shifting cam or cams also on the slide-bar, and means for operating these parts, all substantially as described.

408,561. STRAIGHT-KNITTING MACHINE. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Knitting Machine Company, Jersey City, N. J. Filed Apr. 11, 1889. Serial No. 306,898. (No model.)

Claim.—1. In combination, the reversible thread-carrier, supporting and guiding ways therefor, a driving-block, guideways for said block arranged parallel to the guideways of the carrier, to one side of the same, to permit the block to move past the carrier, a detachable connection between the block and the carrier, means for detaching said connection, and means for reversing the carrier at any point in its stroke, substantially as described.

2. In combination, the reversible thread-carrier, supporting and guiding ways therefor, a driving-block, guideways for said block arranged parallel to the guideways of the carrier, to one side of the same, to permit the block to move past the carrier, a detachable connection between the block and carrier, operating means for said connection, a device for moving said operating means, and means for reversing the carrier at any part of its stroke, substantially as described.

3. In combination, the guide-bars, the carrier supported by the lower portion of said bars, the driving-block between the bars and above the carrier, the detachable connections, and operating means therefor, substantially as described.

4. In combination, the guide-bars, the carrier, and the detachable driving-block, both of said parts being supported by the guide-bars, and means for operating the detachable driving-blocks to release the carrier, substantially as described.

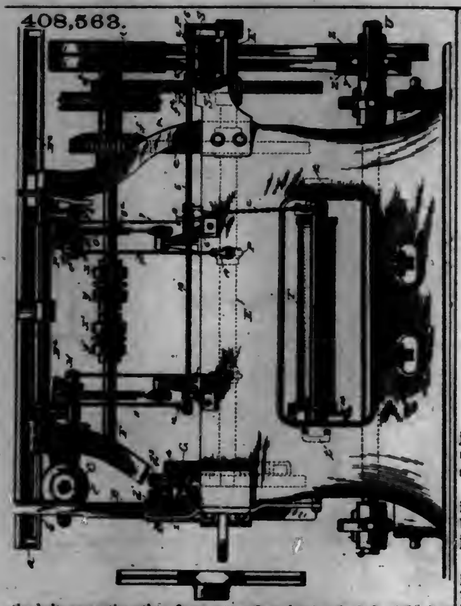
5. In combination, the guide-bars, the reversible carrier, the operating means for reversing the carrier, and the detachable sliding block, all of said parts being supported by the guide-bars, substantially as described.

6. In combination, the guide-bars, the carrier, the detachable driving-block between the bars, means for operating the detachable driving-block to release the carrier, and the thread-guide-reversing mechanism on the outside of the bars, substantially as described.

7. In combination, the carrier, the reversible guide, the detachable driving-block arranged to move past the carrier, means for operating the same, the bar A^3, the operating connections between the same and the guide, and means for operating the bar A^3, substantially as described.

8. In combination, the guide-bars, the driving-block, the reversible carrier, the means for reversing said carrier, the arm E, and means for moving the arm, substantially as described.

9. In combination, the guide-bars, the reversible carrier with operating means for reversing it, the driving-block, the sliding spring-pin for connecting the block and carrier, and the means for operating said pin to release the carrier, substantially as described.



10. In combination, the carrier with its spindle and the guide, said guide consisting of a tubular bar flattened at its lower end and having the opening for the thread extending to the upper end, and a bracket on the spindle, said bracket having the guide secured thereto, substantially as described.

408,562. STRAIGHT-KNITTING MACHINE. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Knitting Machine Company, Jersey City, N. J. Filed Apr. 22, 1889. Serial No. 308,107. (No model.)

Claim.—1. In a knitting-machine adapted to fashion, means for driving the same at a normal rate of speed for plain knitting, means for driving at a lower rate of speed for fashioning, a pawl for holding the high-speed connections in operation, a pattern mechanism and connections between the pawl and said mechanism for releasing the high-speed connection, and an automatically-operating clutch for driving the low-speed connection when the high-speed is released, substantially as described.

2. In a fashioning knitting-machine, the fast and loose pulleys,

408,563.

the belt-connections therefrom, means for releasing the belt of the fast pulley, and an automatic clutch in engagement with the loose pulley for driving the same, substantially as described.

3. In combination with a high-speed driving-connection, a low-speed driving-connection, a pawl for holding the high-speed connection to work, a rock-shaft carrying said pawl, pattern mechanism, and operating connections from the rock-shaft to the pattern mechanism, substantially as described.

4. In combination, in a fashioning-machine, high and low speed driving-connections, a pawl for holding the high-speed connection to work, a pattern mechanism for setting in motion the fashioning devices, and connections between said pawl and the same pattern mechanism which operates the fashioning devices.

5. In combination, the two pulleys, the belt-connections to impart different rates of speed to the machine, means for releasing one belt-connection, automatic means for rendering the other belt-connection operative, and automatic means for releasing said last-named belt-connection, substantially as described.

6. In combination, the driving-connections, the movable roller for the fabric, a pawl for holding the driving-connections to their work, and a connection between said movable roller and said holding-pawl, whereby the machine is stopped when the fabric is removed from the needles, substantially as described.

7. In combination, the two driving-connections, the pawls for holding said connections to their work, pattern mechanism and connections to one pawl for rendering one set of driving-connections inoperative, an automatic clutch for rendering the other set operative, the movable roller for the fabric, and connections therefrom to the pawls for releasing both sets of driving means when the thread is removed from the needles.

8. The tension device for the widened portion of the fabric, consisting of the band *b'*, the drum *y*, the pulley *x'*, and the spring, and the connection between the spring and pulley *x'*, substantially as described.

9. In combination, the slides, the cross-head having a channel, connections between the cross-head and slides, the slotted face-plate, the sliding connection between the face-plate and cross-head, and a cam having a groove G, said groove being adapted to receive the projecting portion of the sliding connection, substantially as described.

10. In combination, the slides, the face-plate, the cross-head, the connections from the cross-head to the slides, the bar D, sliding through the cross-head, the multiplying mechanism, the said cross-head having a channel to one side of the bar D, and the direct connection 4 between the cross-head and the face-plate.

11. In combination, the movable roller for the fabric, the two driving-connections, the pawls for holding said driving-connections to their work, and connections between the movable roller and the holding-pawls for releasing both driving-connections when the thread is removed from the needles.

408,563. COMBINED ROLL-PAPER HOLDER, CUTTER, STAMPER, AND MEASURER. CHARLES R. WILLIAMSON, Kansas City, assignor to the American Roll-Paper Company, St. Louis, Mo. Filed Aug. 3, 1888. Serial No. 281,852. (No model.)

Claim.—1. In combination, a roll of paper, a pair of clamping-jaws between which the paper is fed, the said jaws forming at the same time a brake to stop the unrolling of the paper, and a knife, substantially as set forth.

2. In combination, a roll of paper, a pair of clamping-jaws having a free movement toward and away from the surface of the roll, both together and independently, and a knife secured to one of the jaws, substantially as set forth.

3. In combination, a roll of paper journaled between two supports, a lower clamping-jaw loosely secured to the supports to move freely toward and away from the roll, a knife secured to the lower jaw, an upper jaw secured to the support to slide freely toward and away from the lower jaw, the front edge of the lower jaw being above the face of the jaw back of it to give the end of the paper an upward cant, substantially as set forth.

4. The herein-described end holder and clamp for paper-cutters, consisting of a pair of jaws having a free lateral movement relatively to the paper and to each other, substantially as set forth.

5. In combination, a roll of paper, a pair of end supports for the roll, a pair of jaws secured to the end supports and having a free movement toward and away from the roll, and a knife, the said jaws being actuated toward the roll by gravity to form a clamp for the end of the paper and a brake for the roll, substantially as set forth.

6. In combination, a roll of paper suitably suspended, a knife to sever the paper, a knife-support bearing on the roll of paper, and a stamp supported in proximity to the paper, substantially as set forth.

7. In combination, a roll of paper suitably suspended, an end clamp and feed supported above and in proximity to the roll, a knife, and a stamp supported upon the end clamp and feed in position to imprint the paper on the roll, substantially as set forth.

8. In combination, a roll of paper suitably suspended, an end clamp and feed supported in proximity to the roll, a knife, and a tape-measure supported with its end normally in proximity to the end of the paper, substantially as set forth.

9. In combination, a roll of paper suitably suspended, a knife to sever the paper, a stamp to imprint the paper, and a tape-measure to indicate the length to be severed, arranged substantially as set forth.

10. The combination, with a roll of paper, of a knife supported above the roll, the knife exerting its weight upon the roll, the edge of the knife being in position to sever the paper as the same is drawn across it at an abnormal angle, and a guide for conducting the paper over the edge of the knife, said guide formed by a portion of the knife-support and a movable part located above the knife-support, substantially as set forth.

11. The combination, with a roll of paper, of a knife and a pair of clamping-jaws, the latter forming an end-holder to retain the end of the paper in position to be drawn into engagement with the edge of the knife, substantially as set forth.

408,564. FORCE-PUMP. JOHN M. WISNER, Springfield, assignor to the Superior Machine Company, New Carlisle, Ohio. Filed Oct. 8, 1888. Serial No. 287,488. (No model.)

Claim.—1. The combination, with the pump tube or stock A and the outer main cylinder D, of the cup-shaped casting B, provided at top and bottom with internal screw-threads for receiving the stock A and cylinder D, and the inner cylinder E, diaphragm C, and screw-threaded flange F, formed in one piece and arranged substantially as described.

2. The pump-stock A, the outer main cylinder D, and the internally-screw-threaded coupling B, provided with the annular groove

408,564.

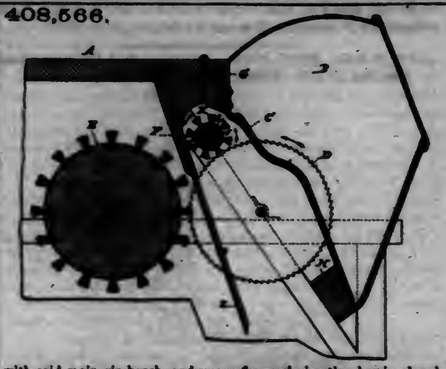
b^3, for the reception of and in combination with the diaphragm C, and its integrally-formed inner cylinder E and screw-threaded flange F, all arranged to operate as specified.

3. The pump-stock A, the outer main cylinder D, and the internally-threaded coupling B, provided with the annular groove or recess b^3, for the reception of and in combination with the diaphragm C, whose diameter is less than the diametrical measurement of the groove or recess b^3, whereby space is provided between the periphery of the diaphragm C and the wall of the groove or recess b^3 for the passage of water, said diaphragm being provided with the perforation or vent *d'*, and having the integrally-formed inner cylinder E, substantially as and for the purpose specified

408,565. CIGAR-BOX OPENER. GEORGE D. WOODWORTH, Brooklyn, N. Y. Filed Apr. 4, 1888. Serial No. 269,082. (No model.)

Claim.—1. A cigar-box opener consisting of a handle attached to a shank B, and a semicircular blade springing from one edge of said shank and extending substantially at right angles or laterally thereto and returning or curving back into the opposite edge of the shank, as set forth.

2. A cigar-box opener composed of a handle attached to shank B, a circularly-shaped blade C, extending substantially at right angles or laterally thereto, and a hammer-head E, provided with claw F, as set forth.



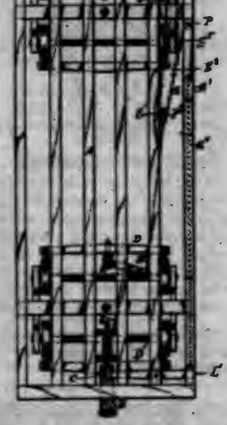
3. A cigar-box opener composed of a handle attached to a shank B, a circularly-shaped blade C, extending substantially at right angles or laterally therefrom, and a hammer-head arranged oppositely to the cutting edge of said blade C, and having a claw F, as set forth.

4. A cigar-box opener composed of a handle attached to a shank B, a semicircular blade C, extending substantially at right angles therefrom, a slot G, formed in said blade at some suitable point, and hammer-head E, arranged oppositely to the cutting-edge of said blade C, and having a claw F, as set forth.

408,566. COTTON-GIN. CORNELIUS YOUNG, Selma, Ala. Filed Nov. 27, 1888. Serial No. 291,966. (No model.)

Claim.—1. In a cotton-gin, the combination of the adjustable cleaning-brush, the gang of saws, the gin-ribs, and the main gin-brush, said adjustable cleaning-brush being arranged between the upper portions of the said saws and above the line of engagement of said saws

408,566.

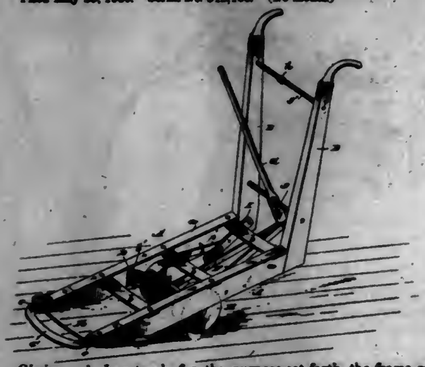


with said main gin-brush, and means for rendering the cleaning-brush adjustable consisting of the bearing-plates and their tangentially-adjusting-plates, substantially as and for the purpose set forth.

2. In a cotton-gin, the combination, with the gang of saws and the gin-ribs, the main gin-brush, and the inclined feeder, of the endwise and tangentially adjustable cleaning and smoothing brush between said feeder and the upper portion of said gang of saws and above the line of engagement of said gang of saws with the main gin-brush, and the means for effecting the tangential and endwise adjustment of said cleaning and smoothing brush, consisting of bearing-plates and their tangentially-adjusting plates, and the collars having set-screws and fitted upon the journals of said brush, substantially as specified.

3. In a cotton-gin, the combination, with the gang of saws and the gin-ribs, the main gin-brush, the feeder, and the grooved ribs, of the endwise and tangentially adjustable cleaning and smoothing brush between said feeder and the upper portion of the gang of saws and above the line of engagement of said gang of saws with the main gin-brush, and the means for effecting the tangential and endwise adjustment of said cleaning and smoothing brush, consisting of bearing-plates and their tangentially-adjusting plates, and the collars having set-screws and fitted upon the journals of said brush, substantially as specified.

408,567. AUTOMATIC CAR-BRAKE. CHESTER I. ARMS, Calvary, assignor of one-half to Charles Brunner, Peru, Ill. Filed June 10, 1889. Serial No. 313,717. (No model.)



Claim.—1. In combination with the frame and brakes of a car, the chains S S' S^2 S^3, rods S^4 and R, levers L L', draw-bars B, brake-lever K, coil-spring S^5, pulleys P P', and brake-rod *a*, all arranged substantially as and for the purpose set forth.

2. In a car-brake, in combination with the brakes of a truck, brake-rod, and the reciprocating draw-bars, the levers L L', chains S

S^2 S^3, coil spring S^4, rods S^5 and R, brake-lever K, pulley P, and pulley-block P', substantially as and for the purpose set forth.

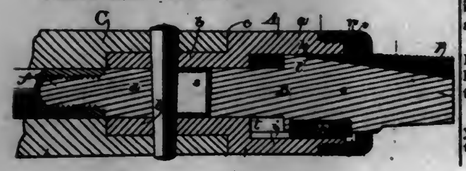
408,568. STOVE-TRUCK. GEORGE W. ARMS, Burlingame, Kans. Filed May 25, 1889. Serial No. 312,103. (No model.)

Claim.—1. In a truck, for the purpose set forth, the frame or side pieces A A, having handles B B rigidly secured thereto, rollers mounted on an axle connected to the side pieces by links D D, and with the lower end of a pivoted lever by connecting-rods F F, the said lever being pivoted between the handle-bars, and means for securing the lever in place between the handle-bars, substantially as shown, and for the purpose set forth.

2. The combination, in a truck, for the purpose set forth, of the side pieces A A, connected to each other at their forward ends by a cross-piece C, having recesses *c c*, whereby the truck is adapted to be used in connection with a U-shaped bail, substantially as and for the purpose set forth.

3. The combination, in a stove-truck constructed substantially as shown and provided at its forward end with recesses or indentations, of a bail K, having a curved central portion and end members which extend at right angles from the central portion, said members being of a greater width or distance from each other than the outer edges of the side frame, substantially as shown.

4. In combination with a truck, the frame A, having rollers pivotally connected thereto, and a lever connected with the axle of said rollers, said lever being pivoted between the handles, pivoted legs I I, having notched braces *i i*, said braces passing through staples or guides, substantially as and for the purpose set forth.



408,569. FEED-TROUGH. WILLIAM ANDERS, Reedsburg, Wis. Filed Mar. 26, 1889. Serial No. 304,796. (No model.)

Claim.—1. The feed-trough and its limiting-stops, in combination with the oscillatory hopper or bin, the shaft-like rod or bar forming a bearing for said hopper and having fingers extending downward in said hopper toward its discharge-opening, substantially as specified.

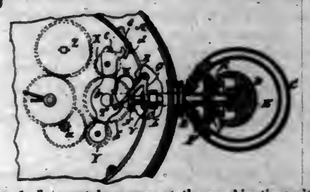
2. The feed-trough, in combination with the oscillatory hopper or bin, the vertically-adjustable shaft or rod upon which said hopper is suspended, and the agitator-fingers of said shaft or rod extending into said hopper, substantially as and for the purpose set forth.

408,570. COLLAPSIBLE TAP. ARTHUR B. BARRETT, Boston, Mass., assignor to Caleb C. Walworth, same place. Filed Mar. 18, 1889. Serial No. 303,796. (No model.)

Claim.—1. The combination of a hollow arbor, a tap-body arranged axially in said arbor and interlocked therewith to insure coincident rotation, but allowing a free endwise movement of said tap, a series of tapering threaded cutters interlocked in grooves that are oblique to the axis of said tap to allow a sliding movement thereof, said cutters having an external projection interlocked in said hollow arbor, all substantially as specified.

2. The combination of hollow arbor A, with its cap *u* and space *v*, tap-body B, arranged axially in and interlocked therewith and having the radial tapering grooves *k* formed therein, and tapering cutters *j*, interlocked in said grooves by rib *m*, and also interlocked in arbor A by studs *n*, seated in space *v*, all substantially as specified.

408,571. MOP. CHARLES A. RAGON and HAMILTON F. LOW, Manchester, N. H. Filed Aug. 7, 1888. Serial No. 280,336. (No model.) Patented in England Nov. 1, 1888, No. 14,042.



Claim.—A mop composed of roving loosely knitted, as described, having the widened portions 2 2, the intermediate narrowed portion 3, and the narrowed ends 4 4, as set forth.

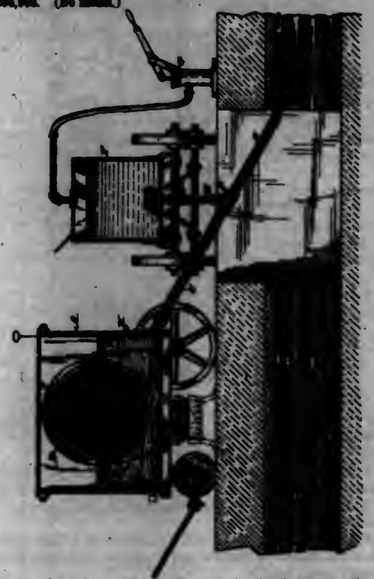
408,572. BASIC PROCESS OF MAKING STEEL. RUDOLF REITMAIR, Kladno, Bohemia, Austria-Hungary, assignor to the Pottstown Iron Company, Pottstown, Pa. Filed July 19, 1883. Serial No. 260,440. (No model.)

Claim.—As an improvement in the basic process of making steel, the mode herein described of determining during the progress of the blow the amount of lime necessary to be added to the charge to exactly neutralize, combine with, or remove the silica present in the molten metal, said mode consisting in measuring the amount of air blown into the charge during the fore-blow and then proportioning the lime to the said amount of air so blown in.

408,573. STEM WINDING AND SETTING WATCH. EDWARD E. BOYD, Chicago, Ill. Filed Jan. 31, 1889. Serial No. 298,171. (No model.)

Claim.—1. In a watch-movement, the combination, with an actuating-arbor made adjustable to and from the winding and setting position and provided with shoulders or stops H H, of a spring adapted to engage said stops to hold the arbor in position, said spring being formed of a single piece of wire and having an eye for the reception of the arbor, substantially as described.

2. In a watch-movement, the combination, with a stem-arbor E and intermediate shifting head L, having an angular opening for the shank of the stem-arbor and provided with an angular shank M, passing into the winding-pinion N, of a lever comprising two arms Q and R, one of which engages the shifting head, and the swinging yoke T, having the tooth U to engage the other arm of the lever, substantially as described.



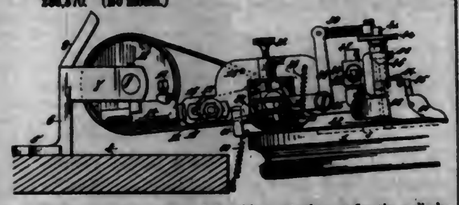
3. In a watch-movement, the combination, with a stem-arbor E, an intermediate shifting head L, a winding-pinion N, and a lever comprising two arms Q and R, one of which engages the shifting head, of the spring V for the lever and the swinging yoke T, having a tooth U to engage the other arm of the lever, substantially as described.

4. In a watch-movement, the combination, with a stem-arbor E, an intermediate shifting head L, a winding-pinion N, and a lever comprising two arms Q and R, one of which engages the shifting head, of the spring V for the lever, a swinging yoke T, having a tooth U to engage the other arm of the lever, and the curved spring W, extending from the yoke and acting on one arm of the lever, substantially as described.

5. In a watch-movement, the combination, with the stem-arbor E and swinging yoke T, of an intermediate shifting head L and the lever comprising the two arms Q and R, for transmitting motion from the stem-arbor to the yoke, substantially as described.

6. In a watch-movement, the combination, with a handle and a yoke for transmitting motion from the handle to the winding and setting mechanism, said yoke being provided with a tooth U, of a lever Q R, connected to the handle and adapted to engage the tooth U to move the yoke to the setting position, and a spring W, extending from the lever to the yoke, said spring when under tension tending to move the yoke to the winding position, substantially as described.

408,574. METHOD OF INTRODUCING MOLTEN INSULATING MATERIAL INTO UNDERGROUND CONDUITS. DAVID RESSER, Jr., Philadelphia, Pa., assignor to the Electric Cable Construction and Maintenance Company, of Pennsylvania. Filed Jan. 21, 1889. Serial No. 296,993. (No model.)



Claim.—1. The method of introducing insulating or other material into a conduit for electric wires or cables, consisting in first heating the conduit and then passing said material simultaneously with the wire or cable from the containing-tank into the conduit, substantially as described.

2. The method of insulating and laying cable or electric wires, consisting, first, in heating the conduit by passing heated air under pressure through said conduit; second, passing the cable into said conduit, and, third, simultaneous with the passage of the cable to the conduit coating the same with a suitable insulating substance under pressure, substantially as described.

3. The method of preparing conduits and introducing cables or wires therein, consisting in first heating the conduits and then passing the cable into the said conduit, and simultaneously passing therein under pressure the insulating material, substantially as described.

408,575. TRIMMING ATTACHMENT FOR LOOPING-MACHINES. NORMAN H. BROWN, Waterford, N. Y. Filed Sept. 26, 1888. Serial No. 286,370. (No model.)

Claim.—1. A cutting and brushing attachment for the cylinder of a turning-off machine, consisting of a supported arm having a brush-shaft bearing, a brush-carrying shaft arranged in said bearing and having a crank-pin, means for revolving the brush-shaft, a cutter-carrying shaft having a wrist-pin, and devices connecting the wrist-pin with the crank-pin of the brush-shaft for oscillating the cutter, substantially as described.

2. A cutting and brushing attachment for the cylinder of a turning-off machine, consisting of a supported arm having a brush-shaft bearing, a brush-carrying shaft arranged in said bearing and having a crank-pin, means for revolving the brush-shaft, a pivoted bell-crank lever connected with and oscillated by the crank-pin, a rock-shaft carrying a cutter and a wrist-pin, and a pitman connecting the latter with the bell-crank lever, substantially as described.

3. A cutting and brushing attachment for the cylinder of a turning-off machine, consisting of a supported arm having a brush-shaft bearing, a brush-carrying shaft journaled in said bearing, means for revolving the brush-shaft, a pivoted bell-crank lever connected with and oscillated by the crank-pin, a rock-shaft carrying a cutter and provided with a wrist-pin, and a flexible and elastic pitman connecting the wrist-pin with the bell-crank lever, substantially as described.

4. A cutting and brushing attachment for the cylinder of a turning-off machine, consisting of a supported arm 15, an arm 19, pivoted to the latter and provided with a brush-shaft bearing, a brush-carrying shaft 23, journaled in said bearing and having a crank-pin 38, a spring 36, for raising the arm carrying the brush-shaft bearing, a set-screw 32, for depressing said arm, means for revolving the brush-shaft, a vertical rock-shaft 41, carrying a cutter 42 and provided with a wrist-pin 44, and connections between the wrist-pin and the crank-pin of the brush-shaft, substantially as described.

5. A cutting and brushing attachment for the cylinder of a turning-off machine, consisting of a supported arm 15, an arm 19, pivoted thereupon and having a brush-shaft bearing, a brush-carrying shaft 23, journaled in said bearing and having a crank-pin 38, a spring 36, for raising the said pivoted arm, a set-screw 32, for depressing the latter, means for revolving the brush-shaft, a pivoted bell-crank lever 36, connected with and oscillated by the crank-pin of the brush-shaft, a rock-shaft 41, carrying a cutter 42, and provided with a wrist-pin 44, and a pitman 39, connecting the wrist-pin with the bell-crank lever, substantially as described.

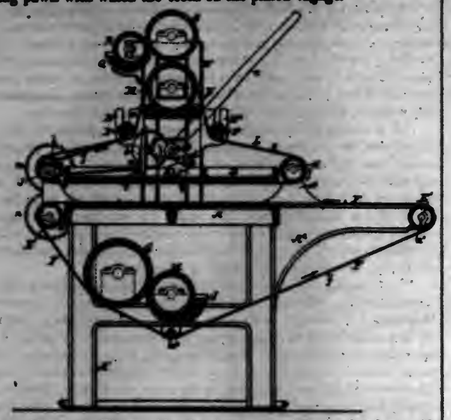
6. A cutting and brushing attachment for the cylinder of a turning-off machine, consisting of a supported arm provided with a brush-shaft bearing, a brush-carrying shaft having a crank-pin, means for revolving the brush-shaft, a bell-crank lever connected with and oscillated by the crank-pin, a rock-shaft carrying a cutter and having a disk provided with a series of openings arranged at intervals, a wrist-pin adapted to be fitted to any one of said openings, and a flexible and elastic pitman connecting the wrist-pin with the bell-crank lever, substantially as described.

408,576. JEWELRY-TRAY. LOU BURT, Detroit, Mich., assignor to the Burt & Herbst Company, same place. Filed May 1, 1889. Serial No. 309,264. (No model.)

Claim.—1. A jewelry-tray consisting of side pieces and a bottom board, the said bottom board slotted in the direction of the grain by slots which lap past each other, whereby it is prevented from warping, substantially as described.

2. A jewelry-tray consisting of side pieces and a bottom board, said bottom board provided with slots b^1 b^2, lapping past each other, and with unbroken sections b^3, substantially as and for the purpose described.

408,577. SADDLE-TREE. CHARLES F. BOSTON, Boston, Mass. Filed Aug. 29, 1888. Renewed May 23, 1889. Serial No. 311,883. (No model.)



Claim.—The combination of the saddle-tree for harness, composed of pulp, the pulp cheek-rest having embedded therein a bolt, and the cruciform opening, the bolt square in cross-section and having the lateral lugs, and the curved plate having the loop and flange, substantially as specified.

408,578. PRESS FOR KNITTED OR WOVEN FABRICS. WALTER D. BOYD, Norristown, Pa. Filed Sept. 15, 1888. Serial No. 285,458. (No model.)

Brief.—The movable platen has a vertical rack engaging a pinion provided with ratchet-teeth on its side and turning loosely on the shaft of a driving-pulley connected with one of the drums of one of

the dampening-belts, said drum being geared to a corresponding drum of the lower belt. Said shaft is provided with a clutch member having pawls with which the teeth on the pinion engage.

Claim.—1. The combination, in a press, of the fixed and movable platens, operating devices for said movable platen, with upper and lower dampening belts or aprons between said platens, and means for driving said belts, substantially as described.

2. The combination, in a press, of the stationary and movable platens, and operating devices for said movable platen, with a dampening-belt between said platens, driving-gear for said movable belt, and an operating device for said driving-gear attached to the movable platen, substantially as described.

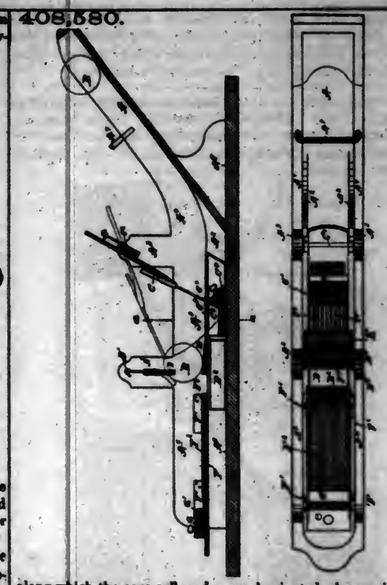
3. The combination, in a press, of the fixed and movable platens, operating devices for said movable platen, moistening-belts passing between said platens, operating devices for the belts, liquid-tanks, and rollers for distributing the liquid upon the moistening-belts, substantially as described.

4. The combination, in a press, of the fixed and movable platens, and operating devices for said movable platen, with an endless belt passing between said platens and carrying type, and inking mechanism for said type, substantially as described.

5. The combination, in a press, of the fixed and movable platens, operating devices for said movable platen, upper and lower endless belt-drums geared together, and devices whereby said drums are actuated from the movable platen, so that on the operation of the platen the belts will be moved simultaneously, substantially as described.

408,579. PROCESS OF MOLDING. JOSEPH J. CARR, Wilkes-Barré Pa., assignor to the Wilkes-Barré Molding Machine Company, same place. Filed Apr. 19, 1888. Serial No. 307,699. (No model.)

Claim.—1. The within-described process of molding, said process consisting in pressing against the sand a succession of patterns, the preparatory patterns having their projecting portions so shaped in respect to the corresponding projecting portions of the finished pattern that the recesses will be formed in the mold by gradually displacing the material until it assumes the finished form, substantially as specified.



2. The mode described of forming molds for casting, said mode consisting in pressing against the sand a series of patterns acting successively upon the mold, the projecting portions of the preliminary or preparatory patterns being tapered, so as to effect the gradual displacement of the sand and the formation of recesses therein for the reception of the projections of the finished pattern, substantially as specified.

3. The within-described process of molding car-wheels, said process consisting in first pressing against the sand a pattern in which the ribs of the wheel are tapered in cross-section, and then subjecting the sand, after the action of the preliminary pattern, to the pressure of the finished pattern, having ribs of the finished shape, which enter the tapering recesses previously formed in the mold by the ribs of the preliminary pattern, substantially as specified.

408,580. MACHINE FOR LABELING CANS. MALCOLM R. CHARTERS, Glenferrie Road, Malvern, Victoria. Filed July 10, 1888. Serial No. 307,681. (No model.) Patented in Victoria Aug. 11, 1884, No. 3,514.

Claim.—1. The combination, in a labeling-machine, of a race

408,580.

along which the cans roll, and a comb pivoted above said race and depending into the paste-box to be lifted therefrom by the contact of the cans, substantially as set forth.

2. The combination, in a labeling-machine, of an inclined and horizontal race, a paste-box, a paste-applying comb pivoted above said race and depending into the paste-box, and a spreading-brush D, substantially as set forth.

3. The combination, in a labeling-machine, of a paste-box, a pivoted comb depending therein, and a yielding spreading-brush, substantially as set forth.

4. The combination, in a labeling-machine, of the paste-box and pivoted comb depending therein, and springs for maintaining the labels in proper position, substantially as set forth.

5. The combination, in a labeling-machine, of a paste-box and pivoted comb depending therein, and a piece F^2, for elevating the ends of the labels, substantially as set forth.

6. The combination, with the race, paste-box below the same, and pivoted comb depending therein, of a supplemental device G', substantially as set forth.

7. The combination, in a labeling-machine, of the paste-box having bars C^2 at its top, and a pivotal comb having its teeth depending into said box between said bars C^2, substantially as set forth.

408,581. SUPPORT FOR SPINNING-SPINDLES. CHARLES H. CHAPMAN, Groton, Mass. Filed Apr. 16, 1888. Serial No. 307,440. (No model.)

Brief.—The object of the invention is to provide improved means for supporting the spindle so that it may yield both vertically and laterally while being held against excessive gyration.

Claim.—1. A support for the bolsters of spinning-spindles, consisting of the base or thimble *o*, ring *q*, springs *p*, connecting the thimble and ring, and rigid guard *r*, as set forth.

2. A support for the bolsters of spinning-spindles, consisting of the base or thimble *o*, ring *q*, springs *p*, provided with the V-shaped portions *s*, and rigid guard *r*, as set forth.

3. A spindle and its sleeve-whirl and a bolster-case, combined with a bolster and step support, a support for the bolster and step support, elastic both vertically and laterally, and a rigid guard to prevent undue deflection and gyration of the spindle-support and spindle, as set forth.

4. A support for bolsters of spinning-spindles, consisting of a support proper, elastic both vertically and laterally, and a rigid guard, as set forth.

408,582. SUPPORT FOR SPINNING-SPINDLES. CHARLES H. CHAPMAN, Groton, Mass. Filed Apr. 16, 1888. Serial No. 307,447. (No model.)

Brief.—The object of the invention is to provide improved means for supporting the spindle, which will permit it to yield and at the same time will prevent too great motion, and to facilitate lubrication.

Claim.—1. A spindle and bolster-case, combined with a shell arranged in said bolster-case, a step-bearing supported by said shell, a bolster-bearing arranged in said shell, and an elastic support attached to the bolster-case and secured to the shell and bolster-bearing, as set forth.

2. A spindle and its sleeve-whirl and a bolster-case provided with a shell having a bolster and step bearing, and an elastic support attached to the bolster-case and secured to the bolster-bearing and shell at a point substantially on a line centrally of the whirl, as set forth.

3. A spindle and its sleeve-whirl and a bolster-case provided with a shell having a step-bearing in its lower end and a bolster-bearing in its upper end, and a rigid guard to prevent undue deflection of the shell and spindle attached to the bolster-case, and having an elastic support secured to the bolster-bearing and shell, as set forth.

4. A spindle and its sleeve-whirl and a bolster-case, combined with a bolster and step support, a rigid guard, and an elastic support for the bolster and step support, as set forth.

5. A support for the bolsters of spinning-spindles, consisting of a rigid guard and an elastic support, as set forth.

6. The combination, with the open bolster-case and a bolster and step supporting shell suspended therein and extending therethrough, of the nut *d*, provided with ears *q*, and an open sheet-metal oil-cup adapted to be sprung upon and held by said ears, as set forth.

7. The combination, with the open bolster-case, of the nut for securing the bolster-case to the rail, an open sheet-metal oil-cup adapted to be sprung upon and held by said nut, and the covering-rim arranged upon said nut over said cup, as set forth.

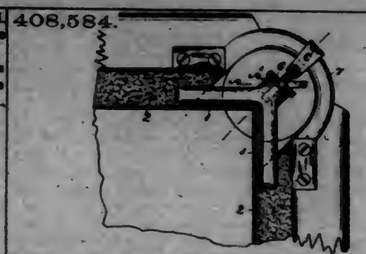
408,583. RECTIFICATION OF ALCOHOL. ANDRÉ T. CHRISTOPH, Paris, France. Filed Dec. 10, 1888. Serial No. 293,171. (No specimens.) Patented in France Aug. 9, 1888, No. 192,321, and in Belgium Aug. 10, 1888, No. 82,861.

Claim.—1. The process herein described, which consists in mixing the impure spirit of alcohol with sodium-tin alloy and then rectifying it.

2. The process herein described, which consists in mixing the impure spirit of alcohol with an alloy or amalgam of sodium and a hypochlorite—such as bleaching-powder—and then rectifying it.

3. The hereinbefore-described process for the rectification of alcohol, which consists in mixing the impure spirit, containing about forty per cent. of absolute alcohol, with sodium-tin alloy, in the manner specified, in the proportion of about fifteen or twenty grams of sodium for each one hundred liters of liquid, and distilling the mixture, as set forth.

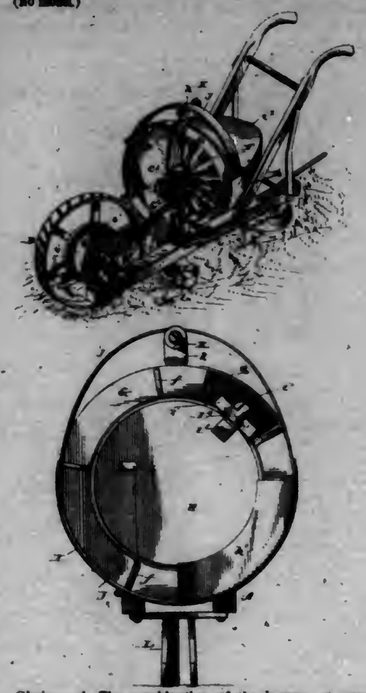
4. The hereinbefore-described process for the rectification of alcohol, which consists in successively diluting the impure spirit to about forty per cent. of absolute alcohol, adding hypochlorite of lime (bleaching-powder) in about the proportion of one gram per liter of the diluted spirit, stirring the mixture, and then adding sodium-tin alloy in about the proportions specified, and then distilling the mixture, as set forth.



5. The hereinbefore-described process for the rectification of alcohol, which consists in mixing hypochlorites with cold diluted impure spirit, adding sodium-tin alloy, agitating the mixture, allowing it to stand, and then distilling it, all substantially as set forth.

6. The hereinbefore-described process for the rectification of alcohol, which consists in successively diluting the impure spirit to about forty per cent. of absolute alcohol, mixing it with hypochlorite of lime (bleaching-powder) in about the proportion of one gram per liter of the diluted spirit, stirring the mixture, allowing it to stand, then adding an alloy of alkaline metal in such proportion as to have present about fifteen to twenty grams of alkaline metal for each one hundred liters of liquid, then agitating and distilling, substantially as specified.

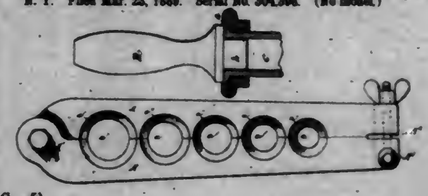
408,584. CORNER-BLOCK FOR BILLIARD AND POOL TABLES. THOMAS CLARK, Philadelphia, Pa. Filed Dec. 5, 1888. Serial No. 292,731. (No model.)



Claim.—A corner-block for the purpose stated, consisting of an angular plate with a boss projecting from the angle thereof, a nut

408,584.

having a neck with a peripheral groove and provided with a head, a screw passing through the boss into said groove, and a screw working in said nut and having a hook connected therewith, the head of the nut being between the boss and hook, said parts being combined substantially as described.

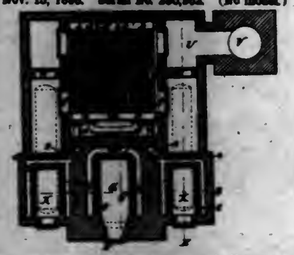


408,585. POTATO-PLANTER AND SEED-DRILL. WILLIAM I. COFFIN, Bloomingport, Ind. Filed Sept. 28, 1888. Serial No. 286,675. (No model.)

Claim.—1. The combination of the hopper, an annular rim secured thereto, a discharge-spout secured to the annular rim, a feed-wheel within the hopper, a shield, and a guard secured to the shield to regulate the flow of the material with which the hopper is filled to the feed-wheel, substantially as described.

2. The combination of the hopper, an annular rim secured thereto, a pulley journaled on the rim, a feed-wheel journaled in the hopper, and a flexible band moving in the hopper and over the pulley, substantially as and for the purpose specified.

408,586. FLANGING-APPARATUS. ISAIAH B. COLEMAN, Elmira, N. Y. Filed Mar. 23, 1889. Serial No. 304,306. (No model.)



Claim.—1. In pipe-flanging apparatus, the combination, with portable clamp having a series of holes for holding different-sized pipes, each hole having a counterbore for flanging purposes, of hand-tools adapted, respectively, to distend and flange the respective pipes into the counterbores of the clamp by means of blows applied to such hand-tools, substantially as set forth.

2. In pipe-flanging apparatus, the combination, with clamp for holding the pipe, of a reversible hand-tool having a conical or tapering end for distending the pipe end, the reverse end of the tool having a head adapted to fit in the counterbore of the clamp, and having a center-pin adapted to fit the bore of the pipe, substantially as set forth.

3. In pipe-flanging apparatus, the combination, with clamp-jaws pivoted together at the one end thereof, and having a pivoted securing-bolt operating in transverse slots in the free ends of the jaws, a series of holes located along the line of intersection of the jaws, for holding different sizes of pipes, each hole having a counterbore, of hand-tools for distending and flanging the respective pipe ends into the respective counterbores of the clamp, substantially as set forth.

4. A portable pipe-flanging apparatus consisting of clamp-jaws adapted to be opened or closed and having a series of different-sized holes along the contact-line of the jaws, each hole having a counterbore, a series of reversible hand-tools, respectively, for each hole of the clamp, each hand-tools having respectively a tapering end adapted to enter the end of the pipe, and having a head adapted to enter the counterbore of the clamp, and having a center-pin adapted to enter the bore of the pipe, substantially as set forth.

408,587. BAGASSE-FURNACE. FREDERIC COOK, New Orleans, La. Filed Nov. 15, 1888. Serial No. 290,963. (No model.)

Claim.—1. A bagasse-burner having a boiler upon the side thereof, said boiler-furnace being without grate-bars and provided with tuyeres in its side walls, the bagasse-burner having openings in its side walls communicating with the boiler-furnace and provided with dampers or gates adapted to close said openings, substantially as described.

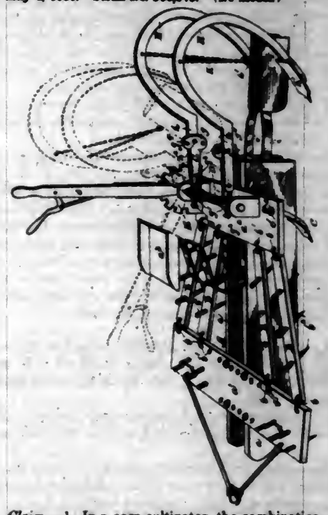
2. In an apparatus to burn damp bagasse, the combination of a bagasse-furnace between the boilers, auxiliary furnaces under the boilers, having side tuyeres in the furnace-walls, a draft-door and furnace-door, an air-heater, and dampers to turn on or off the waste heat from heater, and thereby change the blast from hot to cold, or the reverse.

3. In a bagasse-burner having openings in its side walls, in combination with boiler-furnaces, with which said openings communicate, said boiler-furnaces being arranged each beneath a battery of boilers and having no grate-bars, all of said furnaces being supplied with tuyeres in their side walls, an air-heater, and dampers whereby the waste heat may be driven over said heater or diverted therefrom and carried directly to the stack, substantially as described.

4. The combination of a bagasse-furnace with auxiliary furnaces for forced blast, each furnace being connected by distinct air-passages to a reservoir of compressed air provided with blast-gates to regulate supply of air to each furnace, substantially as described.

408,588. BAGASSE-FURNACE. FREDERIC COOK, New Orleans, La. Filed Nov. 15, 1888. Serial No. 290,963. (No model.)

Claim.—1. A central furnace for burning bagasse, situated between a divided battery of steam-boilers and supplying heat from one furnace to each divided part of the battery, as described.



2. A central furnace for burning bagasse, situated between a divided battery of steam-boilers, part being each side of the bagasse-furnace, the boiler-setting arranged with exit-holes and dampers to admit and regulate the waste heat from boilers to air-heating pipes, and exit-holes with dampers leading direct to chimney.

3. The combination of a central bagasse-furnace with steam-boilers each side of the furnace-openings and dampers in the boiler-walls to admit or close off the waste heat from an air-blast heater or turn it direct to the smoke-stack, an air-blast heater, and an air-forcer.

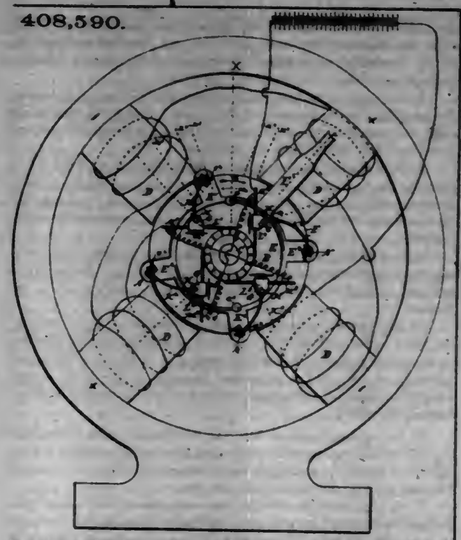
4. An air-heater without bends or turns, composed of straight tubes connected to air-boxes and provided with dividing or heat-diverting plates through which the tubes pass for the purpose of deflecting the heat, substantially as described.

5. A bagasse-furnace arranged, as described, to receive a cold or hot blast by means of regulating-dampers to let on or shut off waste heat from an air-blast heater, or to let the heat pass direct to chimney without passing through the heater.

408,589. CULTIVATOR. FRANK P. CRAIG, Holton, Kans. Filed May 4, 1889. Serial No. 309,575. (No model.)

Claim.—1. In a corn-cultivator, the combination, with the main frame composed of the runners and the transverse beams a' a^2, of the removable bars B, extending inward and rearward, provided with the harrow-teeth b^2, and connected to the beams a' a^2 by flexible joints, so that the said teeth can turn laterally out of the way of obstructions, substantially as specified.

2. In a corn-cultivator, the combination, with the shaft D and means, substantially as described, for rotating the same to and holding it in a desired position, of the arms G, provided with the heads g, having the openings g^4, having the openings g^3 at proper points, and provided on their inner ends with the sleeves g', the set-screws g^5, to hold the sleeves in proper position on the shaft D, the plow-beams having in their straight portions A openings registering with the openings g^3, and the pivotal pins or bolts A^3, substantially as specified.



3. In a corn-cultivator, the combination, with the main frame provided with the runners a, of the arms G, turning on the shaft D, the plow-beams H, vertically adjustable on the arms G, the shield I, with its arms i pivoted on the rear ends of the runners, and the chain K, connecting the beams H and shield I, so that the latter will rise with the former, substantially as specified.

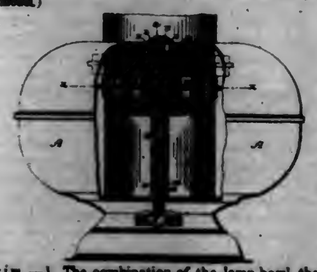
408,590. ELECTRIC MOTOR. STANLEY G. C. CURRIE, Philadelphia, Pa., assignor to the United Electric Improvement Company, Gloucester City, N. J. Filed Oct. 9, 1888. Serial No. 287,614. (No model.)

Claim.—1. In an electric motor, the combination, with a commutator, of a movable section arranged to turn concentrically with said commutator, and four or more brushes connected to said section and adapted to be successively or at intervals raised out of contact with the commutator by the movement of the said section, substantially as described.

2. In an electric motor, the combination, with a commutator and

408,590.

four or more brushes, each secured in pivotal brush-holders adjacent to said commutator and with their free ends in contact therewith, of a movable section connected to each brush-holder by a spring, the springs being each strained to a greater degree than the preceding one, whereby as such section is moved the brushes will be successively raised from contact with the commutator, substantially as described.

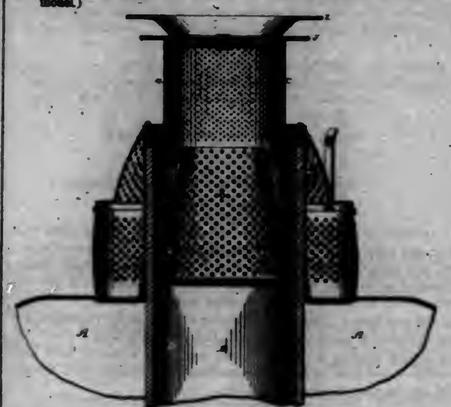


3. In an electric motor, the combination of a commutator, a series of brushes, pivotal brush-holders, springs connected to said brush-holders, a movable section, and jaws or rollers carried by said section and adapted to embrace said springs, the jaws being arranged at variable intervals on a circular line concentric with said commutator, substantially as described.

4. In an electric motor, the combination, with a commutator and four or more double-ended brushes attached at the center to swiveled brush-holders, of a movable section carrying clamping-jaws arranged concentrically to said commutator at unequal distance apart, and springs projected through said jaws and connected to said holders, whereby the brushes may be successively raised from contact with the commutator and their opposite ends successively brought into contact therewith by a progressive movement of said movable section, substantially as described.

5. In an electric motor, the combination, with a commutator, brushes adapted to contact therewith, swiveled brush-holders, and a movable ring or section carrying clamping-jaws or rollers secured in swiveled frames adjustably secured to said movable section, of springs having one end attached to the brush-holders and the other end projected through said clamping-jaws, substantially as described.

6. In an electric motor, the combination, with commutator B, brushes M' M^3 M^4, and swiveled brush-holders L' L^3 L^4, of movable ring E, carrying swiveled frames N N, with clamping-rollers n n, and flat springs K' K^3 K^4, attached to said brush-holders and passing between said rollers, all constructed and arranged substantially as described.



408,591. WICK-RAISER FOR CENTRAL-DRAFT LAMPS. ZENOLON DAVIS, Cleveland, Ohio. Filed Aug. 15, 1888. Serial No. 282,762. (No model.)

Claim.—1. The combination of the lamp-bowl, the stationary tube placed inside thereof, an operating-rod which extends through this tube, a metallic connection which is so shaped as to form a chamber and connected to the operating-rod, a screw-threaded operating-tube which surrounds the stationary tube and is attached to the metallic connection, and the wick-raising devices which are placed upon and operated by the screw-threaded tube, substantially as shown.

2. The combination of the lamp-bowl A, the stationary tube D, placed inside of the bowl for making a tight joint therewith at its lower end, an operating-rod E, which passes through the stationary tube, the metallic connection H, so shaped as to form a chamber around the upper end of the tube D, a screw-threaded operating-tube which incloses the stationary tube, and the spring-actuated wick-raising devices provided with screw-threads engaging said operating-tube, substantially as described.

408,592. BURNER FOR CENTRAL-DRAFT LAMPS. ZENOLON DAVIS, Cleveland, Ohio. Filed Aug. 15, 1888. Serial No. 282,763. (No model.)

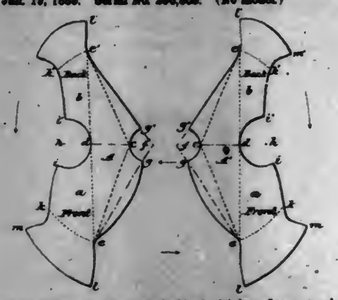
Claim.—1. The combination of the lamp-bowl and the central-draft tube with a burner-tube consisting of the lower imperforate portion which snugly fits the draft-tube and the smaller upper perforated portion, the tube being provided with a series of perforations H, which extend around the side of the burner below the small openings in its upper end, so that the air which rises through the perforations H will be heated between the outer side of the perforated part of the burner-tube and the inner side of the upper end of the central-draft tube, substantially as shown.

2. The combination of the lamp-bowl and the central-draft tube with the perforated burner-tube provided with a series of openings H below the fine perforations in its upper end and the open-ended conical tube which is secured in the lower end of the burner-tube and in a different vertical plane from the fine perforations in the burner-tube, substantially as described.

3. In a burner for a central-draft lamp, the combination of the burner-tube provided with perforations at its upper end and a series of larger perforations H near its center with a conical open-ended perforated tube which has its upper end to project to a point at or below the lower line of the smaller perforations through the upper end of the burner-tube, substantially as set forth.

408,593. CAR-COUPLING. ALEXANDER H. S. DAVIS, Washington, D. C., assignor of one-fourth to William T. Arrick, same place. Filed Nov. 22, 1888. Serial No. 291,576. (No model.)

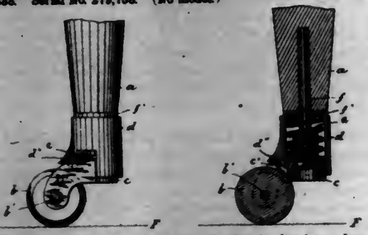
Claim.—1. In a car-coupling, the combination of a draw-head notched upon its upper surface and having a ledge upon the inner surface of its aperture, a coupling-pin having a projection adapted to fit into the notch in draw-head, and a coupling-link having a flange which trips the pin into its locked position, substantially as described.



2. In a car-coupling, the combination, with a draw-head notched upon its upper surface, of flanges or lugs upon each side of the notch, a coupling-pin having a projection adapted to fit into the notch in draw-head, and a coupling-link having a flange which trips the pin into its locked position, substantially as described.

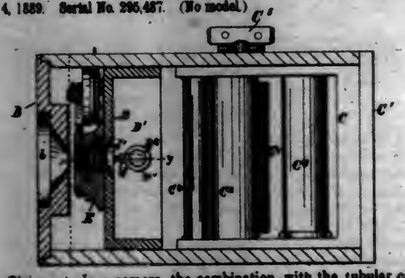
3. The combination, with a car provided with shoulders or abutments, as described, of: a draw-head having flanges described, interposed springs, and bands or straps, substantially as described.

4. The combination of a car, a draw-head of the form described, and springs and bands flexibly connecting the car and draw-head, substantially as described.



5. A car-coupling link slotted at d' and d^3, and having a flange d^4 and enlarged or weighted portion d^5, as and for the purpose described.

408,594. **DRESS-WAIST.** JOSEFA O. DE CARACHEA, New York, N. Y. Filed Jan. 19, 1889. Serial No. 296,803. (No model.)



Claim.—A dress-waist each half of which is formed solely of a front and back of one piece, the two pieces having the same configuration and each consisting of two lengths *a* and *b*, of varying widths, diverging at an angle more or less obtuse from opposite neck and arm curves *g c g'* and *i d i'*, the wider front length *a* having outwardly-curved side lines *n e* and *i k*, converging slightly to the waist-line, and the narrower or back length *b* having straight side lines *g' e'* and *i' k'*, converging slightly to the waist-line, and both widening with outwardly-curved lines beyond the waist-line, substantially in the manner and for the purpose herein set forth.

408,595. **CASTER.** LEON O. DION, Natick, Mass. Filed July 12, 1888. Serial No. 279,738. (No model.)

Claim.—A caster consisting of a pin *f* to be fixed in a leg, a hollow case *d*, swiveled at its upper end upon the pin to rotate thereupon and provided with a lateral brake projection d^2, and a vertically-yielding spring-pressed hub *e*, rotatable axially on the pin and arranged in and rotating with the swiveled case and having the wheel *b*, so that the hub and case can rotate axially, and when the case descends its lateral brake projection comes in direct contact with the wheel to prevent the latter turning, substantially as described.

408,596. **CAMERA.** GEORGE EASTMAN, Rochester, N. Y., assignor to the Eastman Dry Plate and Film Company, same place. Filed Jan. 4, 1889. Serial No. 295,487. (No model.)

Claim.—1. In a camera, the combination, with the tubular casing having the fixed front and the small aperture therein, of the frame carrying the lens and shutter adapted to be inserted from the rear, securing devices for fastening the frame to the casing operated only from the interior of the casing, and a holder for sensitized material fitting the casing and forming the rear end of the camera, substantially as described.

2. In a camera, the combination, with the tubular casing having the small aperture in the end, of the frame carrying the lens fitting inside the casing, having the slotted sides, and the screws for securing it to the casing, substantially as described.

3. In a camera, the combination, with the casing, of the frame carrying the lens and shutter capable of adjustment therein, a latch for the shutter having a laterally-extended end, and a releasing-pin for operating the latch supported in the casing, substantially as described.

4. In a photographic shutter, the combination, with a lens-opening and a perforated movable shutter, of an auxiliary shutter and a latch for holding it in line with the lens-opening, substantially as described.

5. In a photographic shutter, the combination, with a lens-opening and a perforated movable shutter, of an auxiliary shutter adapted to be moved in line with the lens-opening, a latch for holding said auxiliary shutter, and a projection operated by the main shutter adapted to engage the latch and release the auxiliary shutter, substantially as described.

6. In a photographic shutter, the combination, with a lens-opening and a perforated movable exposing-shutter, of an auxiliary opaque shutter, a spring for moving it, and a latch for holding it in line with the lens-opening, substantially as described.

7. In a photographic shutter, the combination, with a lens-opening and a perforated movable exposing-shutter, of an auxiliary opaque shutter and connections between it and the main shutter whereby it is moved in line with the lens-opening when the main shutter is moved in one direction, substantially as described.

8. In a photographic shutter, the combination, with a lens-opening and a perforated movable exposing-shutter, of an auxiliary shutter and connections between it and the main shutter for moving it in line with the lens-opening by the movement of the latter, a spring for moving the auxiliary shutter independently, and a latch operated by the exposing-shutter releasing the auxiliary, substantially as described.

9. In a photographic shutter, the combination, with a lens-opening and a perforated exposing-shutter, of an auxiliary shutter, a spring connecting the two shutters, and connections between them for moving the auxiliary over the lens-opening by the movement of the main exposing-shutter, and a latch for holding the auxiliary adapted to be released by the main shutter, substantially as described.

10. In a photographic shutter, the combination, with the perforated exposing-shutter, of an auxiliary shutter arranged to cover the exposing-aperture in the main shutter while passing the lens-opening moving in one direction, a catch for holding the auxiliary in this position, and devices for releasing the catch after the exposing-aperture has passed the lens, substantially as described.

11. In a photographic shutter, the combination, with the perforated shutter having a stop thereon, of an auxiliary shutter and connections between them for causing their simultaneous movement when operated in one direction and a latch engaging the stop on the main and the auxiliary shutters, substantially as described.

12. In a photographic shutter, the combination, with the perforated exposing-shutter having a stop thereon, an auxiliary shutter, and connections between them for causing their simultaneous operation when operated in one direction, of a latch for engaging the stop on the exposing and the auxiliary shutter, said stop on the exposing-shutter operating to release the auxiliary shutter before being itself engaged by the latch, substantially as described.

13. The combination, with the perforated exposing main shutter having a stop thereon, an auxiliary shutter, and connections between them for causing their simultaneous movement when operated in one direction, of a catch for engaging the stop on the exposing and the auxiliary shutter, said stop on the exposing-shutter operating to release the auxiliary shutter before being itself engaged by the latch, and a manually-operated portion co-operating with the latch to cause the release of the exposing-shutter, substantially as described.

14. In a photographic shutter, the combination, with the base or support, of the exposing-shutter having the flange on one side, the auxiliary shutter operated by the main shutter, and the spring for holding it against the said flange, substantially as described.

15. In a photographic shutter, the combination, with the base or support, of the exposing-shutter having the laterally-projecting flange adapted to engage the side of the support and constitute a stop to limit the movement in one direction, substantially as described.

16. In a photographic shutter, the combination, with the base or support, of an exposing-shutter having the flanges on opposite sides adapted to engage the support and constituting stops for limiting the movement in opposite directions, substantially as described.

17. The combination, with the base or support constructed of a single piece of material having two coincident apertures for the lenses and a slit between them, of a pivoted shutter operating in the slit and a latch for operating on the shutter, substantially as described.

18. In a photographic shutter, the combination, with the base or support constructed of a single piece of material having two coincident apertures for the lenses and a slit between them, of a pivoted oscillating shutter operating in the slit and a latch for operating on the shutter, substantially as described.

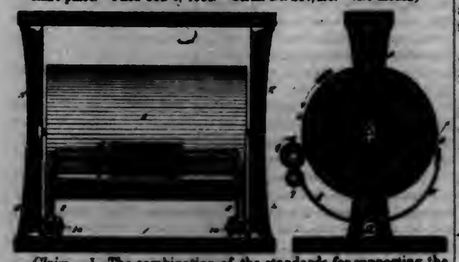
19. In a photographic shutter, the combination, with the base or support having the boss, of the exposing-shutter, the stud passing through it, the spring connected to the shutter and the stud, and the slotted disk pivoted on the boss arranged to connect with and move the shutter when rotated in one direction, substantially as described.

20. In a photographic shutter, the combination, with the base or support, the exposing-shutter, and a spring for operating it in one direction, of a pivoted plate arranged concentric with the shutter-pivot, a slot-and-pin connection between the said plate and shutter, a spring for rotating the plate, and the flexible cord connected to the plate, substantially as described.

21. As a means for operating a pivoted oscillating photographic shutter to set it, the combination of a plate pivoted on the pivotal center of the shutter, a spring for oscillating said plate in one direction, and a flexible cord connected to the plate and moving the shutter, substantially as described.

22. In a photographic shutter, the combination, with the base or support and a latch, of the pivoted shutter having a pin and a flange or casing, a spring connected to the shutter inside the casing, a plate having a slot in which the pin on the shutter operates, a spring connected to the plate, and a flexible cord also connected to the plate for operating it against its spring, substantially as described.

23. In a photographic shutter, the combination, with the base having the boss and the stud thereon, of the shutter pivoted on the stud having a flange or casing and projecting pin, the spring connected to the shutter and stud inside the casing, the plate pivoted on the boss having the segmental slot, the spring connected to the plate and boss, and the flexible cord connected to said plate, substantially as described.



24. The combination, with the lens-opening and a reciprocating shutter provided with an exposing-aperture, of a reciprocating auxiliary shutter arranged to co-operate with the lens-opening when the main shutter is moved in one direction and to remain out of position when moved in the other, substantially as described.

25. In combination with the camera-box, the lens, and a reciprocating shutter provided with an exposing-aperture, a reciprocating auxiliary shutter arranged to co-operate with the lens and devices connected to the main and auxiliary shutters for moving both of them in one direction, with the auxiliary shutter covering the exposing-aperture, substantially as described.

26. In combination with a camera-box, a lens, and a reciprocating exposing-shutter, an auxiliary shutter co-operating with the lens to cover the exposing-aperture as the main shutter is operated in one direction, said auxiliary shutter being connected to the devices for operating the main shutter and operated thereby to insure the exclusion of light from within the camera-box during the movement of the main shutter in one direction, substantially as described.

27. In combination with the camera-box, the lens, and a reciprocating shutter provided with an exposing-aperture, an auxiliary shutter held removed from the lens-opening in one position, devices for operating the main shutter connected to the auxiliary shutter to automatically move the latter in line with the lens-opening during the passage of the aperture in the main shutter, and means for retracting the auxiliary shutter after the passage of the exposing-aperture in the main shutter, substantially as described.

408,597. **COMBINED PAPER PRINTER AND CUTTER.** LEO EHRLICH, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed Oct. 6, 1888. Serial No. 287,430. (No model.)

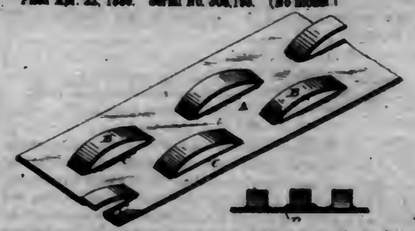
Claim.—1. The combination of the standards for supporting the paper roll, the pair of spring-pieces—one at each end of the machine—having arms 5 and 8, a knife mounted on the ends of the arms 5, and a roller mounted on the ends of the arms 8, substantially as described.

2. The combination of the standards for supporting the paper roll, the pins—one at each end of the machine—the pair of spring-pieces coiled around the pins having arms 5 and 8, a knife mounted on the ends of the arms 5, and a roller mounted on the ends of the arms 8, substantially as described.

3. The combination of the standards for supporting the paper roll, the pair of spring-pieces—one at each end of the machine—having arms 5 and 8, a knife mounted on the ends of the arms 5, and a printing-roller and an inking-roller mounted on the ends of the arms 8, substantially as described.

4. The combination, with the base and the standards, of the pins 10, located at the lower ends of the standards, the pair of spring-pieces having coils 9 around the pins and provided with arms 5 and 8, the knife 4, secured to the ends of the arms 5, the printing-roller 6, journaled to the ends of the arms 8, and the inking-roller 7, journaled to the arms 8 beneath the printing-roller, substantially as described.

408,598. **ROLL-PAPER HOLDER AND CUTTER.** LEO EHRLICH, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed Oct. 6, 1888. Serial No. 287,427. (No model.)



Claim.—1. The combination of the paper-roll, support for the roll, a knife fitting on the roll, rods extending upwardly from the knife, and a cross-piece through which the rods pass, substantially as set forth.

2. The combination of the paper-roll, support for the roll, a knife fitting on the roll, rods extending upwardly from the knife, cross-piece through which the rods pass, and sleeves on the cross-piece, substantially as set forth.

3. The combination of the roll, support for the roll, knife resting on the roll, rods extending upwardly from the knife, cross-piece through which the rods pass, sleeves secured to the cross-piece, and heads on the upper ends of the rods, substantially as set forth.

4. The combination of the paper-roll, support for the roll, knife resting on the roll, rods extending upwardly from the knife, cross-piece through which the rods pass, and sleeves on the cross-piece, the sleeves being slightly inclined to give an inclination to the knife, substantially as set forth.

408,599. **METAL LATHING.** IRA S. BLAKE, New York, N. Y. Filed Apr. 22, 1889. Serial No. 308,193. (No model.)

Claim.—1. A metal lath consisting of a piece of metal formed with a series of pairs of parallel slits arranged at suitable intervals, and having the body of the metal between the slits of each pair drawn forward or upward to form loops, all upon the same side of the sheet, and the edges of the slits adjacent to the loops being provided with forwardly or upwardly turned flanges.

2. A sheet-metal lath having loops made in its face, arching over the openings thus formed, the edges of the openings having upward flanges, substantially as specified.

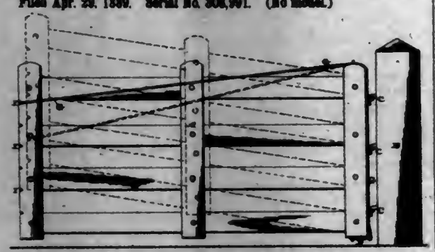
3. As a new article of manufacture, a sheet-metal lath having loops made at regular intervals over its entire surface on one side only, and upwardly or forwardly turned flanges along the edges of the said openings, substantially as described.

4. A metal lath having expanded loops on one side only, the said loops covering or arching over the openings from which the loops are formed, substantially as described.

408,600. **INSULATING-COUPLING FOR PIPES.** ERSKINE R. BRICKSON, Boston, Mass., assignor of one-half to Winthrop Thayer, same place. Filed Mar. 5, 1888. Serial No. 301,902. (No model.)

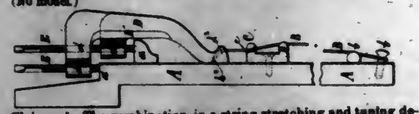
Claim.—1. An insulating pipe-coupling consisting of two inter-

408,601.



nally-threaded metallic sleeves a^4, and a connecting-piece b, of hardened plastic insulating material, in which said metallic sleeves are embedded separated from each other, said insulating connecting-piece having a hole b^2 between said sleeves.

2. An insulating pipe-coupling consisting of two internally-threaded metallic sleeves a^4 and a connecting-piece b, of hardened plastic insulating material, in which said metallic sleeves are embedded separated from each other, said insulating connecting-piece having the hole b^2 between said metallic sleeves and a polygonal exterior, substantially as set forth.



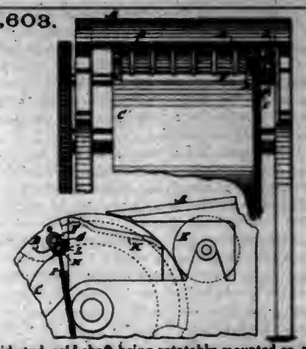
3. The insulating-coupling herein described, comprising the metal sleeves a^4, having shoulders a^5 and longitudinal recesses a^6, with the compressed insulating-connection b of formative material, having the interposed section b', and surrounding and firmly united to the said sleeves a^4, substantially as described.

408,601. GATE. ALEXANDER FAWCETT, Mount Vernon, Ohio. Filed Apr. 29, 1889. Serial No. 308,991. (No model.)

Claim.—The combination of the gate with the clevis secured to its lower inner corner, and the brace-wire, which extends along up the outer edge of the inner stile, over its top and along over the top of the gate, so as to engage with notches formed in the free end of the gate, substantially as shown and described.

408,602. STRING STRETCHING AND TUNING DEVICE. ABRAHAM PELLER, Auburn, N. Y. Filed May 23, 1888. Serial No. 275,276. (No model.)

Claim.—1. The combination, in a string stretching and tuning device, of a string-frame, as A, having the string-holding studs b, bridges b' D, agraffe C, and shoulder or shoulders c, for the stretching-screws, the suspender-yokes and stretching-screws, said yokes bridging said shoulders and having toes of the string ends bearing at one side of the shoulders on the surface of the string-frame, and heads for the adjusting-screws on the other side of the shoulders and in line with the surface of the string-frame or thereabout, substantially as described.

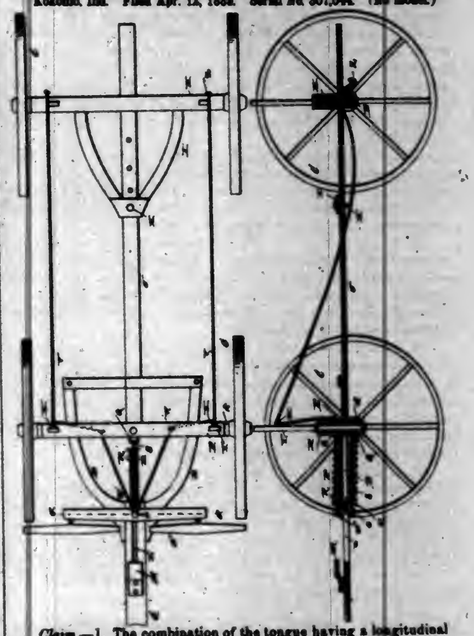


2. The combination, in a string-stretching device, of a string-frame, as A, having the string-holding studs b, bridges b' D, agraffe C, and upper and lower shoulders c, for the stretching-screws, the suspender-yokes and stretching-screws, said yokes bridging said shoulders and having toes of the string ends bearing at one side of the shoulders on the surface of the string-frame, and heads for the adjusting-screws on the other side of the shoulders gaged for the bearing of the adjusting-screws on the upper and lower shoulders alternately, substantially as described.

3. The combination of an agraffe C, having vertical slots c', provided with side notches c, with a bridge D, said bridge and agraffe being both rigid upon a common bar G, securable to the string-frame.

408,603. GRIPPER-MOTION FOR PRINTING-MACHINES. GEORGE P. FRISBEE, New London, Conn. Filed Mar. 14, 1889. Serial No. 303,283. (No model.)

Claim.—1. The combination, with the gripper-shaft F, having fingers or grippers, and an arm G, provided with a stud H, of a cam



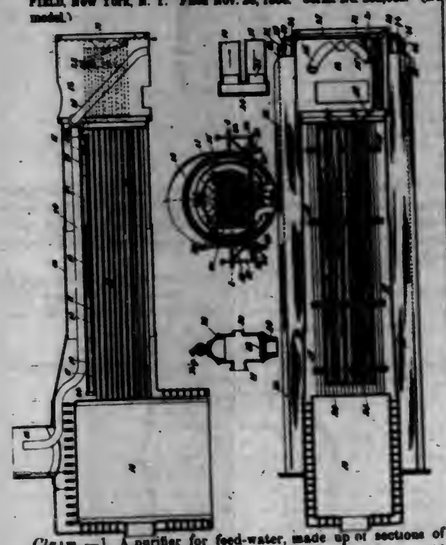
408,603.

K for said stud, said shaft being rotatably mounted so that the stud H can be swung out of action while the cylinder is rotating, and means, substantially as described, for holding the stud out of action.

2. The combination, with the gripper-shaft F, having fingers or grippers, and an arm G, provided with a stud H, of a cam K for said stud, a spring-rod I, and a stop L, for holding the stud in position out of reach of the cam, substantially as described.

408,604. RUNNING-GEAR FOR VEHICLES. JOHN H. FRANCIS, Kokomo, Ind. Filed Apr. 12, 1889. Serial No. 307,044. (No model.)

Claim.—1. The combination of the tongue having a longitudinal slot at its rear end, the stop or bracket at the front end of said slot, the longitudinally-sliding doubletree, the hammer-bolt extending through the doubletree and through the slot in the tongue, and springs connecting the upper and lower ends of the hammer-bolt with the front axle and sand-board, respectively, and serving to draw the hammer-bolt and doubletree in a rearward direction, substantially as and for the purpose set forth.



2. The combination of the front axle and sand-board, the staples secured to the front sides of the same, the hounds, the tongue mounted pivotally between the front ends of the latter and having a longitudinal slot at its rear end, a stop or bracket at the front end of said slot, the doubletree connected to the tongue by means of the hammer-bolt arranged to slide in the longitudinal slot on the tongue, and the spring-connections between the upper and lower ends of the hammer-bolt and the staples of the front axle and sand-board, said spring-connections comprising the bails arranged in pairs, connected, respectively, to the said staples and to the upper and lower ends of the hammer-bolt, and the springs coiled around the said bars and confined by the

hooked ends of the legs of the latter, substantially as and for the purpose set forth.

3. The combination of the longitudinally-sliding doubletree, springs arranged to force the latter in a rearward direction, and wire ropes attached to the rear side of the doubletree, passing through suitably-arranged guides, and provided with hooks at their free ends, substantially as and for the purpose set forth.

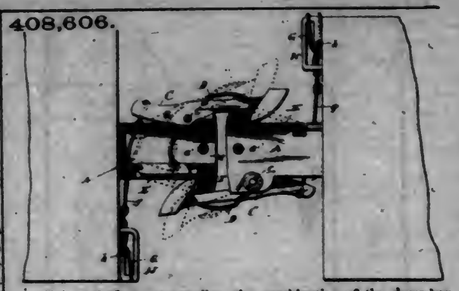
4. The combination of the tongue having a longitudinal slot at its rear end, the hammer-bolt moving in said slot and carrying the doubletree, springs connecting the upper and lower ends of the hammer-bolt with the front axle and sand-board, respectively, and serving to draw the said hammer-bolt and doubletree in a rearward direction, a staple attached to the rear side of the doubletree, and wire ropes attached to the said staple, passing through suitable guides upon the sand-board and front wagon-stakes, and provided with hooks at their free ends adapted to engage the spokes of the hind wheels, substantially as and for the purpose hereinbefore specified.

408,605. FEED-WATER HEATER AND PURIFIER. GEORGE B. FIELD, New York, N. Y. Filed Nov. 26, 1888. Serial No. 292,062. (No model.)

Claim.—1. A purifier for feed-water, made up of sections of sheet-metal pipe joined together and having in one or more of said sections a coil of sheet metal for arresting the sediment.

2. A feed-water purifier for boilers, made up of sections of sheet-metal pipe, having in one or more sections a coil of sheet metal and scrap-iron for arresting the sediment.

3. The combination to form a feed-water purifier, located wholly within the boiler, of cylindrical sheet-metal pipes 18, joined together in the manner described, one or more coils of sheet metal located in the sections of said purifier, and castings 24, joining the adjacent lengths of the feed-water purifier together, in the manner described.



4. A feed-water heater consisting of a coil of pipe arranged within the smoke-box of a locomotive and having a water-circulating pipe 38 connected to the upper and lower parts of the coil, for the purpose described.

5. The combination, with a locomotive-boiler, of a feed-water purifier located wholly within said boiler, a coil of pipe communicating with said purifier arranged in the smoke-box of said locomotive in the direction of the length of the same between one of the steam-pipes and the shell of the smoke-box, a water-circulating pipe 38, connecting the upper and lower part of said coil of pipe together, and a feed-water connection, substantially as and for the purpose described.

6. The combination, with a locomotive-boiler, of a feed-water purifier located wholly within said boiler and made up of sheet-metal pipes having one or more coils of sheet-iron therein, together with scrap-iron, a coil of pipe located within the smoke-box communicating with said purifier, a circulating-pipe connecting the upper and lower part of the coils together, a pump and injector connection opening into said coil, and blow-offs controlled in the manner described.

408,606. CAR-COUPLING. JAMES A. FLEMING, Hoopeston, Ill. Filed May 1, 1889. Serial No. 309,196. (No model.)

408,606.

Claim.—1. In a car-coupling, the combination of the draw-bar having a lateral projection F at one side, the releasing-plate E on the same side of the draw-bar as projection F, the hook C, pivoted between its ends to the side of the draw-bar opposite the plate E and projection F, and the link e, connecting the hook C with the plate E, substantially as and for the purpose described.

2. The combination, with the draw-bar and the coupling-hook, of the lever G, pivoted between its ends and connected with the said hook, the ends of the said lever being yielding, and the notched keepers, substantially as and for the purpose described.

3. The herein shown and described coupling, composed of a draw-bar having a throat a, vertical opening a', and a lateral extension F, the coupling-hook C, pivoted to the draw-bar between its ends, the releasing-plate E, connected by link e with the hook C, the spring D, the operating-lever G, and the notched keepers H, substantially as and for the purpose described.

408,607. ELECTRIC DRINKING-VESSEL. FREDERICK W. PLANT, Mount Airy, Ga. Filed May 6, 1889. Serial No. 309,703. (No model.)

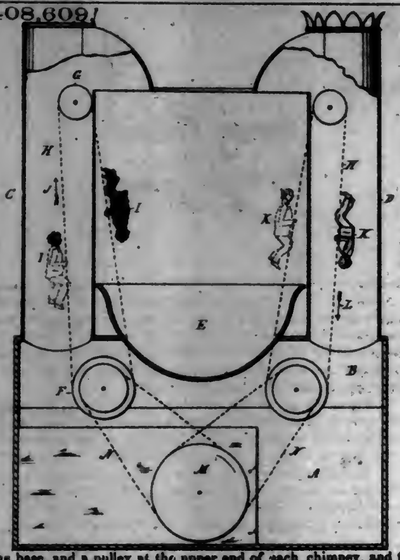
Claim.—1. A drinking-vessel constructed partly of a non-conducting and partly of a conducting material, and provided with a suitable battery-connection, the said vessel being adapted to contain a beverage or liquid, which will serve in connection with the said vessel as an electrode for establishing a circuit through the body or system of the drinker when imbibed, substantially as specified.

2. A drinking-vessel constructed partly of non-conducting and partly of conducting material, the latter having a suitable battery-connection, in combination with an electrode applied to the handle thereof, whereby an electric current may be established through the body or system of the drinker during the act of drinking from said vessel, substantially as specified.

3. A drinking-vessel constructed of non-conducting material having an internal electrode adapted to be brought into contact with the contents of the vessel, and an external electrode to be grasped by the hand during the act of drinking to complete the circuit through the body of the drinker, substantially as specified.

408,608. PROCESS OF REMOVING VERMIN OR SCALES FROM PLANTS. EDWIN P. FOWLER, National City, Cal. Filed Jan. 24, 1889. Serial No. 297,436. (No specimens.)

Claim.—1. The process of removing vermin or scale from plants or trees, which consists in exposing the plants or trees to an artificial current of air charged with sand, substantially as set forth.



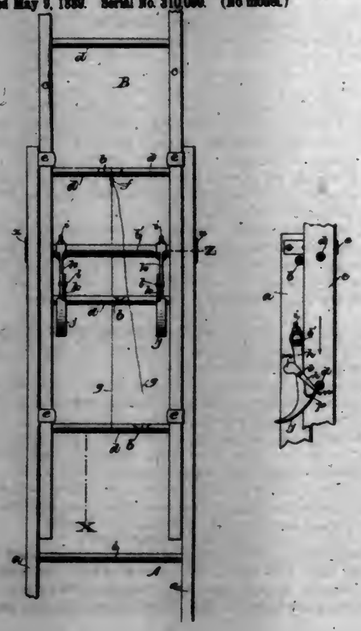
2. The process of removing vermin or scale from plants or trees, which consists in exposing the plants or trees to an artificial current of heated air charged with sand, substantially as set forth.

3. The process of removing vermin or scale from plants or trees, which consists in exposing the plants or trees to an artificial current of air charged with hot sand, substantially as set forth.

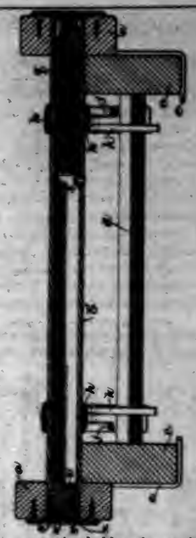
408,609. ADVERTISING DEVICE. ROBERT FREELAND, Cincinnati, Ohio. Filed Mar. 5, 1889. Serial No. 301,993. (No model.)

Claim.—1. An advertising toy consisting of the house A, having a chimney at each end, the basin E between the chimneys, the drum

408,609.



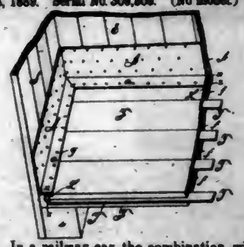
at the base, and a pulley at the upper end of each chimney, and the chain H, having the figures I and K attached thereto, substantially as and for the purposes set forth.



2. An advertising toy in representation of a house or factory, having mounted thereon two chimneys and a basin between them, in combination with an endless belt or chain having a figure thereon, which passes down into the basin, and a similar figure of a different color placed on a similar chain on the other side of the basin, which emerges from the basin, substantially as herein set forth.

3. In an advertising device, the combination, with belts having figures attached thereto and drums and pulleys over which said belts pass, of smoke-stacks up and down through which said figures can be caused to move alternately and a representation of a water-basin through which said figures appear to pass down and up, substantially as and for the purposes described.

408,610. EXTENSION-LADDER. CHARLES FERRELL, Boston, Mass. Filed May 9, 1888. Serial No. 310,069. (No model.)



408,610.

Claim.—1. In an extension-ladder, the combination of a hollow rung, a pair of hooks secured on said rung, a spring arranged in the rung to actuate the same and the hooks thereon, and a clutch interlocked with the rung, all combined and arranged to operate substantially as specified.

2. The combination, in an extension-ladder, of a hollow rung *b*, hooks *h*, secured on said rung, spring *g*, arranged in the rung to actuate it, and cam-plate *x*, interlocked with the rung to control the rotation thereof, all substantially as specified.

408,611. RAILWAY-CAR. MYERS A. GARRETT, Englewood, Ill. Filed May 6, 1889. Serial No. 309,809. (No model.)

Claim.—1. In a railway-car, the combination, with a water-tight floor, of a water-tight strip extending around the outer edge of said floor, one edge of said strip being secured water-tight to the top surface of said floor and the other edge carried upward therefrom and secured to the car, substantially as set forth.

2. In a car, the combination, with a water-tight floor having a groove extending around the outer edge thereof, of a water-tight strip secured water-tight around the outer edge of said floor, said strip having a lip projecting into said groove, substantially as set forth.

3. In a car, the combination, with the water-tight floor having the groove *g* extending around the outer edge thereof, of the strip A, having the lip L projecting downward into said groove, so as to form a water-tight joint, said strip being extended up and secured to the sides of the car, substantially as set forth.

4. In a car, the combination, with a water-tight floor having a groove around the outer edge thereof, of the continuous water-tight strip A, extending completely around the interior of the car save at the doorways, said strip being bent to fit the angle formed by the sides and floor and secured therein and provided with a lip projecting into said groove, substantially as set forth.

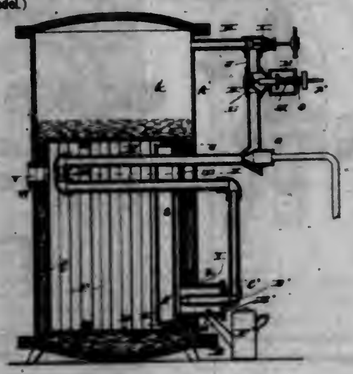
5. In a car, the combination, with the floor F and the strip A, secured water-tight around the outer edge thereof, of the tongues T, interposed between the strips of flooring, forming water-tight joints and extending outward beyond the inner edges of strip A, substantially as set forth.

6. In a car, the combination, with the floor having the groove *g* around its outer edge, and the strip A, secured water-tight around the outer edge of the floor and having the lip L projecting downward into said groove, of the separate tongues T, fitted water-tight between the strips *f* and extending outward beyond the lips L, substantially as set forth.

7. In a car, the combination, with the floor having the groove *g* extending around its outer edge, and the strip A, secured water-tight around the outer edge thereof and having the lip L projecting down into said groove, of the tongues T, fixed water-tight between the strips of flooring, extending outward beyond the lips L and having their ends bent upward, terminating above the lower edges of said lips, substantially as set forth.

8. In a car, the combination of the floor F, having the groove *g* extending around its outer edge, the strip A, extending around the interior of the car save at the doorways, bent to fit the angle formed by the floor and sides of the car and there secured water-tight, said strip having the lip L extending down into said groove, and the separate tongues T, fixed water-tight between the strips of flooring, extending outward beyond the lips L and bent upward, terminating above the lower edges of said lips, substantially as set forth.

9. In a car, the combination of the floor F, formed of strips *f*, having grooves O in their meeting edges, said floor having the groove *g* extending around the outer edge thereof, the strip A, bent to fit the angle formed by the floor and sides of the car, secured therein water-tight, and having the lip L extending down into said grooves *g*, and the separate tongues T of slightly greater thickness than the width of grooves O, having their opposite edges forced into said grooves, so as to form water-tight joints, said tongues extending outward beyond the lips L, and having their ends bent upward, terminating above the lower edges of said lips, substantially as set forth.

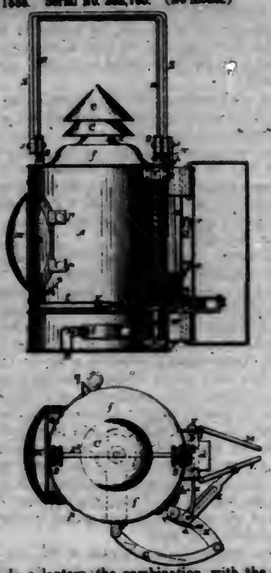


408,612. CHILD'S ADJUSTABLE CHAIR. CYRUS P. GIFFORD and CHARLES A. ALLEN, North East, Pa., assignors to Robert J. Moorhead and Marvin A. Caldwell, same place. Filed Sept. 21, 1888. Serial No. 286,032. (No model.)

Claim.—1. In a convertible chair, the combination, with the outer rockers pivoted to the front legs of the chair, of the inner rockers pivoted centrally to the outer rockers and forming a double rocking surface at the base of the chair, a round journaled in the rear ends of the said inner rockers, and sliding links pivoted to the rear legs of the chair and engaging with the said round, substantially as and for the purpose set forth.

2. In a convertible chair, the combination, with the outer rockers provided with ears *e e*, pivoted to the front legs of the chair, of the inner rockers pivoted centrally to the outer rockers and provided with grooves *h* in their ends for engaging with the rounds *d* of the chair, the revoluble round E, journaled in the inner rockers, and the links F F, pivoted to the rear legs of the chair and free to slide back and forth in holes formed through the said round E, substantially as and for the purpose set forth.

408,613. STEAM-GENERATOR. OLIVER F. GILBERT and GILBERT W. FARRAR, East Saginaw, Mich. Filed Mar. 5, 1889. Serial No. 301,996. (No model.)



Claim.—1. In a steam-generator, the combination, with an outer shell or casing, of an interior shell or casing constituting the fire-box, said inner casing having openings near its upper and lower ends connected with corresponding openings in the outer casing by steam-tight flanges or collars, a refractory tube arranged vertically in the inner casing and provided at its upper end with an opening registering with the openings in the shells or casings and at its lower end with a transverse perforation, and the fuel-supply pipe entering through a tube adjusted in the lower openings of the casings, substantially as set forth.

2. The combination of the outer casing constituting the boiler, the inner casing constituting the fire-box, the steam-pipe equipped with a globe-valve and a check-valve, an injector connected with said steam-pipe and supplying liquid hydrocarbon, a refractory air-supply pipe located in the fire-box, and a torch arranged below the burner of the fuel-supply pipe, substantially as set forth.

3. The combination of the outer casing or boiler, the inner casing or fire-box, and the fuel-supply pipe extending through the tube-casings and having a return-bend in the fire-box, substantially as set forth.

4. The combination of the outer shell or boiler, the inner shell or fire-box, the vertical water-flues connecting the heads of the latter, the refractory air-supply pipe located in the fire-box, the fuel-supply pipe having a check-valve adapted to regulate the steam-supply, said fuel-supply pipe extending through the upper portion of the fire-box, a torch arranged to ignite the fuel, and suitably-arranged pipes to carry off the products of combustion, all arranged and operating substantially as and for the purpose set forth.

408,614. LANTERN. HUMPHREY G. GRIFFITH, Indianapolis, Ind. Filed Aug. 15, 1888. Serial No. 282,765. (No model.)

Claim.—1. In a lantern, the combination, with the outer case adapted to receive a lamp and provided with an opening in its side through which the light passes, and a slot, of a revolving shutter placed therein, provided with an operating-pin which projects through the slot, a handle pivoted upon the lantern, and a rod connecting the handle and the shutter, whereby the shutter is operated by the movement of the handle, for the purpose set forth.

2. In a lantern, the combination, with a slotted case adapted to receive a lamp and provided with an opening through its side through which the light passes, and the disk Q, having a central aperture the edge of which is turned up to form a bearing, and through which opening the wick-tube passes, of a cylindrical revolving shutter having an opening to register with the opening in the side of the case, a disk at its lower end having a central aperture fitting over the upturned edge of the aperture in the disk Q, and a pin which projects through the slot in the case for operating the shutter, whereby a simple bearing is formed for the shutter, substantially as shown.

3. In a lantern, the combination of the slotted case having an opening in its side through which the light passes and adapted to receive a lamp, a revolving shutter placed therein having an opening, a pin upon the shutter extending through the slot in the case, a handle pivoted to the case, connections between the handle and the pin, and

a second handle pivoted near the said first handle having a limited movement, whereby, when the two handles are brought together, the shutter is caused to partially revolve, substantially as set forth.

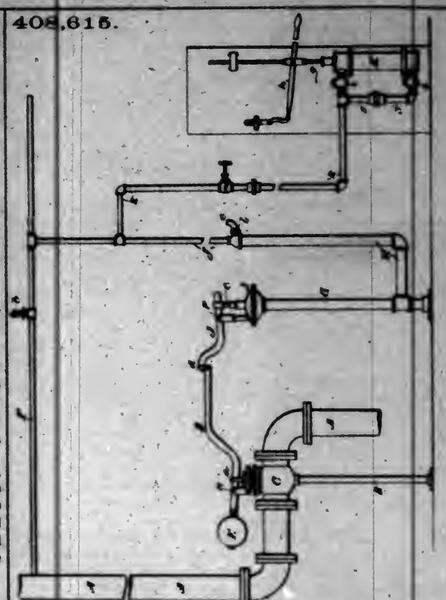
4. In a lantern, the combination of the slotted case having an opening in its side, a revolving cylindrical shutter placed therein, having an opening in its side, an operating-pin which passes through the slot formed in the case, a handle pivoted upon the case, and a spring-actuated rod connecting the shutter and the handle, whereby the shutter is made to close the opening in the case when the handle is not operated, substantially as specified.

5. The combination of the case A, shutter B, journaled therein, having pin F, the vertical spring-actuated rod Y, journaled upon the case, the arm H, secured thereto, the handles M L, pivoted to the case, and the levers K G, for connecting the handles and the pin F together, whereby, when the handle L is operated, the shutter is given a partial revolution, substantially as described.

6. The combination of the case having an opening for the passage of light, a revolving shutter placed therein having an opening for the passage of light, the slot *t* in the case, pin F, connected to the shutter, vertical rod Y, lever G, arm H, secured to the rod Y, lever K, connecting the arm H and the handle L, the handles L M, pivoted to the case, and the spiral spring Z, surrounding the rod Y, having its upper end bearing upon the case and its lower end formed into a lever *a* and bent downward so as to engage the arm H, for returning the shutter to position when the grasp upon the handles L M is released, substantially as set forth.

7. The combination of a case having an opening through its side, a revolving shutter placed therein, having an opening in its side, the pin F, slot *t*, lever G, spring-actuated rod Y, arm H, lever K, the handle M, pivoted to the case and having a limited movement, and the handle L, pivoted to the case and having its lower end formed into a crank X and engaging the lever K, whereby, when the handle L is operated, the shutter is caused to partially revolve, for the purpose specified.

8. The combination of the slotted case having an opening in its side, a revolving shutter placed therein, provided with an operating-pin which projects through the slot made in the lower end of the case and an opening in its side, the handles L M, pivoted to the back side of the case, the lever G, spring-actuated rod Y, arm H, and the lever K, connecting the arm H and handle L, said lever provided with a longitudinal slot, whereby the handle L can be separated from the one M and folded against the side of the case, out of the way, substantially as described.

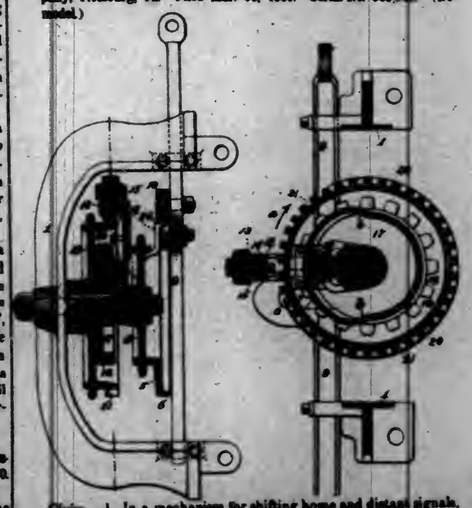


9. In a lantern, the combination of the slotted case provided with an opening in its side, a revolving shutter placed therein, having an opening, and an operating-pin which projects through the slot in the lower end of the case, the operating-bail R, engaging the lever T, the bail S, having a limited movement, and the lever T, connecting-rod I, arm H, spring-actuated rod Y, and the lever Q, connecting the arm H and operating-pin F, whereby, when the bail R is operated, the shutter is given a partial revolution, for the purpose specified.

10. In a lantern, the combination of a slotted case having an opening for the passage of light, a revolving shutter placed therein, provided with an opening in its side, and an operating-pin projecting through the slot, the lever G, arm H, spring-actuated rod Y, connecting-rod I, pivoted to the lower end of the lever T, the lever T, pivoted upon the upper end of the case, and the bails R S, pivoted to the upper end of the case, the bail R engaging the lever T, whereby, when it is operated, the shutter is given a partial revolution, for the purpose substantially as set forth.

11. In a lantern, the combination of the case provided with a revolving shutter for the purpose described, the frame *d*, secured to its rear side, the disks P Q, secured in the shutter and case, respectively, the case having a slot or opening opposite the space between the two disks, and perforations in its bottom for the admission of air to the opening, whereby air for combustion is fed directly to the flame, substantially as shown and described.

12. In a lantern, the combination of the case provided with a revolving shutter for the purpose described, an operating-pin secured to the shutter and which projects through an opening in the case, the lever G, arm H, spring-actuated rod Y, connecting-rod I, lever T, ears *g g*, secured to the top of the case, and the bails R S and lever T, journaled upon the same bearing which passes through the ears, the bail S having its lower ends extending below its pivotal point to form a stop, the bail R having one of its lower ends to extend below its pivotal point and which engages the lever T, whereby, when the bail R is operated, the shutter is given a partial revolution, for the purpose specified.



408,615.

valve which seats against the fluid-pressure, and a stem extending above it, a lever pivoted at one side of said stem so as to bear thereon, a diaphragm-motor actuated by a water-column subjected to the air-pressure in the distributing-pipes, and a lever engaged and actuated by the piston of said motor and connected with the valve-controlling lever to thereby hold the valve to its seat, substantially as specified.

2. In fire-extinguishing apparatus, the combination of supply-pipe A, having a water-distributing system therewith connected, valve C, having stem *a* extending above the valve, lever D, pivoted at one side of said stem and engaging it, diaphragm-motor I, its stand-pipe G, closed at the bottom and having branch pipe H, air-pump K, connected by a conduit with pipe H and the distributing system, and pivoted lever J, connected at one end with stem *e* of the motor and at the opposite end connected with lever D, to control the same, and thereby the valve, substantially as specified.

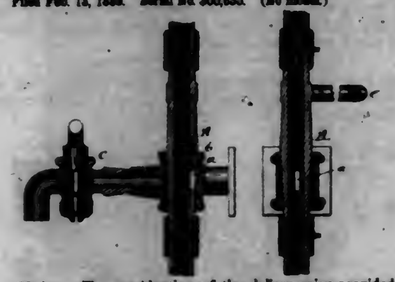
408,616. MECHANISM FOR OPERATING SIGNALS. JAMES T. HANRAY, Wilkinsburg, assignor to the Union Switch and Signal Company, Pittsburg, Pa. Filed Mar. 30, 1889. Serial No. 305,340. (No model.)

Claim.—1. In a mechanism for shifting home and distant signals, the combination of a wheel provided with means for operating the

---

408,615. AUTOMATIC FIRE-EXTINGUISHING APPARATUS. OSBORN B. HALL, Malden, Mass. Filed Feb. 26, 1889. Serial No. 301,570. (No model.)

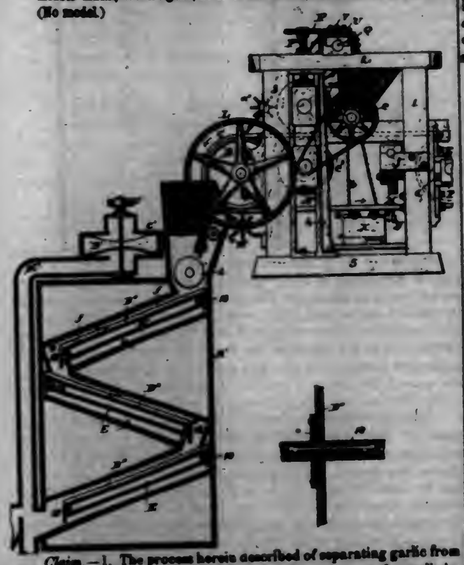
Claim.—1. In an automatic fire-extinguishing apparatus, the combination of a main supply-pipe provided with an intercepting-



home-signal, a wheel provided with means for operating the distant signal, and a lock for so connecting said wheels as to cause them to rotate together, substantially as set forth.

2. In a mechanism for shifting home and distant signals, the combination of a wheel provided with means for operating the home signal, a wheel provided with means for operating the distant signal, and a lock operated by the home signal wheel for locking said wheels together, substantially as set forth.

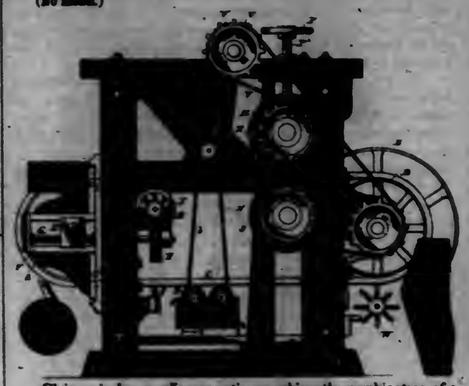
3. In a mechanism for shifting home and distant signals, the combination of a horizontally-slotted signal-bar having a friction-roller 10 mounted thereon, a wheel provided with a pin for engaging the slot in the signal-bar and with a flange for engaging the friction-roller 10, a wheel provided with means for operating the distant signal, and a lock for connecting said wheels, substantially as set forth.



4. In a mechanism for shifting home and distant signals, the combination of a wheel for operating the home signal, a radially-moving slide having a latch mounted on said wheel, a stationary disk having a cam-groove formed therein adapted to engage and operate the slide, and a sprocket-wheel for operating the distant signal having pockets for the reception of the latch, substantially as set forth.

408,617. SUPPLY AND WASTE COCK. CLARK HAY, Portland, Oreg. Filed Feb. 13, 1889. Serial No. 300,035. (No model.)

Claim.—The combination of the delivery-pipe provided with faucets at intervals on the same for supplying water to the different floors of a building, said delivery-pipe being provided with openings and having the supply and waste valve connected therewith, and means for turning said pipe to admit water and allow the same to be drained to prevent freezing, as and for the purposes set forth.



408,618. METHOD OF SEPARATING GARLIC FROM WHEAT. AUSTIN HERR, Washington, D. C. Filed Dec. 20, 1886. Serial No. 222,911. (No model.)

Claim.—1. The process herein described of separating garlic from wheat, which consists in first crushing or flattening out the garlic by pressure sufficient to crush the garlic but not the wheat, then separating the hulls, and finally drying the material by evaporating the juices therefrom, substantially as described.

2. The process herein described of cleaning and separating garlic from wheat, which consists in crushing or flattening out the garlic without injuring the wheat, then drying or evaporating what remains of the garlic and juices of same, and finally completing the separation by induced air currents or blasts.

408,619. MACHINE FOR SEPARATING GARLIC FROM WHEAT. AUSTIN HERR, Washington, D. C. Filed Mar. 20, 1886. Serial No. 262,944. (No model.)

Claim.—1. In a garlic-separating machine, the combination of a traveling band of partially-vulcanized india-rubber, two or more hard-faced rolls operating upon the surface of said band, and means for operating the band and rolls, substantially as described.

2. In a garlic-separating machine, the combination of the upper roll, having movable bearings and means for adjusting the same, the lower roll having stationary bearings, the intermediate traveling elastic resilient band, and means for operating the whole, substantially as described.

3. In a garlic-separating machine, the combination of two rolls, a revolving cylinder at each end of the machine beyond the rolls, means for adjusting one of said cylinders longitudinally of the belt, a resilient elastic band passing around the cylinders and between the rolls, and means for operating the parts, substantially as described.

4. In a garlic-separating machine, the combination of two rolls supported in bearings one above the other, means for adjusting the said rolls with relation to each other, two cylinders supported in bearings at opposite ends of the machine, means for adjusting said cylinders with relation to each other, an elastic band passing around the cylinders and between the rolls, and means for operating the parts, substantially as described.

5. In a garlic-separating machine, the combination, with the traveling resilient elastic band, of the tank and washing-rolls located beneath the same, and means for revolving the said rolls against the surface of the band, substantially as described.

6. In a garlic-separating machine, the combination of the hopper feed-roll bearing at one end a sprocket-wheel, the tank X, and the sponge-rolls Z Z, each bearing also a sprocket-wheel, and the sprocket chain or belt passing around these wheels, substantially as shown, and for the purpose described.

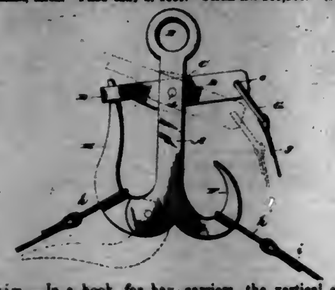
7. In a garlic-separating machine, the combination, with the traveling resilient elastic band or belt, of the scraper W, and the tank and washing-rolls, and means for operating said rolls, substantially as described.

8. In a garlic-separating machine, the combination, with the traveling resilient elastic belt, of the tank and washing-rolls, the squeegee *g*, and the blower following thereafter, substantially as shown, and for the purpose described.

9. In a garlic-separating machine, the combination of the two rolls, each bearing a sprocket-wheel at one end of its shaft, the two cylinders arranged at opposite ends of the machine, the shaft of one having a corresponding wheel, the idler U and sprocket-chain, and the resilient elastic band passing around the cylinders and between the rolls, the whole adapted to operate substantially as described.

10. In a garlic-separating machine, the combination, with the frame having slotted extensions F, of the cylinder A, supported in bearings movable in said slotted extensions, the screws G, carrying worm-wheels H, the shaft J, having hand-wheel and provided with worms engaging said wheels H, the opposite cylinder B, having fixed bearings, and the resilient elastic belt passing and traveling around the two cylinders, substantially as shown and described.

11. In a garlic-separating machine, the combination, with the rolls M N, of the hopper feed-roll *d*, bearing at one end a sprocket-wheel



and at the other the pulley *c*, the tank, and the sponge-rolls having sprocket-wheels corresponding to *d*, the sprocket-belt *b*, and the belt c^2, connecting the pulley *c* with the shaft of roll N, substantially as shown, and for the purpose described.

12. In a garlic-separating machine, the combination, with the elastic traveling band, of a scraper, washer, and drier for said band, the same being successively arranged beneath the band and operated by suitable means, substantially as described.

13. In a garlic-separating machine, the combination, with the rolls, the cylinders, and the traveling elastic band passing around the cylinders and having its surfaces operated upon by the rolls, of a hopper for feeding the material to the band at the bite of the rolls, substantially as described.

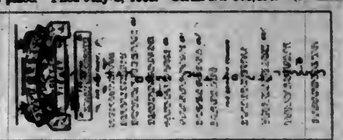
14. In a garlic-separating machine, the combination, with two or more hard-faced rolls, an intermediate traveling elastic band, and means for operating said band and rolls, of a suitable drying or evaporating apparatus for the grain or material, substantially as described.

408,620. **HOOK FOR HAY-CARRIERS.** THOMAS J. HITCHCOCK, Portland, Mich. Filed May 2, 1889. Serial No. 309,379. (No model.)

Claim.—In a hook for hay-carriers, the vertical shank A, provided with intermediate horizontal recess C, having inclined walls, an eye B at its upper end, and with oppositely-extending integral complete and incomplete hook portions at its base, an extended member E, having its inner extremity pivotally connected to said incomplete portion, and a latch-bar D, centrally pivoted in said recess and having a vertically-perforated end to engage the upper extremity of said member E to form a closed hook, and perforated at its other end for the attachment of an operating-cord, substantially as set forth.

408,621. **ROLL-PAPER HOLDER AND CUTTER.** EDWARD HOFFMAN, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed June 20, 1888. Serial No. 278,013. (No model.)

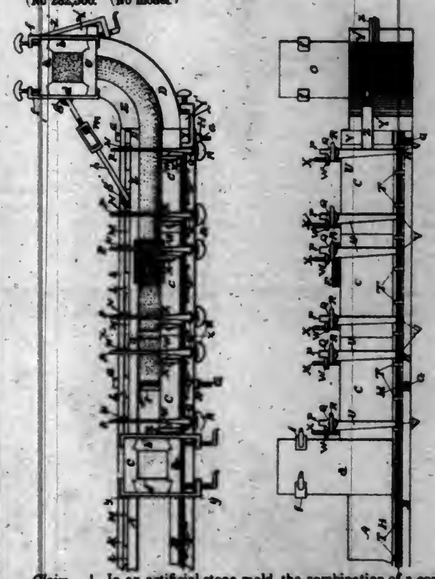
Claim.—1. In a roll-paper holder and cutter, the combination of the posts or standards, a roll of paper, and vertically-movable bearings for securing the roll of paper to the standards, substantially as and for the purpose set forth.



2. In a roll-paper holder and cutter, the combination of the posts or standards, a roll of paper, and vertically-movable bearings consisting of slotted sleeves and tightening screws, substantially as and for the purpose set forth.

3. In a roll-paper holder and cutter, the combination, with a roll and frame supporting the roll, of a horizontal knife mounted on the frame by bearings that will prevent its rocking, feeding by gravity, resting upon the roll, and having an edge against which the paper is cut in an upward direction and which projects beyond the point of contact of the knife with the roll, whereby cutting-pressure on the knife binds it to prevent its removal from the roll, as explained.

4. The combination, with the freely-suspended roll of paper, of a floating weighted cutter-bar held by gravity alone against the periphery of said roll and having a cutting-edge removed from the point of contact between said bar and roll, whereby said cutter-bar is caused to act as a friction-brake to the roll to adapt itself automatically to the size and contour of the roll and to serve as means for severing the free end of the paper when the latter is pulled upward against it, substantially as described.



5. A roll-paper holder and cutter embodying supports in which to suspend a roll of paper, a weighted cutter-bar for bearing by gravity alone upon the suspended roll of paper and having a cutting-edge removed from its contact or bearing point against which the paper is adapted to be separated by an upward draw upon it, and guides on which the cutter-bar works, substantially as described.

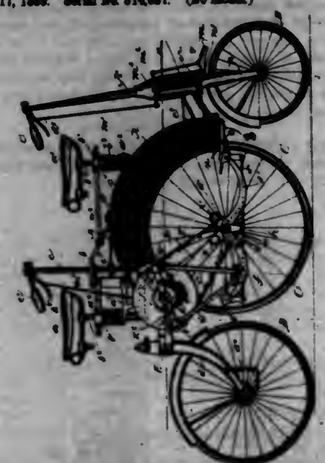
408,622. **METHOD OF CANCELING BALLOTS.** SILAS J. HOWELL, Boston, Mass., assignor to the American Ballot Box Association, same place. Filed July 2, 1885. Serial No. 170,490. (No model.)

Claim.—The method of canceling ballots voted upon in a voting-machine by printing a line of characters across the face of said ballots from end to end as they are passed one by one through the machine, so as to cross and mark every material thing or name or statement upon such ballot, whether there originally or applied thereto before voting, substantially as set forth.

408,623. **MOLD FOR ARTIFICIAL-STONE FENCES.** JOHN JENSEN and HENRY JENSEN, Santa Ana, Cal. Filed Aug. 9, 1888. Serial No. 282,300. (No model.)

Claim.—1. In an artificial-stone mold, the combination of a continuous facing-wall, as A, provided with sockets, as M, a continuous wall-sill, as B, provided with the rod S, removable means for securing the sill and wall to each other, with an intervening space between them, segmental facing-walls, as C, and the clamps comprising the upright arm N, the horizontal arm P, pivoted thereto at one end and being bent downward at the other end to form the depending arm Q, the screw R, the clamp U, provided at one end with the hook V and at the other end with the screw-seat W, and screw X.

2. In an artificial-stone mold, substantially such as set forth, the means for securing the segmental walls of the mold to the continuous wall thereof, comprising the combination of the sill, the rod S, secured thereto, the clamp U, provided with a hook at one end and the screw-seat W at the other end, the screw X, the horizontal arm P, provided with the depending arm Q and the screw R, the arm N, pivoted to the arm Q, the sockets M, and means for securing the sill and continuous wall to each other, with an intervening space between.



3. The combination of the continuous wall-facing provided with the sockets M, the sill B, the rod S, secured thereto, the segmental walls, the rods and nuts G H, bars I O, block J, clamps U, provided with the hook V, screw-seat W, and screw X, the arm N, the horizontal arm P, pivoted thereto and provided with the depending arm Q, and screw R.

4. In an artificial-stone mold, the combination of a continuous facing-wall, as A, a continuous wall-sill, as B, secured thereto, with an intervening space between the sill and the wall, segmental walls, clamps for securing the segmental walls to the sill, and the intermediate-post molds having three short sides extending upward from the top of the wall A and one long side extending upward from the top of the sill B.

5. The combination of the continuous wall-facing A, provided with the strip K and blocks L, the sill B, rod S, and staples T, segmental walls C, the clamps N P Q R and U V W X, and means for securing the sill B to the wall A, with an intervening space between them.

6. The combination of the continuous wall-facing A, provided with the strip K and the blocks L, the sill B, rod S, and staples T, segmental walls C, the clamps N P Q R and U V W X, the bars I blocks J, bolts G, and nuts H.

408,624. **TRICYCLE.** GOTTFRIED JOHNSON, Chicago, Ill. Filed June 17, 1889. Serial No. 314,637. (No model.)

Claim.—1. In a tricycle, the combination of three wheels placed one before the other, a main frame connecting said wheels, the steering-shafts, the drums having a connecting-chain provided with lugs, ratchet-wheels, the pawl-bearing levers, and the connecting-rods, all arranged and operating substantially as and for the purpose set forth.

2. In a tricycle, the combination of the main frame A, forked piece E, the drums *c c'*, chain F, ratchet c^3, pawls *h h*, levers *g g'*, connecting-rods *i i'*, treadle-arms *f f'*, having pedals *e e*, steering-shaft A', and wheels B C D, substantially as shown and described, and for the purpose set forth.

3. In a tricycle, the steering-shaft A', having the handle *c'*, brake *m*, lever m^2, rod *m'*, grip c^5, and a fork *n* at its lower end, in combination with the wheel B and the frame A, having connected thereto the wheels C D, substantially as and for the purpose set forth.

4. In a tricycle, the steering-shaft A', having the handle *c'*, brake *m*, lever m^2, rod *m'*, grip c^5, the hollow piece n^4, provided with plate n^5, having a square hole n^6, the shank *o'*, having shoulders o^2, fork *n*, and the spring *o*, encircling the shank *o'* and resting between the plate n^5 and shoulders o^2 within the hollow piece n^4, in combination with the wheel-bearing frame A, having sleeve n^3, and the wheel B, all constructed, arranged, and operating substantially as shown and described, and for the purpose set forth.

5. In a tricycle, the steering-shaft A', having handle *c'*, brake *m*, lever m^2, rod *m'*, grip c^5, the hollow piece n^4, having hole n^6 in plate n^5 and arm c^6, the compensating spring *o*, encircling the shank *o'*, having shoulders o^2, and fork *n*, carrying wheel B, in combination with the frame A, having the sleeve n^3, wheels C D, pulleys c^4 c^3, chains c^3, connected at one end to the arms c^6 and at the other end to arms c^4 on standard *c*, the standard *c*, having handle *c'*, brake, grip, and connecting-rods, substantially as shown and described, and for the purpose set forth.

6. In a tricycle, the combination of the seat *a'*, standard b^4, collar b', spring b^3, brace-bearings a^3 c^2, the frame A, having bracket-arms *b*, and wheels B C D, substantially as shown and described, and for the purpose set forth.

408,625. **PACKAGE OF SURGEON'S SILK OR CATGUT.** ROBERT W. JOHNSON, Elizabeth, N. J. Filed May 27, 1889. Serial No. 312,175. (No model.)

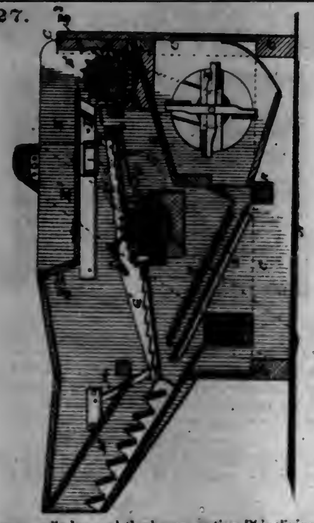
Claim.—The herein-described package of surgeon's silk or catgut, consisting of a bottle containing antiseptic liquid, a spool-holder consisting of non-metallic plates having perforations for the reception of the flanged ends of the bobbins and sewing material wound thereon, in combination with a disk, a tightly-compressed flexible tube passing therethrough and receiving said sewing material, and a flexible seal surrounding the flexible tube, substantially as described.

408,626. **STEP FOR RAILWAY-CARS.** FRANCIS W. JOHNS, near Perryville, Md. Filed June 26, 1889. Serial No. 315,505. (No model.)

Claim.—1. Steps for a railway-carriage, comprising a fixed frame and movable treads adapted to be folded so as to present a substantially plane surface, or opened to offer a foot-hold, the frame and treads constituting a close or tight surface in either position, whereby the circulation of air-currents through the steps is prevented.

2. Steps for a railway-carriage, comprising a fixed frame and a series of treads pivotally mounted so as to rock therein, fixed stops on the frame to limit the movement of the treads in either direction, and a shifting-lever accessible to an operator on the platform, adapted to rock all of the treads simultaneously in either direction.

3. Steps for a railway-carriage, comprising a fixed frame, a series of treads pivotally mounted so as to rock therein, dust bars or walls between the treads shaped to permit an opening and closing movement of the treads, the surface of the steps being closed at all points to prevent air-currents passing through in either position, and a controlling-lever for shifting the treads.

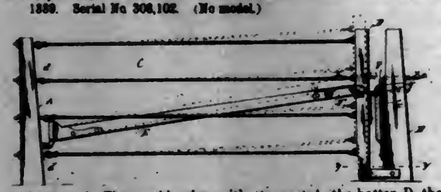


4. Steps for a railway-carriage, comprising a fixed frame having a series of pivoted treads, as 4, a series of dust-bars and stops, as 11 14, between the treads, a controlling-lever, as 9, connecting-rods, as 7, and a lock-piece for the lever in its extreme positions.

5. Steps for a railway-carriage, comprising a fixed frame, a series of treads pivotally mounted so as to rock therein, the frame and treads forming a substantially plane surface when closed and offering a foot-hold when opened, a gate on the platform leading to the steps, and a controlling device for simultaneously opening or closing the gate and the treads, as and for the purpose set forth.

408,627. **MACHINE FOR HULLING PEAS.** WILLIAM K. JOHNS, Trenton, Tenn. Filed May 2, 1888. Serial No. 308,830. (No model.)

Claim.—1. In a machine for hulling and separating peas, the combination of the primary toothed cylinder and its toothed concave, and the secondary toothed cylinder and its toothed concave arranged at a lower level, with the reciprocating separator composed of two perforated sections G and G', each provided with suitable surface-feeders, and connected by side bars *g g*, leaving a cross-opening F between the sections and the bars, the upper section G inclining downward



408,627.

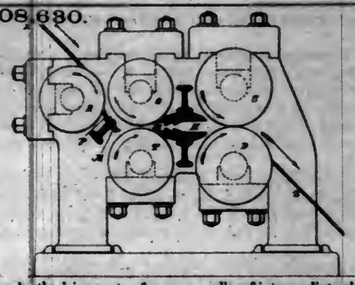
from the primary cylinder, and the lower section *D'* inclining downward from the said second cylinder, and suitable means for suspending and for vibrating the said separator in relation to the two concaves and their cylinders, for operation as described.

2. In a machine for hulling and separating peas, the separator composed of two perforated sections G G', connected by side bars *g g*, leaving a cross-opening F between the latter and the sections, the section G' being on a plane below the other section, and each provided with suitable surface-feeders, in combination with the primary cylinder D and its concave, and the secondary cylinder H, arranged to operate within the opening F, the toothed concave of said second cylinder, the dash-boards I I, and the links *a a*, suspending the separator in a downwardly-inclined relation to each cylinder, as described.

408,628. GATE. EDWIN KEMBY, Calvert, Kans. Filed Apr. 22, 1889. Serial No. 308,102. (No model.)

Claim.—1. The combination, with the post A, the batten D, the wire C, connecting the post A and batten D, and the oblique brace E, extending from the post A to batten D and adapted to swing horizontally and vertically, of the stop H on batten D, having arms *h h*, the post B, and the latch G, having the hook *g* to engage with the stop H, and having the bent end *q*, substantially as and for the purpose described.

2. The combination of the posts A and B, the batten D, the wires C, connecting the post A and the batten D, the oblique brace E, extending from post A to batten D and adapted to swing horizontally and vertically, the stop H, having arms *h h*, the latch G, having the hook *g*, and having the bent end *q*, and the keeper I, secured to the post B and adapted to embrace the foot of the batten D, substantially as and for the purpose described.



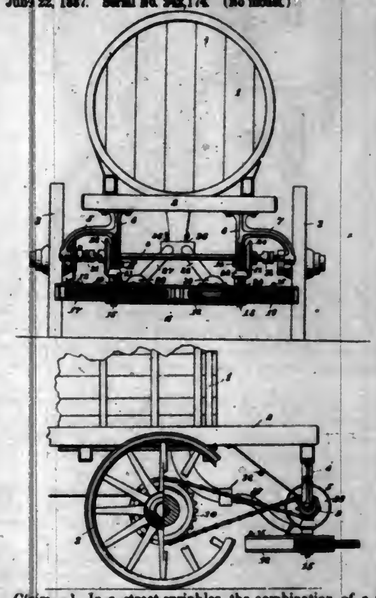
408,629. METHOD OF PRODUCING BATTERY SOLUTIONS. WILLIAM P. KOOKOGEY, Brooklyn, assignor to the Kookogey Electric Company, New York, N. Y. Filed June 7, 1887. Serial No. 240,534. (No model.)

Claim.—The herein-described method of producing chromic battery solution, which consists in adding to water (preferably heated) bichromate of soda, and adding to this mixture sulpheric acid, allowing the mixture to stand until the sulphate of soda is precipitated, and then siphoning off the liquid, the ingredients being combined in substantially the proportions stated.

408,630. SUGAR-CANE MILL. ALFREDO LEBLANC, Havana, Cuba. Filed Oct. 20, 1888. Serial No. 288,094. (No model.)

Claim.—1. In a cane-mill, the combination, with two or more in-

408,630.



dependently-driven sets of pressure-rolls, of intermediate closed boxes or conduit-chambers for confining and conducting the bagasse as it passes from one set of rolls to the next, as herein set forth.

2. In a cane-mill, the combination, with independently-driven sets of pressure-rolls, of intermediate closed conduits having teeth or projections on their inner surfaces for tearing and dividing the bagasse forced through said conduits from one set of rolls to the next.

3. In a cane-mill, the combination, with two or more sets of pressure-rolls, of closed guides or conduits for confining the bagasse as it passes to and from said rolls, and having teeth or projections on their faces for dividing and tearing the bagasse forced through them, as herein set forth.

408,631. SPRINKLING APPARATUS. ANTON MAYER and HENRY G. STIEBEL, Cincinnati, Ohio; said Mayer assignor to said Stiebel. Filed June 22, 1887. Serial No. 242,174. (No model.)

Claim.—1. In a street-sprinkler, the combination of a wheeled reservoir, one or more circular brushes arranged to rotate horizontally at the rear of the same, driving-connections with the bearing-wheels and water-connections with the reservoir, whereby the forward travel of the vehicle distributes the water to the rear and sides in a horizontal expanding shower of finely-divided particles from the brushes, substantially as set forth.

2. The combination, in a street-sprinkler, of a wheeled reservoir-cart, a containing-casing arranged behind the same and open at the rear, a circular brush arranged to rotate horizontally in said casing and through the opening of the same as a distributer, driving-connections with the bearing-wheels of the cart for the rotation of said distributer, and water-connections with the reservoir entering the casing, arranged and operating to distribute the water horizontally in an expanding shower of finely-divided particles rearward and laterally across the path of the vehicle, substantially as set forth.

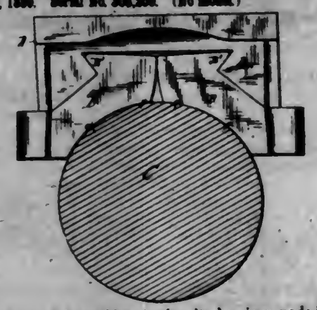
3. In a street-sprinkler, the combination, with the wheeled reservoir and its bearing-wheels, a double casing carried at the rear of the reservoir and having two independent adjacent semi-cylindri-

cal compartments open at the rear, two brushes revolving horizontally in said compartments and through the rear openings, respectively, in opposite directions, and a branched supply-pipe from the reservoir entering the casings, respectively, and driving-connections with the wheels for the rotation of the distributers, substantially as set forth.

4. The combination, in a street-sprinkler, of a semi-cylindrical casing to and through which water is distributed, a circular distributer or sprinkler mounted and rotated axially within the same, and one or more adjustable partitions extensible rearwardly across the radial lines of sprinkling action, substantially as set forth.

5. In a street-sprinkler of the character described, the combination, with a rotating sprinkler driven from the bearing-wheel of the cart, an adjustable clutch to determine the rotation or non-rotation of the rotating sprinkler, and a cock or valve governing the water-supply to said sprinkler, of connecting mechanism between said stop-cock and the clutch-actuating devices, whereby the movement of the clutch out of action closes the water-supply to the sprinkler, and vice versa, substantially as set forth.

408,632. PULLEY. JOSEPH T. MITCHELL, Shelbyville, Tenn., assignor of two-thirds to John H. Sullivan and John R. Wallace, trustee, same place. Filed Sept. 4, 1888. Serial No. 284,534. (No model.)

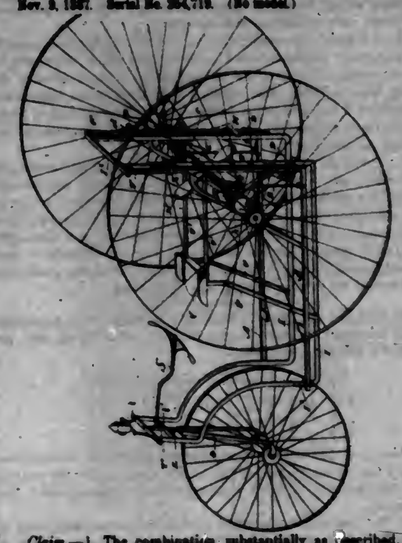


Claim.—1. The combination, with a pulley having a pin O', of a balance-cup having points *i* and adapted to contain metal and secured to pin O', substantially as set forth.

2. A pulley having a hub, a rim of cast metal, and wrought-iron spokes, such spokes being formed with loops or bends *a* in a common plane with the body of the spokes and with the rim, substantially as set forth.

3. The improved pulley herein described, having its hub and rim provided with socketed bosses, and the spokes held at their ends in said sockets and formed with loops or bends *a*, such bends or loops being arranged in a common plane with the body of the spokes and with the rim, substantially as and for the purposes specified.

408,633. AXLE-BOX. PETER PFEIFER, Durhamville, N. Y. Filed Mar. 14, 1889. Serial No. 303,250. (No model.)



Claim.—1. A journal-box having its bearings made in halves, the abutting faces of which are slightly convex, so as to form a V-shaped opening between said abutting faces, whereby the said bearings are automatically adjusted to the axle, substantially as specified.

2. The combination, with the cap or shell of an axle-box provided with dovetailed recesses, of the bearings formed in halves having convex abutting faces and provided with dovetail projections engaging the grooves, whereby the bearings are permitted to yield while being held securely in the shell, substantially as specified.

3. In an axle-box, the combination, with the shell thereof, of the bearings having convex abutting faces and the glass blocks set in recesses in the said bearings, substantially as and for the purposes specified.

4. The combination, with the cap or shell, of the bearings having convex abutting faces and dovetail projections, the latter fitting in grooves in the cap, and the glass blocks set in recesses in the bearings, substantially as and for the purposes specified.

408,634. VELOCIPEDE. WILLIAM H. RUBY, Hagerstown, Md. Filed Nov. 9, 1887. Serial No. 254,719. (No model.)

Claim.—1. The combination, substantially as described, of the side bars of the frame, bridges *i i'*, carrying bearings, the center pin journaled in said bearings, a coiled spring interposed between the top of the fork and the lower bridge, and a steering-bar secured at its forward end to the center pin between the bridges.

2. The combination, substantially as set forth, of the steering-wheel, the crank-axle and its wheels, the frame supported by the wheels, the pedal-bars sliding vertically on the frame, and the guide-loops secured to the pedal-bars and embracing the frame.

3. The combination, substantially as described, of the steering-wheel, the crank-axle and its wheels, springs interposed between wheels and frame, the vertically-sliding pedal-bars and their pitmen, and guide-loops secured to the pedal-bars and embracing the frame.

4. The combination, substantially as described, of the steering-wheel, the crank-axle and its wheels, the frame, the guide-bars secured to the frame, the vertically-sliding pedal-bars and their pitmen, and guide-loops secured to the pedal-bars and embracing the guide-bars of the frame.

5. The combination, substantially as described, of the wheels and their axles, the frame mounted thereon and provided with vertical guide-bars, the pedal-bars and their pitmen, guide-loops secured to the pedal-bars to embrace the guide-bars of the frame, and friction-rolls journaled in the guide-loops to run in contact with the guide-bars.

6. The combination, substantially as described, of the wheels and their axles, the frame, the vertically-sliding pedal-bars and their pitmen, and springs connecting the pedal-bars with the side bars of the frame.

7. The combination, substantially as described, of the steering-wheel, the crank-axle and its wheels, a weighted arm secured to the crank-axle at an angle to the cranks, the frame, the vertically-sliding pedal-bars, and the pitmen and springs connecting the pedal-bars with the side bars of the frame.

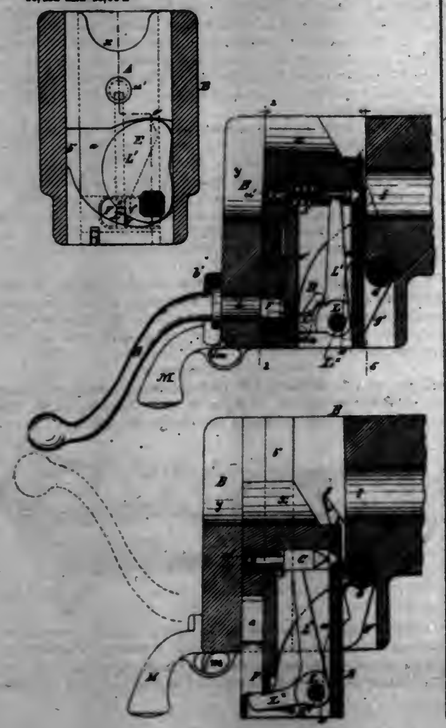
408,635. MUSICAL TOY. FELIX A. SOMERS, Hammersmith, County of Middlesex, England. Filed Apr. 28, 1888. Serial No. 308,944. (No model.) Patented in England Aug. 21, 1888, No. 12,077.

Claim.—1. A musical toy consisting of a vertical column having side walls which are provided with slots, a series of alternating inclined musical plates, and vertical cords running continuously through the column from top to bottom thereof at each end of all the plates

and freely suspending both ends of every plate, so that the entire plate can freely vibrate free from supporting contact with every portion of the column, substantially as described.

2. A musical toy consisting of a column having two opposite side walls each provided with a series of slots which alternately incline in reverse directions, the musical plates inclined sidewise and having their opposite ends arranged alternately at the highest and lowest ends of the slots, and a flexible support for each end of every plate to freely suspend the same from contact with the column, substantially as described.

3. A musical toy consisting of a column having side walls provided with slots, a series of vertical cords extending continuously through the column from top to bottom thereof, a series of transverse cords connected with the vertical cords at each of two opposite sides of the column, and musical plates inclined sidewise and alternately arranged at opposite sides of the column, and having each of their ends supported by a transverse cord to freely suspend the plates from contact with the column, substantially as described.



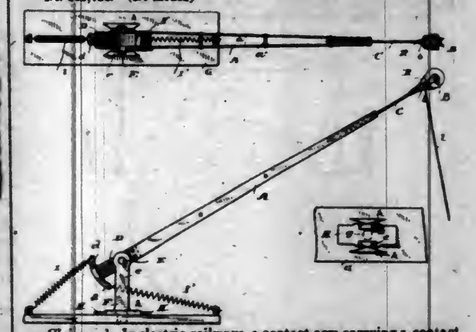
408,636. GELATINOUS PRODUCT. FREDERICK W. P. SWINBORNE and LATIMER P. SWINBORNE, London, England. Filed Nov. 26, 1888. Serial No. 292,141. (Specimens.)

Claim.—1. The hereinbefore-described gelatinous product, consisting of the middle portion of hide or skin remains after the removal of its superficial layers, dried thoroughly before decomposition has commenced.

2. The hereinbefore-described gelatinous product, consisting of the middle portion of hide or skin remaining after the removal of its superficial layers, subdivided into thin leaves or pieces, and dried thoroughly before decomposition has commenced.

408,637. BREECH-LOADING ORDNANCE. HARALD T. J. THRONEN, Finspong, Sweden, assignor to the Aktiebolaget Finspongs Styckebruk. Filed July 7, 1888. Serial No. 279,234. (No model.) Patented in Sweden May 3, 1888, No. 1,696; in France June 16, 1888, No. 191,273; in Norway June 16, 1888, No. 957; in Belgium June 18, 1888, No. 83,230; in England June 19, 1888, No. 8,974, and in Germany June 20, 1888, Nos. 46,432 and 46,994.

Claim.—1. The combination, with the gun having a vertically-arranged mortise in its breech, of the breech-block A in said mortise and adapted to play vertically in a right line in said mortise, the cam-shaft A, mounted in the rear wall of the breech with its axis parallel with the bore of the gun, the cam E, fixed on the inner end of said cam-shaft and engaging the recess *a* in the breech-block, and the weighted counterbalancing-crank H, fixed on the outer end of the cam-shaft and standing opposite to the higher part of the cam, whereby the breech-block is embraced at all times by the walls of said mortise and is held in its elevated position by said crank, substantially as set forth.



2. The combination, with the gun having a vertically-arranged mortise in its breech, of the breech-block A, mounted in and adapted to play vertically in said mortise and provided with cam-faces *a' a''*, the cam-shaft A, mounted in the rear wall of the breech with its axis parallel with the bore of the gun, the cam E, fixed on the inner end of said shaft and engaging a recess in the breech-block, the weighted crank H, fixed on the outer end of said cam-shaft, and the cartridge-shell extractor G, pivotally mounted in a recess in the gun in front of the breech-block, said extractor having an arm *g'*, with a shoulder *g''*, to engage the cam-faces on the breech-block, and also having arms which embrace the shell in the cartridge-chamber, substantially as and for the purposes set forth.

3. The combination, with the gun having a mortised breech-piece, of the breech-block A, the recessed firing-pin and its spring mounted in said block, the tumbler having an upright arm that engages the firing-pin and a rearwardly-projecting arm L^1, the sear D and its spring, the cam E, provided with a notch to engage arm L^2 of the tumbler and the cam-shaft A, the crank H on said shaft, and the trigger, all arranged to operate substantially as set forth.

4. The combination, with the gun having a mortised breech and the breech-block, of the firing-pin, tumbler, and sear or spring-dog mounted in said block, the notched slide-plate F, mounted in said block and provided with a lug *f*, the trigger, the cam E, provided with the shoulder *e' e''*, whereby said slide-plate is moved, the cam-shaft A, and the handle H, all arranged substantially as and for the purposes set forth.

5. The combination, with the gun having a mortised breech-piece and the breech-block, of the firing-pin, the tumbler, the sear and its spring, all mounted in said block, the cam and its crank for moving said block, the trigger mounted in the breech-piece, and the flat-sided bolt *n*, arranged over the trigger, whereby the trigger may be depressed, for the purpose set forth.

408,638. CONTACT-ARM FOR ELECTRIC-RAILWAY MOTOR-CARS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Apr. 2, 1889. Serial No. 305,728. (No model.)

Claim.—1. In electric railways, a contact-arm carrying a contact device at its free extremity and hinged at or near its lower end in a support adapted to be mounted upon the roof of a car or vehicle, and a plurality of tension-springs connected to the lower part of the arm and to its support and coacting under tension to impart upward pressure to the free end thereof, substantially as described.

2. In electric railways, a contact-arm carrying a contact device at its free extremity and hinged at or near its lower end in a support adapted to be mounted upon the roof of a car or vehicle, and two sets of tension-springs connected to the arm and to its support and coacting under tension to press the outer end of the arm upward from either direction, substantially as described.

3. In electric railways, a car provided with a contact-carrying arm having a contact device at its free extremity and mounted at or near its lower end upon a support located upon the top of the car, and tension-springs connected to the lower part of the said arm and to its support from opposing directions and coacting under tension to impart upward pressure thereto, substantially as described.

4. The combination, with an electric-railway car, of a contact-carrying arm extending upwardly therefrom and pivotally supported near its lower end, and oppositely-acting tension-springs connected to the lower part of the arm and to its support and arranged to coact under tension to impart upward movement to the free end thereof, substantially as described.

5. In electric railways, a contact-arm carrying a contact device at its free extremity and hinged at or near its lower end in supports adapted to be mounted upon the roof of the car, pressure-equalizing devices at the lower end of said arm below its support, and tension-springs connected to said lower extremity and to the support from opposite directions and coacting under tension to impart upward movement to the free end thereof, substantially as described.

6. In electric railways, an upward-pressure contact device comprising a suitable base, a bifurcated support pivoted upon said base, an arm having a contact device at its free extremity and pivoted near its lower end in the bifurcated support, and tension-springs connected to the lower portion of the arm below its pivot and from opposing directions, said springs coacting to impart upward movement to the free extremity of the arm, substantially as described.

7. A contact-wheel or trolley having metal contact-surfaces and non-metallic anti-friction bearings supporting each end of the axis thereof.

8. A contact-wheel having a grooved metallic periphery, a metallic hub, and non-metallic bearings supporting each end of the axis thereof, and contact-making devices electrically connecting the contact-wheel and its supports, substantially as described.

9. A contact-wheel having a grooved metallic outer portion to receive the conductor, non-metallic anti-friction bearings rotatively sustaining said metallic portion, and electrical connections between the metallic portions of the wheels and suitable connections for carrying the current collected thereby, substantially as described.

10. The combination, with a bifurcated support, of non-metallic anti-friction bearings therein, a metallic grooved contact-wheel mounted between said bearings, and contact devices carried by the support and engaging the exterior of the contact-wheel, substantially as described.

11. The combination, with a metallic support, non-metallic bearings therein, and a grooved metallic contact-wheel mounted in the non-metallic bearings and insulated thereby from its support, of contact devices connected to the support and in electrical connection with the metallic contact-wheel, substantially as described.

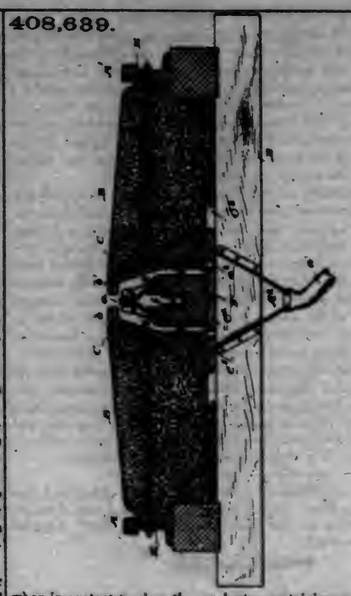
12. A contact-wheel having a solid metallic hub and removable flanges adapted to be secured to said hub and having a groove between their upper edges, substantially as described.

13. The combination of a metallic contact-wheel, anti-friction supports or bearings therefor, and carbon-contacts spring-pressed upon the exterior of the hub of the wheel, substantially as described.

14. The combination of a bifurcated support, a contact-wheel mounted therein, and guides R, for deflecting the wheel and protecting it from injury, substantially as and for the purpose set forth.

408,639. UNDERGROUND CONDUIT FOR ELECTRIC RAILWAYS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed June 24, 1889. Serial No. 315,266. (No model.)

Claim.—1. A conduit for electric-railway conductors, comprising a slotted exterior conduit, an interior insulating conductor-support, and a slitted flexible casing or cover attached to the conductor-support and within the conduit, substantially as described.



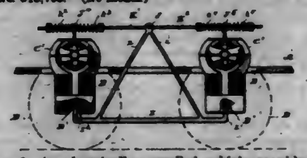
2. A conduit for electric-railway conductors, comprising a slotted exterior conduit, an interior insulating conductor-support, and a slitted flexible casing or cover attached to the conductor-support and within the conduit, and a traveling contact device adapted to enter through the slot of the conduit and to open the conductor-inclosing casing during its passage, the said casing closing behind it, substantially as described.

3. A conduit for electric-railway conductors, comprising an exterior slotted protective conduit, an insulated or insulating conductor-support, a longitudinally-slitted flexible or yielding casing or cover inclosing the conductor within its support, and a series of springs acting against the flexible material to normally close the conductor-chamber, substantially as described.

4. A conduit for electric-railway conductors, comprising an exterior slotted protective conduit, an insulated or insulating conductor-support, a longitudinally-slitted flexible or yielding casing or cover inclosing the conductor within its support, and a series of springs acting against the flexible material to normally close the conductor-chamber, and re-enforcing strips along the edges of said flexible material, substantially as described.

5. A conduit for electric-railway conductors, comprising an exterior metallic conduit having a continuous surface-slot therein, a continuous grooved support of wood or other insulating material, a main supply-conductor contained within the groove in the support, flexible non-conducting strips carried by the conductor-support and arranged

408,689.



when in contact to close the conductor-containing groove or channel, and springs acting against the flexible material to keep said strips in contact and the channel closed, substantially as described.

6. In electric railways, a conduit comprising metallic side walls formed or provided with surface or capping plates at their upper edges and with extended feet or flanges at intervals along their lower edges, said feet or flanges being formed to sustain the side walls in relatively-sloping positions, cross-ties for sustaining the feet of the side walls of the conduit, rails sustained upon the cross-ties, and tie-rods extending from the rails to the side walls of the conduit for laterally sustaining the same and preventing closure of the surface-slot under pressure, substantially as described.

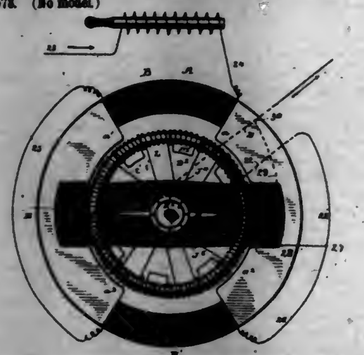
7. A conduit for electric-railway conductors, comprising an exterior metallic casing, an interior insulating conductor-support and projections or extensions extending inwardly from the walls of the exterior casing and engaging and sustaining the conductor-support out of contact with the walls of the casing, substantially as described.

8. A conduit for electric railways, comprising an exterior metallic casing, an interior insulating conductor-support, and adjustable extensions, as screws, extending through the walls of the casing and engaging and sustaining the conductor-support, whereby the same may be positioned or aligned, substantially as described.

408,640. MULTIPLE-MOTOR ELECTRIC LOCOMOTIVE. CHARLES J. VAN DEPOELE, Lynn, Mass. Original application filed Mar. 7, 1889, Serial No. 302,981. Divided and this application filed June 27, 1889. Serial No. 315,705. (No model.)

Claim.—1. An electrically-propelled vehicle provided with sets of driving-wheels rigid upon their axles, electric motors vertically mounted directly upon said axles and extending upwardly therefrom and radially movable thereon, driving-gears upon the axles, driving-pinions upon the armature-shafts of the motors in connection with the driving-gears upon the axles, and buffer-springs for limiting the oscillations of the free ends of the motors, substantially as described.

2. An electrically-propelled vehicle provided with one or more sets of driving-wheels rigidly secured upon their axles, electric motors vertically journaled upon said axles and extending upwardly therefrom, driving-gears upon the axles, driving-pinions upon the armature-shafts of the motors in mesh with the driving-gears upon the axles, and buffer-springs and connections upon the upper ends of the motors, substantially as described.



3. In an electrically-propelled vehicle, a plurality of sets of driv-

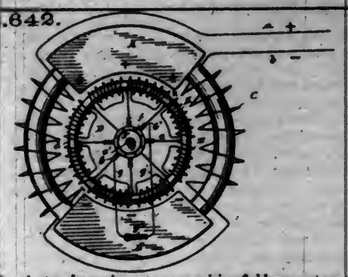
ing-wheels mounted rigidly upon transverse axles, electric motors journaled upon and radially movable upon said axles, driving-gears upon the axles and driving-pinions upon the armature-shafts of the motors in mesh with the driving-gears upon the axles, a longitudinally-rigid connection between the free extremities of the motors, a rigid or stationary brace or support connected to the axles and formed with an upward extension for guiding the connection extending between the motors, and buffer-springs bearing against the upward projection of the brace and attached to the connection uniting the free ends of the motors, substantially as described.

4. In an electrically-propelled vehicle, two sets of driving-wheels, electric motors journaled upon the axles thereof and radially movable thereon, driving-gears upon the axles to be driven and driving-pinions upon the armatures of the motors in mesh with the said driving-gears, a brace or support extending between and journaled at its extremities upon the driving-axles and extending upwardly between the free ends of the motors, a longitudinally-rigid connection attached to the free ends of the motor and passing through and guided between the upwardly-extending support, and buffer-springs secured to the support and to the motor-connection, substantially as described.

5. In an electrically-propelled vehicle, the combination, with the driving-axle, a motor supported thereon and radially movable with respect thereto, a driving-gear upon the axle and a driving-pinion upon the armature-shaft of the motor in mesh with the driving-gear, and a supporting-link journaled upon the armature-shaft at one end and upon the driving-axle at the other, substantially as described.

408,641. **ALTERNATING-CURRENT MOTOR.** CHARLES J. VAN DEPOELE, Lynn, Mass. Original application filed Mar. 8, 1889, Serial No. 302,544. Divided and this application filed July 5, 1889. Serial No. 316,573. (No model.)

Claim.—1. An electro-dynamic motor comprising a wire-wound armature, means for connecting the armature-conductor into one or more closed circuits, an adjustable resistance in the circuit or circuits across the armature, a stationary coil for inducing currents in the armature, and a suitable field-magnet for reacting upon the resultant armature-poles, substantially as described.

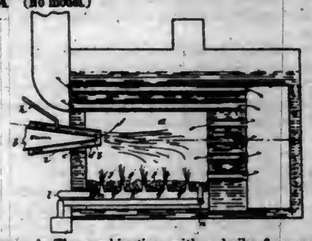


2. In an electro-dynamic motor, a wire-wound armature, a commutator to which sections thereof are connected, adjustable commutator-brushes therefor, a stationary field-magnet, a non-rotating coil inclosing the armature and adjustable relatively with respect to the poles of the field-magnet and acting inductively upon the armature to produce magnetizing-currents therein upon the line of the axis of the said coil, and connections for maintaining a fixed relation between the inducing system and the commutator-brushes, substantially as described.

3. In an electric motor, an armature-core with a plurality of circuits all independent of each other and closed upon themselves, a stationary induction system therefor, a field-magnet for the armature, a single source of current, and means for adjusting the phase of the divided circuit with relation to each other, substantially as described.

408,642. **INDUCTIONAL ELECTRIC MOTOR.** CHARLES J. VAN DEPOELE, Lynn, Mass. Original application filed Apr. 23, 1889, Serial No. 308,241. Divided and this application filed July 13, 1889. Serial No. 317,432. (No model.)

Claim.—1. An electro-dynamic motor comprising a suitable field-magnet system energized by alternating or intermittent currents, and an armature rotatively mounted within the field of force and having a plurality of windings upon its core, a sectional commutator and connections between the sections of said commutator and a portion of the armature-coils, and a suitable circuit spanning the commutator-brushes, the remaining armature-coils forming a circuit or circuits closed upon themselves, substantially as described.

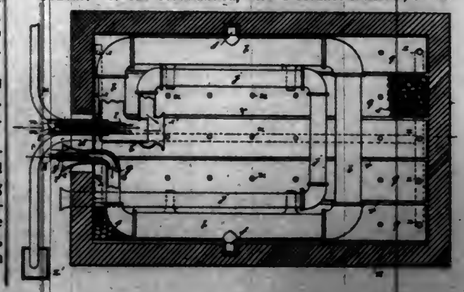


408,642.

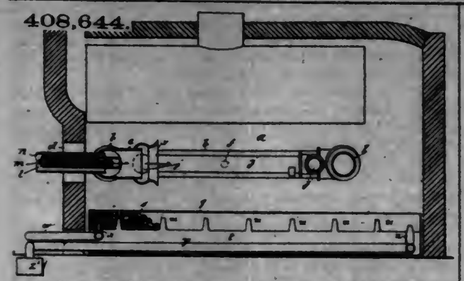
2. An electro-dynamic motor comprising field-magnets energized by alternating or intermittent currents, and an armature rotatively mounted within the field of force and having two windings upon its core, the alternate coils being connected to a sectional commutator provided with contact-brushes spanned by a suitable conductor, the remaining coils forming local circuits closed upon themselves, substantially as described.

3. An electro-dynamic motor comprising suitable field-magnets energized by alternating or intermittent currents, an armature rotatively mounted within the field of force of said magnets and provided with conductors upon its core, a portion thereof being connected to a sectional commutator provided with contact-brushes connected in closed circuit, the remaining conductors upon the armature-core being arranged and connected to form a plurality of separate closed circuits therefor, substantially as described.

408,643. **APPARATUS FOR BURNING PETROLEUM.** JOHN WILSON, New York, and ALLAN MASON, Brooklyn, assignors to Herbert H. Sanderson, trustee, New York, N. Y. Filed Mar. 8, 1888. Serial No. 266,564. (No model.)



Claim.—1. The combination, with a boiler-furnace, of the injector-nozzle having the laterally-expanded and vertically-contracted issue and provided with a series of troughs for distributing oil laterally in said injector, pipes for supplying oil thereto, a series of oil-burners and supply-pipes, and an absorbent bed of non-combustible material in the lower portion of the furnace-chamber, said burners forming a grate to hold the absorbent material, substantially as described.



2. The combination, with a boiler-furnace, of the injector-nozzle having the laterally-expanded and vertically-contracted issue, orifices *e*, connected by narrower slits *f*, and provided with a series of troughs for distributing oil laterally in said injector, and pipes for supplying oil thereto, said nozzle being detachably fitted in the fire-doorway, substantially as described.

408,644. **APPARATUS FOR VAPORIZING AND BURNING PETROLEUM AND OTHER HYDROCARBONS.** JOHN WILSON, New York, and ALLAN MASON, Brooklyn, assignors to Herbert H. Sanderson, trustee, New York, N. Y. Filed Mar. 8, 1888. Serial No. 266,565. (No model.)

Claim.—1. The combination, with a furnace-chamber, of the

408,644.

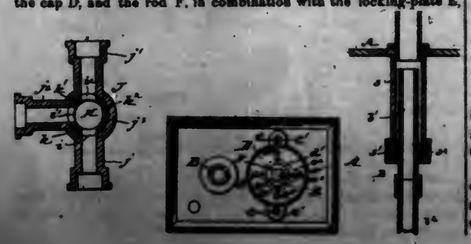
vaporizing or gasifying pipe-retort and an injector for feeding it, said retort located and suitably coiled in the furnace-chamber, and arranged for the resultant vapors to pass out of the unobstructed inner terminal of the retort into the chamber, and also mounted on trunnion-pivots for varying and adjusting the inclination, substantially as described.

2. The combination, with a furnace-chamber, of the vaporizing or gasifying pipe-retort, an injector for feeding it, and the air-heating pipe-retort, said retorts located and suitably coiled in the furnace-chamber, and connected together by the annular injector K at the issue-nozzle *e*, for discharging the resultant vapors and the hot air, so as to combine at and pass out of the inner terminals of the retorts *en masse* into the combustion-chamber, substantially as described.

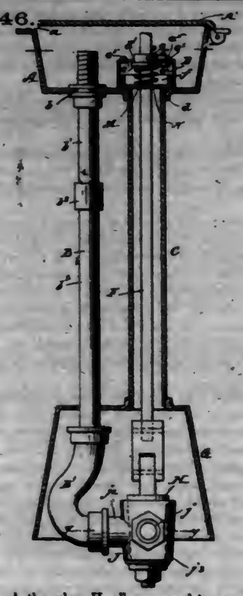
3. The combination, with a furnace-chamber, of the vaporizing or gasifying pipe-retort located and suitably coiled in the furnace-chamber, and arranged for the resultant vapors to pass out of the inner terminal of the retort into the combustion-chamber at or near the front of the same, an injector for primarily feeding the retort, and another injector feeding fresh air, oil, and steam at the inner terminal of said retort, substantially as described.

4. The combination, with a furnace-chamber, of the vaporizing or gasifying pipe-retort located and suitably coiled in the chamber, and arranged for the resultant vapors to pass unobstructedly out of the inner terminal, an injector for feeding the retort, the air-heating pipe-retort, also located and coiled in the furnace-chamber and connected with the vaporizing-retort at its inner terminal, and the bed of refractory, or refractory and absorbent, material and oil-burners located below the retorts, substantially as described.

408,645. **KNOTTER FOR GRAIN-HARVESTING MACHINES.** JOHN S. WOODHOUSE, Amberley, Canterbury, New Zealand. Filed June 25, 1889. Serial No. 315,515. (No model.)



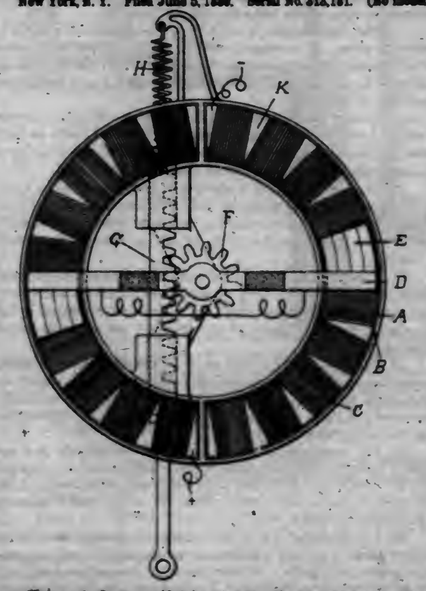
Claim.—1. A knotter consisting of a cylindrical body projecting laterally from a revolving shaft and having a transverse opening, and a slot extending from said opening in an inclined direction to the top edge, leaving a solid outer end having an inclined upper face, substantially as set forth.



2. A knotter consisting of a cylindrical body or head projecting laterally from a revolving shaft, with a transverse opening through the body thereof, and an inclined slot extending from the opening to the top edge, and having a solid end inclined at the top, with grooves at the opposite sides of the latter, substantially as set forth.

408,646. **STREET-WASHER.** JUAN R. ARCI, Brooklyn, N. Y., assignor to Thekla C. Arci, same place. Filed Feb. 18, 1889. Serial No. 300,447. (No model.)

Claim.—1. The surface-box A and shell C, connected therewith, the cap D, and the rod F, in combination with the locking-plate E,



408,646.

spring M, and the plug H, all arranged to operate substantially as and for the purposes set forth.

2. The rod F, connected to the plug, the top box A, and the cap D, formed with sockets or detents d^2, in combination with the locking plate or tumbler E, placed on the rod and adapted to engage with the detents, substantially as described.

408,647. **ELECTRICAL RESISTANCE.** FRANCIS O. BLACKWELL, New York, N. Y. Filed June 5, 1889. Serial No. 313,181. (No model.)

Claim.—1. In an artificial resistance, the combination, with an inclosing-box, of a circular series of plates in contact with one another, and one or more filling-pieces to compensate for the difference between the internal and external peripheries of the series.

2. In an artificial resistance, the combination of a box or frame containing a circular series of plates in contact with one another, and an arm journaled to said frame and provided at its extremity with a contact-piece adapted to move over the surface of the plates.

3. The combination, in an artificial resistance, of a circular series of plates, an electrical connection to one end of the series, and a contact-arm concentric to the plates and provided with an electrical connection, whereby the current may pass along said arm through more or less of the series of plates.

4. The combination, with a series of resistance-plates, of a box or frame therefor, and a contact-arm for the said plates pivoted to the said frame.

5. The combination, with a series of resistance-plates, of a pivoted contact-arm therefor, a pinion or wheel concentric to the said arm, and an actuating device therefor moving substantially in a straight line.

6. The combination, with a series of resistance-plates and a centrally-pivoted contact-arm, of an actuating-rod for said arm, moving substantially in a straight line longitudinally with its axis.

7. The combination, with two series of resistance-plates oppositely placed, of an intermediate pivoted contact-arm having a moving connection at each end with the two series of plates, respectively.

8. The combination, with a series of resistance-plates, of a frame or support therefor, having a contact-arm pivoted to the said frame but insulated therefrom, and an electrical connection to the series of plates along said arm.

9. The combination, with a circular series of resistance-plates, of a pivoted contact-arm, an inclosing-case insulated from said arm, an electrical connection to one end of the series of plates, and the opposite electrical connection extending along the said arm.

10. The combination of two circular series of resistance-plates and an intermediate pivoted contact-arm connecting its opposite ends with the two series of plates, respectively, an inclosing box or frame for the plates insulated from the said arm, an electrical connection to each of the said series of plates, and an intermediate electrical connection between them through the said contact-arm.

11. In an electrical resistance, the combination of inclosing-box A, insulating material B, the centrally-pivoted contact-arm D, having at its outer end a contact-piece E, and an electrical connection therefrom extending radially toward a fixed center.

12. The combination, in an electrical resistance, of the box or support A, insulation B, plates C, pivoted contact-arm D, a wheel concentric with the contact-arm, and a longitudinally-moving actuating device for the said wheel.

13. The combination, with a series of resistance-plates, of an inclosing box or frame therefor, a pivoted contact-arm, and a longitudinally-moving device actuating the said arm.

14. The combination, in an artificial resistance, of a series of resistance-plates, and a contact-piece adapted to move over the surface of said plates, with an actuating device for positively moving the contact-piece in one direction and a spring for moving it in the reverse direction, as described.

15. In an artificial resistance, the combination of a box or frame, a series of resistance-plates, and a pivoted contact-arm, with an actuating device for moving the arm in one direction and a spring to automatically restore the arm to its normal postion.

16. The combination of a plurality of resistances and a corresponding set of contact-pieces for cutting the resistances into and out of circuit, with a common actuating device for moving the contact-pieces in one direction and a spring for moving them in the reverse direction.

17. The combination of two series of radially-arranged resistance-plates, with two corresponding contact-pieces adapted to sweep over said series of plates, respectively, and a common actuating device therefor, whereby the plates are cut into and out of circuit simultaneously.

18. The combination of two series of resistance-plates arranged adjacent to each other and connected to the line-circuit at their opposite ends, respectively, with two contacts sweeping over said resistances and moving in opposite directions and a common actuating devices for both contacts, substantially as described.

19. The combination of a box or frame divided into two sections, a series of resistance-plates in each section, and a connection with an electric circuit situated at opposite ends, respectively, of the said series of plates, and contact-pieces for cutting said resistances into and out of circuit.

20. The combination of a box or frame, a circular series of resistance-plates, a pivoted contact-arm, an actuating device therefor moving in substantially a straight line, and mechanism within the box for converting the rectilinear motion of the actuating device into the circular movement of the arm.

21. The combination of a series of radially-arranged resistance-plates with a contact-arm adapted to sweep over said plates, pivoted substantially at the center from which the plates radiate.

22. The combination, with a curved series of plates forming an electrical resistance, of a concentric contact-arm moving over the plates in connection with their edges, and an operating device extending therefrom in diametrically-opposite directions.

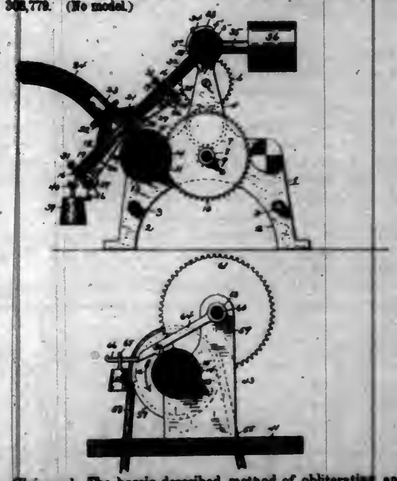
23. The combination of a resistance composed of a series of plates in contact with one another, an arm or traveler for the plates passing along their contact-surfaces, and an actuating device for said arm extending therefrom in opposite directions.

24. The combination, with a curved series of plates forming an artificial resistance, of a concentric arm or traveler passing over their contact-surfaces and a positive operating-connection in engagement with said arm or traveler.

25. The combination, with a series of plates forming an artificial resistance, of a centered arm or traveler passing over their contact-surfaces, a wheel concentric with said arm, and a longitudinal operating-connection in engagement with said wheel.

26. As an article of manufacture, an electrical resistance consisting of an inclosing-box having an insulating fire-proof lining, with a series of metallic plates inclosed therein, and a centered contact-arm or traveler pivoted on said box.

27. As an article of manufacture, an electrical resistance consisting of an inclosing-box having an insulating and fire-proof lining, with a series of metallic plates inclosed therein, and a movable contact-piece having bearings on the inclosing-box but insulated therefrom.



408,648. PUMP AND SIPHON. JOHN G. BRUNER, Albany, N. Y. Filed Sept. 21, 1888. Serial No. 286,055. (No model.)

Claim.—1. In a combination with the cylinder of a pump having at its lower end openings, and a bar across its diameter, as described, a discharge-orifice near its upper end, terminating with a pipe and petcock, and a plunger with valve, as described, closely fitting said cylinder, and a hollow plunger-rod passing through upper end of cylinder, with handle adapted to raise or depress plunger, and surrounded by suitable packing at upper end of cylinder above discharge-orifice, with a small rod or valve-lock with knob at upper end passing down through hollow plunger-rod, as described, with suitable packing at lower end of said rod or valve-lock H, within said hollow plunger-rod E E', adapted to lock said valve, as and for the purposes set forth.

2. The combination, in a siphon, of a cylinder A A', having at its lower end openings and a bar *m* across its diameter, as described, a discharge-orifice B near its upper end, terminating in a pipe K K' with petcock L and plunger F with valve G, as described, closely-fitting cylinder A A', a hollow plunger-rod E E', passing through upper end of cylinder, with handle at upper end suitable to raise or depress plunger, surrounded by suitable packing at upper end of cylinder above discharge-orifice B, and a small rod or valve-lock H H', with knob I at its upper end passing down through hollow piston-rod, surrounded by suitable packing adapted to lock said valve, all substantially as set forth.

408,649. METHOD OF REPREPARING GRAPHOPHONE-TABLETS. DAVID W. BROWN, Washington, D. C. Filed Apr. 27, 1889. Serial No. 308,779. (No model.)

Claim.—1. The herein-described method of obliterating an engraved or indented sound-record from a waxy or other plastic surface, which consists in forcing the ridges of material between the record-grooves into the said grooves, substantially as described.

2. The herein-described method of obliterating an engraved or indented sound-record from a waxy or other plastic surface, which consists in forcing the ridges of material between the record-grooves into the said grooves by external mechanical pressure and solidifying and smoothing the surface by such pressure, substantially as described.

3. The herein-described method of repreparing a graphophone or phonograph tablet having a sound-record in plastic material for the reception of a new record, which consists in obliterating the old record by forcing the material of the ridges which separate the record-grooves into such grooves by the forcible application thereto of a tool, substantially as described.

4. The herein-described method of repreparing a cylindrical graphophone or phonograph tablet having a grooved sound-record upon a surface of plastic material for the reception of a new sound-record, which consists in rotating the tablet and feeding a pressure-tool bearing upon a portion of the surface of the tablet along the same, substantially as described.

5. The method of recording sounds upon a plastic surface having a grooved sound-record already formed thereon, which consists in successively obliterating the successive portions of the old record by forcing the ridges of material between the record-grooves into the said grooves, and simultaneously therewith producing a new record upon the reprepared portion of the surface, substantially as described.

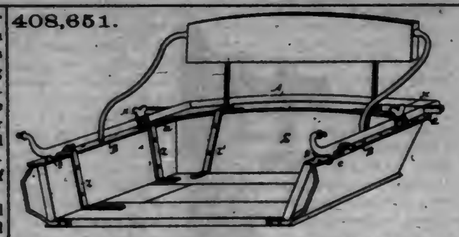
408,650. GLOVE. PAUL BOWLEY and HARLE H. DICKER, Chicago, Ill. Filed Mar. 21, 1888. Serial No. 304,173. (No model.)

Claim.—1. In a catcher's glove having the front of its palm and finger portions provided with padding *g*, the inner cover *c'*, extending continuously across the finger portion, the back portion A', also extending continuously across the finger portion, secured at intervals to the cover *c'*, and affording separate compartments for the fingers, and a protuberance *y* at the base of the thumb and palm portions, formed with additional padding *g'*, substantially as and for the purpose set forth.

2. In combination with a catcher's glove, a shield B, of stiff material, secured to the glove and extending continuously across the back of the finger portion thereof, substantially as and for the purpose set forth.

3. In combination with a catcher's glove, a shield B, of stiff material, secured to the glove and extending continuously across the back and beyond the extremity of the finger portion thereof, substantially as and for the purpose set forth.

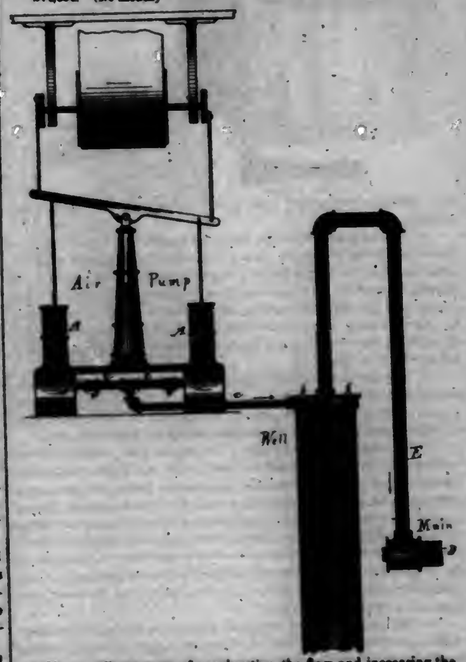
4. In a catcher's glove, the combination of a front A^2, padded throughout and having additional thickness of padding at the bases of the thumb and palm portions, a back A', and a shield B, of stiff material, secured to the glove and extending continuously across the back of the finger portion thereof, substantially as and for the purpose set forth.



5. In a catcher's glove, the combination of a front A^2, padded throughout and having additional thickness of padding at the bases of the thumb and palm portions, a back A', secured at intervals to the inner side of the front portion to afford separate compartments for the fingers, and a shield B, of stiff material, secured to the glove and extending continuously across the back and beyond the extremity of the finger portion thereof, substantially as and for the purpose set forth.

408,651. SHIFTING RAIL FOR VEHICLES. STEPHEN BUSHNELL, Fremont, Ohio, assignor to John V. Beery and David Davis, same place. Filed Apr. 25, 1889. Serial No. 308,614. (No model.)

Claim.—1. In a combination with the seat-irons having open slots at their forward ends, and the raised supports, the detachable rail adapted to encircle the seat, its forward ends having hooks to engage with the seat-irons, and screws passing through the detachable rail at a point midway between the raised supports, substantially as specified.



2. In combination with the seat-iron having the slot at the forward end, and the raised supports, the detachable rail having a hook at the free end, said detachable rail adapted to engage with the seat-iron at the back of the seat, and screws passing through the rail into the seat-iron, as and for the purposes specified.

408,651.

3. In combination with the seat-irons having the open slots at their forward ends, and the raised supports, the detachable rail adapted to encircle the seat, its forward ends having hooks to engage with the seat-irons, its back portion having ears to engage with the legs of the brace-irons, and screws passing through the detachable rail into the seat-irons, substantially as set forth.

408,652. PROCESS OF ACCELERATING THE FLOW OF NATURAL GAS FROM GAS-WELLS. HEWIS A. COOK, McComb, assignor of one-half to H. Walter Doty, Findlay, Ohio. Filed May 29, 1888. Serial No. 274,856. (No model.)

Claim.—The process of accelerating the flow and increasing the fuel and illuminating capacity of natural gas from gas-wells, which consists of injecting air into said wells in sufficient quantities to make it intermix with the natural gas therein and impart to said gas sufficient pressure and volume to cause the same to flow readily from the well, substantially as described and set forth.

408,653. HYDRAULIC PRESS. CHARLES D. DAVIS, Washington, D. C., assignor to Lewis Miller, Philadelphia, Pa. Filed Jan. 28, 1888. Serial No. 267,902. (No model.)

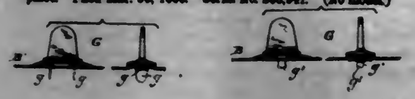
Claim.—1. The combination of a pair of rams, abutting or head blocks, rods connecting these abutting blocks with the ram-cylinders, the toggle-levers pivotally connected at their ends to the piston-rods of the rams and the stationary abutting blocks, the main driving-shaft provided with sliding clutches and loose pinions, and the rack-bars engaging these loose pinions and pivotally connected to the said toggle-levers, as described.

2. The combination, with the rams and stationary head-blocks, of the toggle-levers pivotally connected at their ends to the piston-rods of the rams and the head-blocks, the inwardly-extending rack-bars, links connecting the outer ends of the rack-bars to the joints of the toggles, guides for the rack-bars, and a main shaft provided

408,653.

with sliding clutches and loose pinions, as and for the purpose described.

3. The combination of the rams and toggle-levers, the rack-bars connected to the toggles by means of pivoted links, a main shaft located between the toggle-levers and provided with loose pinions and clutches, one of the said rack-bars passing over the top of one of these pinions and the other bar passing below the other pinion, and guides for the rack-bars, whereby the said main shaft may be revolved continuously in one direction and the toggles drawn in from both sides, substantially as described.



4. The combination, with the rams and toggle-levers, of the rack-bars connected to joints of the toggle-levers by means of pivotal links, a main shaft provided with pinions, and guides for the rack-bars set at right angles to the said shaft, substantially as described.

5. The combination of a pair of rams, the head-blocks and connecting-rods, the toggle-levers connecting the ram-piston rods to the head-blocks, a main driving-shaft journaled in bearings between the said toggle-levers, a pair of loose pinions on this main shaft, sliding clutches also upon this shaft, these clutches being adapted to engage the said pinions, rack-bars engaging the said loose pinions, links R, pivotally connecting the outer ends of the rack-bars to the joints of the respective toggle-levers, spur-wheels J J upon the ends of the main shaft, and motors K K, for imparting motion to the shaft, substantially as herein set forth.

6. The combination of a pair of rams, head-blocks, connecting-rods connecting the head-blocks to the rams, toggle-levers connecting the head-blocks and ram-pistons, bearings H H, located between the said connecting-rods, transverse bracing-rods F', connecting the said bearings H H to the respective connecting-rods, a main shaft provided with sliding clutches and loose pinions, means for operating these sliding clutches, and rack-bars engaging the pinions and pivotally connected to the toggle-levers, as and for the purpose set forth.

7. The combination of a pair of rams, toggle-levers connected to the pistons of the rams, a main driving-shaft journaled between the toggle-levers and provided with loose pinions, clutches upon this shaft, outwardly-inclined grooved ways or bed-plates located opposite sides of this main shaft, rack-bars working in these inclined grooved ways and engaging the said pinions constantly, and pivotal links R, connecting the outer ends of the rack-bars to the toggle-levers, substantially as described.

408,654. CARRIER-BELT FOR HARVESTERS. JOHN S. DAVIS, Cleveland, Ohio, assignor to the Davis Platform Binder Company, same place. Filed Mar. 30, 1888. Serial No. 268,941. (No model.)

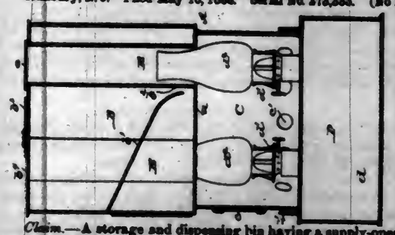
408,654.

Claim.—The combination of a carrier-belt with metal spurs attached at suitable intervals along its length, said spurs being formed with a thin or pointed top and a broad base, which is concaved on its under side and has a ductile-metal pin projecting therefrom, said pin passing through the belt fabric and clinched or riveted on its under side, substantially as hereinbefore set forth.

408,655. MUSICAL INSTRUMENT. JOHN C. DEAGAN and JOSEPH CARROLL, St. Louis, Mo.; said Carroll assignor to said Deagan. Filed May 7, 1888. Serial No. 273,113. (No model.)

Claim.—1. In a musical instrument, the combination of a supporting-frame with a series of metallic tubes laid thereon and movable endwise, substantially as set forth.

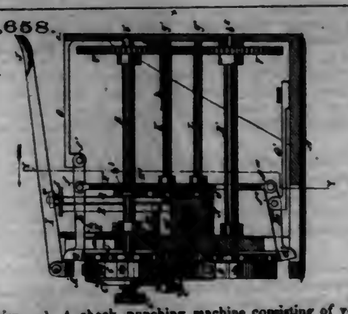
2. In a musical instrument, the combination of a supporting-frame with a series of tubes which are movable endwise thereon, and pins *a*, which separate said tubes, substantially as set forth.



408,656. CASTER FOR FURNITURE. WILHELM H. DICKE, St. Louis, Mo., assignor of one-half to August H. Gaertner, same place. Filed Mar. 12, 1889. Serial No. 303,033. (Model.)

Claim.—1. The combination of the main wheel, the grooved body, the top plate, and the anti-friction wheel, said anti-friction wheel having journals rollable upon bearings in or upon said body, and said top plate turning upon said body and bearing upon said anti-friction wheel, substantially as described.

2. The combination, in a caster, of the caster-body, the top plate, and the anti-friction wheel, said body having a curved groove and bearings at the sides, respectively, thereof, said anti-friction wheel having tapering journals rollable upon said bearings, and said top plate being pivoted to said body and bearing upon said anti-friction wheel, substantially as described.

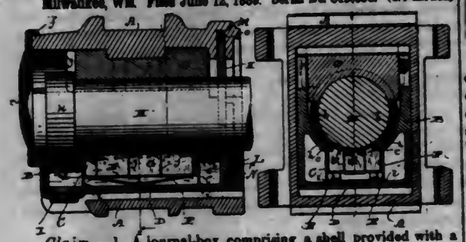


408,657. CAN FOR COFFEE, GRAIN, &c. STEPHEN A. FRENCH, Cranbury, N. J. Filed May 10, 1888. Serial No. 273,333. (No model.)

Claim.—A storage and dispensing bin having a supply-opening at the top, a delivery-door in front, an inclined partition extending from the front toward the rear side, and the vertical heating-flues traversing said bin and connecting the top and bottom thereof, substantially as and for the purpose set forth.

408,658. CHECK-PUNCHING MACHINE. ROBERT GARNER, Jersey City, N. J. Filed July 3, 1888. Serial No. 278,948. (No model.)

408,658.



Claim.—1. A check-punching machine consisting of vertical rotary disks C D, arranged upon shafts B B' in a frame A, and standard A' *a a'*, said disks C D having punches *b b* and dies *d d* upon their respective peripheries, and being adapted to be brought into contact at their said peripheries, so that when in contact a punch of the one disk will be in cutting correspondence with a die of the other disk, a mechanism having suitable lever, and indicating-disk, slotted slide, and shoe H *h*, spring *h'*, locking-disks C' D' revolving upon the same shafts as the disks C D, locking-arms E *e* E' *e'*, and connecting-rod F for bringing and holding said disks C D in contact at their peripheries in position for punching, and a feed device in connection with the shaft B, having rollers M N, ratchet O, regulating-arm Q, slotted slide S, hooked lever B^3 b^3, pawl P, and spring *p*, all substantially as described.

2. In a check-punching machine with suitable supporting-frame and shafts, hand-lever, and indicating-disk, the combination of vertical rotary disks C D, having punches *b b* and corresponding dies *d d* upon their respective peripheries, locking-disks C' D', having cuttings b^3 *d'*, and revolving with the same shafts as the disks C D, together with a slotted slide and shoe H, a spring *h'*, a locking-arm E *e*, pivoted upon a stiff spring G, a connecting-rod F, and a locking-arm E' *e'*, pivoted upon a stiff spring G', all substantially as set forth.

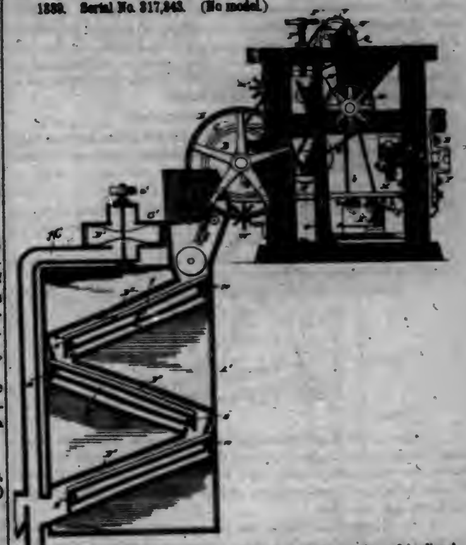
3. In a check-punching machine, substantially as described, the combination, with the shaft B, of feed-rollers M N, a ratchet O, a regulating-arm Q, a slotted slide S, a hooked lever B^3 b^3, a pawl P, and a spring *p*, all substantially as set forth.

408,659. JOURNAL-BOX. THOMAS R. HAYES and ALBERT J. READ, Milwaukee, Wis. Filed June 12, 1889. Serial No. 313,863. (No model.)

Claim.—1. A journal-box comprising a shell provided with a bearing, a hollow casting supported in the shell, a spring-controlled tray having a perforated bottom and arranged to depend into said casting, and a wick carried by the tray, substantially as set forth.

2. A journal-box comprising a shell provided with a bearing, a hollow casting supported in the shell, a frame arranged to depend into said casting, a spring-controlled perforated tray arranged within the frame, and a wick carried by the tray, substantially as set forth.

3. A journal-box comprising a shell provided with a bearing, a hollow casting supported in the shell and having its front of such area as to entirely close the front of said shell, and a spring-controlled wick-carrying tray having a perforated bottom and arranged to depend into said casting, substantially as set forth.



4. A journal-box comprising a shell provided with a bearing, a hollow casting supported in the shell and having its front of such area as to entirely close the front of said shell, a spring-controlled wick-carrying tray having a perforated bottom and arranged to depend into said casting, and spring-controlled non-absorbent plates arranged in the shell and casting to fit around a journal and overlap each other, substantially as set forth.

5. A journal-box comprising a shell provided with a bearing, a hollow casting supported in the shell and having its front of such area as to entirely close the front of said shell, a frame arranged to depend into the casting, and a spring-controlled wick-carrying tray having a perforated bottom and arranged in the frame, substantially as set forth.

6. A journal-box comprising a shell provided with a bearing, a hollow casting supported in the shell and having its front of such area as to entirely close the front of said shell, a frame suspended in the casting and provided with a transverse brace, one or more springs secured to the brace, and a perforated wick-carrying tray supported on the spring or springs, substantially as set forth.

7. A journal-box comprising a shell provided with a bearing, a hollow casting having a concave upper face provided with a central opening and concave recess, a flanged circular plate extended above said concave face, an arch adjacent to the plate and a groove in the bottom of said casting, a pin passed through the sides of the shell to engage the groove in the casting, and a spring-controlled wick-carrying tray having a perforated bottom and arranged to depend into the casting, substantially as set forth.

408,660. DRYING OR EVAPORATING APPARATUS. ARMIN HERR, Washington, D. C. Filed Mar. 20, 1888. Renewed July 16, 1889. Serial No. 317,843. (No model.)

Claim.—1. In a drier, the combination of the series of inclined chutes, the pans E', located in said chutes, the steam-supply pipes entering the pans in one side at or near their upper ends, and the discharge or exhaust pipes entering the same in like manner on the opposite sides at near their lower ends, openings *g* in one side of the chutes beneath the pans, and similar openings *i i'* in their opposite sides, an air-trunk communicating with the chutes above the pans, and a fan for inducing air-currents, substantially as shown and described.

2. In a drier, the housing A', constructed of an outer wall F', and a series of inclined chutes D', having in one side the openings *i i'* and in the other the inlet *g'*, controlled by slides *h'*, in combination with the hollow pans E', arranged as shown, and having upper side flanges *f f*, an air-trunk communicating with the chutes above the pans and with a fan-case, and valve-controlled inlet and discharge pipes entering the sides of the pans at near their opposite ends, which also serve as supports for the said pans, substantially as described.

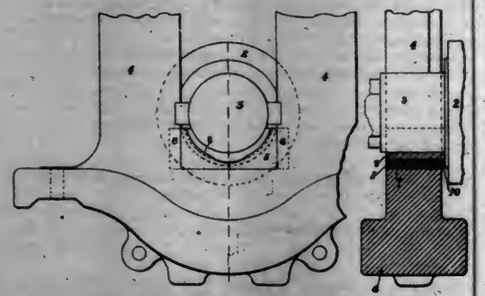
3. The combination, with the inclined chutes having in one side the openings *i i'* and in the other the inlets *g'*, of the hollow pans E' and the outer wall F', whereby air entering beneath the pans will be induced to pass up and over the tops thereof, substantially in the manner described and indicated.

408,661. HARNESS-D. JOHN R. KNEBLY, Syracuse, N. Y. Filed Mar. 16, 1889. Serial No. 303,549. (No model.)

Claim.—1. In a harness-D, the integral frame *a*, comprising the vertical bar *a*, horizontal bars *b c*, projecting from its lower portion and connected by a forward vertical cross-bar *d* and forming the horizontal opening 1, the horizontal bar *c*, projecting from the upper portion of the bar *a* diametrically over the bar *b* and forming a horizontal slotway 2, in which is mounted a roller *f*, the cross-bar *i*, projecting laterally from upper portion of bar *a* and linearly opposite the bar *c*, the upward parallel projections *k k'*, rising therefrom and conjointly forming the slotway 3, in which is mounted a transverse roller *l*, the curvilinear bar *o*, extending downward from the bar *i* and terminating at the base of the vertical bar *a* and conjointly creating the vertical opening 4, all combined substantially as described.

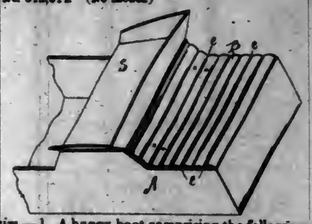
2. An integral harness-D frame comprising the vertical bar *a*, horizontal bars *b c*, projecting from its lower portion and connected by a forward vertical cross-bar *d* and creating the horizontal opening 1, the horizontal bar *c*, projecting from the upper portion of the bar *a* directly over the bar *b* and creating a horizontal slotway 2, the cross-bar *i*, projecting laterally from the upper portion of the bar *a* and longitudinally opposite the bar *c*, the upward parallel projections *k k'*, rising therefrom and conjointly creating the slotway 3, the curvilinear bar *o*, extending downwardly from the bar *i* and terminating at the base of vertical bar *a* and conjointly creating the vertical opening 4, all combined substantially as described.

408,662. GRINDSTONE-FRAME. ROBERT KIRK, Hartwell, Ohio, assignor of one-half to Oliver J. Bailey, same place. Filed Apr. 19, 1889. Serial No. 307,798. (No model.)



Claim.—1. In a grindstone-frame, a bifurcated stock with wide base having prongs at the upper end provided with bearings between which the grindstone revolves, and having lugs to pivotally receive the seat attachment, seat-support, and forward support, substantially as shown and described.

2. In a grindstone-frame, the combination, with a bifurcated stock, of a pivotally-attached forward support, a shield, a pivotally-attached seat, a pivotally-attached seat-support, and a treadle-bar carrying forwardly-extending treadles to operate the stone, substantially as described.

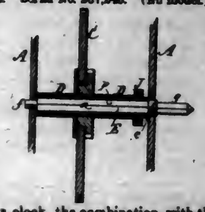


3. In a grindstone-frame, the bifurcated stock carrying the grindstone in the bifurcation and the seat and the seat-support each pivotally attached to the stock, substantially as and for the purposes set set forth.

408,663. SHAFT COOLING-BOX. HENRY KLEMAN, Pittsburg, Pa., assignor of one-half to Richard Morgan and James Evans, both of same place. Filed Aug. 30, 1888. Serial No. 284,157. (No model.)

Claim.—The combination, with the roll and its neck or journal and the housing, of the concave-faced block set in the housing and a lining for said block removably arranged therein and constituting the bearing for the roll, the block being provided next to and beneath the lining with grooves or channels 7 open from end to end, substantially as and for the purpose described.

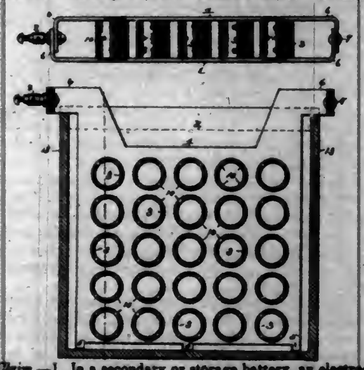
408,664. BUGGY-BOOT. JAMES K. LORER, Ionia, Mich., assignor of one-half to John M. Bradley, same place. Filed May 31, 1888. Serial No. 312,314. (No model.)



Claim.—1. A buggy-boot comprising the following elements: the outer water-proof covering, the inner textile facing, the series of interposed stiffening-blades, and the stitching of the covering fabrics between the blades, substantially as specified.

2. In a buggy-boot, the combination of the leather covering, the inner textile fabric lining, the interposed series of ribs round on their upper faces and flat on their under faces, said coverings being made fast to said ribs, and the angle-iron attached to the under face of the boot, as and for the purposes specified.

3. A buggy-boot comprising the following elements: the outer water-proof covering and the series of ribs, said ribs being made fast to the covering, the rib at the rear end of the boot being L-shaped in cross-section, whereby it is adapted to embrace the rear corner of the vehicle-box.



408,665. CLOCK. EDWARD M. MOULTON and MARK MOULTON, Rochester, N. Y.; said Mark Moulton assignor to said Edward M. Moulton. Filed Oct. 4, 1888. Serial No. 287,243. (No model.)

Claim.—1. In a clock, the combination, with the main wheel and spring, of a sleeve fitting between the sides of the clock-frame and provided with a smooth interior, a winding-arbor fitting loosely in said sleeve, the ends forming journals resting in the frame and one end projecting, forming a winding-stem, and a fastening device locking said parts together, as shown and described, and for the purpose specified.

2. In a clock, the combination, with the main wheel and spring, of a sleeve fitting between the sides of the clock-frame and provided with a smooth interior, a winding-arbor fitted in said sleeve, the ends forming journals resting in the frame and one end projecting, forming a winding-stem, and a nut screwing on a beveled screw-thread on one end of the sleeve to clamp the sleeve and arbor together, as herein shown and described.

408,666. SECONDARY BATTERY. JAMES F. MCLAUGHLIN, Philadelphia, Pa. Filed Apr. 29, 1889. Serial No. 308,968. (No model.)

Claim.—1. In a secondary or storage battery, an electrode consisting, essentially, of plates of lead or other suitable material held a

distance apart by a series of lead tubes extending between and through the plates, and spaced, as shown, to leave a clear passage between the tubes, substantially as described.

2. In a secondary or storage battery, an electrode composed of plates of lead or other suitable material held a distance apart by a series of perforated tubes extending between and through the plates, and spaced, as shown, to leave a clear passage between the tubes, substantially as described.

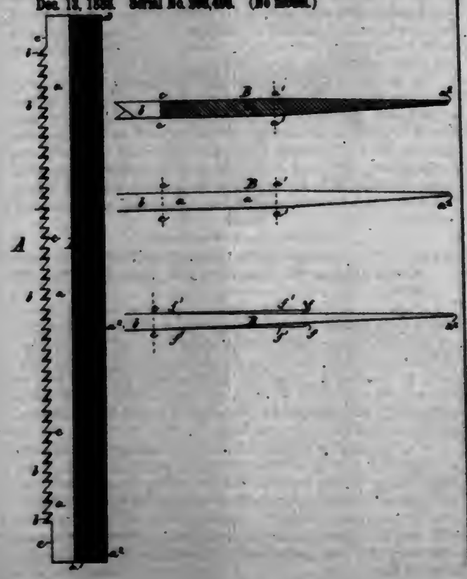
3. In a secondary or storage battery, an electrode composed of plates of lead or other suitable material held a distance apart by a series of tubes extending between and through the plates, said tubes being spaced, as shown, to leave a clear passage between them to expose their whole surface to the electrolyte, and filled with active material, substantially as described.

4. In a secondary or storage battery, an electrode composed of plates of lead or other material held a suitable distance apart, with lead tubes extending between and through the plates, and a core of baked active material within each tube, substantially as described.

5. In a secondary or storage battery, an electrode composed of plates of lead or other material held a suitable distance apart, with perforated lead tubes extending between and through the plates, a core of baked active material in each tube, and a plug of plastic active material in each end of the tubes, substantially as described.

6. In a secondary or storage battery, an electrode consisting of the combination of two lead plates arranged parallel to and at a suitable distance from each other, with perforated lead tubes extending between and through the plates, a core of baked red oxide of lead within each tube, and a plug of pasty red lead for each end of each tube, substantially as described.

408,667. HOLLOW SPINDLE FOR DYEING YARN IN COPS. IRA F. PERK, Providence, assignor to W. P. & F. C. Sayles, Pawtucket, R. I. Filed Feb. 20, 1889. Serial No. 300,869.

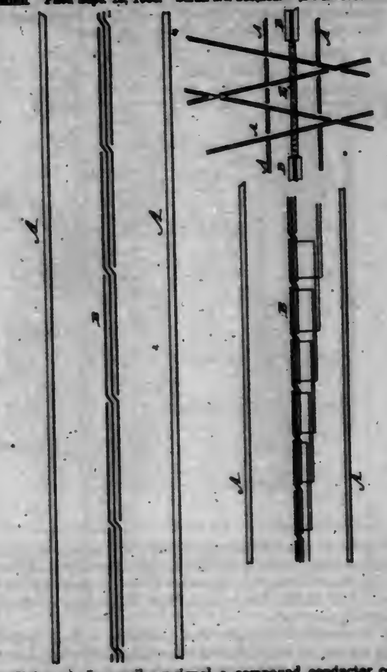


Claim.—The hollow spindle having a tube adapted for attachment, the terminating tip, the longitudinal ribs, and the inner wire coil, substantially as and for the purpose specified.

408,668. HOLLOW SPINDLE FOR DYEING YARN IN COPS. WALTER L. PERK, Providence, assignor to W. P. & F. C. Sayles, Pawtucket, R. I. Filed Mar. 6, 1889. Serial No. 301,973. (No model.)

Claim.—The hollow spindle having a tube adapted for attachment, a terminating tip, and a reticulated wire body, which connects the tube and tip, substantially as described.

408,669. SAW. GEORGE W. PRESCOTT, Eau Claire, Wis. Filed Dec. 12, 1888. Serial No. 293,490. (No model.)



Claim.—The within-described new article of manufacture, consisting of a straight-cut saw-blade adapted to saw lumber with a reciprocating up-and-down movement, said blade being formed with its sides, back, and teeth in one piece, and having an even thickness of metal from the base-line of the teeth rearwardly for a proper distance—say about two or four inches—according to the width of the blade, and tapered from the rearward termination of said portion of even thickness to its back edge, substantially as described.

408,670. POTATO-DIGGER. ARTEMAS REMY, Old Town, Me. Filed Apr. 12, 1889. Serial No. 307,192. (No model.)

Claim.—In a potato-digger, the combination of a sifting-plow, on each side and a little in advance thereof a turning-plow H, running not quite so deep as the sifting-plow, and the turning-plows I in front of plows H, and not running so deep, but closer to the potatoes, whereby so little earth will be left to go over the sifter that all the potatoes, large and small, will be made plainly visible on the surface of the ground.

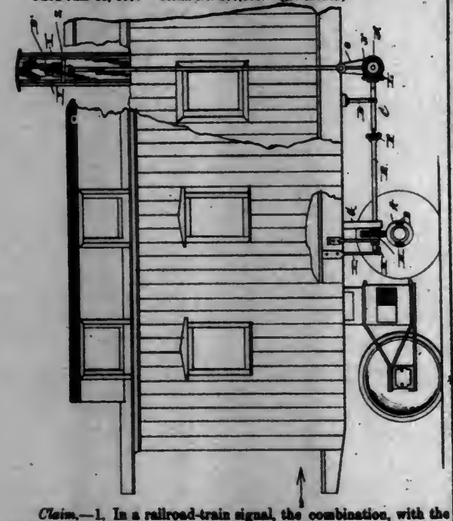
408,671. RAILWAY-SIGNAL. JOSEPH W. RIGGS, St. Paul, assignor to the Riggs Electric Traveling Danger Signal Company, Minneapolis, Minn. Filed Sept. 13, 1888. Serial No. 285,262. (No model.)

Claim.—1. In a railway-signal, a compound conductor consisting of three parallel flat bars or plates placed edgewise in sections and embedded of an insulating material except at their upper exposed edges, one bar or plate of each section having its terminal at the end of said section, the second bar or plate having its terminal at the end of the second section, and the third bar or plate having its terminal at the end of the third section, substantially as set forth.

2. In a railway-signal, a compound conductor consisting of a support provided in its top with a longitudinal vertical groove having a filling of insulating material, and the flat parallaled spaced plates embedded edgewise in said material in sections, with their upper

edges only exposed, one bar or plate of each section having its terminal at the end of said section, the second bar or plate having its terminal at the end of the second section, and the third bar or plate having its terminal at the end of the third section, substantially as set forth.

3. In a railway-signal, the combination, with the car and the compound conducting-rail B, of the brush E, formed of the metallic back A, the wires *i*, the insulating-sleeve *f*, the metallic sleeve *g*, and the loop *e*, suspended from the bottom of the car and adapted to support the brush in the position of use, substantially as specified.



4. In a railway-signal, the combination of the compound conductor having three parallel conductors arranged in sections connected together, as described, a metallic brush E', the pivoted switch-arms *m m'*, connected together and one of them connected to the brush, the contact-points *k k' l l'*, the points *k k'* and *l l'* being connected together, the battery F, connected to the contact-points *k l*, and the bell G, connected to the battery, substantially as described.

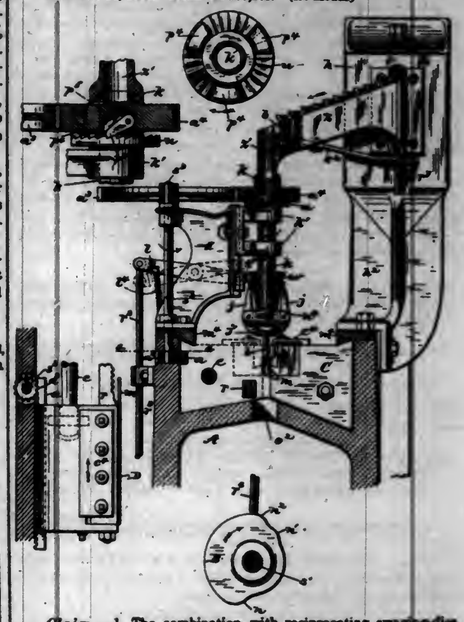
5. In a railway-signal, the combination of the compound conducting-rail B, having three parallel conductors in each section connected by diagonal connections, as described, the metallic brush E', the switch-arms *m m'*, the contact-points *k l k' l'*, the battery F, the alarm-bell G, the contact-springs *o o'*, and the circuit-opening wedge J, provided with the insulating-surface *p*, substantially as specified.

6. In a railway-signal, the combination, with the circuit-wires, of the springs *o o'*, insulated from each other, the throttle-valve lever I, and the wedge J, provided with the insulating-surface *p*, the springs *o o'* being arranged in the path of the wedge J, substantially as specified.

7. In a railway-signal, the combination, with the electrical conducting-rail B and switch-stand O, of the branch conductors *s' f'*, shaft *g'*, provided with the arm *t'*, the arm *r'*, the rod *u'*, and arm *v'*, attached to the switch-stand, substantially as specified.

408,672. SIGNAL FOR RAILWAY-CARS. ALFRED A. ROBINSON, Lynchburg, Va., assignor of two-thirds to John R. Parrott, same place. Filed Jan. 11, 1889. Serial No. 296,065. (No model.)

Claim.—1. In a railroad-train signal, the combination, with the vertically-moving signals, of an independent crank-shaft connected to each signal and to the car-axle, and a device for connecting or disconnecting the shafts, whereby one or both signals may be operated, substantially as specified.



2. In a railway-train signal, the combination, with the vertically-moving signals, of independent rotary crank-shafts connected with the car-axle, and of a coupling device adapted to automatically couple the shafts when the train is moving in one direction and to uncouple the same when moving in a reverse direction, substantially as specified.

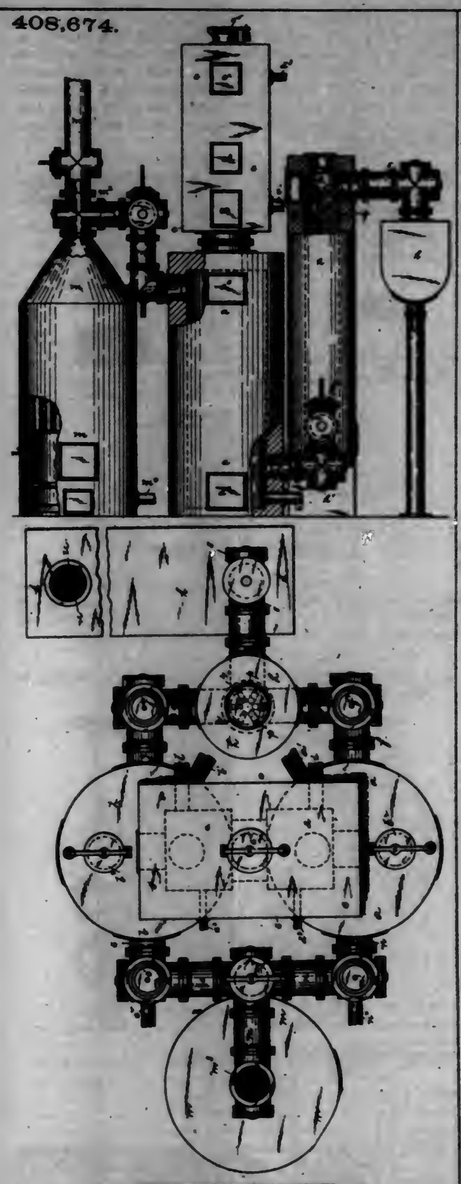
3. The combination, in a railway-car signal, of the shafts M P, having the cranks, the vertically-movable lamp-brackets, the pitmen connecting the same to the cranks, and the gears connecting the shaft M to one of the car-axles, for the purpose set forth, one of said shafts being provided with a ratchet-wheel and the other with a double pawl for operating in the teeth of the ratchet, substantially as described.

4. In a car-signal, the combination of the movable lamp, the crank-shaft connected to and vertically operating the lamp, the shaft C, geared thereto, and the shaft E, flexibly jointed to shaft C and having the worm-wheel H and the worm B secured to one of the car-axles and engaged by the wheel H, substantially as described.

5. The combination, in railway-car signals, of the vertically-movable signal-lamp, the crank-shaft M, connected to and rotated by one of the car-axles, connections between said shaft and lamp, the plate T, secured to said shaft, the shaft P, in line with shaft M and carrying the rack-wheel S, and the detent U, pivoted to plate T and having the engaging-points V, adapted to engage the rack-wheel S and to disengage the same, substantially as described.

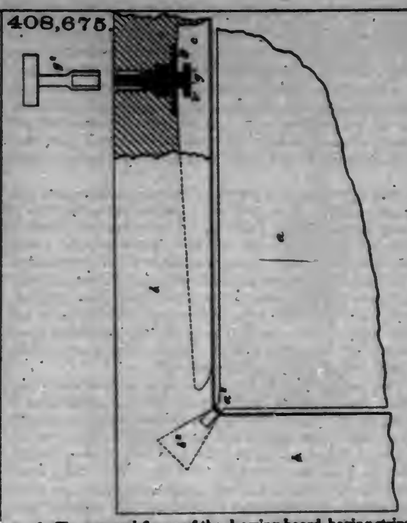
408,673. SCREW-SWAGING MACHINE. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Dec. 11, 1888. Serial No. 293,269. (No model.)

Claim.—1. The combination, with reciprocating swaging-dies which roll threads upon a screw-blank by rotating it between them and expanding the metal radially, of a revolving blank-carrying spindle and mechanism, substantially as described, which permits the spindle to be independently revolved by the action of said swaging-dies upon the blank, substantially as hereinbefore set forth.



2. In a screw-swaging machine, the combination, with swaging-dies for rolling threads upon a screw-blank, of a revolving blank-carrying spindle provided with a pawl-and-ratchet gearing which permits the spindle to be revolved by the action of said swaging-dies upon the blank at a greater speed than that which is normally due to the gearing, but which comes into action to compel the spindle to rotate the blank if the engagement of the dies with the blank fails to insure its rotation at the required rate, substantially as hereinbefore set forth.

408,674. APPARATUS FOR THE MANUFACTURE OF GAS. JAMES M. ROSS, Allegheny, Pa. Filed Oct. 4, 1888. Serial No. 287,349. (No model.)



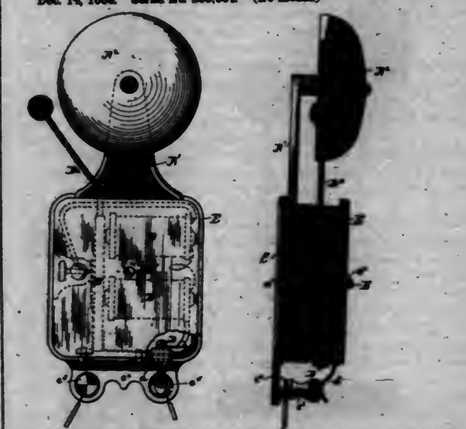
Claim.—1. A gas-making apparatus having a cupola gas-generator, a steam-generator containing a grate and fire-chamber and having its chimney-flue opening into the upper end of the gas-generator, and a casing having one or more chambers containing refractory material for treating the gases and provided with an oil entrance or entrances through which the resultant waste products of combustion and gas from the gas-generator are carried to treat the same, substantially as and for the purposes set forth.

2. A gas-making apparatus having two vertical gas-generators each provided with an air-blast pipe and a gas-eduction pipe at the base, a casing having a double chamber resting on said generators and containing refractory material for treating the gas, the compartments of said double chamber being connected to said generators and with each other, and a steam-generator having its chimney-flue communicating with each gas-generator, substantially as and for the purpose set forth.

408,674.

408,675.

408,675. ARTIST'S DRAWING-BOARD. THEODORE C. ROUSSEL, Chelsea, County of Middlesex, England, assignor to Benjamin Rouxel, Legué, France. Filed May 3, 1887. Serial No. 236,925. (No model.) Patented in England Apr. 6, 1886, No. 4,733; in Belgium Dec. 11, 1886, No. 68,980, and in France Dec. 11, 1886, No. 167,416.



Claim.—1. A drawing-board adapted for stretching paper, and consisting of a board with grooved edges, and a surrounding frame furnished with strips capable of being advanced into the grooves and operating to extend the paper therein, substantially as herein described.

2. A drawing-board adapted for stretching paper, and consisting of a board having recessed edges, and a frame formed with projections for entering the several recesses, the parts being so arranged in relation to one another that during the operation of applying the frame to the board the sheet of paper becomes gripped and then extended, substantially as described.

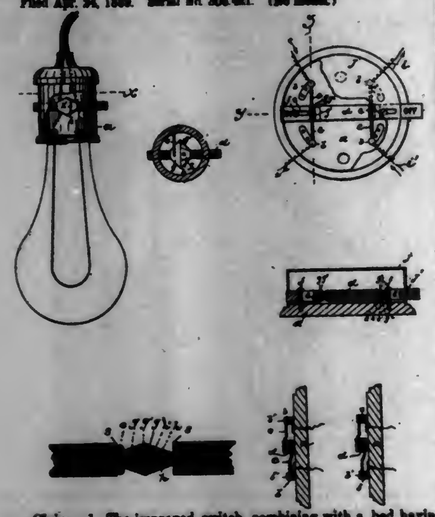
3. The recessed frame of the drawing-board, having stripe—such as *c*—mounted in its recesses, and having also means whereby said strips may be advanced and retracted, substantially as set forth.

4. A drawing-board adapted for stretching paper, provided with studs or supports *h* on one of its faces, substantially as and for the purpose set forth.

408,676. ELECTRIC CALL-BELL. THOMAS J. SMITH, Brooklyn, N. Y., assignor to the E. S. Greeley & Company, of New York. Filed Dec. 14, 1888. Serial No. 293,604. (No model.)

Claim.—In an electric call-bell, the inclosing-case thereof composed of the back plate C, adapted to be permanently secured to the place of support and carrying the described binding-posts c^3 and c^4, the skeleton frame A, containing the magnet, armature, and its bell-striker, and provided with the standard A', supporting the bell A^2, the post D and its spring *d*, adapted to engage said post c^4, and the front plate or cover E, said frame and cover being detachably mounted upon said back plate, substantially as and for the purpose specified.

408,677. ART OF MAKING METAL-FOUNDERS' PATTERNS. HARRIS TABOR, New York, N. Y., assignor to the Tabor Manufacturing Company, same place. Filed Sept. 22, 1888. Serial No. 286,103. (No model.)

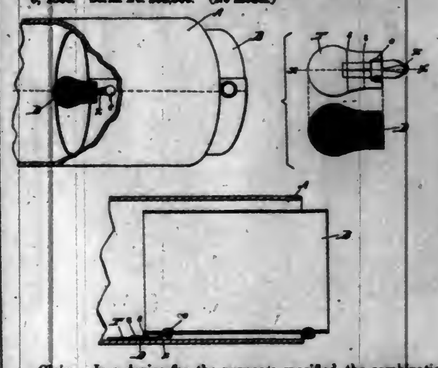


Claim.—1. That improvement in the art of making metal-founders' patterns which consists in, first, producing a pattern having the form of the casting desired; second, producing a doweled two-part sand mold therefrom; third, laying the two mold parts upon their backs; fourth, fitting dowel elements to the dowel elements of said separate mold parts, and, fifth, pouring a suitable pattern-forming material into said separate mold parts and into connection with said fitted dowel elements, whereby are produced two pattern parts each fitting the mold portion and dowel elements of its respective mold part.

2. That improvement in the art of making metal-founders' patterns which consists in, first, producing a pattern having the form of the casting desired; second, producing a doweled two-part sand mold therefrom; third, laying the two mold parts upon their backs; fourth, fitting the dowel elements to the dowel elements of said separate mold parts; fifth, pouring a suitable pattern-forming material into said separate mold parts and into connection with said fitted dowel elements, and, sixth, securing the two pattern parts thus produced side by side with their backs against a bed or platen, whereby is produced a pattern adapted, by one impression in one direction, to produce two half-molds which will join and form a perfect mold.

3. That improvement in the art of making metal-founders' patterns which consists in, first, producing a pattern having the form of the casting desired; second, producing a doweled two-part sand mold therefrom; third, laying the two mold parts upon their backs; fourth, laying a proper stripping-plate upon the mold-faces in dowel engagement with the dowel elements of the mold parts; fifth, fitting dowel elements to the dowel elements of said separate mold parts, and, sixth, pouring a suitable pattern-forming material into said separate mold parts and said stripping-plates and into connection with said fitted dowel elements, whereby are produced two pattern parts each fitting the mold portion and dowel elements of its respective mold part and stripper-plate.

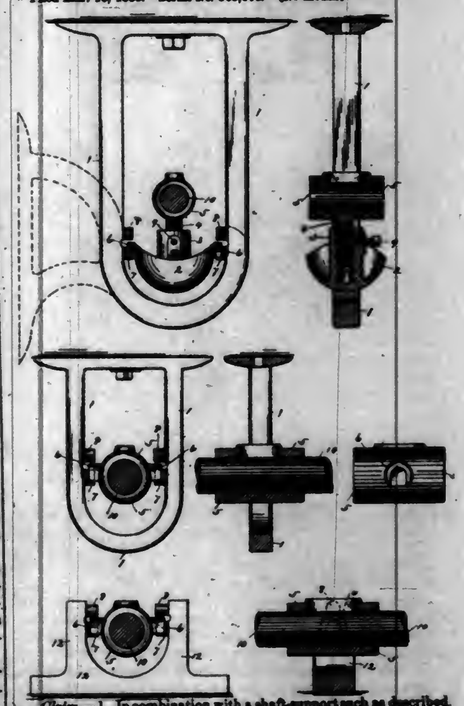
408,678. ELECTRIC SWITCH. WALTER THOMPSON, Orange, N. J. Filed Apr. 24, 1889. Serial No. 308,421. (No model.)



Claim.—1. The improved switch, combining with a bed having terminals an electric circuit secured thereon and projecting toward one another at approximately right angles to a sliding bar and overlapping one another, as shown, said sliding bar interposed between said overlapping terminals and provided on opposite sides thereof with opposite inclines $g\,g^5\,g\,g^5$, which unite at a point or apex g', and a connection K', substantially as and for the purpose set forth.

2. The improved switch, combining with a bed having springs $e\,e$, serving as terminals, secured thereto, a sliding bar having opposite inclines $g\,g^5$, forming an apex g', and a connection K', for connecting the terminals $e\,e$, said connection having inclined contact-surfaces over which said springs may slide, substantially as and for the purpose set forth.

3. In combination with the disk or bed-plate a, having screws or pins $f\,f$ and a cap j, a slotted bar d, of non-conducting material, extending at its opposite extremities through said cap, the said bar being provided with opposite inclines $g\,g^5$, the latter being provided with an inclined contact-plate serving as a terminal of a circuit, and a spring-arm e, serving as a co-operating terminal, substantially as and for the purpose set forth.



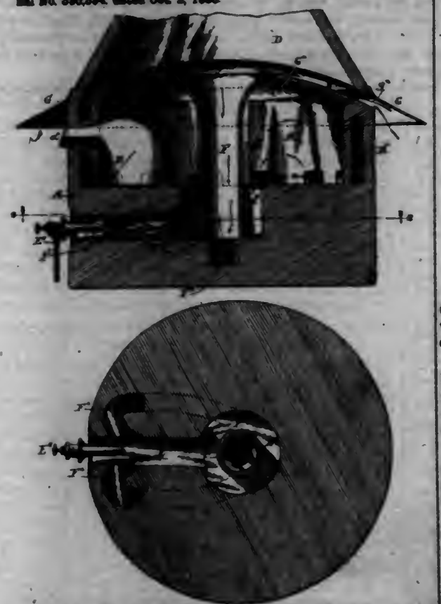
4. In combination with the disk or bed-plate a, having screws or pins $f\,f$ and a cap j, a slotted bar d, of non-conducting material, extending at its opposite extremities beyond the limits of said cap, the said bar being provided with opposite inclines $g\,g^5$, which unite at point g' and extend therefrom to shoulders or stops s, said inclines and stops being on opposite sides thereof, and spring-arms $e\,e$, extending into engagement with the opposite sides of said bar, substantially as set forth.

408,679. CUFF-HOLDER. HARRY B. WILLIAMS, Brooklyn, assignor to the Self-Attaching Cuff Holder Company, New York, N. Y. Filed Dec. 3, 1888. Serial No. 292,509. (No model.)

Claim.—In a device for the purposes specified, the combination of the textile-fabric body T, the elastic-tape loop Z, having its ends attached to said body, and the coating of gutta-percha made adherent to the textile-fabric body, substantially as specified.

408,680. SHAFT-SUPPORT. GEORGE RIEMER, Allegheny, Pa. Filed Mar. 18, 1889. Serial No. 303,808. (No model.)

Claim.—1. In combination with a shaft-support such as described, the frame having formed thereon the lugs or projections 7 8, and the drip-pan 2, provided with the hollow lugs 6, adapted to engage with the projections 7 8, whereby the said drip-pan may oscillate in its bearings, as and for the purpose set forth.



2. In a shaft-support, the combination of the frame 1, provided with the two sets of lugs 7 8, the drip-pan 2, having formed thereon two hollow lugs 6, adapted to engage with the said projections 7 8, the socket 3, and pivoted bearing 5, having stem 4, and the set-screw 9, for adjusting the said bearing 5, substantially as set forth.

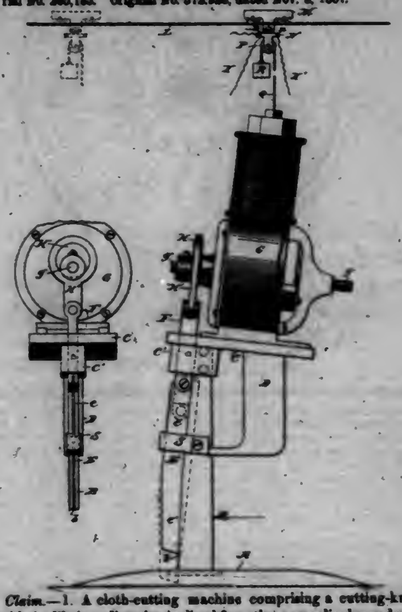
3. In a shaft-support such as described, the drip-pan 2, detachably pivoted to the frame 1, provided with the socket 3, formed integral therewith, the bearing 5, having stem 4, pivoted in the said socket 3, and a set-screw 9, for adjusting the bearing 5, whereby the said bearing 5 may be adjusted vertically and horizontally.

4. In a shaft-support, the frame having formed integral therewith the projections 7 8, and the bearing provided with two semicircular lugs 6, adapted to engage with the projections 7 8 on the frame to confine the bearing in position and permit the same to adjust itself to to the shaft 10.

REISSUES.

11,018. GLASS-FURNACE. ERNEST DE LA CHAPELLE and JOHN PEARCE, Ottawa, Ill. Filed May 20, 1889. Serial No. 311,475. Original No. 390,394, dated Oct. 2, 1888.

Claim.—1. The combination, with a glass or other furnace, of a projecting canopy extending outwardly from the furnace-wall at or near the top of the latter, and an air passage or passages arranged to take heated air from the exterior of the furnace below the canopy and to conduct the same into the fire-box of the furnace.



2. The combination, with a glass or other furnace, of a central air-flue F, leading from above the crown of the furnace, a passage or passages leading from the exterior of the furnace to the top of said flue, and a passage or passages leading from the lower part of said flue to the fire-box of the furnace.

3. The combination, with a glass or other furnace provided with a fire-box and a heating-chamber, of a canopy extending outwardly from the furnace-wall at or near the top of the latter, and an air flue or flues leading from beneath the canopy through the heating-chamber into the fire-box.

4. The combination, with a glass or other furnace, of a central air-flue F, leading from above the furnace-crown, and provided with a branch or branches leading into the fire-box, a sheet G', arranged over the crown and providing an air-space g, a canopy exterior to the furnace-wall at or near the top of the latter, and passages leading from beneath the canopy to the space g.

5. The combination, with a glass or other furnace provided with a fire-box and a fluid-burner within the fire-box, of a central flue F, communicating at its upper end with the exterior of the furnace, and provided with one or more branch flues leading from the lower end of said flue F to the fire-box and having their delivery ends directed toward the rear of the fire-box.

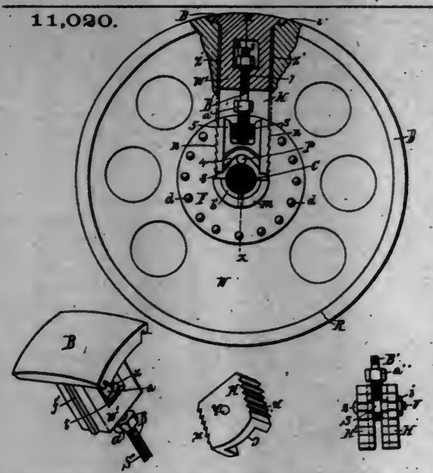
11,019. CLOTH-CUTTING MACHINE. FRANK W. NEVERS, Minneapolis, Minn., assignor, by direct and mesne assignments, to the Electric Cutting Machine Company, Chicago, Ill. Filed Feb. 24, 1888. Serial No. 265,183. Original No. 372,926, dated Nov. 8, 1887.

Claim.—1. A cloth-cutting machine comprising a cutting-knife movable bodily in a direction inclined from the perpendicular and provided with a vertical cutting-edge, and means giving longitudinal reciprocatory motion to said knife, substantially as described.

2. A cloth-cutting machine comprising a disk for lifting the lower layer of cloth, a motor sustained upon the disk, and a knife movable bodily in a direction inclined to the lower bearing-surface of the disk and provided with a cutting-edge which is perpendicular to the said lower surface of the disk, substantially as described.

3. The combination, with a table or horizontal cloth-support and a cutting-machine movable thereon, of an elevated track, and a traveler upon the track connected with and partially supporting the cutting-machine, substantially as described.

4. In a cloth-cutting machine, in combination with a disk adapted to lift up the lower layer of cloth, a vertical standard rigidly attached to said disk and provided with a knife guide or groove at a slightly obtuse angle to said disk, a knife or cutter reciprocating in the vertical plane provided with a straight-edged back adapted to fit into said groove and with a cutting-edge set on an incline upward and outward from said back, and an electromotor located on said carriage and coupled to said cutter, substantially as described, for imparting motion to said knife, whereby said knife operates with a drawing or shear-like cut.



5. In combination with a cloth-cutting machine, an elevated track, a traveler movable to and fro along said track, a pendent block swiveled to said traveler, a sheave attached to said block, and a chain or cord passing over said sheave carrying a counter-weight at one end and attached to said cloth-cutting machine at the other, substantially as described, whereby the work of moving the said machine about the table in cutting the cloth is greatly lessened.

6. In combination, the disk A, the standard B, provided with a knife-groove b, cap-plate or motor-seat C at an acute angle to said standard and provided with the cross-head slot or guide c, the electric motor G, having a driving-shaft g set at an acute angle to the groove b when the motor is in position on the seat C, and the vertical plane passing through the axis of the driving-shaft cutting the groove b, the cutting-knife E e e', as described, working in the groove b, eccentric H on shaft g, eccentric-rod H', cross-head F, working in said slot c and connecting said eccentric-rod and knife, and an electric circuit connecting said motor with a source of electricity, substantially as and for the purpose set forth.

11,020. DRIVE-PULLEY. GEORGE C. COWLES, East Saginaw, Mich., assignor of one-half to Edward Germain, same place. Filed June 8, 1889. Serial No. 313,080. Original No. 406,460, dated May 14, 1889.

Claim.—1. In a pulley having an opening from the center out

11,020.

through the periphery, the combination, with a removable hub-section adapted to be placed in the opening in the web and means for engaging it in place, of a removable rim-section adapted to fill the opening in the rim, and intermediate adjusting mechanism, whereby the parts have a relative adjustment toward or from each other, substantially as described.

2. In a pulley having a portion of the hub and rim made removable, the combination, with the main body of the wheel, of a hub within said opening engaged with said main body by a notched or ratchet engagement, and in connection therewith separate rim and hub sections with adjusting mechanism, whereby said sections may be adjusted toward or from each other, substantially as described.

3. In a pulley having an opening from the center out through the periphery, the combination, with a removable hub-section and means for securing it in the opening in the web, a removable rim-section adapted to fill the opening in the rim, and intermediate adjusting mechanism whereby the parts have a relative adjustment toward or from each other, of flanges secured to each side of the web adjacent to the center, said flanges carrying the journal-bearing, substantially as described.

4. In a drive-pulley having an opening from its center to its periphery, the combination, with flanges secured to the web and carrying the journal-bearing, of a saddle, with means for securing it in said opening, said saddle being of greater concavity than the convexity of the shaft, and a roller between the shaft and saddle adapted to lock the pulley firmly to the shaft when the former is partially revolved, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

BEACH *v.* FOWLER.

Decided July 18, 1889.

1. PRIORITY OF INVENTION—LACHES.

When one of the parties to an interference has made the invention independently of the other party and has reduced it to practice upon an extended commercial scale, and has obtained a patent which he has held unchallenged for nearly a year, he must be adjudged the prior inventor as against the other who, though he may have been the first to conceive the invention, without any excuse for his non-action, never did anything toward reducing it to practice, but who bases his claim to priority on a previous application filed by him which contained claims for the invention in controversy, which claims were rejected and positively and deliberately abandoned nearly four years before the filing of the application involved in this interference.

2. SAME—EFFECT OF ALLUSION IN A PATENT TO ABANDONED CLAIMS IN A FORMER APPLICATION ON QUESTION OF DILIGENCE.

When an applicant, who is also patentee of an invention other than that involved in controversy, alludes in his patent to abandoned claims in a former application, the only effect that can be given to such reference is as evidence of continued interest in the subject-matter of the earlier application and of diligence in seeking to perfect and patent the invention; but such an allusion can have no effect whatever in that direction when the former application had been for nearly two years unprosecuted, and all the claims therein which had any relationship to his pending application had been deliberately stricken out and positively abandoned at the time the patent was issued.

3. SAME—ABANDONED APPLICATION NOT A BAR TO SUBSEQUENTLY GRANTED PATENT.

An abandoned application cannot of itself constitute a bar to a subsequently granted patent.

SAME—PROOF OF DATE OF CONCEPTION BY ABANDONED APPLICATION.

If the thing described in the abandoned application is the same invention that is subsequently patented, it certainly does establish conception of the invention as of its own date, and if proof *dehors* the patent establishes reduction to practice or introduction into public use, and the time of the reduction to practice or of public use is in dispute, then the application shows that reduction to practice *might* have taken place at any time subsequent to its date; but when, as in the present case, there is no proof even of experiment, it can have no other effect than to establish the date of conception of the invention which it discloses.

5. SAME—DECLARING ISSUE.

When it appears that one party to an interference cannot be allowed a method claim while the other party bars the way, the issue covering the method practiced is properly declared, in spite of minor differences in the conflicting claims.

APPEAL from Examiners-in-Chief.

MANUFACTURE OF CAR-WHEELS.

Application of Clifton B. Beach filed September 27, 1887, No. 250,791. Patent granted Hervey W. Fowler October 26, 1886, No. 200,683.

Mr. George H. Christy, Mr. J. Snowden Bell, and *Mr. William Bakewell* for Beach.

Mr. William C. Wood and *Mr. R. H. Parkinson* for Fowler.

MITCHELL, *Commissioner:*

The issues in controversy are as follows:

1. The method of manufacturing cast-steel car-wheels, which consists, first, in casting a solid integral wheel-blank having a rudimentary flange, a hub and a web substantially complete as to dimensions and form, and a rim which at the tread and flange is larger in diameter than the finished wheel; and, secondly, in peripherally rolling the rim and concentrically reducing the diameter of said blank to the diameter desired in the finished wheel, and thereby evenly condensing the metal at the outer portion of the rim in radial and peripheral lines and developing the flange and hardening the tread of the wheel.

2. As an improved article of manufacture, an integral cast-steel car-wheel having its hub, its web, and the main portion of its rim composed of the metal in its normal soft and tough condition, and a flange and tread composed of metal which is hardened and condensed in radial and peripheral lines.

These issues are embraced in substantially the same language as the claims of the Letters Patent to Fowler. The gist of the invention resides in the peripheral rolling by which the rim of a car-wheel is evenly condensed in radial and peripheral lines, thereby developing the flange and hardening the tread of the wheel.

The first count or subdivision of the issue emphasizes the method by which the car-wheel is produced, while the second emphasizes the characteristics possessed by the wheel itself. It is questioned by Beach whether the interference is properly declared as to the first issue, and therefore it may be the more satisfactory manner of proceeding to the discussion to consider the testimony bearing upon the second count and to afterward attend more particularly to the first issue, with reference to which the question before mentioned has been raised.

There seems to be no doubt that Fowler conceived of the invention in controversy in 1884; that he reduced it to practice as early as August or September, 1885; that he took steps immediately to demonstrate the practicability of his invention; that he practiced it upon an extensive scale, involving great expense in establishing a plant, and that wheels embodying the invention immediately went into extensive public use. His application for a patent bears date April 30, 1886. That he was an original inventor there is no question, and there is no room for doubt that in all respects demanding diligence he fully complied with the most rigid requirements of the law. Under these circumstances the material question in the case is whether the testimony introduced on behalf of Beach is sufficient to establish the invalidity of the patent already granted to Fowler, for, as has been abundantly decided, the Office would not be warranted in issuing a second patent except upon proof which would render the first

patent invalid and would warrant its cancellation if jurisdiction existed for that purpose.

It seems to be clear that Beach never practiced the invention or in any way tested its practicability; that he never experimented with relation to it to any extent whatever; nor did he ever make any models or drawings, excepting that a certain rejected application contains drawings which are claimed to exhibit the invention in controversy. This rejected application was originally filed April 20, 1882, and it is this application which is principally relied upon to establish priority on behalf of Beach. In other words, it is claimed that the pending application of Beach, filed September 27, 1887, is in such sense a continuation of the application filed April 20, 1882, as to establish the right of Beach to the date of the first application as the date of his invention, and thus entitle him to an award of priority.

It is agreed that the method claims embraced in this first application were abandoned by amendment filed December 28, 1883, canceling the same and substituting three new claims for certain chuck-rolls, either alone or in combination with associated devices. It will be observed also that an interval of nearly four years elapsed between the abandonment of the method claims of the first application and the filing of the application involved in this interference, and that meanwhile Fowler had conceived the invention in controversy, reduced it to practice, entered upon the use of it on an extensive scale, and applied for and obtained a patent, and that nearly a year had elapsed after the patent was published to the world before Beach filed the application now in controversy.

That an abandoned application cannot of itself constitute a bar to a subsequently-granted patent is abundantly established. If the thing described in the abandoned application is the same invention that is subsequently patented, it certainly does establish conception of the invention as of its own date, and if proof *dehors* the patent establishes reduction to practice or introduction into public use, and the time of the reduction to practice or of the public use is in dispute, then the application shows that reduction to practice *might* have taken place at any time subsequent to its date; but when, as in this case, there is no proof even of experiment, it can have no other effect than to establish the date of conception of the invention which it discloses. (*Webster* v. *Sanford*, 44 O. G., 567; *Brown* v. *Guild et al.*, 23 Wall., 181.) If, then, it be assumed that the invention disclosed in the abandoned application is identical with the invention in controversy, it follows that Beach is entitled to have his date of conception established as early as April 20, 1882.

It remains to be considered whether Beach used due diligence in adapting and perfecting his invention, so as to be entitled to the date mentioned as the date of his invention, in spite of the fact that Fowler was the first who actually reduced the invention to practice and put it in public use. Upon this subject there is no room for doubt. Beach neither did anything, nor does his testimony afford any excuse for his failure to take suitable action in embodying and testing his intellectual conception. It appears that he possessed sufficient pecuniary ability so that the excuse of poverty could not avail him. Indeed, the excuse of poverty is not even made in his behalf. Beach therefore shows no diligence and no excuse for want of diligence.

In this state of the facts it would probably be conceded that Beach has no title to ask that the Government grant a second patent for the invention in controversy. But Beach filed a subsequent application for another invention relating to car-wheels on the 26th day of February, 1883, and obtained a patent thereon November 3, 1885, in which he referred to the method set forth and illustrated in his first application. In this second application is contained an allusion to the application then pending in the following language:

> The blank A may be cast in the first instance approximately to the form shown in Fig. 3, and its rim be worked by periphery hammering or rolling, or by both, into the base of the chuck-groove *d*, to form a wrought tire integral with the cast metal of the web and hub, the step or operation illustrated in Fig. 2 being omitted; but such method of working is not claimed herein, as it forms in part the subject-matter of a separate application for patent, which was filed by me April 20, 1882, Serial No. 58,873.

The only effect that can be given to this allusion in the published patent is as evidence of continued interest in the subject-matter of the earlier patent and of diligence in seeking to perfect and patent the invention; but, although when the second patent was applied for these words had significance in that relation, they had no significance whatever in that direction when the patent was actually issued, November 3, 1885, for, as has been already said, the first application had been for nearly two years unprosecuted, and the method claims, which alone have any relationship to the pending application of Beach, had been deliberately stricken out and positively abandoned. Besides, it will be noticed that before the publication to the world in the patent of November 3, 1885, of the reference to the abandoned method claims of the first application, Fowler had made his invention and fully reduced it to practice. It is very clear that this allusion in the patent of November 3, 1885, to an application which had been abandoned by failure to prosecute within two years could in no way alter the fact that the method claims had been deliberately stricken out of the application, and that the application had been deliberately abandoned, and that no steps had been taken or were in contemplation to revive it. Thus matters remained without an effort on Beach's part to test his conception or put it to practical use or build a machine or do anything else whatever tending in the direction of giving the world the benefit of his invention until nearly a year after the date of the patent to Fowler, when he filed the application now in interference.

Since it is true, as we have seen, that the rejected and abandoned application can have no other effect than to establish the fact and date of conception, it clearly follows, in the absence of all effort during the intervening years while his rival was making the invention, patenting it, and giving it to the world, that Beach cannot be heard to say that the patent issued to Fowler is null and void, and that he is the one who is entitled to a patent. Indeed, there is much in the case which tends to show that, if Fowler had not made and perfected and tested the invention and demonstrated its value, Beach would never have attempted to revive his old claims nor sought to secure a patent.

It follows that Fowler having made the invention independently of Beach and having reduced it to practice upon an extended commercial scale, and having obtained a patent which he held unchallenged for nearly a year, must be adjudged the prior inventor as against Beach, who, though he may have been the first to conceive the invention, was utterly lacking in diligence under circumstances which afford him no excuse.

I have thus far assumed that the method described in the abandoned application of Beach is the same as that covered by the interference issue. It is not absolutely clear, however, that Beach is entitled to this assumption in view of the fact that in the abandoned application the tread of the wheel seems to be subjected—at least to some extent—to lateral expansion. Whether or not such is the case, however, is not material to this decision, in view of what has been already said.

I agree with the Examiners-in-Chief that the gist of the invention in controversy resides in the "peripheral rolling by which the rim is evenly condensed in radial and peripheral lines," and that, since Beach cannot be allowed a method claim while Fowler bars the way, the issue covering the method practiced is properly declared.

The decision of the Examiners-in-Chief awarding priority to Fowler is affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Connecticut.

ADEE *v.* PECK BROTHERS & CO.

Decided June 27, 1889.

1. USE OF A PATENTEE'S NAME IN CONNECTION WITH A PATENTED ARTICLE AS DESCRIPTIVE THEREOF DOES NOT CONSTITUTE A TRADE-MARK.
   The name which is given to a patented device to distinguish it as a patented article from other articles of the same character is not, properly speaking, a Trade-Mark.
2. SAME—IT DESIGNATES STRUCTURE BUT NOT WORKMANSHIP OR MANUFACTURER.
   It designates nothing except that the structure has a definite character as the structure that was patented, and indicates nothing in regard to the character of the workmanship or the person by whom it was manufactured.
3. TRADE-MARK DEFINED.
   A Trade-Mark is something different from the article itself, which the mark designates, and is a name, mark, or device attached to the article to indicate its origin.
4. INFRINGEMENT OF PATENT, NOT OF TRADE-MARK.
   The selling by the defendant of valves under the name of "Foley's," or "Foley's Patent Valves and Overflows," signifies that they are the kind of valves invented and patented by Foley, but not that they are the valves which he or his successor is manufacturing.

Mr. Arthur v. Briesen for the complainant.
Mr. Edward H. Rogers for the defendant.

SHIPMAN, *J.*:

This is a bill in equity, which is brought by a citizen of the State of New York, against a corporation created under the laws of the State of Connecticut.

The bill alleges, with the usual and necessary averments in such cases, that the defendant has infringed upon reissued Letters Patent No. 6,789, dated November 16, 1875, which were granted to James Foley and George C. Gunning, for an improvement in waste valves and overflows, and are now owned by the complainant. The original patent was issued to James Foley as inventor. The bill also alleges that the complainant has sold said valves under the trade name and style of "Foley's" and "Foley's Patent;" that by such name they are recognized by the public; that said trade-name, during the life of said Letters Patent, is identified therewith and of great value to your orator in describing said patented valves as a trade-mark, and that the defendant has sold his infringing valves under the trade-name of "Foley's Patent Valves." The bill prays, among other things, that the defendant may be enjoined against selling "any waste valves or overflows known as or under the name of 'Foley's' or 'Foley's Patent Valves and Overflows.'"

The defendant has demurred because the bill exhibits distinct, separate, and unconnected matters, viz—"the infringement of Letters Patent of the United States and the infringement of a trade-name or Trade-Mark."

In my opinion, the bill shows upon its face that an infringement of patented rights only was committed. It will be observed that the defendant is not charged with having done anything which is prohibited by section 4901 of the Revised Statutes, and that the alleged Trade-Mark is simply the name which is usually or properly given to the patented article. It is not any peculiar form, label, brand, or device which is put upon the article to designate its origin or the person by whom it is manufactured, and it is not the patent mark which is required to be stamped upon patented articles by section 4900. The name which is given to a patented device to distinguish it as a patented article from other articles of the same character is not, even during the life of the patent, properly speaking, a Trade-Mark. It designates nothing except that the structure has a definite character, as the structure which was patented, and indicates nothing in regard to the character of the workmanship or the person by whom it is manufactured. A Trade-Mark "is something different from the article itself which the mark designates," (*Fairbanks* v. *Jacobus*, 4 Blatchf. C. C. R., 337,) and is a name or a mark or a device which is attached to the article to point out its origin. This alleged Trade-Mark, "Foley's Patent Valves," signifies that they are the kind of valves which Foley invented and patented, and not that they are the valves which he or his successor is manufacturing.

> In all cases where rights to the exclusive use of a Trade-Mark are invaded it is invariably held that the essence of the wrong consists in the sale of the goods of one manufacturer or vender as those of another, and that it is only when this false representation is made that the party who appeals to a court of equity can have relief. (*Canal Co.* v. *Clark*, 13 Wall., 311.)

By this bill it appears that the defendant is deceiving no one in regard to the origin of the goods. It is infringing upon the complainant's patent rights by making a valve substantially like his, and it is asserting that its valve is the complainant's patented invention. Thus far no false representation is made, but the truth is asserted. But if it is said that the assertion is that the defendant has a right to make Foley's patent valve, and that thus the public is deceived, this assertion and the act of sale are nothing

more than an infringement of the exclusive patent rights of the complainant. It is not intended to be asserted that if a person manufactures and sells an article which is not an infringement, but which he falsely brands as the patented device, that for such fraud and consequent injury a bill for an injunction may not lie—not upon the ground that he is simulating a Trade-Mark, but because he is committing a continuous fraud for which the preventive remedy by injunction affords the only adequate relief. (*Washburn & Moen Mfg. Co.* v. *Haish*, 9 Biss., 141; 4 Bann. & Ard., 571.) Neither is it intended to be asserted that the owner of a patented device may not have a Trade-Mark affixed to his articles which distinctively declares the origin, in point of manufacture, of his goods. The imitation of the patent-mark is another and separate act from the one which is alleged to have been committed.

It is evident that the pleader intended in the bill to treat the name as a Trade-Mark and to aver that the defendant had not only infringed the complainant's patent rights but his rights as the owner of a Trade-Mark. His theory is that the defendant, by the sale of its valve under this name, has by one act infringed two rights of the complainant—his patent right and his right to the undisturbed use during the life of the patent of the Trade-Mark which he has adopted. If his theory was true, his bill perhaps would not be open to the charge of misjoinder upon the ground that if two good causes of complaint grow out of one transaction for which the same character of relief is sought, and in regard to which all the defendants have the same claim of right, such causes may be included in one bill, (Story's Eq. Pl., sec. 284;) but the bill in this case shows only one good cause of complaint.

The demurrer is overruled.

U. S. Circuit Court—District of Massachusetts.

THE UNITED STATES OF AMERICA *v.* THE AMERICAN BELL TELEPHONE COMPANY AND ALEXANDER GRAHAM BELL.

Decided July 2, 1889.

PRACTICE IN THE COURTS—TESTIMONY BEFORE EXAMINER.

On a motion for the appointment of an examiner to take testimony in an equity cause the court will not limit or restrict the taking of testimony or determine what is proper testimony. Objections taken to evidence on the ground of incompetency or irrelevancy properly come before the court at the final hearing.

MOTION for the appointment of an examiner to take testimony.

Mr. George A. Jenks, Mr. Charles S. Whitman, Mr. W. C. Strawbridge, and *Mr. G. P. Lowrey* for the complainant.

Mr. Chauncey Smith and *Mr. B. F. Thurston* for the defendants.

COLT, *J.*:

The plaintiff moves the court for the appointment of an examiner to take testimony. The defendant Bell also moves for the appointment of an examiner to take testimony upon the issue raised by his plea filed in this case. The defendant company have answered generally to the bill. The defendant Bell has filed a plea and an answer in support of the plea. To the answer of the defendant company and to the plea the plaintiff has filed replications. The cause therefore is at issue, and it is proper for the court to appoint an examiner to take testimony. The defendants' motion seeks in effect to restrict the testimony by order of court to the single issue of fraud which is raised by the plea.

It is certainly unusual upon a motion made in the ordinary way for the appointment of an examiner to ask the court by an interlocutory order to limit in advance the scope of the testimony to be taken. It is probable that no appeal would lie from such an order. But however this may be, such action on the part of the court seems to be contrary to established equity practice. Objections may be taken to the evidence on the grounds of incompetency or irrelevancy, and these objections properly come before the court at the final hearing of the cause; but I find no precedent for limiting or restricting the taking of testimony in advance. The court should not be called upon at this stage of the case to determine what is proper testimony and what is not, nor to determine the scope of the decision of the Supreme Court upon the demurrer in this case. Upon a motion in the ordinary way for the appointment of an examiner it is not for the court to settle questions which cannot be properly and intelligently passed upon at this time. The fact that this is an important, and in some respects an exceptional, case should not prevent the court from following the usual and ordinary course of equity practice.

The defendants' motion is denied and the plaintiff's motion is granted, and Henry L. Hallett is hereby appointed examiner.

THE OFFICIAL GAZETTE OF THE United States Patent Office.

[BY AUTHORITY OF CONGRESS.]

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months.

Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 750 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1878, inclusive, (subject-matter, one volume, 925 pages, bound in cloth	$10 00
INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 190 pages—	
Bound half-turkey	2 50
Bound in cloth	1 25
Paper covers	1 00

Issue of August 13, 1889.

DESIGNS.

19,261.—BACK FOR BRUSHES, &c.—*Henry Berry*, Shelton, Conn. Application filed July 17, 1889. Serial No. 317,809. Term of patent 7 years.

19,262 and 19,263.—CURTAIN AND COVER.—*Josef Daubek*, Vienna, Austria-Hungary, assignor to *Mills & Gibb*, New York, N. Y. Applications filed July 22, 1889. Serial Nos. 318,326 and 318,327. Term of patents 3½ years.

19,264.—MEMORIAL TABLET.—*John W. Dowling*, Evanston, Ill. Application filed April 26, 1889. Serial No. 308,723. Term of patent 14 years.

19,265.—FOUNTAIN-PEN NOZZLE.—*Noyes F. Palmer*, Brooklyn, N. Y. Application filed June 26, 1889. Serial No. 315,641. Term of patent 14 years.

19,266.—ORNAMENTATION OF KNITTED SHIRTS.—*Thomas A. Pearce*, Philadelphia, Pa. Application filed July 3, 1889. Serial No. 316,443. Term of patent 7 years.

19,267.—CLOCK-CASE.—*Edward C. Stoddard*, Plymouth, Conn. Application filed July 18, 1889. Serial No. 317,947. Term of patent 7 years.

19,268.—SUSPENDER-END.—*Edward W. Whittaker*, New York, N. Y. Application filed July 1, 1889. Serial No. 316,237. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,910.—STOMACH REMEDY.—*Henry Asthalter*, Pittsburg, Pa. Application filed June 27, 1889. Used since October 7, 1887.

"The representation of a serpent feeding from a vessel, an open book resting upon closed volumes located at the rear of the serpent, and a lighted lamp at the rear of the open book."

16,911.—CERTAIN REMEDY FOR INDIGESTION.—*George Batten*, New York, N. Y. Application filed July 16, 1889. Used since April 12, 1889.

"The words 'HENRY'S EUPEPSIA.'"

16,912.—[Withdrawn.]

16,913.—SOAP.—*Joseph Crosfield & Sons*, Warrington, county of Lancaster, England. Application filed July 5, 1889. Used since February 1, 1889.

"The word 'PRESIDENT.'"

16,914.—VARNISHES, STAINS, JAPANS, SURFACERS, AND KINDRED GOODS.—*The Watts Le Golyer Company*, Chicago, Ill. Application filed July 5, 1889. Used since March 15, 1889.

"The word 'ROCK.'"

16,915.—COMPOSITION WATCH-CASES.—*The Dueber Watch Case Manufacturing Company*, Cincinnati and Canton, Ohio; Newport, Ky.; Chicago, Ill.; New York, N. Y.; Boston, Mass., and San Francisco, Cal. Application filed May 6, 1889. Used since April 25, 1884.

"The word 'SILVERINE.'"

16,916.—TAPE-WORM REMEDY.—*Jennie G. Egersdorff*, Kansas City, Mo. Application filed February 18, 1889. Used since July 1, 1872.

"The representation of a tape-worm and the word 'EGERSDORFF'S.'"

16,917.—MEDICAL COMPOUND FOR DESTROYING MICROBES.—*Simon E. Gillett*, San Antonio, Tex. Application filed January 19, 1889. Used since January 1, 1889.

"The words 'GILLETT'S MICROBE DESTROYER,' arranged over a cut showing a shield-shaped device having depressions at or near its top and on opposite sides thereof, within which depressions are located herbs, and within the shield-shaped device is located a man with a scythe in his hand in the act of defending himself against a several-headed serpent."

16,918.—BLACK SHOE-BUTTONS WITH METAL LOOPS OR EYES.—*Louis Joseph Emile Gourdé*, Paris, France. Application filed July 1, 1889. Used since October, 1878.

"The letters 'J. P.'"

16,919.—GOITER AND TUMOR OINTMENT.—*Henry H. Haysen*, New Holstein, Wis. Application filed May 22, 1889. Used since April 1, 1889.

"The representation of a bust picture of a woman, showing goiter, and the words 'SURE-GOITER-CURE.'"

16,920.—MEDICINAL AND TOILET CREAM.—*F. Harwood Hillard* and *Silas S. Stewart*, Verndale, Minn. Application filed May 13, 1889. Used since November 1, 1888.

"The word 'RECHERCHE' and the initial script letters 'F. H. H.'"

16,921.—STOMACH-BITTERS.—*The Hostetter Company*, Pittsburg, Pa. Application filed July 18, 1889. Used since July 4, 1850.

"The representation of St. George and the dragon and the symbol of a shield."

16,922.—MEDICINES FOR DISEASES OF THE AIR-PASSAGES OF THE HEAD, THROAT, AND LUNGS AND APPLIANCES USED IN CONNECTION WITH THE SAME.—*William J. Keefe*, Boston, Mass. Application filed June 29, 1889. Used since June 10, 1889.

"The representation of the upper portion of a man holding in close proximity to his nose a device for discharging medicated powder for the cure of disease and having on his head a crown, the whole imposed upon a shield."

16,923.—EXTRACTS FOR BEVERAGES.—*P. B. Knapp & Sons*, New York, N. Y. Application filed June 25, 1889. Used since March 1, 1889.

"The representation of a human figure clothed in the costume of the eighteenth century and presenting a glass."

16,924.—DETERGENTS OR WASHING COMPOUNDS.—*Laundrine Manufacturing Co.*, Rochester, N. Y. Application filed June 10, 1889. Used since April 15, 1889.

"The word 'LAUNDRINE.'"

16,925.—SALVE.—*George Fickett Leighton*, Waterville, Me. Application filed July 13, 1889. Used since 1881.

"The representation of a pine-tree with a moose reclining at its base and the words 'FOREST SALVE.'"

16,926.—SUGAR AND OTHER PACKED CONFECTIONERY.—*M. Lippman & Bro.*, Philadelphia, Pa. Application filed April 3, 1889. Used since December 2, 1888.

"'PISTOL,' whether expressed pictorially or in word."

16,927.—HARNESS OIL-SOAP.—*Reuben K. Miller*, Pawtucket, R. I. Application filed June 19, 1889. Used since April 6, 1887.

"The word 'CHAMPION.'"

16,928.—OLIVE-OIL AND JAPAN, BLACK, AND GREEN TEAS.—*McCulloch & Co.*, New York, N. Y. Application filed June 25, 1889. Used since February 1, 1869.

"The words 'MCCULLOCH AND COMPANY, GOLDEN SEAL, NEW YORK.'"

16,929.—PULP MADE OF PULVERIZED, POWDERED, AND PREPARED MINERALS.—*Natural Dam Pulp Company*, New York and Gouverneur, N. Y. Application filed June 22, 1889. Used since September 4, 1884.

"The words 'ASBESTINE PULP.'"

16,930.—LIQUID ANTISEPTIC PREPARATIONS.—*Marie Juliette Pinault*, Boston, Mass. Application filed July 19, 1889. Used since December, 1887.

"The word 'PINUSINE.'"

16,931.—INGRAIN CARPETS AND RUGS.—*Van Deventer & Co.*, Plainfield, N. J. Application filed April 9, 1889. Used since March, 1888.

"The word 'WESTMINSTER.'"

16,932.—ILLUMINATING-OILS.—*Roughsedge Wallwork* and *Arthur Collinge Wells*, Manchester and London, England. Application filed July 1, 1889. Used since January, 1888.

"The words 'WELLS OIL.'"

16,933.—FERMENTED MALT AND DISTILLED LIQUORS.—*Charles Watkins & Son*, Hereford, county of Hereford, England. Application filed May 25, 1888. Used since February 1, 1886.

"The word 'SUNLIGHT.'"

16,934.—LEATHER, UPHOLSTERY LEATHER, AND ARTICLES MANUFACTURED THEREFROM, SUCH AS FOOT-WEAR, HAND-BAGS, POCKET-BOOKS, AND THE LIKE.—*White Bros. & Co.*, Boston and Lowell, Mass. Application filed July 5, 1889. Used since June 1, 1882.

"The word 'OOZE.'"

16,935.—PHOSPHATED PREPARATIONS OF GELATINE.—*Charles O. Whitten*, Cambridge, Mass. Application filed July 1, 1889. Used since June 1, 1880.

"The words 'PLYMOUTH ROCK.'"

LABELS.

5,995.—Title: "CYCLE-CHAIN GRAPHITE," (FOR A LUBRICANT FOR TRICYCLE AND BICYCLE CHAINS.)—*James P. Dowse*, New York, N. Y. Application filed July 19, 1889.

5,996.—Title: "SURE CURE, (NEVER FAILS)," (FOR A MEDICINE.)—*Belle F. Hamilton*, Chicago, Ill. Application filed December 10, 1888.

5,997.—Title: "BROMO CELERY COMPOUND," (FOR A MEDICINAL PREPARATION.)—*John H. Hancock*, Baltimore, Md. Application filed June 27, 1889.

5,998.—Title: "POMEROY'S QUINTESSENCE OF CELERY."—*Henry R. Pomeroy*, Indianapolis, Ind. Application filed October 8, 1888.

PATENTS

GRANTED AUGUST 13, 1889.

408,681. SLED. SAMUEL L. ALLEN, Commissioner, N. J. Filed Feb. 14, 1889. Serial No. 300,004. (No model.)

Claim.—1. A sled having laterally-bending runners, substantially as and for the purposes described.

2. A sled having laterally-bending runners elastic in a horizontal plane, substantially as and for the purposes described.

3. In a sled, the combination, with laterally-bending runners, of standards secured to said runners, cross-benches secured to said standards, and a sled-body secured to the rearmost cross-bench, but free to slide over the forward bench, substantially as described.

4. In a sled, a laterally-bending runner-frame, in combination with a sled-body secured to said runner-frame near the rear of the same, substantially as and for the purposes described.

5. In a sled, a laterally-bending runner-frame, in combination with a sled-body secured to said runner-frame near the rear of the same, and a suitable steering device, whereby the lateral bending of the runner-frame is accomplished either by the hands or feet, substantially as described.

6. In a sled having laterally-bending runners, a steering device consisting of a connecting-bar secured to said runners, in combination with a steering-bar pivoted to the sled-body and connected with the said connecting-bar, and a foot or handle bar secured to the steering-bar, substantially as described.

7. In a sled having laterally-bending runners, a steering device consisting of a connecting-bar secured to said runners, in combination with a steering-bar pivotally secured to the sled-body and to the said connecting-bar, and a foot or handle bar, substantially as described.

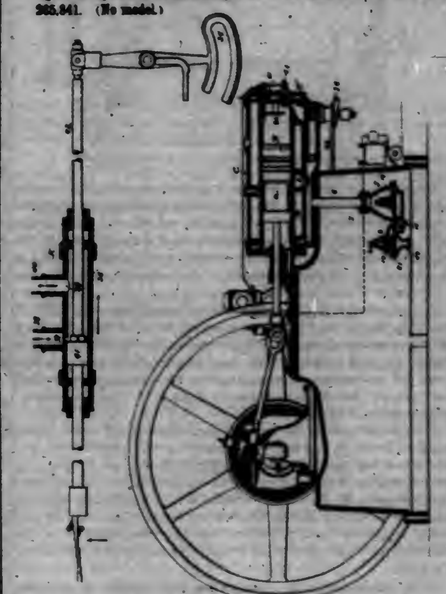
8. In a sled, a laterally-bending runner-frame, in combination with a sled-body secured to said frame near the rear end of the same, a connecting-bar G, a steering-bar pivoted to the sled-body and to the connecting-bar, and a foot or handle bar R, secured to the steering-bar, substantially as described.

9. In a sled having laterally-bending runners, a steering device consisting of a connecting-bar, a steering-bar pivoted to the body of the sled and to the connecting-bar, and a foot or handle bar secured to the steering-bar, substantially as described.

10. A sled provided with a detachable oscillating seat pivoted near its center, substantially as described.

11. A sled provided with an oscillating spring-seat supported near its center on elastic sleeves K and held by regulating-bolts *k*, substantially as and for the purposes described.

12. A sled provided with one-piece runners having the bent portion *a'*, substantially as and for the purposes described.



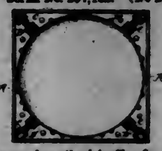
13. In a sled having a laterally-movable cross-bench, the straps *O'*, in combination with the bar O and the said cross-bench, substantially as and for the purposes described.

408,682. GRAIN-STEAMER. LEROY ATKINS, Trenton, Mo. Filed Aug. 5, 1887. Renewed Mar. 16, 1889. Serial No. 303,822. (No model.)

Claim.—In a grain-steamer, a grain-chamber open at both ends, a steam-chamber under the grain-chamber, and a horizontal foraminous partition between said chambers, in combination with a steam-supply pipe and a pipe for conducting water of condensation from the steam-chamber, both of said pipes being at one end of the steamer, and a baffle-plate in the plane of the foraminous partition and constructed to direct steam along the under side of said partition, substantially as described.

408,683. GAS-ENGINE. CYRUS W. BALDWIN, Yonkers, N. Y., assignor to William E. Hale, Chicago, Ill. Filed Mar. 1, 1888. Serial No. 265,841. (No model.)

Claim.—1. The valve-casing of a gas-engine, provided with a single valve-plate covered by two casings for the air and the air and gas mixture, with a valve upon the upper side within each casing, a casing below the said plate containing the mixing-chamber, and a port in the plate between the latter chamber and the air-chamber, substantially as set forth.

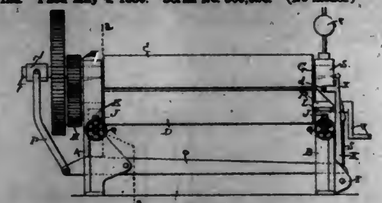


2. The combination, in a gas-engine, of a rod 42, connected with the regulating-wedge 34 and with the governor, and a valve 41, carried by said rod, and a valve-case containing said valve and provided with gas inlet and outlet ports, substantially as set forth.

3. The combination, with the cylinder and electrodes of a gas-engine having their contactings ends within the cylinder, of a rod independent of the electrodes sliding in the cylinder-head in position to contact with the piston and connected by connections outside the cylinder with the movable electrode, substantially as set forth.

4. The combination, with the cylinder of a gas-engine, of a plug extending into the explosion-chamber and carrying a yoke or bearing constituting one of the electrodes, and a rod constituting the other electrode sliding in insulated bearings in the plug, and movable connections between the rod and the piston, whereby the rod is moved by the

action of the piston in one direction, and a spring for moving the rod in the opposite direction, substantially as set forth.



408,684. PACKING-CASE. GEORGE W. BARKER, Brooklyn, N. Y. Filed Jan. 22, 1889. Serial No. 297,182. (No model.)

Claim.—1. The above-described buffer for a packing-case, comprising, essentially, a fixed bar, a movable bar, guiding and holding devices whereby the movable bar is held in proper position and compelled to move in proper directions, and springs interposed between the two bars, substantially as set forth.

2. In combination with a case or box of angular cross-section, a plurality of spring-buffers fastened in the interior of the box and located in the corners thereof, the buffers comprising, essentially, a fixed bar, a movable bar, guiding and holding devices for the movable bar, and springs interposed between the two bars, substantially as set forth.

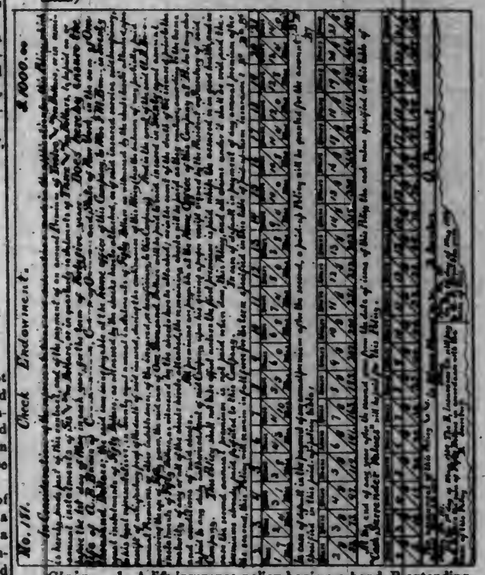
408,685. BENDING-ROLL. CHARLES A. BERTSCH, Cambridge City, Ind. Filed May 4, 1889. Serial No. 309,626. (No model.)

Claim.—1. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a removable buckle-bearing at the tail end of the top pinching-roll, an outboard-bearing at the head end of the pinching-roll, and mechanism connecting said buckle-bearing and outboard-bearing in such manner that the disengagement of the buckle-bearing will cause the depression of said outboard-bearing.

2. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a buckle-bearing engaging the tail-journal of the top pinching-roll, a vertically-movable support for the head-bearing of the bottom pinching-roll, and mechanism connecting said buckle-bearing and supported in such manner that the disengagement of the buckle-bearing will permit the descent of said support.

3. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a buckle-bearing engaging the tail-journal of the top pinching-roll, an outboard-bearing at the head end of the top pinching-roll, a vertically-movable support for the head-bearing of the lower pinching-roll, and mechanism connecting said buckle-bearing and outboard-bearing and movably supported in such manner that the disengagement of the buckle-bearing causes the descent of said outboard-bearing and movable support.

4. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a buckle-bearing engaging the tail-journal of the top pinching-roll, an outboard-bearing at the head of the top pinching-roll, a roll-opening lever, and mechanism connecting said lever with said outboard-bearing in such manner that the manipulation of said lever may serve in elevating and depressing said outboard-bearing.



5. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a buckle-bearing engaging the tail-journal of the top pinching-roll, a vertically-movable support for the head-bearing of the lower pinching-roll, a roll-opening lever, and mechanism connecting said lever with said movable support in such manner that the manipulation of said lever produces vertical movement of said vertical support.

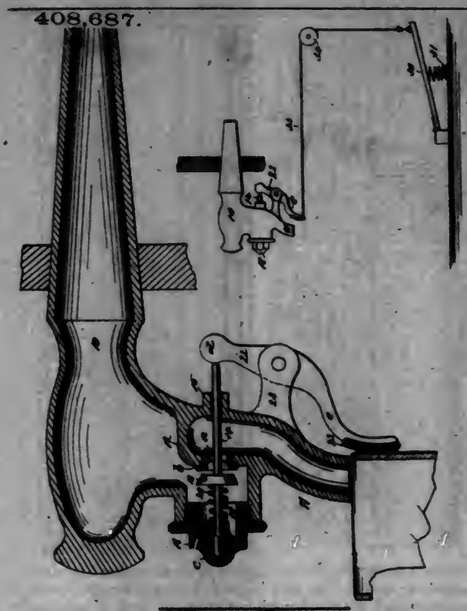
6. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a buckle-bearing engaging the tail-journal of the top pinching-roll, an outboard-bearing at the head of the top pinching-roll, a vertically-movable support for the head-bearing of the lower pinching-roll, a roll-opening lever, and mechanism connecting said lever with said outboard-bearing and said movable support in such manner that the manipulation of the lever will elevate or depress said outboard-bearing and movable support.

7. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a vertically-moving bearing for the head-journal of one of said pinching-rolls, a buckle-bearing engaging the tail-journal of the top pinching-roll, mechanism connecting said buckle-bearing with said vertically-moving bearing in such manner that the disengagement of the buckle-bearing causes a roll-opening movement of said vertical bearing, and an adjustable counterbalance-weight on said buckle-bearing.

8. In bending-rolls, the combination, substantially as set forth, of a pair of housings, top and bottom pinching-rolls journaled therein, a crank at the tail of the lower pinching-roll, and a buckle-bearing engaging the tail-journal of the top pinching-roll and vertically slotted at said crank.

408,686. LIFE-INSURANCE POLICY. ALEXANDER R. READ, Cambridge, N. Y. Filed July 2, 1888. Serial No. 278,573. (No specimens.)

Claim.—1. A life-insurance policy having a band B extending across the face thereof, provided with a longitudinal dividing-line B', forming upper compartment B^2 and lower compartment B^3, subdivided by vertical lines B^4 into oblong compartments B^5 and square compartments B^6, substantially as described.



2. A life-insurance policy having a band B extending across the face thereof, provided with a longitudinal dividing-line B', forming upper compartment B^2 and lower compartment B^3, subdivided by vertical lines B^4 into oblong compartments B^5 and square compartments B^6, having diagonal lines B^7, substantially as described.

408,687. FAUCET. AL. R. BRADLY, New York, N. Y. Filed Nov. 28, 1888. Serial No. 292,051. (No model.)

Claim.—1. The combination, with the faucet-barrel 10, having a downward-extending nozzle 11, provided with a vertical partition 12, having a transverse opening *a* and a valve-seat *b* around the same, of the transverse valve-stem 14, extending through the opening *a* and through the rear wall of the nozzle, as at 15, a spring pressing the valve against its seat, a vertically-rocking lever pivoted between its ends to the rear side of the nozzle, bearing at its upper end against the exposed end of the transverse stem 15 and at its lower end extending adjacent to and below the discharge end of the nozzle, substantially as set forth.

2. A faucet consisting in the barrel 10, having a downward-projecting nozzle 11, provided with a partition 12, and horizontally-aligned openings in the partition, the front end of the barrel and rear wall of the nozzle, respectively, the valve-seat *b* around opening *a*, and the plug 18 in the latter opening and provided with a recess *c*, the valve 13 closing against the seat and having a horizontal stem 16 entering recess *c*, and a similar stem 14 extending through the other two openings, the lever 22, pivoted between its ends to the sides of the nozzle with the upper end bearing against the exposed end of the stem 15 and its lower end projecting below and adjacent to the lower end of the faucet, and a pad 23 on the lower end of the said lever, substantially as set forth.

408,687.

408,688. LOCK-CASE. CHARLES M. BURDSAL, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Mar. 26, 1889. Serial No. 304,815. (No model.)

Claim.—A sheet-metal lock-case having the projecting wards for the key swaged or struck up integral with a lock-plate that forms the side of the lock-case, said wards being formed by projections on one side of said plate and corresponding depressions upon the other side, substantially as described, and for the purpose specified.

408,689. WHIFFLETREE-CLIP. WILLIAM W. BURSON, Chicago, Ill. Filed June 6, 1888. Serial No. 313,250. (No model.)

Claim.—1. A whiffletree-clip provided with deflecting points at its inner end, which are adapted to pass over the wood of the whiffletree until nearly "home," and then to be inclined inward and to pierce the wood, whereby it is held securely in position, substantially as set forth.

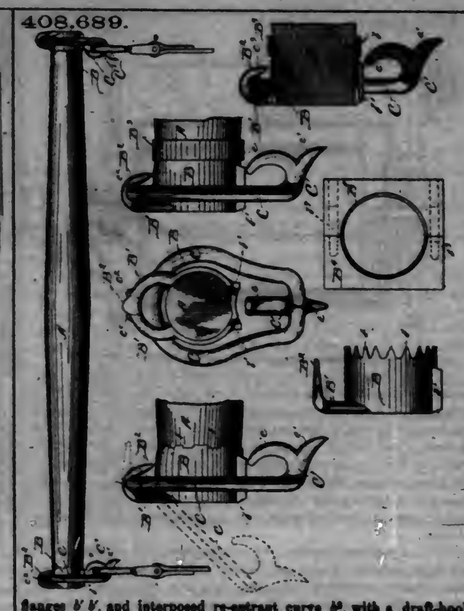
2. A whiffletree-clip provided with a clasping-finger extending outward from one end of said clip, said finger having a longitudinal extension substantially parallel with the side of said clip when cast, adapted to be bent about and to hold a draft hook or ring, in combination with a draft hook or ring, operating substantially as and for the purpose set forth.

3. The combination of a whiffletree-clip provided with the deflecting points *b* at its inner end, adapted to pierce the wood of the whiffletree, and having the hook-clasping finger B^2, with a draft-hook or ring held by said finger, substantially as specified.

4. The combination of a whiffletree-clip provided with the deflecting points *b* at its inner end, and having the hook-clasping finger B^2 and the stop-flanges B^3 B^3, with a draft hook or ring, operating substantially as and for the purpose set forth.

5. The combination of a whiffletree-clip provided at its inner end with the points *b*, and a fastening-ring held in close contact with the wood and operating to deflect the points and cause them to enter into the wood, substantially as set forth.

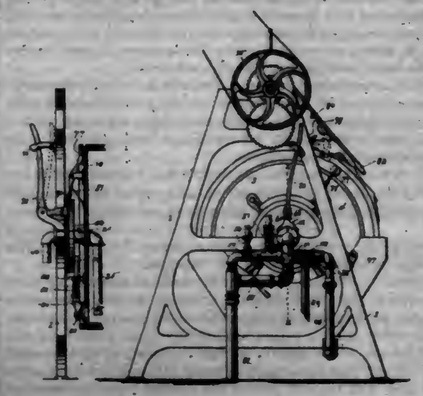
6. The combination of a whiffletree-clip provided at its inner end with the points *b*, and the fastening-ring B^3, operating to deflect points *b* and cause them to enter the wood as the clip is driven into place, substantially as specified.



7. The combination of a whiffletree-clip provided with the clasping-finger B^2 to hold the draft hook or ring, and provided with the flanges b' b', and interposed re-entrant curve b^3, with a draft-hook having a return-point *c* operating to securely hold the tug in working position, substantially as specified.

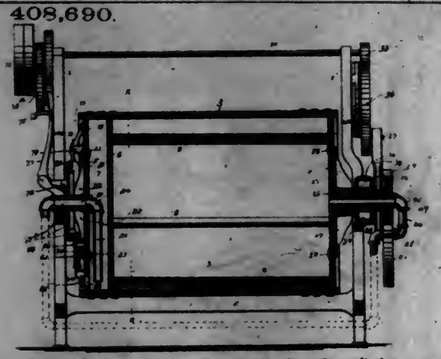
8. The combination of a whiffletree-clip provided with the clasping-finger B^2 to hold the draft hook or ring, and a hook provided with a point *c*, extending backward toward the whiffletree, and a safety-spur *c'* extending forward, operating to hold the tug in working position, substantially as described.

9. The combination of a whiffletree-clip provided with the clasping-finger B^2, and a draft-hook C held therein, provided with the lugs c^2 c^2, operating to prevent the said hook from turning axially in said clasping-finger, substantially as specified.



10. The combination of a whiffletree-clip provided with the deflecting points *b*, the clasping-finger B^2, and the stop-flanges B' B', with a draft-hook held by said clasping-finger and provided with the lugs c^2 c^2, the hook C, having the return-point *c*, and safety-spur *c'*, operating substantially as and for the purpose set forth.

408,689.



408,690. WASHING-MACHINE. CHARLES C. BURTON and DANA H. BENJAMIN, Utica, N. Y. Filed June 23, 1886. Serial No. 206,081. (No model.)

Claim.—1. In a washing-machine, the combination of a cylinder provided with bearings at each end having openings or passage-ways into the cylinder, a connecting-pipe or passage-way connecting the said openings, a chamber in a pipe connecting with said passage-way and having steam and fluid pipes entering the same, the steam-pipes projecting into the chamber at or beyond the entrance of the fluid-pipe, and valves for controlling the passage-ways.

408,690.

2. In a washing-machine, the combination of a cylinder, a perforated partition forming a chamber in one end of the cylinder, hollow bearings at each end of the cylinder, a connecting-pipe or passage-way connecting the hollow bearings outside of the cylinder, a pipe connecting one hollow bearing with the chamber in the cylinder formed by the perforated partition below the entrance, the steam and fluid pipes entering chambers connected with said passage-way, the steam-pipe extending into the chambers at or beyond the entrance of the fluid-pipes, and valves in the pipes or passage-ways for controlling the same.

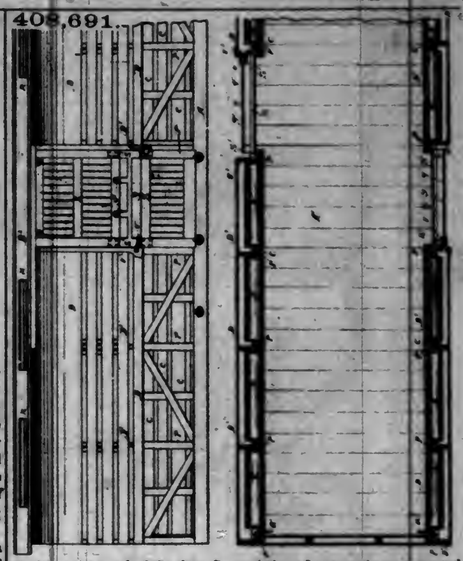
3. In a washing-machine, the combination of a cylinder and a perforated partition in one end thereof, hollow bearings at each end of the cylinder, one hollow bearing having a pipe opening into the end of the cylinder provided with the perforated partition at or near the bottom of said chamber, the outer end of the other bearing being connected with the pipe or passage-way having chamber a^{27} therein, into which chamber a steam-pipe projects, said passage-way having its discharge end open below the bottom of the cylinder, the hollow bearing at the opposite end of the cylinder being connected with a fluid-supply pipe, and valves for controlling the pipes, whereby water may be passed through the cylinder of the machine and discharged by atmospheric pressure after the steam is shut off.

4. In a washing-machine, the combination of the rotating cylinder, the hollow bearings opening into the cylinder and connected at their outer ends with a passage-way for the admission of steam and water, the cylinder-head having an opening for the passage of the fluid, and an automatically opening and closing valve for relieving the steam-pressure in the cylinder while the same is in motion.

5. In a washing-machine, the combination, with a rotating cylinder provided with an opening for the reception of the clothing, of the frame surrounding the opening, the door hinged to the frame, the elastic packing in the frame, the pivoted lever on the door, and the cam and spring-catches on the frame, substantially as set forth.

6. The combination of the cylinder having an opening in one end for the passage of the fluid, the pivoted lever attached to the cylinder-head, a cam, one end of the lever carrying a stop to fit said opening and the opposite end constructed to engage said cam for automatically opening the stop, substantially as set forth.

7. In a washing-machine, the combination, with a rotating cylinder having an opening through the cylinder-head, the automatically opening and closing valve fitting said opening, the connecting-rod connecting with the valve at one end and the opposite end carrying a roller engaging the movable circle, the movable circle, and the lever for moving the circle, whereby the same may be used concentrically and eccentrically, for the purposes stated.



8. In a washing-machine, the combination, with an alternately-reversing cylinder, of a plate with a circular groove formed therein, a corresponding groove formed in the transmitting-wheel, anti-friction rollers fitted in the groove, the wheel-plate being attached to the frame, substantially as described.

9. In a washing-machine, the combination, with the rotating cylinder having pin 90, of the catch 87, having notch 89, and the belt-shifting lever 82, having lug 91, substantially as described.

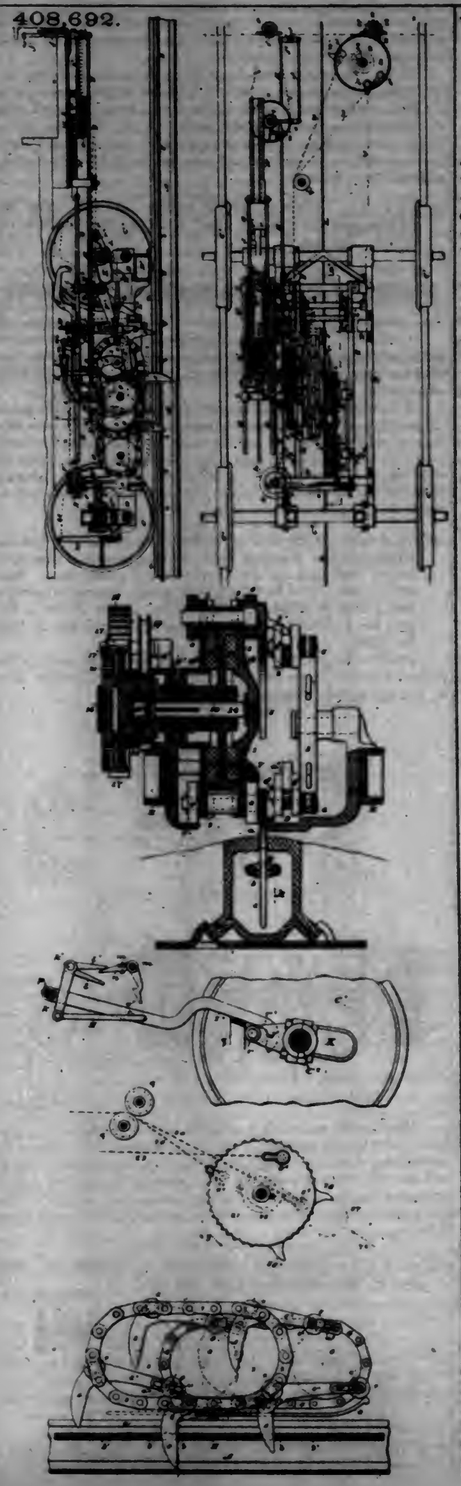
408,691. STOCK-CAR. John M. Burton, Wichita, Kans. Filed Sept. 24, 1888. Serial No. 286,149. (No model.)

Claim.—1. The combination, in the stock-car described, provided with the side posts P, of the hoods D, having the ribs D' secured to said posts and arranged dividing the said hoods into separate sections, of the folding racks G, hinged at their lower part to the inner part of said posts, of the cranked tie-bolt V, connecting the depending corner of said hood adjacent the doorway at the side where the door slides back with the door-post, of the connected pivoted watering-troughs E, arranged between said side posts adjacent the doorways

408,691.

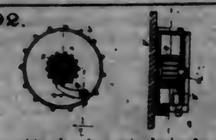
at either side, and of the door S, consisting of two sections connected together by means of the bent straps S', a strap either side of said cranked tie-bolt, thus forming a recess across the body of said door parallel with said troughs and adapted to slide open within said hood and pass said troughs, wherein the bent straps of said door will engage the hollow of the crank of said tie-bolt to turn said bolt and permit the door to slide its full distance either way, substantially as specified.

2. The combination, in the stock-car described, provided with the side posts P, of the hoods D, having the ribs D' secured to said posts and arranged dividing the said hoods into separate sections, of the connected pivoted troughs E, arranged between said side posts from adjacent the doorways either way, of the door S, consisting of two sections connected together by means of the bent straps S', thus forming a recess across the body of the door parallel with said troughs, and of the cranked tie-bolt V, arranged between the bent straps of said door and connecting the depending corner of said hood adjacent said door to the door-post, wherein said door is adapted to slide back within said hood and pass the extending troughs E, and its said straps engage the hollow of the crank of said bolt to turn said crank to provide a recess therein to permit said door to slide its full distance either way, substantially as specified.



3. The combination, in the stock-car described, provided with the side posts P, of the hoods D, having the ribs D', securing them to said posts, and arranged to divide said hoods into separate sections, the end ribs thereof adjacent the doorways where the doors slide back arranged a distance from the door-posts to admit the passage of doors S within the hoods adjacent the side posts, the pivoted cranked tie-bolt V, arranged to connect the lower part of said end ribs to the door-posts, and the doors S, consisting of two sections connected together by the bulging side straps S', arranged to inclose said tie-bolts between said straps, wherein the hollow of the crank of said bolts is engaged by said door-straps to turn and reverse the crank of said bolts to permit the doors to slide their full distance either way, substantially as set forth.

4. The combination, in the stock-car described, of the side posts P, the hoods D, having the ribs D' secured to said posts adjacent the door or other side, the end ribs thereof adjacent the door on the side that the door slides, arranged at a distance from the door-post, to admit the passage of the door within the hood, and door S, consisting of the two sections connected together by means of the bulging side straps S', whereby said door is permitted to slide within said hood and pass the watering-troughs and feed-racks adjacent thereto, substantially as described.



408,692. GRIP AND APPLIANCE FOR CABLE-ROAD CARS. Andrew Campbell, Brooklyn, N. Y. Filed Feb. 18, 1888. Renewed June 21, 1889. Serial No. 315,049. (No model.)

Claim.—1. A grip for a cable-road car, comprising two endless chains and their sprocket-wheels, and L-shaped teeth to engage the cable, said teeth being pivotally mounted in the main endless chain, with their tails pivotally connected to the auxiliary endless chain, substantially as set forth.

408,692.

408,692.

2. The combination, in a grip device for a cable-road car, of two endless chains, as 2 and 4, arranged side by side, two pairs of sprocket-wheels on which said chains are mounted, L-shaped teeth, as 5, pivotally mounted in the chain 2, and having slotted tails $5^{\times}$, pivotally connected to the chain 4, friction-rollers, as 6 and 8, mounted in said chains, respectively, at the points where the teeth are pivoted, and the tracks on which said rollers run, substantially as set forth.

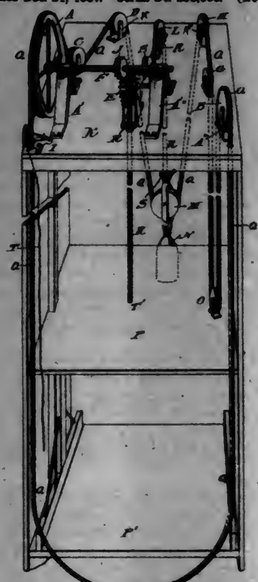
3. A brake for a grip for a cable-road car, consisting of brake-disks 13 and $13^{\times}$ and their brake-blocks, said blocks being arranged on opposite sides of the web of the grip-wheel, a screw 15, connected rigidly to one of said disks, a nut $15^{\times}$, connected rigidly to the other of said disks, and a nut 16, screw-threaded externally and internally and intermeshing with the screw 15 internally and the nut $15^{\times}$ externally, whereby rotation of said nut serves to operate both brake-disks simultaneously, as set forth.

4. The combination, with a sprocket-wheel 1 of a grip device, of the brake-disk 13, furnished with a block 12, a stem 14, and a male screw 15, said stem extending through the tubular journal of the wheel 1, the brake-disk $13^{\times}$, furnished with a block $12^{\times}$, stems $14^{\times}$, and a nut or female screw $15^{\times}$, a nut 16, furnished with a male screw which engages nut $15^{\times}$ and a female screw which engages screw 15, and an operating-wheel 17, secured to said nut 16 concentrically, substantially as set forth.

5. The combination, with the grip-carrying frame E, its supporting-chains and their sheaves, of the carriage G, a hooked draw-bar, as I, pivoted therein, a supporting-hook which holds up said draw-bar, a trip, as l, for releasing said hook, an operating-rod H, a crank-arm k, connecting said rod H with said trip, the car-axle, the crank J thereon provided with a crank-pin r, and the cam on the axle for raising said draw-bar, substantially as set forth.

6. The combination, with the rod H, the crank-arm k, to which it is coupled, the rock-shaft k', and the toes l $l^{\times}$, forming trips, of the carriage G, the hooked draw-bars I $I^{\times}$, of unequal length, mounted in said carriage, the elbow-levers n $n^{\times}$, mounted on said carriage and having pendent hooks which engage pins o $o^{\times}$, respectively, in said draw-bars, the axle of the car and the crank J thereon, provided with two crank-pins r $r^{\times}$, arranged at different distances from the axle, substantially as and for the purposes set forth.

7. The combination, with the frame D, carried by the car-axles, and the grip-carrying frame E, suspended in said frame D, of the rock-shaft F in frame D, provided with arms F', and the links F^3, connecting said arms with the frame E, substantially as and for the purposes set forth.

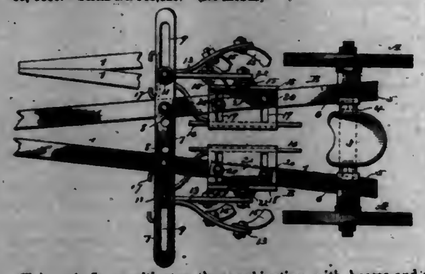


8. The combination, with the frame D and the grip-carrying frame E suspended therein, of the rock-shaft L, provided with an arm $L^{\times}$, that takes over some part of frame E normally, a weighted arm L' and an operating-arm L^2, having a pin or bowl s, of the pendent bar M, having two cams on its lower end, adapted to act on said pin or bowl, whereby the shaft L is rocked by the swinging of said bar M, as set forth.

9. The combination, with the grip-carrying frame, its supporting and elevating chains and sheaves, and the carriage G, of the rack N coupled to said carriage, the pinion t, engaging said rack, the dog or pawl w, engaging said pinion, said dog being provided with a tail $w^{\times}$, the lever x, the upright shaft j, the cross-head j^3 on said shaft, the connecting-rod x', which couples one end of said cross-head to said lever x, the wheel O, mounted loosely on the same axis with pinion t, the pawl y, carried by said wheel and engaging said pinion, the upright shaft P, its pinion $z^{\times}$, and the chain or belt connecting wheel O with pinion $z^{\times}$, substantially as set forth.

10. The brake-applying device for the grip-brake, comprising the upright operating-shaft 26, a pinion carried thereby intermeshing with a spur-wheel, the said spur-wheel, and the brake-chain 20, its ends connected to studs in the face of the said wheel at opposite sides of its center, whereby the said chain is slackened on one side to the same extent that it is taken up on the other, and whereby the braking-leverage is increased, as set forth.

11. The brake-applying device comprising the combination of the spur-wheels 21 and $21^{\times}$, connected together by a spring 25 and provided, respectively, with stops 28 and $28^{\times}$, the car-brake chain 23, connected with wheel 21, the grip-brake chain 20, connected at its ends with wheel $21^{\times}$, the nut 31, the operating-shaft 26, provided with a screw 30 in said nut and a short spline, and the pinions 27 and $27^{\times}$ on said shaft, meshing, respectively, with said wheels 21 and $21^{\times}$ and provided with spline-grooves and spiral spline-recesses, whereby both brakes may be operated successively from the same shaft.



408,693. HAND-ELEVATOR. GEORGE W. CARSON, Poughkeepsie, N. Y. Filed Dec. 21, 1887. Serial No. 258,606. (No model.)

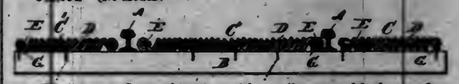
Claim.—1. The combination of an elevator-car with a hoist-wheel A, axle F, cog-wheels J and E, and groove-wheel *e*, counterpoise-weight N, brake I, pulleys M, L, B, C, D, H, G, and S, hoist-rope R, and power-rope Q, as shown and described.

2. The combination of the elevator-car with the hoist-wheel A, axle F, cog-wheels J and E, wheel *e*, counterpoise-weight N, pulleys M, L, B, C, D, H, G, and S, the hoist-rope R, and endless power-rope Q, as shown and described.

408,694. CULTIVATOR. JOHN CLARK, Imogene, Iowa. Filed Mar. 19, 1889. Serial No. 303,825. (No model.)

Claim.—1. In a cultivator, the combination, with beams and a cross-bar secured thereto, of teeth or blade supports adjustable laterally toward and away from the beams, and levers also adjustable toward and away from the beams for elevating the teeth or blade supports.

2. In a cultivator, the combination, with beams, a cross-bar adjustably secured thereto, and teeth-supports adjustably connected to said cross-bar, of plates adjustably secured to the beams, and levers pivoted to said plates and connected to the teeth-supports, substantially as set forth.



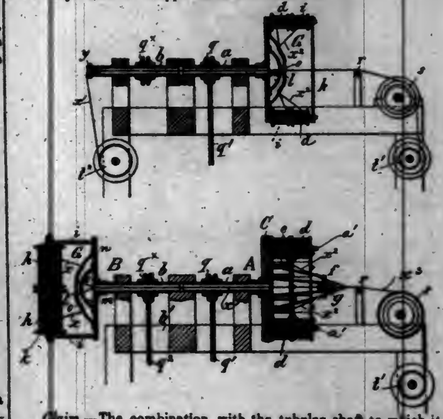
3. The combination, with a beam, of a cross-bar thereon, teeth-carrying arms and guards adjustably connected to the cross-bar, and levers for raising and lowering the teeth-carrying arms, substantially as set forth.

4. The combination, with the beams and a cross-bar secured thereto, of knuckles adjustably secured to the latter, pendent arms pivoted to the knuckles, forked arms connected with the pendent arms, teeth adjustably secured to the forked arms, and means for raising and lowering the arms, substantially as set forth.

5. The combination, with beams and a cross-bar secured thereto, of knuckles adjustably secured to the cross-bar, pendent arms pivoted to the knuckles, means for applying the draft thereto, and shields extending from the knuckles and teeth-carrying arms from the pendent arms, substantially as set forth.

6. The combination, with a pair of beams and cross-bar, the latter having elongated slots therein, of knuckles adjustably secured in the slots, arms pivoted to the knuckles, forked arms connected with the pivoted arms, teeth adjustably secured to the branches of the forked arms, segments adapted to be shifted on the beams, and latch-levers pivoted on the segments and connected with the forked arms, substantially as set forth.

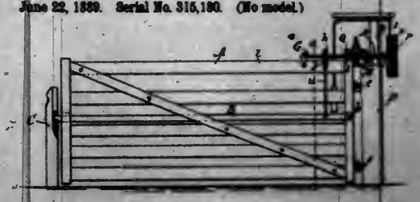
408,695. SURFACE CATTLE-GUARD. EDWIN M. CLARK and CHARLEMAGNE CLARK, Detroit, Mich. Filed May 29, 1889. Serial No. 312,664. (No model.)



Claim.—1. In combination with a railway road-bed, a surface cattle-guard secured thereto and constructed of sections of wire web-bing having an upward presentation of loops or bends, substantially as described.

2. In combination with a railway road-bed, a surface cattle-guard secured thereto and constructed in sections, consisting of a wire web-bing of interlocking spirals and the frame, substantially as described.

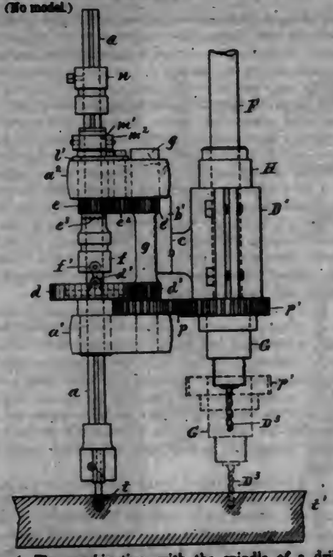
3. In a surface cattle-guard, the combination of the following elements: a rectangular frame, a web of interlocking wire coils connected at the sides and ends to the rectangular frame, and spools or blocks G, substantially as described.



408,696. MACHINE FOR TWISTING AND COVERING CORDS, &c. WILHELM CLOSER, Mannheim, Baden, Germany, assignor to Hugo Levi, Leopold Oestreicher, and Daniel Oestreicher, all of same place. Filed Jan. 16, 1889. Serial No. 296,500. (No model.) Patented in Germany Sept. 3, 1888, No. 47,228; in France Nov. 30, 1888, No. 194,454; in Belgium Dec. 14, 1888, No. 84,292, and in Austria-Hungary Mar. 21, 1889, No. 62,525.

Brief.—The object of the invention is to improve the construction of the flier which carries the strands to be twisted to form the core, or, it may be, to be wrapped around a core.

Claim.—The combination, with the tubular shaft to which it is fixed, of the flier G, consisting of the bar *n*, furnished with a socket at its middle to receive said shaft, the arms *i i* on the respective ends of said bar, the removable spool-carrying stretcher *k*, mounted in said arms, and the two arched tension-bars mounted on the face of the bar *n* and provided with holes *o* for the passage of the strands, as set forth.



408,697. ROAD-GATE. THOMAS DOUP, Jr., Columbus, Ind. Filed June 22, 1889. Serial No. 315,180. (No model.)

Claim.—1. The combination, with the post D and the gate hinged thereto and having a latch-bar, of the shaft G, mounted in bearings on the gate, segment-wheel *h*, having arms *k* and *j*, and secured to said shaft, cord *u*, connecting the arms to the latch-bar, shaft N, mounted in bearings on the post and having pulley *p* secured thereto, a cord attached to the periphery of the pulley, and intermediate connecting mechanism connecting shafts N and G, whereby the latch-bar is raised by the rotation of the shafts, substantially as specified.

2. The combination of the gate-post, the gate hinged thereto and having the latch-bar, the shaft mounted in bearings on the gate and carrying the pinion, and the segment-wheel having a pair of arms which embrace loosely the top edge of the gate, the cord connecting said arms with the latch-bar, the horizontal shaft mounted in bearings on the post and carrying the gear-wheel and the pulley, the cords attached to the periphery of the pulley, the vertical shaft mounted on the post, and the crown-wheel mounted on the vertical shaft and arranged to engage the gear-wheel and the pinion, all combined and arranged to co-operate as specified, whereby the latch is first raised and the gate then swung on its hinges, as set forth.

408,698. TAPPING ATTACHMENT FOR DRILLING-MACHINES. ULRICH ERSENHARDT, Newark, N. J. Filed Feb. 16, 1889. Serial No. 300,154. (No model.)

Claim.—1. The combination, with the spindle of a drilling-machine and the gearing for rotating the same, of a tap-spindle mounted in a head sustained adjacent to the drill-spindle, gearing for driving such tap-spindle in opposite directions, and gearing connected with the same and with the gearing of the drill-spindle, and a movable table for applying the work in succession to the drill and tap, substantially as herein set forth.

2. The combination, with the spindle of a drilling-machine and the gearing for rotating the same, of a tap-spindle mounted in a head sustained adjacent to the drill-spindle, gearing for driving such tap-spindle in opposite directions, and gearing connected detachably with the same and with the gearing of the drill-spindle, and a movable table for applying the work in succession to the drill and tap, substantially as herein set forth.

3. The combination, with a column-drill, of a table, a table-arm supporting the same and movable around the column, a drill-spindle and tap-spindle sustained by the column of the drill, gearing for driving the drill-spindle to drill holes, gearing for driving the tap-spindle in opposite directions, and gearing connected with the same and with the gearing of the drill-spindle, substantially as herein set forth.

4. The combination, with the spindle of a drilling-machine and the gearing for rotating the same, of a tap-spindle, a head affixed to the lower drill-spindle bracket, gearing to reverse the tap-spindle, a toothed coupling-wheel inserted in such gearing adjacent to the lower side of the drill-spindle bracket, and a cog-wheel fixed upon the drill-spindle and movable therewith to mesh at pleasure with the coupling-wheel, as and for the purpose set forth.

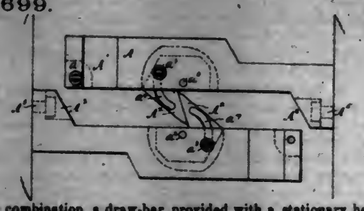
5. The combination, with a column-drill having a table and a table-arm movable around the column and having a drill-spindle bracket adapted to sustain the drill concentric with the table, of a tap-spindle head sustained adjacent to the drill-spindle and adapted to sustain the tap-spindle concentric with the table when the latter is moved around the column, and gearing for reversing the drill-spindle, as and for the purpose set forth.

6. The combination, with a tap-spindle and suitable bearings for sustaining the same, of two gear-wheels fitted loosely upon the spindle and rotated in opposite directions, a clutch-block feathered upon the spindle and movable between the gear-wheels, teeth upon the clutch-block and upon one of the gear-wheels for driving the spindle in one direction, and rollers affixed to the clutch-block and the other gear-wheel and moved into contact with one another past their respective centers for driving the spindle in the opposite direction, substantially as herein set forth.

7. The combination, with a tap-spindle and suitable bearings for sustaining the same, of two gear-wheels fitted loosely upon the spindle and rotated in opposite directions, a clutch-block feathered upon the spindle and movable between the gear-wheels, teeth upon the clutch-block and upon one of the gear-wheels for driving the spindle in one direction, rollers affixed to the clutch-block and the other gear-wheel and adapted to engage past their respective centers for driving the spindle in the opposite direction, a lever having a fixed fulcrum and pivoted at one side of the fulcrum to the clutch-block and provided at the other side of the fulcrum with a sloping face, a spring-dog adapted to press the lever laterally when engaged with such face, and a handle applied to the lever for shifting the clutch-block toward either of the gear-wheels, substantially as herein set forth.

8. The combination, with a tap-spindle and suitable bearings for sustaining the same, of two gear-wheels fitted loosely upon the spindle and rotated in opposite directions, a clutch-block feathered upon the spindle and movable between the gear-wheels, teeth upon the clutch-block and upon one of the gear-wheels for driving the spindle in one direction, rollers affixed to the clutch-block and the other gear-wheel and adapted to engage past their respective centers for driving the spindle in the opposite direction, a lever having a fixed fulcrum and pivoted at one side of the fulcrum to the clutch-block and provided with a handle, the link *m*, pivoted to the lever at the opposite side of the fulcrum, the depth-collar *m'*, the arm m^2, pivoted to the link and actuated by such collar, and the collar *n*, fixed upon the spindle above the depth-collar *m'* and adapted when moved downward into contact with the latter to raise the clutch-block into contact with the reversing gear-wheel, substantially as herein set forth.

9. The combination, with a tap-spindle and suitable bearings for sustaining the same, of two gear-wheels fitted loosely upon the spindle and rotated in opposite directions, a clutch-block feathered upon the spindle and movable upon the gear-wheels, teeth upon the clutch-block and upon one of the gear-wheels for driving the spindle in one direction, rollers affixed to the clutch-box and the other gear-wheel and adapted to engage past their respective centers for driving the spindle in the opposite direction, a lever having a fixed fulcrum and pivoted at one side of the fulcrum to the clutch-block and provided with a handle, the link *m*, pivoted to the lever at the opposite side of the fulcrum, the collar *m'*, the arm m^2, pivoted to the link and actuated by such collar, the collar *n*, fixed upon the spindle, the tap-lever *n'*, actuated by such fixed collar, the weight n^2, for moving the lever to normally raise the spindle, and the handle n^3, for pressing the spindle downward, as and for the purpose set forth.



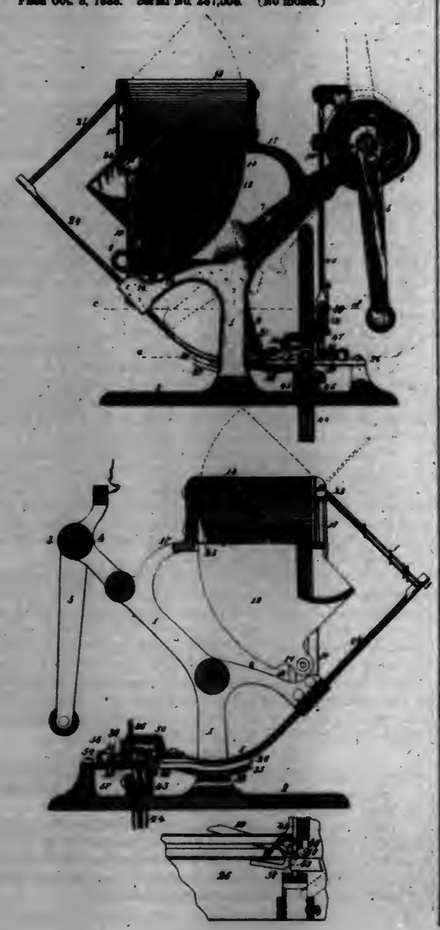
10. The combination, with the spindle of a drilling-machine and the gearing for rotating the same, of a tap-spindle mounted in a movable frame adjacent to the drill-spindle, and gearing for driving such tap-spindle in opposite directions, connected with the gearing of the drill-spindle, the movable frame being adapted by its movement to detach the gearing of the tap-spindle from the gearing of the drill-spindle, as and for the purpose set forth.

11. The combination, with a tap-spindle and suitable bearings for sustaining the same, of two gear-wheels fitted loosely upon the spindle and rotated in opposite directions, a clutch-block feathered upon the spindle and movable between the gear-wheels and adapted to engage with either of such gear-wheels, a depth-collar fitted loosely to the tap-spindle above its bearings and connected by a link and suitable levers with the clutch-block to raise the same by the depression of the depth-collar, an adjustable collar fixed upon the tap-spindle to press upon the depth-collar, and a scale upon the tap-spindle for setting the adjustable collar, as and for the purpose set forth.

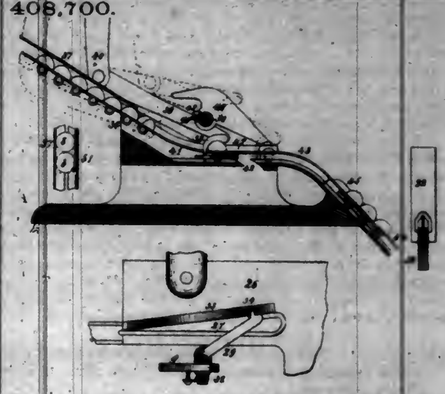
408,699. CAR-COUPLING. JOHN V. D. ELSAMSER, Detroit, Mich., assignor of one-half to Curtis B. Eldridge, same place. Filed May 27, 1889. Serial No. 312,271. (No model.)

Claim.—1. A draw-bar provided with a head having an upward projection and adapted to come to a bearing against the sill of an adjacent car and having a pivoted hook projecting from its side at a point some distance back of the head adapted to engage a corresponding hook on a similar bar, substantially as described.

408,699.



2. In combination, a draw-bar provided with a stationary head adapted to engage an ordinary link-and-pin coupler, said bar having at a distance back of the stationary head a pivoted hook housed in and projecting from its side, a locking-pin to lock said hook, and means for readily disengaging the pin to uncouple the cars, substantially as described.



3. The combination, with the draw-bar having a head adapted to engage a link-and-pin coupler, of the coupling-hook housed in and projecting from the side of the draw-bar and having a groove in its upper side, and a locking-pin adapted to ride in said groove when the hook is released and to limit its movement, substantially as described.

4. In combination, a draw-bar having a stationary head at its forward end projected upward to bear against the sill of an adjacent car, a pivoted hook projecting from its side at a distance back from this head, and a sidewise projection at the rear end of the bar adapted to engage a center draft-rod, substantially as described.

408,700. BUTTON-MACHINE. WILLIAM R. ELLIOTT, Marion, Iowa. Filed Oct. 8, 1888. Serial No. 287,558. (No model.)

408,700.

Claim.—1. In a button-machine of the class specified, the combination of the tilting blade thickened on the side from which the fasteners escape for the purpose of righting them, and having a recess therein to receive the upper end of an abutting raceway, and a raceway the upper end of which extends practically to the adjacent end of the blade in its vertical movement and enters the recess therein when tilted, substantially as and for the purpose set forth.

2. In a button-machine of the class specified, the combination of the hopper 13, blade 12, and gate 22, having an aperture therein for the escape of fasteners, substantially as and for the purpose set forth.

3. In a button-machine of the class specified, the combination of the fastener-chute 24, having a slot in its under side to receive the push-pin of a feed-finger the table 26, having slot 27 and cam 33, and the reciprocating feed-finger 29, having push-pin 28, and the lug 34, whereby the fastener is fed through the shank of a button and turned partly around and the feed-finger returned to its normal position in a different path, substantially as set forth.

4. In a button-machine of the class specified, the combination of a chute adapted to convey fasteners to a position for insertion in the shanks of buttons, a feed-finger, substantially as described, adapted to engage a fastener and feed it to said position, a table upon which said fasteners rest and fed forward, said table being provided with a shoulder to engage one of the tangs of the fastener, and a slot for the push-pin of the feed curved at the terminus nearest the said point of insertion of the fastener in the button-shank, whereby the fastener is thrust through the button-shank and turned partially around, as specified.

5. In a button-machine of the class specified, the doubly-jointed feed-finger 29, provided with springs 31 and 32, in combination with the table 26, having slot 27 and cam 33, substantially as described.

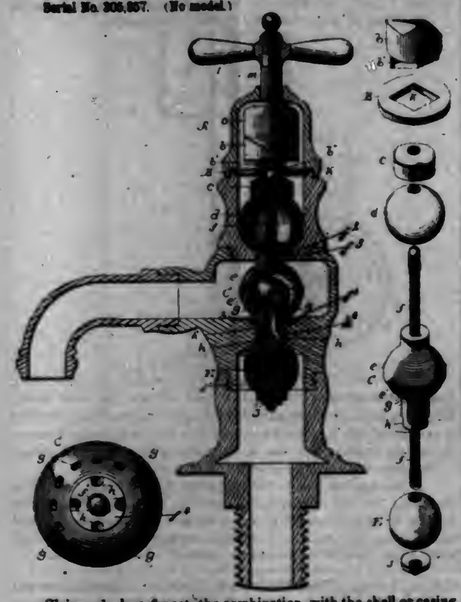
6. In a button-machine of the class specified, the combination of a chute adapted to convey buttons to a position for inserting fasteners in their shanks, a button-holder connected with a reciprocating arm and adapted to cut out and carry forward a single button from a row in said chute and hold the same in position while the fastener is inserted in its shank, and a cam adapted to tilt and allow the holder to pass under it in pushing the connected button and fasteners from the machine and to carry said holder over it in returning for a new button, substantially as described.

7. In a machine of the class specified, the combination of a button-chute in which buttons are conveyed to a point for insertion of fasteners, a feed-finger having a button-holder thereon connected with a reciprocating arm, a detent adapted to serve as a stop for the shank of the button in its forward movement, and a supplemental finger connected with said reciprocating arm adapted to push said detent forward in advance of the button after the fastener is connected therewith, substantially as set forth.

8. In a machine of the class specified, the combination of a reciprocating arm, a button-feed finger having a slotted connection therewith, whereby said finger is adapted to yield somewhat according to the size of the button, and a spring adapted to press the button-holder of said feed upon the button, substantially as and for the purpose set forth.

9. In a button-machine of the class specified, the combination, with feed mechanism, substantially as described, of a button-chute having a lateral spring near its lower end to retain the lower button, said chute being open on its upper side from a point slightly above said lower button to its lower end to admit the button-holder of said feed, substantially as set forth.

10. In a button-machine of the class specified, the combination, with the table 26, having the groove 41, of a button-holder 38, having a narrow portion entering and adapted to drag said slot to clear the same, substantially as described.



11. In a button-machine of the class specified, the combination of the slotted feed-finger 30, spring 52, detent 53, finger 56, and spring 54, substantially as and for the purpose set forth.

12. In a button-machine of the class specified, the combination, with actuating mechanism, substantially as described, of the fastener-catching blade 12, bell-crank lever 8 9, and finger 20, doubly jointed thereto, substantially as and for the purpose set forth.

13. In a button-machine of the class specified, the combination, with feed mechanism, substantially as described, of the oscillating arm 7, eccentric 6, mounted on shaft 4, oscillating arm 40, having traveler 59, and cam 60, mounted on said shaft, all substantially as and for the purpose set forth.

14. In a button-machine of the class specified, the combination, with a hopper for fasteners, substantially as described, of a fastener-catching blade adapted to move vertically for a limited distance in said hopper and then tilt to discharge the fasteners from one end thereof, the discharge end of said blade being extended at an angle to the vertical corresponding to the angle of tilt, whereby the opening in the end of the hopper is kept closed when said blade is tilted, as described.

408,701. SELF-ACTING FAUCET. PIERCE R. EVERETT, Kansas City, Mo., assignor to Charles Doherty, same place. Filed Apr. 3, 1889. Serial No. 305,857. (No model.)
